At a more localized level, for example for individual subdivisions or tracts, smaller-scale measures may be used to safely trap debris and route water and sediment around or through individual residential developments. Such measures include: drop structures to reduce flow velocity; debris fences; local dikes or channels; site plans to convey flow; street design and/or alignment to convey flow; elevation on armored fill. In these cases, a combination of elements are often the most effective strategy for ensuring flood protection. If necessary, protective measures can also be introduced for single lots or structures. The most cost-effective of these include: elevation on properly designed foundations (piles, columns or armored fill); floodwalls and berms; and reinforcement of uphill walls, windows and doors against debris impact (or avoid these features on uphill walls entirely, if possible).

F. Flood Hazard Reduction Efforts

1. Surface Runoff Hazards

The conversion of undeveloped, natural areas to urbanized uses throughout Riverside's watersheds have increased flooding potential by increasing the rate and amount of runoff in watersheds and altering drainage patterns. Construction of impervious surfaces such as rooftops, roads and driveways reduces the amount of rainfall that can infiltrate the ground surface and percolate into the subsurface. As a result, the volume of surface water runoff increases within a watershed. Subsequently, artificial conveyances such as gutters, storm pipes and natural channel improvements to accommodate additional volume also accelerate the rate of flow in the watershed. This faster-

moving, higher-volume surface water runoff results in a higher probability and increased severity of flooding within a watershed, if facilities are not adequately maintained or constructed to carry peak flow capacity.

Any alteration to natural drainage patterns by modifying landforms controlling the conveyance of surface water can increase the potential for flooding. Grading or other modifications, including directly altering the course of a stream or river by excavation or embankment, can increase velocities of floodwaters, which increases the potential for flooding downstream of the modification. A reduction in the capacity of the watercourse can also increase the potential for flooding at the site of the modification as well as upstream from the activity, if flood waters backup as a result.

Drainage facilities, including storm drains, culverts, inlets, channels or other such structures, are designed to prevent flooding by collecting stormwater runoff and directing flows away from urban development to either a natural drainage course or man-made one as part of a storm drain system. The capacity of a drainage structure can typically be adequately determined by a hydrology and drainage study. However, if drainage facilities are not adequately designed, built and maintained, the facilities can overflow or fail, resulting in flooding.

2. Master Drainage Plans in Riverside County

In urban and built-up areas, precipitation, irrigation and their runoff from impermeable surfaces must be managed and controlled to avoid flooding-related problems, such as erosion, water damage and water contamination, both at the location the runoff is generated, as well as offsite / downstream. As discussed extensively in Section 4.19, the federal Clean Water Act and one of its implementing programs, the National Pollution Discharge Elimination System (NPDES) protect water quality by regulating sources of runoff that could pollute waterbodies. Among other things, under NPDES cities and counties are required to comply with the conditions of both general and municipal separate storm sewer (MS4) permits. Within western Riverside County, FCWCD oversees implementation and compliance of both general and MS4 permits. Within the Coachella Valley, this function is maintained by the Coachella Valley Water District (CVWD). In addition, these agencies also oversee Riverside County's municipal storm drain systems for conveying stormwater flows. This is done via two main planning instruments: the master drainage plan (MDP) and the area drainage plan.

According to Riverside County Flood, a master drainage plan addresses the current and future drainage needs of a given community. The boundary of the plan usually follows regional watershed limits. The facilities proposed or covered by a MDP may include channels, storm drains, levees, basins, dams, wetlands or any other conveyance capable of economically relieving flooding problems within the plan area. The plans also include estimates of facility capacities, sizes and costs. MDPs are prepared for a variety of purposes. First, the plans provide a guide for the orderly development of Riverside County. Second, they provide an estimate of costs to resolve flooding issues within a community and are used by Riverside County to determine capital project expenditures for each budget year. In addition, the MDPs can be used to establish Area Drainage Plan fees for a given community, which prevent existing taxpayers from having to shoulder the burden of land development costs. As discussed further in Section 4.19 (and, in particular, as shown in Figure 4.19.9 and listed in Table 4.19-E), there are presently 48 Master Drainage Plans within Riverside County, encompassing areas from the western edge of the county all the way out through the Coachella Valley region to the east and encompassing both incorporated city and unincorporated county territories.

3. Capital Improvement Projects Related to Flooding

As noted above, the FCWCD designs, constructs, manages and maintains an extensive network of flood control and storm drain infrastructure in western Riverside County. The list below outlines some of the capital

improvement projects the County of Riverside (or other agency) has recently completed or proposes to construct in the next 1-2 years to provide flood water management as per the Riverside County Capital Improvement Plan (CIP).

a. Under Construction (As of January 2013)

Murrieta Creek: The Murrieta Flood Control, Environmental Restoration and Recreation Project is a flood control master plan to provide 100-year flood protection to the cities of Murrieta and Temecula by deepening and channelizing Murrieta Creek and its major tributaries using several concrete-lined open channels and a small network of underground storm drains. The proposed system will carry storm runoff through the rapidly developing Murrieta Valley to the valley's south end, where Murrieta Creek and Temecula Creek converge to form the Santa Margarita River. The project includes a 250-acre detention basin as well as a recreational park and 160 acres of wetlands and wildlife habitat. The Army Corps is in charge of construction and Phase 1 of the four-phase project was completed in 2005. Work on Phase 2 was slated to begin April 2013. Completion of the remaining phases will depend on financial constraints.

Calimesa – Avenue L Storm Drain: This project occurs in the City of Calimesa, just south of the boundary between Riverside and San Bernardino counties. It runs from the upstream end of stage 1 at 4th Street almost 1.5 miles easterly to Douglas Street and includes laterals at cross streets.

Day Creek Channel: Construction of Phase 1 (from Limonite Avenue to 700 feet downstream) is complete. Phase 2 runs from Lucretia Street to 700 feet south of Limonite Avenue. The existing interim channel is to be upgraded with approximately 2,700 linear feet of rectangular concrete-lined channel. It will connect to 1,100 linear feet of riprap outlet channel within Goose Creek Golf Club.

Day Creek Master Drainage Plan - Line J: This project is a developer-driven project to complete the last link in Master Drainage Plan line. It consists of 2,000 linear feet of storm drain discharging at the Caltrans culvert where the 68th Street overpass crosses Interstate 15.

Eagle Canyon Dam: Located southwesterly of Canyon Plaza Drive and East Palm Canyon Drive. The project is dependent on the cleanup of an existing dump at the site by others, including the cities of Palm Springs and Cathedral City. Riverside County Flood CIP costs are based on the premise that the $1,500,000 needed for the cleanup effort will be incorporated into dam construction contract, although the funding will come from the cities. The project will provide flood detention and flood hazard mitigation for the developed portion of Cathedral City located downstream via construction, operation and maintenance of an earthen dam, debris catchment and underground storm drain.

Mira Loma – Beach Street Storm Drain: Working upstream from the proposed outlet just south of 58th Street, this storm drain proceeds northerly through private property and then along Beach Street to just north of 55th Street where it again splits property lines to 54th Street. It branches off twice, once at 55th Street and once between 55th and 54th Streets. Lines then run east to sump in Cedar Street and west to sump in Rutile Street.

b. To Begin Construction In or Around 2013

Arroyo Del Toro Channel: A 40-foot wide earthen channel is proposed from the Elsinore Outlet Channel downstream of State Highway 74, northwesterly approximately 3,800 feet to I-15. It runs around two sides of the Elsinore Valley Cemetery.

Corona Master Drainage Plan – Line 52: This proposes an underground storm drain beginning near Third Street and Grand Blvd., extending north along East Grand Blvd. then under the 91 freeway to discharge into the Temescal Creek Channel. The City of Corona is to design and build the project with Riverside County Flood funds.

Gilman Home Channel Lateral A: For this project, approximately 1,000 linear feet of reinforced concrete pipe will be run from Eighth Street westerly in Cottonwood Road to the existing channel at George Street between 10th and 12th Streets in the City of Banning.

Hemet Master Drainage Plan – Lines C and D: Line C provides an underground storm drain in Whittier Boulevard extending nearly 7,000 linear feet from the existing storm drain at Palm Avenue east to Santa Fe Street. Line D provides an underground storm drain in Stetson Avenue running 1,400 linear feet from Meridian Street to Hemet Street.

Monroe Master Drainage Plan – Monroe Channel: At request of the City of Riverside, its existing open channel will be replaced with an underground reinforced concrete box with the capacity to carry ten-year storm flows. The project will run under Monroe Street from California Avenue upstream to Magnolia Avenue.

Norco Master Drainage Plan – Lateral N1-D and Spirit Knoll Court Storm Drain: Project will construct two North Norco Channel lateral storm drains, one in Spirit Knoll Court and one in Rose Court. These facilities will outlet to existing interim channel and will drain sumps along Temescal Avenue.

Palm Canyon Wash – Cherley Creek Levee Restoration: Major construction under this project will bring the existing levee serving small tributary upstream of South Palm Canyon Wash into compliance with FEMA certification guidelines. The existing channel will be upsized and the north bank levee will be restored. The project will use a combination of rock slope protection (i.e., rip-rap) and soil-cement lined channel for the levee.

Palm Springs Master Drainage Plan – Lines 43 and 43A: This project will connect the Eagle Canyon Dam outlet (described above) to West Cathedral Canyon Channel. The storm drain will begin south of East Palm Canyon Drive and run southwesterly to discharge into the North Cathedral Canyon Channel. The 42-inch drainage pipeline will run roughly 3,300 linear feet in total.

