Introduction

Changes made to General Plan Amendment (GPA) No. 960’s Climate Action Plan after the close of the February 2015 recirculation of Draft Environmental Impact Report No. 521 are noted below. The changes to the Climate Action Plan do not affect the overall policies and conclusions of the GPA No. 960 (or Draft EIR 521), and instead represent changes to the Climate Action Plan that provide clarification, amplification and/or “insignificant modifications” as needed as a result of public comments on the Climate Action Plan, or due to additional information received during the public review period. These clarifications and corrections do not warrant recirculation pursuant to CEQA Guidelines §15088.5. As set forth further below and elaborated upon in the respective Response to Comments, none of the Errata to the Climate Action Plan below reflect a new significant environmental impact, a “substantial increase” in the severity of an environmental impact for which mitigation is not proposed, or a new feasible alternative or mitigation measure that would clearly lessen significant environmental impacts but is not adopted, nor do the Errata reflect a “fundamentally flawed” or “conclusory” Draft EIR.

In order to clearly display all of the changes that have been made during the General Plan Update Process, text has been formatted to show changes made in each step of the process. This includes:

- **Black Text:** General Plan text prior to GPA No. 960 is noted in black text.
- **Red Text:** Textual changes proposed as part of the May 2014 previously circulated document are shown in red text.
- **Blue Text:** Textual changes made to the documents after the May 2014 circulation are shown in blue text.
- **Green Text:** Textual changes made to the documents after the February 2015 recirculation are shown in green text.

The color coding of the edits allows the reader to distinguish more clearly between the original General Plan text, the previously proposed May 2014 revisions (red), the February 2015 proposed revisions to GPA No. 960, Draft EIR No. 521 and the Climate Action Plan (blue), and the proposed revisions from the February 2015 recirculation (green). Added or modified text is shown by italicizing (example) while deleted text is shown by striking (example).

The revisions incorporated into the Climate Action Plan as a result of the February 2015 recirculation are described below.

**CLIMATE ACTION PLAN (CAP)**

Pages 8-9 and 15-16, CEQA Thresholds and Screening Tables

Note: The following footnote has been added to Screening Table Measures E2.A.1, E2.A.2, E6.A.1, and E6.A.2:

1The term total power refers to the actual, expected output from the facility implemented and not the potential capacity of facility.

**APPENDIX F: GREENHOUSE GAS EMISSIONS SCREENING TABLES**

Cover Page

**May 2011 March 2015**

Page 1, Below “Introduction”

The County of Riverside Climate Action Plan (CAP) includes reducing 4,288,863 Metric Tons of Carbon Dioxide Equivalents (MTCO2e) per year from new development by 2020 as compared to the 2020 unmitigated conditions.

Mitigation of GHG emissions impacts during the development review process of projects provides one cost effective way of implementing the GHG reduction strategies for reducing community-wide emissions associated with new development. The development review process procedures for evaluating GHG impacts and determining significance for CEQA purposes will be streamlined by (1) applying an emissions level that is determined to be less than significant for small projects, and (2) utilizing Screening Tables to mitigate project GHG emissions that exceed the threshold level. Projects will have the option of preparing a project-specific technical analysis to quantify and mitigate GHG emissions. A threshold level above 3,000 MTCO2e per year will be used to identify projects that require the use of Screening Tables or a project-specific technical analysis to quantify and mitigate project emissions.

Page 2, First Paragraph below “Statewide or Regional Thresholds of Significance”

There are currently no published statewide or regional thresholds of significance for measuring the impact of GHG emissions generated by a proposed project. CEQA Guidelines §15064.7 indicates only that, “each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects.” The County of Riverside CAP addresses cumulative GHG emissions, has a reduction target that reduces the cumulative GHG impacts to less than significant, has a set of reduction measures that achieves the reduction target and provides an implementation plan to implement the reduction measures. This document provides guidance in how to address GHG emissions in CEQA analysis and determine the significance of project generated GHG emissions.

Page 2, First Paragraph below “Methodology Overview”

An individual project cannot generate enough GHG emissions to influence global climate change. The project participates in this potential impact by its incremental contribution combined with the cumulative increase of all other sources of GHGs, which when taken together may have a significant impact on global climate change. To address the State’s requirement to reduce GHG emissions, the County prepared the Technical Report CAP with the target of reducing GHG emissions within the unincorporated County by 15% below 2008 levels by the year 2020. The County’s target is consistent with the AB 32 target and ensures that the County is providing GHG reductions locally that will complement the State and international efforts of stabilizing climate change.
Because the County’s CAP addresses GHG emissions reduction in concert with AB 32 and international efforts to address global climate change and includes specific local requirements that will substantially lessen the cumulative problem compliance with the CAP fulfills the description of mitigation found in CEQA Guidelines §15130(a)(3) and §15183.5.

No single project has the ability to generate GHG emissions in sufficient quantities to change the global climate. Rather, it is the incremental contribution of all past, present, and future projects that when combined with all other anthropogenic sources of GHG emissions globally generates climate change impacts. Because GHG emissions are only important in the context of cumulative emissions, the focus of the analysis is on answering the question of whether incremental contributions of GHGs are a cumulatively considerable contribution to climate change impacts. The CAP includes a set of mitigation measures designed to substantially lessen cumulative impacts associated with GHG emissions as described in CEQA Guidelines §15130(a)(3), in determining if a project’s effects will result in significant impacts. The CAP has the following components that fulfill cumulative mitigation for GHG emissions:

1. The CAP provides a community-wide GHG emissions reduction target that will substantially lessen the cumulative impact;

2. The CAP provides measures that new development projects to follow to meet the County’s reduction target and substantially lessen the cumulative impact;

3. The CAP provides a set of GHG emission inventories that provides quantitative facts and analysis of how the measures within the CAP meet the reduction target that substantially lessens the cumulative impact;

4. The CAP provides an implementation, monitoring and update program to insure that the reduction target is met.

The CAP satisfies the first condition by adopting a target of reducing GHG emissions down to 15 percent below existing levels within the County of Riverside by 2020. This reduction target is compliant with AB 32; the AB 32 Climate Change Scoping Plan states: “In recognition of the critical role local governments will play in the successful implementation of AB 32, ARB recommended a greenhouse gas reduction goal for local governments of 15 percent below today’s levels by 2020 to ensure that their municipal and community-wide emissions match the State’s reduction target” (Scoping Plan page ES-5, CARB, December 2008). In this way, the City is teaming with the State’s efforts to reduce GHG emissions globally and substantially lessen the cumulative problem.

The CAP satisfies the second condition through the implementation of the reduction measures for new development. This document supplies the specific criteria that new development must follow to ensure that the reduction measures associated with new development are implemented and the reduction target is met.

The CAP satisfies the third criteria by providing a set of community-wide GHG emissions inventories for existing conditions, for future 2020 GHG emissions that are anticipated without the reduction measures (Business As Usual; BAU), and reduced levels of 2020 GHG emissions which demonstrates how the implementation of reduction measures achieves the reduction target (15 percent below existing GHG emission levels by 2020).

The CAP satisfies the fourth criteria through the implementation and monitoring program described in detail in Chapter 7 of the CAP.

Because the County’s Technical Report addresses GHG emissions reduction, the Report is in concert with AB 32 and international efforts to address global climate change. The Technical Report includes specific local requirements that will substantially lessen the cumulative contribution attributed to activities under the County’s land use control. Compliance with the Report fulfills the approach found in CEQA Guidelines §15130(a)(3) for determining whether a project’s contribution is cumulatively considerable.