Pyrite Channel Bypass: This will be a cooperative project with the Riverside County Economic Development Agency (EDA). A storm drain will run in Pyrite Street from Jurupa Road north to discharge into to the existing Jurupa Channel. The project will not convey the entire 100-year storm flows, but will provide substantial relief to properties between Pyrite Street and Jurupa Avenue.

Romoland Master Drainage Plan – Line A: This project is to construct an open (interim) channel for 4,000 linear feet from west of Interstate 215, north parallel to Barnett Road and west along Ethanac Road to discharge at an interim outlet near San Jacinto River.

San Jacinto Master Drainage Plan – Lines C, B and C-5: This project proposes 8,150 linear feet of storm drains. Line C will run from Esplanade Avenue south and to east along Midway Street to San Jacinto Street, with short Lines C-4 and C-5 branching off along the way. At San Jacinto Avenue, it joins Line B, which runs south to Menlo Avenue.

Southwest Riverside Master Drainage Plan – Lines G, G-1 and F-1: A total of 4,200 linear feet of storm drain in Meyers Street and laterals in Victoria Avenue will be constructed under this project. Line G runs southeasterly along Meyers Street to a T-split at Victoria Avenue. Along Victoria Avenue, Lateral G-1 runs

northeasterly towards Van Buren Boulevard and Lateral F-1 runs southwesterly to Harrison Street. The City of Riverside is to design and build the project.

Sunnymead Master Drainage Plan – Line P-6: Consists of the construction of 600 feet of storm drain in Eucalyptus Avenue from Perris Boulevard to Shirebourn Road in Moreno Valley.

Sycamore Dam – Outlet Structure Modifications: Located in the City of Riverside, east of the intersection of Central and Chicago Avenues, this project will install an access road, replace the inlet tower and reconstruct and armor the outlet structure of Sycamore Dam to prevent blockage by debris accumulation. The effort is a pilot project to develop a solution for the six other reservoirs in Riverside.

Temescal Creek – Foster Road Storm Drain: An underground storm drain in Foster Road will be constructed from I-15 to Temescal Creek. Project also includes environmental enhancement adjacent to Temescal Creek.

West End Moreno Master Drainage Plan – Line LL: This project involves construction of approximately 2,000 linear feet of underground storm drain within the road right-of-way along Dracaea Avenue approximately 500 feet west of Edgemont Street, then southerly 750 feet and southwesterly 1,200 feet along Old I-215 Frontage Road.

c. To Begin Construction In or Around 2014

Banning Master Drainage Plan – Line H: Located south of Banning Municipal Airport, this project proposes to construct approximately 3,400 feet of reinforced concrete pipe from an outlet at Smith Creek Channel running west towards Wesley Street. The storm drain will then run north along Hathaway Street to Barbour Street, for a total of 3,925 linear feet.

Desert Hot Springs Master Drainage Plan – Line E-5: Line E-5 involves the construction of approximately 3,700 linear feet of a reinforced concrete pipe storm drain in Eighth Street from the existing Line E, easterly to Mesquite Avenue.

Little Lake Master Drainage Plan – Line B: Line B provides an underground storm drain under Meridian Street that runs approximately 4,055 linear feet from just south of Florida Avenue to Whittier Avenue in Hemet. Another 4,600 linear feet of Line B will run from north of Berkley Avenue to Florida Avenue, also under Whittier Avenue.

Valle Vista Channel Extension: This project is to construct a 700-foot extension to Valle Vista channel along Acacia Avenue. The rectangular channel and inlet works will connect into the existing channel at the intersection of Acacia and Georgia Avenues.

Woodcrest Dam – Outlet Structure Modifications: As with the Sycamore Dam project, this project proposes to reconstruct the Woodcrest Dam outlet structure to prevent blockage by debris accumulation. It is also a pilot project to develop a solution for Riverside's six other reservoirs.

4.11.3 Policies and Regulations Addressing Flood and Dam Inundation

Many urban areas in California are located in historic floodplains. To reduce the risk of loss of life and property, local, state and federal agencies implement a number of programs and regulations. These include the following.

A. State and Federal Regulations

There are several federal agencies tasked with protecting people and property from flood hazards. Chief among these is the Army Corps, which both constructs and operates federal flood risk management projects and also issues permits for disturbances to "waters of the United States" and associated wetlands pursuant to the federal Clean Water Act. This aspect of the Army Corps' duties is further described in Section 4.8 (Biology) of this EIR. Another key flood management program, the National Flood Insurance Program is administered by FEMA. FEMA is also responsible for disaster planning and recovery programs at the national level.

National Flood Insurance Program: In 1968, Congress created the NFIP in response to the rising cost of taxpayer-funded disaster relief for flood victims and the increasing amount of damage caused by floods. Administered by FEMA, the NFIP makes federally backed flood insurance available in communities that agree to adopt and enforce floodplain management ordinances to reduce future flood damage. As a voluntary, incentive-based federal program, the NFIP requires that new or replacement buildings in flood hazard areas be constructed to limit future flood damage. For participating areas, a series of flood insurance rate maps have been issued to delineate areas of special flood hazards. The program also requires that local governments regulate development in designated floodplains through the adoption of floodplain management ordinances that meet minimum NFIP requirements. The County of Riverside enacted a floodplain management ordinance and policies; see description below.

National Flood Insurance is available in the County of Riverside. In order to participate in the program, FEMA requires that Riverside County and its incorporated cities maintain the carrying capacity of all flood control facilities and floodways. Communities that fail to meet their maintenance responsibilities are subject to expulsion from the NFIP, loss of other federal aid or even exposure to suits by FEMA for recovery of flood insurance and disaster payments.

In 1994, the NFIP was revised under the National Flood Insurance Program Reform Act. Changes addressed how flood insurance is offered and funded for structures within designated floodplains, increased flood insurance limits and eliminated the 1962 buy-out program. It also clarified flood insurance purchase requirements as a condition of receiving federal disaster assistance. If the flood insurance policy were not maintained, in the event of another disaster no disaster assistance would be made available for that structure.

Owners of all structures within a projected 100-year flood inundation area (also called a "Special Flood Hazards Area,") are required to purchase and maintain flood insurance as a condition of receiving a federally-related mortgage or home equity loan on that structure. Such insurance mitigates flood-related impacts by rectifying any damage that occurs.

FEMA Floodplain NFIP Mapping Program: As part of its role in protecting communities from flood hazards, FEMA issued Flood Hazard Boundary Maps for more than 19,000 flood-prone communities nationwide. These maps provide approximate delineations of areas subject to inundation by 100-year floods, aka Special Flood Hazard Areas. Data based on past floods, regional flood depth/drainage area relationships, floodplain maps published by other federal agencies and simplified hydrologic and hydraulic calculations all go

into the development of these maps and their approximate floodplain boundaries. Subsequently, these maps are further refined through a Flood Insurance Study which more closely examines a variety of data and engineering analyses for the floodplain. The results are used to create a FIRM depicting 100- and 500-year floodplain boundaries, flood insurance risk zones, base flood depths and other data. Alternatively, a FIRM may be developed without the first step of a Flood Hazard Boundary Map being prepared. In such cases, the information provided is less detailed, but still sufficient for community flood hazard planning.

When a revision to a NFIP map is warranted, FEMA will revise and republish the affected map panels (e.g., a Physical Map Revision), to show the appropriate changes. Or they will issue a letter referred to as a Letter of Map Revision (LOMR) that describes the changes and officially revises the effective FIRM map.

Another action by FEMA is the making of "conditional determinations," based upon their review of how designated floodplains would be affected by proposed projects. Project activities such as floodplain modification or simply the placement of fill to elevate one or more structures or parcels of land might be proposed. When such conditional determinations are warranted, they are issued in letters referred to as Conditional Letters of Map Revision (CLOMRS) or Conditional Letters of Map Revision Based on Fill (CLOMR-Fs) that describe the effect the proposed project or fill would have on the effective NFIP map. A conditional determination does not actually revise an effective NFIP map.

The County of Riverside participates in the NFIP and uses FIRMs as the basis for county flood risk management planning. These maps were used to provide the general boundaries of the 100-year flood inundation areas, as further developed by FCWCD, and shown in Figure 4.11.1.

Executive Order 11988 Floodplain Management: This federal Executive Order, originally issued in 1977 by President Jimmy Carter, requires federal agencies to provide leadership in the long- and short-term potential adverse impacts associated with the modification and potential occupancy of floodplains and to take action to avoid floodplain development when other practical alternatives exist through the following:

- Avoid development in existing 100-year floodplains, unless such development is the only practicable alternative.
- Reduce hazards and risk associated with floods.
- Minimize the impact of floods on human health, safety and welfare.
- Restore and preserve the natural and beneficial values of existing floodplains.

To comply with Executive Order 11988, it is the Army Corps' policy to formulate projects that, to the extent possible, avoid or minimize adverse effects associated with use of the floodplain and avoid inducing development in an existing floodplain unless there is no practicable alternative.

Federal Water Pollution Control Act of 1972 (aka the Clean Water Act): Under the federal Clean Water Act (CWA) (Title 33, U.S. Code [USC], Section 1251 *et seq.)*, three separate permits, as outlined below, are required to operate and maintain flood control systems. See Section 4.19 for more detailed discussion of these water quality-related issues:

- A NPDES Municipal Stormwater Permit is required to discharge stormwater to "waters of the United States." (See below for more.)

- A Dredge and Fill Permit must be obtained from the Army Corps pursuant to CWA Section 404 for any project that discharges fill to "waters of the United States." As the agency tasked with primary implementation of the CWA, the U.S. Environmental Protection Agency (EPA) retains veto power over any permit issued by the Army Corps.