Because GHG emissions are only important in the context of cumulative emissions, the focus of the analysis is on answering the question of whether incremental contributions of GHGs are a cumulatively considerable contribution to climate change impacts. The GHG Technical Report, in determining if the Project’s effects will result in significant impacts, includes a set of implementation measures designed to substantially lessen cumulative impacts associated with GHG emissions as described in CEQA Guidelines §15130(a)(3). The Technical Report has the following components that fulfill mitigation for cumulative GHG emissions.
The Report provides a countywide GHG emissions reduction target that will substantially lessen the cumulative problem;

The Report provides Implementation Measures that new development projects must follow to meet the County’s reduction target and substantially lessen the cumulative impact; and

The Report provides a set of GHG emission inventories that provides quantitative facts and analysis of how the County implementation measures combined with the State reduction strategies reduce emissions to the reduction target that substantially lessens the cumulative impact.

The Technical Report satisfies the first condition because it includes a reduction target of reducing GHG emissions down to 15% below existing levels within the unincorporated County by 2020. This reduction target is compliant with AB 32. The AB 32 Climate Change Scoping Plan states: “In recognition of the critical role local governments will play in the successful implementation of AB 32, ARB recommended a greenhouse gas reduction goal for local governments of 15 percent below today’s levels by 2020 to ensure that their municipal and community wide emissions match the State’s reduction target” (Scoping Plan page ES-5, CARB, December 2008). The County’s Plan matches the State’s reduction target, which also coincides with the reduction targets of the Kyoto Protocol. In this way, the County is teaming with the State and international efforts to reduce GHG emissions globally and substantially lessen the cumulative problem.

The Technical Report satisfies the second condition through the implementation measures for new development. This document supplies the specific criteria for new development to follow to insure that the implementation measures associated with new development are applied and the reduction target is met.

The Technical Report satisfies the third criteria by providing a set of countywide GHG emissions inventories for existing conditions, for future 2020 GHG emissions that are anticipated without the reduction measures (Business As Usual; BAU), and reduced levels of 2020 GHG emissions that will result from the implementation of the reduction measures. Finally, the reduced 2020 GHG emissions inventory quantitatively demonstrates that implementation of the reduction measures achieves the reduction target (15% below existing GHG emission levels by 2020). These Countywide GHG emission inventories are found in Appendix A of the Technical Report.

3,000 MT CO₂e Emission Level

The County determined the size of development that is too small to be able to provide the level of GHG emission reductions expected from the Screening Tables or alternate emission analysis method. To do this the City determined the GHG emission amount allowed by a project such that 90 percent of the emissions on average from all projects would exceed that level and be “captured” by the Screening Table or alternate emission analysis method.

In determining this level of emissions the County used the database of projects kept by the Governor’s Office of Planning and Research (OPR). That database contained 798 projects, 60 of which were extremely large General Plan Updates, Master Plans, or Specific Plan Projects. The 60 very large projects were removed from the database in order not to skew the emissions value, leaving a net of 738 projects. In addition, 27 projects were found to be outliers that would skew the emission value to high, leaving 711 as the sample population to use in determining the 90th percentile capture rate.

The analysis of the 738 projects within the sample population combined commercial, residential, and mixed use projects. Also note that the sample of projects included warehousing and other industrial land uses but did not include industrial processes (i.e. oil refineries, heavy manufacturing, electric generating stations, mining operations, etc.). Emissions from each of these projects were calculated by SCAQMD to provide a consistent method of emissions calculations across the sample population further reducing potential errors in the statistical analysis. In calculating the emissions from projects within the sample population, construction period GHG emissions were amortized over 30-years (the average economic life of a development project).
This analysis determined that the 90th percentile ranged from 2,983 MT to 3,143 MT CO2e per year. The 3,000 MT CO2e per year value is the low end value within that range rounded to the nearest hundred tons of emissions and is used in defining small projects that are considered less than significant and do not need to use the Screening Tables or alternative GHG mitigation analysis described below.

The 3,000 MT CO2e per year value is used in defining small projects that, when combined with the modest efficiency measures shown in the bullet points below are considered less than significant and do not need to use the Screening Tables or alternative GHG mitigation analysis described below. The efficiency measures required of small projects are summarized below:

- Energy efficiency of at least five percent greater than 2010 Title 24 requirements, and
- Water conservation measures that matches the California Green Building Code in effect as of January 2011.