- A water quality certification or waiver must be obtained pursuant to CWA Section 401 before any given Section 404 permit becomes valid. This process has been delegated by the U.S. EPA to the State Water Resources Control Board.

Cobey-Alquist Floodplain Management Act: This law (Public Resources Code [PRC] Section 8400 *et seq.*) states that the State of California will not appropriate money to support projects within federally designated floodway boundaries unless affected local governments (such as the County of Riverside) have enacted floodplain regulations meeting certain minimum requirements. Thus, the primary responsibility for planning, adoption and enforcement of land use regulations to accomplish floodplain management rests at the local government level. It is the State of California's policy to provide state assistance and guidance and to encourage local levels of governments to employ land use regulations to accomplish floodplain management and to provide state assistance and guidance. Riverside County has used the guidelines established by this legislation to produce ordinances, such as the Flood Hazard Regulation Ordinance, No. 458, that promote public health, safety and general welfare, and minimize public and private losses due to flood conditions in Riverside County.

Assembly Bill 162 (2007): AB 162 established new requirements for general plans to consider flood management. The land use element of the general plan is required to identify and annually review areas subject to flooding, as identified on FEMA or DWR floodplain maps. The conservation element is required to identify land and water resources that can accommodate floodwater for purposes of "groundwater recharge and stormwater management." And, the safety element must identify flood hazard zones and provide policies to protect against unreasonable flooding risks. The Riverside County General Plan does provide the requested information. See Section 4.11.3.E, below, for policies that fulfill these requirements.

California Water Code: CWC Section 8100 *et seq.* states that county boards of supervisors may appropriate and expend money from the county's general fund for any of the following purposes in connection with streams or rivers in the county:

- The construction of works, improvements, levees or check dams to prevent overflow and flooding.

- The protection and reforestation of watersheds.

- The conservation of the floodwaters.

- The making of all surveys, maps and plans necessary to carry out any work, construction or improvement authorized.

- The carrying out of any work, construction or improvement authorized outside the county if the rivers or streams affect flow in or through more than one county.

National Pollution Discharge Elimination System Permit Program: In California, the State Water Resource Control Board (SWRCB) and its Regional Water Quality Control Boards (RWQCBs) administer the NPDES permit program. The NPDES permit system was established under the CWA to regulate both point and nonpoint source discharges to surface waters of the U.S. The NPDES program encompasses characterizing receiving water quality, identifying harmful constituents, targeting potential sources of pollutants and implementing comprehen-

sive water management programs. Construction and industrial activities are typically regulated under statewide general permits that are issued by the SWRCB. The RWQCB also issues Waste Discharge Requirements that serve as NPDES permits for impacts to waters of the State under the authority delegated to the RWQCBs.

Water quality is overseen by a separate set of State agencies, chiefly, the SWRCB. The SWRCB has divided the state's 10 major watersheds into a number of regions, based on major local watersheds. In western Riverside County, which is within the state's South Coast Hydrological Region, two RWQCBs have jurisdiction: Region 8 (Santa Ana) and Region 9 (San Diego). The eastern two-thirds of Riverside County are in the state's Colorado River Hydrological Region which is under the jurisdiction of RWQCB Region 7 (Colorado River Basin). As detailed in Section 4.19, the County of Riverside is a permittee for three MS4 permits covering extensive portions of the Santa Ana River, Santa Margarita River and Whitewater River watersheds. See Section 4.19 for additional details on these permits and on the hydrology of Riverside County.

B. Local Authorities

In California, state law makes local governmental agencies responsible for flood risk management. CWC Section 8401 states: "The primary responsibility for planning, adoption and enforcement of land use regulations to accomplish floodplain management rests with local levels of government," the land use element of the plan must identify areas that are subject to flooding.

The FCWCD is the primary agency in Riverside County that is responsible for flood risk management, including most of the western county. In eastern Riverside County, this function is performed by the Coachella Valley Water District. During Riverside County Flood's 70-year history, it has developed an extensive flood control system in western Riverside County that includes 61 dams, debris basins and detention basins, 32 miles of levees, 253 miles of open channel and 397 miles of underground storm drains. Proper operation and maintenance of the system is critical to protect the lives and properties of the residents of Riverside County and is essential to ensuring economic activity and transportation corridors are not disrupted during flooding.

Table 4.11-C, below, summarizes agencies with local flood risk management responsibilities in Riverside County. Local governments are authorized to appropriately zone river basin lands within their jurisdictions. However, state and federal agencies (DWR, Army Corps and FEMA) often provide assistance to local planning agencies by determining the probability of flooding and the potential flood damage.

C. Riverside County Regulations

The County of Riverside has adopted a number of ordinances that provide flood risk management, both directly and indirectly, as follows:

Ordinance No. 348 - Land Use: This is the master zoning ordinance for Riverside County. As such, it dictates the types of land uses and development suitable for various conditions. It includes a "W-1 Zone," for water-courses, watersheds and conservation areas. Land zoned W-1 is generally associated with "present conditions not suited for permanent occupancy or residency by persons" because they are subject to periodic flooding and other hazards. Among other reasons, this zone can be applied to lands in which there is no approved drainage and stormwater control plans or for which significant flooding hazards exist. As an example, in 2007 interim W-1 zoning was applied to portions of the communities of Lakeview and Nuevo until appropriate master drainage plans could be approved. Use of this ordinance and the W-1 zone mitigate potential flood impacts by preventing development in areas where which people, property or structures would be at risk for harm due to flooding.

Table 4.11-C: Local Flood Risk Management Agencies in Riverside County

Agency and Contact Information	Territory/Area Covered
Riverside County Flood Control and Water Conservation District	Western Riverside County
Coachella Valley Water District	Majority of Coachella Valley Palo Verde Valley (northeastern-most Riverside County) and a portion of Imperial County
Imperial Irrigation District [1]	Imperial Valley, including portions of south eastern-most Riverside County plus Imperial County
County Service Areas 103 and 121 [2]	CSA 103 serves Wildomar in southwest Riverside County CSA 121 serves Thousand Palms in Coachella Valley
Desert Water Agency	Portions of Riverside County east of Coachella Valley, and excluding the Whitewater River system
San Gorgonio Pass Water Agency [3]	Portions of northern Riverside County, generally between Moreno Valley to the southwest and Beaumont to the east

Footnotes:
1. This district manages agricultural / local drainage facilities rather than regional flood control structures.
2. The two County Service Areas maintain local retention basins.
3. While the agency has authority to acquire and control stormwater, its actions in this regard have been limited to using "runoff" water from local rivers and streams to replenish the groundwater on lands within the agency's jurisdiction.

Source: California Department of Finance, Inventory of Flood Control Agencies, 1997.

Ordinance No. 457 - Building Codes and Fees: This ordinance specifies the various state and/or professional society building and construction standards by which all development approved within unincorporated Riverside County must comply. It includes specifications for use of the California Building Code, the Uniform Housing Code, the California Plumbing Code, the California Mechanical Code and the California Electrical Code, among others. Use of these codes ensures that any development or construction within the county meets the necessary standards for suitability, durability, safety and so on; ensuring that occupants of such structures and facilities are not placed at undue risk. In terms of flood risk management and safety, the codes include requirements for the structural integrity of buildings and other facilities for withstanding precipitation, inundation and water flow. They also specify standards for grading, lot, roadway and drainage design to ensure that water flows (particularly runoff) are directed or channeled appropriate ways. The ordinance also imposes minimum standards for permanent erosion control and associated landscaping. It includes requirements for preparation of a Storm Water Pollution Prevention Plan (SWPPP) for construction sites, implementation of year-round best management practices (BMPs) on such sites and the monitoring and maintaining of the BMPs to ensure they continue to provide adequate stormwater flow / runoff protections, erosion protection and sediment controls, both during and after construction activities on a site. As a result, it ensures adequate measures are in place to prevent significant adverse impacts due to construction and urban runoff, stormwater flows and water erosion on lands subject to development.

Ordinance No. 458 - Regulating Flood Hazard Areas and Implementing the National Flood Insurance Program: This ordinance was adopted pursuant to the requirements of the National Flood Insurance Program (Title 42, USC, Section 4001 *et. seq.,* as amended). Its purpose is to protect the public's health, safety and welfare from flooding hazards. It does so by regulating development within flood hazard areas and establishing a variety of land use and construction standards for such development.

The ordinance includes construction standards that apply to all new structures and substantial improvements to existing structures within Riverside County's mapped Special Flood Hazard Areas and floodplains, as shown in Figures 4.11.1 and 4.11.2. Among other requirements, these types of construction are required to: use materials resistant to flood damage; be anchored to prevent flotation, collapse or lateral movement of the structure resulting from water movement or loading, including the effects of buoyancy; use construction methods and practices that minimize flood damage; and have electrical, heating, ventilation, plumbing and air conditioning

equipment and other service facilities designed and located to prevent water from entering or affecting them during flooding.

Further, all subdivision proposals and other proposed new development, including manufactured home parks or subdivisions greater than 50 lots or 5 acres, whichever is less, are required to identify the base flood elevation (that is, 100-year flood extent) and be reviewed by Riverside County Flood District to ensure the project would be reasonably safe from flooding. This includes ensuring that: all utilities and facilities such as sewer, gas, electrical, propane tanks and water systems are located and constructed to minimize or eliminate flood damage; adequate drainage is provided to reduce flooding potential; and, that all other required state and federal permits have been obtained. All new and replacement water supply systems must be designed to minimize or eliminate infiltration of floodwaters into the systems. New and replacement sanitary sewage systems must also be designed to minimize or eliminate infiltration of floodwaters into the systems and discharges from the systems into flood waters and onsite waste disposal systems must be located to avoid impairment or causing contamination during flooding. Lastly, all manufactured homes must be installed using methods and practices which minimize flood damage.

New construction and substantial improvements of residential structures are required to have their lowest floor, including basement, located at or above the base (100-year) flood elevation. All new construction and substantial improvements of nonresidential structures must meet this standard or, together with attendant utility and sanitary facilities, be designed so that the portion of the structure below the base flood level is watertight. This means walls must be substantially impermeable to the passage of water and structural components must have the capability of resisting hydrostatic and hydrodynamic loads and the effects of buoyancy.

For new structures and substantial improvements within Riverside County's mapped Special Flood Hazard Areas and floodplains, specific flood mapping conditions are required to be met prior to grading or building occupancy. For example, prior to grading, a Conditional Letter Map of Revision (LOMR) must be issued by FEMA and prior to inspection for occupancy, a LOMR must be issued by FEMA for areas shown as floodplain on the effective FIRM. These mean, in essence, that the development must document proof that it has engineered the site or its structures so that it is either out of the floodplain or watercourse, or that the flood hazard no longer exists for stated reasons.

Pursuant to Ordinance No. 458, no structure shall be constructed, located or substantially improved and no land shall be graded, filled or developed in the areas designated as floodways, except upon approval of a plan which provides that the proposed development will not result in any increase in flood levels during the occurrence of the base flood discharge. If a proposed permit qualifies for approval in the floodway, it shall then meet all the requirements necessary for approval of a permit in a Special Flood Hazard Area or floodplain. Until such time that a regulatory floodway is adopted, no new construction or other development (including fill) shall be permitted within Zones A, A1-30 and AE, unless it is demonstrated that the cumulative effect of the proposed development, when combined with all other development, will not increase the water surface elevation of the base flood more than 1 foot or as determined by Riverside County Flood or the CVWD at any point along the floodplain.

For proposed alterations within a watercourse or mapped floodplain, the flood carrying capacity of the altered or relocated portion of the watercourse or mapped floodplain shall be maintained. Manufactured slopes that encroach into a floodplain and are subject to erosive velocities are considered flood control facilities and must be maintained by a public entity. Within certain zones (AH and AO) on Flood Insurance Rate Maps, adequate drainage paths around structures on slopes must be provided, to guide floodwaters around and away from proposed structures. Ordinance No. 458 also specifically requires that all new buildings and/or substantial improvements located within the 500-year floodplain limits of Lake Elsinore shall have their lowest floor elevated

a minimum of 3 feet above the Lake's 100-year water surface elevation. Maps of the 100-year and 500-year floodplains for Lake Elsinore can be obtained through the City of Lake Elsinore's website; all Riverside County areas can be viewed online at www.rcflood.org.

In summary, the specifications, standards and requirements contained in Ordinance No. 458 establish and implement measures that mitigate potential flood hazards within Riverside County. Collectively, these serve to ensure that flooding risks, water flows and runoff are managed appropriately to prevent hazards and undue risk of damage or harm to people, property, structures and facilities within Riverside County. By requiring specific standards for development and establishing a program for the approval, implementation and verification of such measures, this ordinance mitigates potential hazards that could arise from flooding hazards and its effects on people, property and structures.

Ordinance No. 461 - Road Improvement Standards: While not addressing flooding directly, this ordinance does set forth standards for roads, bridges and other transportation-related facilities, including those aspects of flood risk management associated with them. Because of their linear and impervious nature, paved roadways typically act as conduits for water flow, particularly stormwater (urban) runoff from developed areas. In addition, they often may function informally as barriers (dams, dikes or levees) to water flow or cause water channelization when constructed on raised beds or with tall curbs or crowns. Also, roadways often cross rivers, streams, drainages, floodplains and similar features. All crossings must be sufficiently engineered to withstand the potential impacts of flood flows. Hence, Ordinance No. 461 imposes standards and engineering specifications that reduce these potential flood impacts to ensure the safety and integrity of the roadway or improvement. As such, this ordinance serves to mitigate potential flooding hazards to people, property and structures by ensuring that roads and associated improvements and features are designed, constructed and maintained in a manner appropriate for the water flow potential and flooding hazard.

Ordinance No. 659 - Development Impact Fee Program: This ordinance sets a range of development impact fees to be used "in order to effectively implement the Riverside County General Plan, manage new residential, commercial and industrial development and reduce impacts caused by such development." It is intended to mitigate growth impacts (particularly those arising from population growth) on public facilities within the county to ensure residents are not placed into conditions perilous to their health, safety, comfort or welfare.

The ordinance establishes the process for (and nexus to) the construction or acquisition of various types of public facilities, as well as the preservation of open space, wildlife and their associated habitats. The DIF program ensures that "all new development bear its fair share cost of providing the facilities, open space and habitat reasonably needed to serve that development." Hence the program applies to all new residential, commercial and industrial development, as well as to surface mining. Fees are assessed on the basis of regional location within the county, land use type (per dwelling unit for residential units and per acre for all other uses) and the applicable categories of facilities to be provided. The services covered by the fee include: public facilities, fire facilities, regional parks, community parks and centers, regional multi-purpose trails and library services. Fees associated with these services are based on estimates of Riverside County's needs for the subsequent ten years. For transportation and flood risk management, fees are based on forecast development needs for the subsequent 20 years. In regards to flood control facilities, the DIF program ensures fees are collected and expended to provide necessary facilities commensurate with the ongoing levels of development in specific areas not already subject to, or in addition to, Area Drainage Plan fees as under Ordinance No. 458. These areas include the Upper San Jacinto Valley, Mead Valley/Good Hope and the San Gorgonio Pass.

This ordinance provides mitigation for development impacts on flood control facilities and future needs for flood risk management by ensuring that funds are collected and utilized to provide needed facilities as development

progresses within the county. The provision of these facilities ensures new development does not expose people, property or structures to undue flooding risks from urban runoff.

Ordinance No. 754 - Stormwater / Urban Runoff Management and Discharge Controls: Among other things, the ordinance requires that all discharge to storm drain systems be confined to stormwater runoff discharged pursuant to a NPDES permit or as otherwise authorized by the Santa Ana, San Diego or Colorado River Basin RWQCB or the SWRCB in compliance with the federal Clean Water Act. This ordinance also establishes a variety of standards and BMPs associated with controlling stormwater runoff.

Although focusing on the pollution-control aspects of the NPDES program, in conjunction with Ordinance No. 457 and Ordinance No. 460, this ordinance establishes a range of standards and permit requirements that collectively serve to ensure that stormwater flows and runoff in developed areas are managed appropriately to prevent hazards or undue risk of damage or harm to people, property, structures and facilities within Riverside County. By requiring specific standards for development and establishing a program for the approval, implementation and verification of such measures, this ordinance mitigates potential hazards that could arise from stormwater flows and runoff, including flooding and erosion, and its effects on people, property and structures.

D. Existing Riverside County General Plan Policies

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval. The following existing and proposed General Plan Safety (S) Element polices reduce impacts related to flooding, dam inundation and related hazards.

Policy S 4.1: For new construction and proposals for substantial improvements to residential and non-residential development within 100-year floodplains as mapped by FEMA or as determined by site-specific hydrologic studies for areas not mapped by FEMA, Riverside County shall apply a minimum level of acceptable risk; and disapprove projects that cannot mitigate the hazard to the satisfaction of the Building Official or other responsible agency.

Policy S 4.3: Prohibit construction of permanent structures for human housing or employment to the extent necessary to convey floodwaters without property damage or risk to public safety. Agricultural, recreational or other low intensity uses are allowable if flood control and groundwater recharge functions are maintained.

Policy S 4.4: Prohibit alteration of floodways and channelization unless alternative methods of flood control are not technically feasible or unless alternative methods are utilized to the maximum extent practicable. The intent is to balance the need for protection with prudent land use solutions, recreation needs and habitat requirements, and as applicable to provide incentives for natural watercourse preservation, including density transfer programs as may be adopted.

a. Prohibit the construction, location or substantial improvement of structures in areas designated as floodways, except upon approval of a plan which provides that the proposed development will not result in any significant increase in flood levels during the occurrence of a 100-year flood discharge.

b. Prohibit the filling or grading of land for nonagricultural purposes and for non-authorized flood control purposes in areas designated as floodways, except upon approval of a plan which provides that the proposed development will not result in any significant increase in flood levels during the occurrence of a 100-year flood discharge.

Policy S 4.5: Prohibit substantial modification to watercourses, unless modification does not increase erosion or adjacent sedimentation, or increase water velocities, so as to be detrimental to adjacent property, nor adversely affect adjacent wetlands or riparian habitat.

Policy S 4.6: Direct flood control improvement measures toward the protection of existing and planned development.

Policy S 4.8: Allow development within the floodway fringe, if the proposed structures can be adequately flood-proofed and will not contribute to property damage or risks to public safety.

Policy S 4.9: Within the floodway fringe of a floodplain as mapped by FEMA or as determined by site-specific hydrologic studies for areas not mapped by FEMA, require development to be capable of withstanding flooding and to minimize use of fill. However, some development may be compatible within flood plains and floodways, as may some other land uses. In such cases, flood-proofing would not be required. Compatible uses shall not, however, obstruct flows or adversely affect upstream or downstream properties with increased velocities, erosion backwater effects or concentrations of flows.

Policy S 4.10: Require all proposed projects anywhere in the county to address and mitigate any adverse impacts that it may have on the carrying capacity of the local and regional storm drain systems.