**Projects that Exceed 3,000 MT CO2e Emission Level**

Page 4, First Paragraph below “Methodology for the Calculation of GHG Emissions”

Analysis of development projects exceeding the 3,000 MT CO2e emissions level can either be done through emissions calculations or by using the screening tables beginning on Page 67.

Page 4, Sixth Paragraph below “Methodology for the Calculation of GHG Emissions”

Analysis of development projects not using the screening tables should use the latest version of the California Emissions Estimator Model (CalEEMod). Two modeling runs should be completed. The first modeling run calculates GHG emissions at 2011 levels of efficiency using energy efficiency standards (Title 24) and the California Air Resources Board (CARB) on road vehicle emissions factors (EMFAC2012 ) set at 2011. A second modeling run is required that calculates GHG emissions at Project buildout year levels of efficiency and includes Project design features and/or mitigation measures to reduce GHG emissions such that the levels of efficiency result in a 25% reduction of GHG emissions compared to the model run using 2011 levels of efficiency.

For analysis of development projects using the screening tables, please refer to the process described on page 67.

</table>

**Implementation Measure IM T3: Mixed Use Development**

| T3.B.1 Mixed Use | Mixes of land uses that complement one another in a way that reduces the need for vehicle trips can greatly reduce GHG emissions. The point value of mixed use projects will be determined based upon traffic studies that demonstrate trip reductions and/or reductions in vehicle miles traveled. | TBD             |
| T3.B.2 Local Retail Near Residential (Commercial only Projects) | Having residential developments within walking and biking distance of local retail helps to reduce vehicle trips and/or vehicle miles traveled. The point value of residential projects in close proximity to local retail will be determined based upon traffic studies that demonstrate trip reductions and/or reductions in vehicle miles traveled. | TBD             |

**Implementation Measure IM T4: Preferential Parking**

| T4.A.1 Parking | Provide reserved preferential parking spaces for car-share, carpool, and ultra-low or zero emission vehicles. Provide larger parking spaces that can accommodate vans used for ride-sharing programs and reserve them for vanpools and include adequate passenger waiting/loading areas. | 1 point         |

**Implementation Measure IM T5: Signal Synchronization and Intelligent Traffic Systems**

| T5.B.1 Signal improvements | Techniques for improving traffic flow include: traffic signal coordination to reduce delay, incident management to increase response time to breakdowns and collisions, Intelligent Transportation Systems (ITS) to provide real-time information regarding road conditions and directions, and speed management to reduce high free-flow speeds. Synchronize signals along arterials used by project. Connect signals along arterials to existing ITS. | 1 point/signal 3 points/signal |

**Implementation Measure IM T6: Bicycle and Pedestrian Infrastructure**

<p>| T6.B.1 Sidewalks | Provide sidewalks on one side of the street (required) Provide sidewalks on both sides of the street Provide pedestrian linkage between commercial and residential land uses within 1 mile | 0 points 1 point 3 points |</p>

<td>TBD</td>
</tr>
</tbody>
</table>

**Total Points Earned by Commercial/Industrial Project:**

---

**Page 22, Below “References”**

As shown in Table 1, 2,426,141-448,997 MTCO2e are reduced by the County’s Implementation Measure. This amount includes reductions afforded existing building retrofits, other changes to activities associated with existing land uses, as well as reductions associated with new development.
Page 26, Third Paragraph

Table 2 on the next page summarizes the reduction in emissions afforded new development from the Implementation measures. Table 2 shows 1,302,569 2,228,440 MTCO2e being reduced from new development as a result of the County strategies. Within the 1,302,569 MTCO2e of new development reductions afforded County strategies, 619,336 MTCO2e of emissions reduced is accomplished through new Commercial and Industrial Projects, and 683,233 MTCO2e of emissions reduced is accomplished through new residential projects.