Policy S 4.11: Encourage neighboring jurisdictions to require development occurring adjacent to the county to consider the impact of flooding and flood control measures on properties within unincorporated Riverside County.

Policy S 4.12: Require certain existing essential, dependent care and high-risk facilities that are not in conformance with the provisions of county zoning to upgrade or modify building use to a level of safety consistent with the inundation risk.

Policy S 4.16: Utilize power of public land acquisition and other land use measures to create open space zoning of inundation zones in areas that are destined for redevelopment; when this is not feasible, low density land uses should be employed.

Policy S 4.17: Continue to assess and upgrade inundation risk and protection in the county.

Policy S 4.18: Require that the design and upgrade of street storm drains be based on the depth of inundation, relative risk to public health and safety, the potential for hindrance of emergency access and regress from excessive flood depth, and the threat of contamination of the storm drain system with sewage effluent. In general, the 10-year flood flows shall be contained within the top of curbs and the 100-year flood flows within the street right-of-way.

Policy S 4.19: Encourage periodic re-evaluation of 500-year, 100-year and 10-year flood hazard in the county by state, federal, county and other sources, and use such studies to improve existing protection, to review protection standards proposed for new development and redevelopment, and to update emergency response plans.

Policy S 4.20: Balance flood control mitigation with open space and environmental protection.

Policy S 4.21: Encourage the use of specific plans to allow increased densities in certain areas of proposed development; or apply Transfer of Development Credits to encourage the placement of appropriate land uses in natural hazard areas, including open space, passive recreational uses, or other development capable of tolerating these hazards.

Policy S 4.22: Take an active role in acquiring property in high-risk flood zones and designating the land as open space for public use or wildlife habitat.

E. Proposed New or Revised Riverside County General Plan Policies

The following proposed revised General Plan policy addresses impacts related to flooding and dam inundation hazards.

1. Safety (S) Element

Policy S 4.2: *The county shall* ~~E~~enforce provisions of the Building Code in conjunction with the following guidelines:

a. All residential, commercial and industrial structures shall be flood-proofed from the *mapped* 100-year stormflow.~~, and~~ *This may require that* the finished floor elevation ~~shall~~ be constructed at such a height as to meet this requirement. *Non-residential (commercial or industrial) structures may be allowed with a "flood-proofed" finished floor below the Base Flood Elevation (i.e., 100-year flood surface) to the extent permitted by State, federal and local regulations. New* ~~C~~critical facilities *shall* ~~should~~ be constructed above grade to the satisfaction of the Building Official, based on federal, state, or other reliable hydrologic studies. *To the extent that residential, commercial or industrial structures cannot meet these standards, they shall not be approved.*

b. Critical facilities shall not be permitted in floodplains unless the project design ensures that there are two routes for emergency egress and regress, and minimizes the potential for debris or flooding to block emergency routes, either through the construction of dikes, bridges, or large-diameter storm drains under roads used for primary access.

c. Development using, storing, or otherwise involved with substantial quantities of onsite hazardous materials shall not be permitted *within a 100-year floodplain or dam inundation zone,* unless all standards for evaluation, anchoring and flood-proofing have been satisfied; and hazardous materials are stored in watertight containers, not capable of floating, to the extent required by state and federal laws and regulations.

d. Specific flood-proofing measures may require: use of paints, membranes, or mortar to reduce water seepage through walls; installation of water tight doors, bulkheads, and shutters; installation of flood water pumps in structures; and proper modification and protection of all electrical equipment, circuits, and appliances so that the risk of electrocution or fire is eliminated. However, fully enclosed areas that are below finished floors shall require openings to equalize the forces on both sides of the walls.

Policy S 4.7: Any substantial modification to a watercourse shall be done in the least environmentally damaging manner ~~possible~~ *practicable* in order to maintain adequate wildlife corridors and linkages and maximize groundwater recharge.

2. Circulation (C) Element

NEW **Policy C 20.4:** *New crossings of watercourses by local roads shall occur at the minimum frequency necessary to provide for adequate neighborhood and community circulation and fire protection. Wherever feasible, new crossings shall occur using bridging systems that pass over entire watercourses and associated floodplains and riparian vegetation in single spans. Dip or culvert crossings shall be avoided, but, where their use is unavoidable, they shall be designed to minimize impacts on watercourses.*

NEW **Policy C 20.5:** *In order to protect the watershed, water supply, groundwater recharge, and wildlife values of watercourses, the county will avoid siting utility infrastructure and associated grading, fire clearance, and other disturbances within or adjacent to watercourses, if there are feasible alternatives available, and discourage special districts and other governmental jurisdictions outside of the county's authority, from doing so. Where such watershed utility siting locations cannot be avoided, the impacts on watercourses shall be minimized.*

4.11.4 Thresholds of Significance for Flood and Dam Inundation Hazards

The proposed project would result in a significant flood or dam inundation impact if it would:

A. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.

B. Place within a 100-year flood hazard area structures which would impede or redirect flood flows.

C. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam.

D. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site.

E. Expose people or structures to a significant risk of inundation due to seiche, tsunami or mudflow.

4.11.5 Effect of GPA No. 960 on the General Plan and on Flood and Dam Inundation Hazards

The proposed project, GPA No. 960, would have spatial effects where it involves a variety of specific General Plan Land Use Designation (LUD) corrections and changes, several Policy Area, Study Area and overlay changes, proposals for new trail and road alignments and standards, and an incidental commercial policy for rural areas. In addition, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County. In this section, the flood-related changes to the General Plan are outlined and the effects of proposed changes relative to flood and dam inundation hazards are discussed. Specific impacts and mitigation for the project are then evaluated according to identified significance thresholds in the subsequent section.

A. Proposed Changes to the General Plan

As part of the project review process, data and map related to flooding and dam inundation hazards in the General Plan were updated and associated policies reviewed and revised where necessary. The existing General Plan addresses flooding hazards in the Safety Element with the multipurpose open space element also containing riparian and flood plain policies. Texts of relevant existing and revised General Plan policies are provided in Sections 4.11.3E and F.

Flooding Hazard Maps: As part of the GPA No. 960 update, text was added and policies updated to accommodate new 100-year flood mapping released by FEMA and as adopted by Riverside County pursuant to Riverside County Ordinance No. 458 after review and acceptance by FCWCD. Several related Safety policies were revised as part of this and related exhibits were also updated: Figure S-9, 100-year Flood Hazard Zones (and related "Flood Hazard" maps in the Area Plans), and Figure S-10, Dam Failure Inundation Zones.

Land Use Changes: Several proposed changes would affect future development potential within areas at risk for flooding, dam inundation and/or seiche. In particular, this includes the proposed changes to the Lakeland Village area around Lake Elsinore. Changes around the Salton Sea could also occur on lands affected by that waterbody, however, the LUD changes proposed are from higher density/intensity developed uses (including residential) to AG (the Agriculture Foundation) to better recognize and accommodate aquaculture activities along the sea's shores. Such changes would actually *decrease* potential flooding risks associated with the Salton Sea.

The key changes in proximity to flood potential areas are those for Lakeland Village. However, the whole purpose of the proposed GPA No. 960 changes to the area is to better accommodate known flood boundaries. Specifically, in the past few years, the 100-year flood boundaries surrounding Lake Elsinore were adjusted to reflect more recent hydrology data. As a result, more precise LUD assignments can be made, particularly for the long, narrow lake-front lots that lie on the lakeside of Grand Avenue. Although these changes improve flood safety through better definition and accommodation of the lake's floodplain, they also remove existing barriers to growth by providing more suitable LUDs on some parcels formerly with split designations. Paradoxically, the changes may also increase flood risks by exposing more people, property and structures to flood hazards, as well as potentially seiche risks at the southeastern-most end of the lake.

The variety of LUD and policy area changes proposed, as per the descriptions in Section 3.0 (Project Description) of the EIR and associated Figure 3-1 (as well as the corresponding maps within each Area Plan) may indirectly affect flooding hazards, including dam inundation threats. Such changes would lead to either an increase or decrease in development potential (density or intensity); the risks associated with introducing new people and property into areas potentially subject to the various flooding hazards outlined herein would be increased correspondingly.

GPA No. 960 also includes new and revised policies to be implemented at locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies and others, as described in Section 3.0 of the EIR. Similarly, new maps for trails and county roads (GP Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements will be determined based on site assessment of and geotechnical suitability to determine environmentally preferred alignments to minimize adverse effects. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines and area drainage plans, are also developed based on the agency's priorities, including existing and future levels of service and need assessments and forecasts; typically

based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need.

Accordingly, specific locations and timing of future infrastructure, including power transmission lines, water and sewer lines, roads, flood risk management projects and other public services are not presently foreseeable beyond the five-year master plan level. These improvements will require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the General Plan builds out (over the next 50-plus years). As such, future impacts and mitigation would be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed later at the individual project stage.

B. Analysis of GPA No. 960 Effects on Flooding and Dam Inundation Hazards

The General Plan is concerned mainly with the physical build out of the county; many of the changes associated with GPA No. 960 would affect planned land usage. In particular, proposed changes affect land use overlays, land use designations and policies that affect the conversion of rural, semi-rural, agricultural and vacant lands to suburban or urban uses in various parts of Riverside County.

For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), hazards cannot be delineated at present. Likewise, the potential for future development occurring within the proposed revised policy areas and overlays has been generalized for this EIR, but due to the large scale of Riverside County and these policy areas, site-specific flooding hazards cannot be accurately assessed at this time. More generally, future development accommodated by the updated General Plan could be effected by a variety of geologic hazards depending upon location. These include 100-year floods, flash floods, dam inundation, seiche and mud flows. Where not foreseeable at this time, such affects are addressed programmatically, as per the section below.

Floodplains: Spatial analysis performed for the project indicates that a number of land use-related changes with the potential for introducing or intensifying future development are proposed for areas within an existing 100-year floodplain. Within western Riverside County, these areas include land within the floodplains of Prado Basin on the Santa Ana River; within the Airport Land Use Policy Area for Flabob Airport (also adjacent to the Santa Ana River); land within or just off the Temescal Wash floodplain, between Lake Elsinore and Prado Basin; land within the proposed Lakeland Village Policy Area, adjacent to Lake Elsinore; small areas within the proposed Meadowbrook and Good Hope Rural Village Overlays (which are within 100-year flood zones associated with Lake Elsinore or Canyon Lake to the southwest); land associated with Lake Skinner; and, land associated with the proposed Northeast Dairy Business Park Policy Area (which is within the floodplain of the San Jacinto River). Within the Pass and Eastern Riverside County, these areas include: land along the Big Morongo Wash north of Palm Springs; land along washes associated with the hills and canyons of the Little San Bernardino Mountains along the northeast edge of Coachella Valley, including East and West Wide Canyon, Pushawalla, Thousand Palm, Berdoo and Rockhouse Canyons; and other drainages trending southwesterly into Coachella Valley and towards the Whitewater River. And, lastly, a number of areas associated with the floodplain around the Salton Sea.

Dam Inundation Zones: Not all dams within Riverside County have designated dam inundation areas. Although there has never been a historical dam failure in Riverside County, the risk of dam failure, no matter how remote, should be assumed to exist. Figure 4.11.2 shows mapped potential dam inundation areas within the county. Development of areas affected by GPA No. 960 in these areas is assumed to be at risk in the event of a structural dam failure or a dam failure as a result of an earthquake, unless engineering (such as pad elevation), levees, dikes or features exist to prevent flooding damage.

Spatial analysis performed for the project indicates a number of land use-related changes with the potential for introducing or intensifying future development are proposed for areas within existing dam inundation zones. In western Riverside County, these areas include: land along the Santa Ana River outside of the Prado Dam basin; land along Temescal Wash downstream from Lake Elsinore and the reservoir at Hemet (Lee) Lake; land along Lake Elsinore within the proposed Lakeland Village RVO; land downstream from the reservoirs at Diamond Valley and Lake Skinner; and, land along the San Jacinto River and associated with Lake Perris. Due to the sandy soils and lack of reservoirs, there are no dam inundation zones affecting the project in eastern Riverside County.

Seiche Hazards: In terms of seiche hazards, there is no significant potential for any of the waterbodies within Riverside County. For the proposed project, resultant future development along or near lakes and reservoirs is considered minimal. Along the large, man-made reservoirs, such as Diamond Valley Reservoir and Prado Dam, the facilities have been engineered to reduce seiche risks and these facilities are further buffered by public lands along their shores, adding an additional layer of protection from localized flooding. For Lake Elsinore and the Salton Sea, their shallowness and extensive shorelines both tend to minimize seiche potential. Due to its inland location, there are no oceanic tsunami risks in Riverside County. None of the other land use-related changes proposed under GPA No. 960 are within areas affected by either 100-year flooding risks, dam inundation hazards or seiche risks.

Mudflow Hazards: In terms of mudflow hazards, areas of proposed land use-related changes with the potential for introducing or intensifying future development are generally at risk for mudflow hazards if they are: on or below a steep or unstable slope; within a steep-sided canyon; within an area with flashflooding potential; or, in an area denuded of vegetation by recent wildfire, particularly if any of the other factors also occur. Flashflooding potential generally exists along any canyon, swale or other low-lying area in which heavy precipitation fall may be channeled rapidly and unexpectedly. Risks to future development as a result of flashflooding are reduced through the various regulatory floodplain and drainage flow control measures. See discussion under Section 4.11.6 (Flood and Dam Inundation Hazards – Impacts and Mitigation), below.

Alluvial Fan Flooding Hazards: It is beyond the scope of this project to analyze and determine whether or not a given site or parcel of land is located on an alluvial fan.

C. Generalized Flooding Effects

Hazards associated with flooding can be divided into primary hazards that occur due to contact with water, secondary effects that occur because of the flooding, such as disruption of services, health impacts such as water-borne disease and increase in vectors (e.g., mosquitoes), and tertiary effects, such as changes in the position of river channels.

Primary Effects: These effects arise from direct contact with flood waters and the high water velocities commonly associated with flood conditions.

- With higher velocities, streams are able to transport larger particles as suspended load. In addition to rocks and sediment, during a flood, forces may also carry large objects, such as trees, automobiles, houses and bridges. This deposition can cause considerable damage. And, even in storms of lower intensity, if enough water carries sediment into a flood control structure (channel or storm drain, for example), the ability of the structure to convey flood flows could be overwhelmed, leading to additional flooding downstream.

- When large amounts of precipitation fall over a short period on saturated soil or dry soil with poor absorption capacity, the result can be a flash flood. In such floods, runoff collects in gullies and streams,

which flow together creating large-volume flows, often featuring a fast-moving front of water and debris. Such floods can occur anywhere downstream from the source of the precipitation, even many miles distant. Their unexpectedness can cause loss of lives to people hiking in or driving across an affected drainage unable to escape the sudden deluge. (As little as two feet of water can carry away an SUV-sized vehicle.)

- Flood waters can cause massive amounts of erosion and scouring. Such erosion can undermine bridge structures, levees and buildings causing their collapse. Such collapse would cause further additional flood damage.

- Water entering human-built structures causes water damage. Even with minor flooding of homes, furniture is ruined, floors and walls are damaged, and anything that comes in contact with the water is likely to be damaged or lost. Flooding of automobiles usually results in damage that cannot easily be repaired.

- When the flood waters retreat, water velocity slows, causing any suspended sediment load to be deposited. Thus, after retreat of the floodwaters, affected areas are typically covered with a thick layer of stream-deposited mud, including the interior of buildings.

- Flooding of farmland usually results in crop loss. Livestock, pets and other animals are often carried away and drown.

- Humans that get caught in the high-velocity flood waters are often drowned by the water.

- Floodwaters can concentrate garbage, debris and toxic pollutants that can cause the secondary effects of health hazards.

Secondary Effects: As noted above, secondary effects are those that occur because of the flooding. They can include the following:

- Contamination of drinking water supplies, especially if sewage treatment plants are flooded or delivery lines broken. This can also result in disease and other health effects when people consume improperly or inadequately purified water.

- Gas and electrical services may be disrupted due to downed lines, broken pipes, flooded transformers or transfer stations, etc. This can also lead to additional fires due to use of candles and other open-flame sources in or around homes.

- Transportation systems may be disrupted, for example, roads, bridges and railroad tracks flooded, eroded or washed away. This can lead to shortages of food and water, as well as trouble providing medical supplies and evacuating sick or injured victims, due to access difficulties by emergency services. Post-flood clean-up and recovery can also be hindered by difficulties delivering needed heavy equipment, clean-up supplies and personnel to the stricken area.

Tertiary Effects: Lastly, tertiary effects involve long-term changes, including:

- The location of river channels may change as a result of flooding, with new active channels developing and old channels becoming dry.

- Loss of floodplain habitat changes the composition of plants and animals occupying the area. This change can persist for many years if mature riparian woodlands were lost. The new successional vegetation that returns may not support the same species.

- Sediment deposited by flooding may destroy farm land; although silt deposited by floodwaters could also increase the agricultural productivity of the soil.

- Jobs may be lost due to the disruption of services, destruction of businesses (or loss of inventories, etc.) Jobs may also be gained in specific sectors, however, such the construction industry to help rebuild and repair flood damage.

- Insurance rates for properties in the floodplain may increase. Neighborhoods and communities may permanently change composition as some people leave rather than rebuild. Abandoned structures and vacant lots may result where the owner cannot afford to rebuild.

D. Development Effects on Flood Hazards

How the land is used and developed can affect the risks resulting from floods. While some activities can be designed to mitigate the effects of flooding, many land use practices and structures can unwittingly increase flood risk. Clearing a floodplain for agriculture permits a progressively higher percentage of a large flood discharge to be carried in the floodplain. Forest vegetation tends to absorb moisture and lessen runoff. Deforestation or logging practices reduce the vegetation and the forest's absorption capacity thus increasing runoff. Similarly, overgrazing of grasslands and rangelands decreases the vegetation cover and exposes soil to erosion, as well as increased runoff. Also, drainage and irrigation ditches and also water diversions can alter the discharge into floodplains and the channel's capacity to carry the discharge. Obviously, dams, dikes, levees and other flood control structures can lessen an area's flood potential by containing or redirecting flows.

Urbanization of a floodplain or adjacent areas and its attendant construction increases runoff because it reduces the amount of surface land area available to absorb rainfall and it also channels flow into storm drains and drainage ways much more quickly. Also, artificial fill in a floodplain reduces its water capacity and can increase flood height. Thus, the risk of flooding may be increased.

In terms of land use, flood hazards are addressed through several basic means: The simplest and most effective option is avoiding the risk; i.e., redesigning a project to avoid the floodplain by designating it as a project's open space, for example. A second option is diverting a flood hazard through channelization or blocking flow with dikes or levees. This option results in offsite or downstream effects, however, which must also be addressed. One of the most common options is elevating a site (grading pad, for example) to rise at least two feet above the floodplain elevation. This option is not always feasible for large areas and also requires a number of regulatory steps that are enforced by Riverside County (see discussion later in this section). And, lastly, when all else fails, a development or structure may resort to *floodproofing* in some cases (such as non-residential buildings), for which a variety of standards apply. As an example, floodproofed buildings within a FEMA Special Flood Hazard Area must be certified by FEMA and are addressed by several FEMA Technical Bulletins.

4.11.6 Flood and Dam Inundation Hazards - Impacts and Mitigation

A. Would the project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

Impact 4.11.A – Result in Housing Within Flood Hazard Areas: Future development accommodated by the project would result in encroachment into areas of mapped 100-year floods (including some alluvial fans) and other delineated flood hazards areas. Such development may increase the amount of people, structures and property at risk should a flooding event occur. These flood hazard areas are extensively regulated, however, and compliance with existing laws and regulatory programs, in particular Riverside County Ordinance No. 458, as well as General Plan policies and existing Mitigation Measures from EIR No. 441, would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.11.A

Flooding can inundate and damage structures, bury structures, knock them off their foundations or completely destroy them through high velocity water and debris, which can include sizable boulders. Impacts from flooding include the loss of life and/or property; health and safety hazards; disruption of commerce, water, power and telecommunication services; loss of agricultural lands; and infrastructure damage.

As outlined in Section 4.11.5, future development that could result from the proposed project has the potential to introduce people, property, homes, public facilities, roads and other infrastructure into 100-year flood hazard areas. GPA No. 960 proposes parcel-specific land use changes for approximately 163 parcels, totaling 2,038 acres within existing 100-year floodplains. These parcels fall within the Western Coachella Valley, Eastern Coachella Valley, Southwest, Harvest Valley/ Winchester, Eastvale, Temescal Canyon and Elsinore Area Plans. Of these, 124 parcels (totaling approximately 1,876 acres) are proposed for land use designations with the potential to introduce additional people, property, homes, public facilities, roads and other infrastructure into 100-year floodplains. If development were allowed to occur in an unregulated fashion, this impact would be potentially significant. However, compliance with a variety of existing regulations and programs, as described below, would ensure that risks associated with development within 100-year flood hazard areas are less than significant.

2. Regulatory Compliance for Impact 4.11.A

As detailed and explained below, compliance with existing laws, regulatory programs, General Plan policies and existing EIR No. 441 mitigation measures would be sufficient to ensure that adverse effects associated any housing placed within a 100-year flood hazard area mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map are less than significant.

a. Compliance With Federal, State and County Regulations

Federal, state and local regulations would reduce impacts related to placement of housing within a 100-year flood hazard zones area. These include, but are not limited to, the following: National Flood Insurance Act, which establishes flood-risk zones within floodplain areas and requires local compliance with flood proofing building standards; National Flood Insurance Reform Act, which reduces the risk of flood damage to properties by providing a means to rectify any flood-related damage; Cobey-Alquist Floodplain Management Act, which requires local governments to protect people and property from flooding hazards as a condition of the receipt of

State funds; as well as various county ordinances. In particular, as outlined below, Riverside County Ordinance No. 458 implements the National Flood Insurance Program within Riverside County and places strict conditions on acceptable levels of development in floodplains. These items are summarized below:

Through these policies, programs and ordinance standards, development within floodplains and development with the potential to be adversely affected by flooding hazards are highly regulated and potential impacts are reduced to less than significant levels by Riverside County's development review process.

FEMA Floodplain NFIP Mapping Program and Riverside **County Ordinance No. 458:** As discussed above, the County of Riverside participates in the NFIP and uses FIRMs as the basis for Riverside County flood risk management planning. Ordinance No. 458 establishes the official "flood hazard areas" within the county through the adoption of various FIRM maps, as well as maps from other sources. (The current list of official maps recognized by Ordinance No. 458 as of May 2013 are listed previously, above.)

When deemed necessary by Riverside County Flood, developments proposed within FEMA-mapped flood hazard areas must submit their plans to FEMA showing how the project will be elevated out of the floodplain or otherwise eliminated or safely managed. When a floodplain revision is necessary, FEMA will issue a "conditional determination" letter of map revision (CLOMR) summarizing the project's effect on the floodplain and accepting proposed floodplain alterations associated with the project (if any). FEMA makes such determinations based on review of revisions to the designated floodplain, such as a floodplain modification project or simply the proposed placement of fill to elevate structures or parcels. By requiring agency-approved-proof via submitted engineering plans and/or hydrological study, this process ensures that no development is allowed that would cause flood impacts due to development within FEMA-mapped floodplains, or expose any people, property or structures to any significant flood risks. Specifically, Riverside County Ordinance No. 258 prohibits any development or floodway changes that would revise the base flood (i.e., 100-year flood level) elevation by more than one foot.

Ordinance No. 458 - Regulating Flood Hazard Areas and Implementing the National Flood Insurance Program: The specifications, standards and requirements of Ordinance No. 458 mitigate potential flood hazards within Riverside County several ways. They ensure that flooding risks, water flows and runoff are managed appropriately to prevent hazards or undue risk of damage or harm to people, property, structures and facilities within Riverside County. By requiring specific standards for development and establishing a program for the approval, implementation and verification of such measures, this ordinance mitigates potential hazards that could arise from flooding hazards and its effects on people, property and structures. It should also be noted that this ordinance specifically requires that all new buildings and/or substantial improvements located within the 500-year floodplain limits of Lake Elsinore shall have their lowest floor elevated a minimum of 3 feet above the lake's 100-year flood level elevation.

National Pollution Discharge Elimination System (NPDES): The RWQCBs provide state-level water quality policy for Riverside County and oversee the Clean Water Act's NPDES program. Under the NPDES, California's RWQCBs oversee water quality in Riverside County for their respective regions.

Ordinance No. 348 - Land Use: Use of this ordinance and the "Watercourse, Watershed & Conservation Areas" (W-1) zone mitigates potential flood impacts by preventing permanent occupancy or residency in areas potentially at risk for flooding.

Ordinance No. 457 - Adopting and Amending Various Building and Construction Codes: Use of this ordinance establishes building standards and codes that apply in flood zones to ensure that potential flood impacts on structures and the people and property occupying them are minimized. This is accomplished in a number of ways including varying floor elevations based on recommendations from Riverside County Flood as

well as ensuring compliance with other applicable federal, state and county regulations. Potential adverse impacts due to construction, urban runoff, stormwater flows and water erosion on lands subject to development are also minimized through grading and pollution restrictions, erosion control measures and in some cases implementation of various monitoring and reporting measures.

Ordinance No. 659 - Development Impact Fee (DIF) Program: This ordinance sets a range of development impact fees for new residential, commercial and industrial development. For flood control facilities, the DIF program ensures fees are collected and expended to provide necessary flood facilities such as basins, canals, etc. based on the public facilities needs list which is revised based on the ongoing levels of development. The development of these facilities ensures new development does not expose people, property or structures to undue flooding risks.

b. Compliance with Existing General Plan Policies

The following existing Riverside County General Plan policies would help prevent significant impacts to housing within flood hazard areas. See Section 4.11.3.E for full text of each of these policies. Implementation of these General Plan policies in combination with the above existing county, state and federal regulations related to flooding hazards would reduce the effects of future growth and development consistent with GPA No. 960 in relation to flood hazards, to a less than significant level. Specifically:

Regarding Policy S 4.1: Compliance with this policy would reduce potential adverse impacts to new housing located within flood hazard areas by requiring that new development have a minimum level of acceptable risk that is determined through County of Riverside review in order to mitigate potential hazards. Proposals will not be approved if they cannot mitigate those potential hazards to acceptable levels which are determined by the responsible county agency.

Regarding Policy S 4.3: Compliance with this policy would reduce potential adverse impacts to housing located within flood hazard areas by prohibiting the construction of permanent structures in areas that would impede flood waters and potentially expose said structures to property damage or other flooding risks. The policy does allow for low intensity uses in these areas as long as flood risk management functions are maintained.

Regarding Policy S 4.4: This policy prohibits alteration of floodways and channelization unless other methods of flood control are not feasible, thereby maintaining and preventing the obstruction of existing flood control facilities by development proposals consistent with GPA No. 960. The policy also allows for incentive provisions, such as density transfers, to be offered in an effort to maintain natural watercourses and floodways by focusing development away from these critical features.

Regarding Policy S 4.8: This policy allows developments along the floodway fringe only if it has been determined that proposed structures can be flood-proofed and would not contribute to property damage or risks to public safety.

Regarding Policy S 4.9: This policy requires development within the floodway fringe be capable of withstanding flooding and use a minimum amount of fill for the project, thereby directly reducing potential impacts and protecting developments, such as housing projects, within floodplains and other flood areas. The policy establishes uses that may be compatible with being located in floodplains and floodways, and waives flood-proofing requirements for those uses if they do not obstruct flows.

Regarding Policy S 4.10: This policy requires all development proposals to mitigate their potential impacts on the capacity of regional storm drain systems.

Regarding Policy S 4.18: This policy requires the design and upgrade of street storm drains for development proposals based on the depth of inundation, relative risk to public health and safety, the potential for hindrance of emergency access and regress and the threat of contamination of the storm drain system with sewage effluent.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised policy of the Riverside County General Plan would further prevent significant impacts to housing located within flood hazard areas. See Section 4.11.3.F for full text of this policy.

Regarding Policy S 4.2: This proposed policy would further reduce already insignificant flooding hazards by prohibiting projects or construction, such as housing projects, within floodplains and other flood hazard areas under various circumstances.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, which was certified for the 2003 (RCIP) General Plan, it was determined that to fully minimize risks associated with the placement of habitable structures and housing within 100-year flood hazard areas, several mitigation measures were also necessary. These mitigation measures from EIR No. 441 are listed below and apply countywide, thus they also apply to GPA No. 960. They further contribute to ensuring flood impacts would be less than significant.

Existing Mitigation Measure 4.9.2A: Riverside County shall require that all structures (residential, commercial, and industrial) be flood-proofed from the 100-year storm flows. In some cases, this may involve elevating the finished floor more than 1 foot.

Existing Mitigation Measure 4.9.2B: Riverside County shall require that fully enclosed areas that are below finished floors have openings to equalize the forces on both sides of the walls.

Existing Mitigation Measure 4.9.2C: Riverside County shall require that for agricultural, recreation, or other low-density uses, flows are not obstructed and that upstream and downstream properties are not adversely affected by increased velocities, erosion backwater effects, or concentration of flows.

Existing Mitigation Measure 4.9.2D: Provided the applicant does hydrological studies, engineers structures to be safe from flooding and provides evidence that the structures will not adversely impact the floodplain, Riverside County may allow development into the floodway fringe.

3. Finding on Significance for Impact 4.11.A

Compliance with the above regulations, policies and mitigation measures would ensure that people and property are not exposed to significant 100-year flood hazards. As a result, flood hazards associated with future development consistent with the project would be less than significant.

B. Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Impact 4.11.B – Cause Impediment of Flows: Future development as a result of implementation of the proposed project may result in placement of structures within 100-year flood hazard areas, creating the potential

for impeding or redirecting flood flows. As a result, people, structures and property, as well as those introduced by the new development, could be exposed to increased flooding risks. Compliance with existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441, in particular County Ordinance No. 458, would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.11.B

Development along stream channels and floodplains can alter a channel's capacity for conveying water and can increase the height of the water surface corresponding to a given discharge. In particular, structures such as bridges that encroach on a floodplain can increase upstream flooding by narrowing the width of the channel and increasing the channel's resistance to flow. As a result, water is higher when it flows past the obstruction, creating a backwater that could inundate a larger area upstream.

Some of the land use-related changes included in the project would allow for the construction of structures potentially within a drainage, floodway or floodplain. For example, houses would be constructed in areas designated for residential land use, factories and stores would be constructed in areas designated for commercial and industrial land uses, and roads and bridges could be constructed in areas designated as open space in order to provide public access to these areas. Thus, it is important that any structures proposed in a 100-year floodplain be properly designed, engineered and constructed to ensure that they would not impede or redirect flows within the floodway. And, in fact, the County of Riverside requires this as part of a project's Conditions of Approval issued by Riverside County Flood.

Flooding can inundate and cause water damage to structures, bury structures, knock them off their foundations or completely destroy them through high velocity water and debris flows, which can include sizable boulders. Impacts resulting from flooding include the loss of life and/or property; health and safety hazards; disruption of commerce, water, power and telecommunications services; loss of agricultural lands; and infrastructure damage.

As outlined in Section 4.11.5, future development that could result from implementation of the proposed project has the potential to introduce people, property, homes, public facilities, roads and other infrastructure into 100-year flood hazard areas. Without the application of existing regulations and requirements to prevent improper development, this impact could be potentially significant. However, compliance with a variety of existing regulations and programs, as described below, ensures that risks associated with impeding or redirecting flows would be less than significant. No project-specific mitigation is required.

2. Regulatory Compliance for Impact 4.11.B

As detailed and explained below, compliance with the following existing laws, regulatory programs, General Plan policies and existing EIR No. 441 mitigation measures are sufficient to ensure that adverse effects associated with potential impeding or redirecting of flood flows as a result of GPA No. 960 would be less than significant.

a. Compliance With Federal, State and County Regulations

Compliance with federal, state and local regulations would reduce impacts resulting from impeding or redirecting water flows. These include, but are not limited to, the National Flood Insurance Act, the National Flood Insurance Reform Act and the various Riverside County ordinances outlined under Impact 4.11.A, above.

National Flood Insurance Act and National Flood Insurance Reform Act: These acts reduce adverse impacts resulting from impeded flows by requiring development plans be submitted to and reviewed by FEMA

for floodplain effects. FEMA's role in this process ensures that no development would be permitted if it would impede flows and cause a risk to people or property.

Ordinance No. 458 – Regulating Flood Hazard Areas and Implementing the National Flood Insurance Program: This ordinance reduces impacts by regulating development in regards to flooding risks and by ensuring that flood flows are managed appropriately to prevent hazards or undue risk of damage or harm to people, property, structures and facilities within Riverside County.

Ordinance No. 461 - Road Improvement Standards: This ordinance sets standards and engineering specifications (including flood control/risk management attributes) for roads, bridges and other transportation-related facilities. It requires engineering, construction and maintenance to ensure the safety and integrity of the roadway or improvement, thereby mitigating potential flooding hazards.

b. Compliance with Existing General Plan Policies

The following General Plan policies would further prevent significant impacts due to impeded flows. Implementation of these policies in combination with the above federal, state and county regulations would reduce flood hazard effects on future growth and development in Riverside County to a less than significant level. See Section 4.11.3.E for the full text of these policies.

Policy S 4.3: This policy reduces potential flooding hazards caused by impeding or redirecting flows by prohibiting the construction of permanent residential and employment structures in those areas that would impede flood waters and potentially expose said structures to property damage or other flooding risks. The policy does allow for low intensity uses in these areas as long as flood risk management functions are maintained.

Policy S 4.4: This policy prohibits alteration of floodways and channelization unless other methods of flood risk management are not feasible, thereby maintaining and preventing the obstruction of existing flood control facilities by development proposals consistent with GPA No. 960 and reducing potential adverse impacts associated with impeding flows. The policy also allows for incentive provisions, such as density transfers, to be offered in an effort to maintain natural watercourses and floodways and to focus development away from these critical resources.

Policy S 4.5: This policy prohibits substantial modifications to watercourses, thereby reducing potential flooding hazards caused by impeding or redirecting flows. When modifications are unavoidable, those modifications must not be detrimental to adjacent properties or adversely affect adjacent wetlands or riparian habitat.

Policy S 4.8: This policy allows only those proposed structures that can be flood proofed and would not contribute to the property damage or risks to public safety to be developed along the fringes of floodways. Placement along the fringe of a floodway further ensures that natural flows would not be impeded.

Policy S 4.9: This policy requires development within floodway fringes be able to withstand flooding and use a minimum amount of fill, thereby directly reducing potential impacts related to impeding flows and protecting developments, such as housing projects, within floodplains and other flood areas. The policy establishes uses that may be compatible with being located in floodplains and floodways, and waives the flood-proofing requirement for those uses as long as they do not impede flows.

Policy S 4.18: This policy requires the design and upgrade of street storm drains for development proposals based on the depth of inundation, relative risk to public health and safety, the potential for hindrance of emergency access and regress and the threat of contamination of the storm drain system.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised General Plan policies would further prevent significant impacts due to impeded flows. Implementation of these policies in combination with the above federal, state and county regulations would reduce flood hazard effects on future growth and development in Riverside County to a less than significant level. See Section 4.11.3.F for the full text of these policies.

Policy S 4.2 prevents potential flooding hazards by prohibiting projects or construction within floodplains and other flood hazard areas under various circumstances that could impede or redirect flood flows.

Policy S 4.7: This policy requires potential modifications to watercourses to be done in a manner that is the least damaging to the environment, thereby reducing potential flooding hazards caused by impeding or redirecting flows.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, which was certified for the 2003 (RCIP) General Plan, it was determined that to fully minimize risks associated with development impeding or redirecting flood flows, several mitigation measures were also necessary. These mitigation measures from EIR No. 441 are listed below and apply countywide, thus they also apply to GPA No. 960.

Existing Mitigation Measure 4.9.1A: LOMA and LOMR-F are documents issued by FEMA that officially remove a property and/or structure from a special flood hazard area of a Flood Insurance Rate Map (FIRM). These letters shall be accepted by Riverside County where applicable.

Existing Mitigation Measure 4.9.1B: Riverside County shall prohibit alteration of floodways and channelization unless alternative methods of flood risk management are found to be technically, economically and practicably infeasible.

Existing Mitigation Measure 4.9.1C: Riverside County shall not necessarily require all land uses to withstand flooding. These may include land uses such as agricultural, golf courses and trails. For these land uses, flows shall not be obstructed, and upstream and downstream properties shall not be adversely affected by increased velocities, erosion backwater effects, concentration of flows and adverse impacts to water quality from point and nonpoint sources of pollution.

Existing Mitigation Measure 4.9.1D: Riverside County shall require the 10-year flood flows to be contained within the top of curbs and the 100-year flood flows within the street rights-of-way.

3. Finding on Significance for Impact 4.11.B

Compliance with the above regulations, policies and existing mitigation measures would ensure that any potential hazards caused by impeding or redirecting flows as a result of future development would be less than significant. No project-specific mitigation is required.

C. Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Impact 4.11.C – Expose People or Structures to Flooding Risks, Including Flooding Due to Dam or Levee Failure: Future development accommodated by the project may result in placement of structures, including habitable ones, within dam inundation zones, alluvial fan flooding zones and other areas of potential flood hazard. Such development would be at greater risk of flood hazards should a dam, levee, debris basin or other critical flood control structure fail. As a result, existing people, structures and property, as well as those introduced as a result of GPA No. 960, could be exposed to increased flooding risks due to failure of flood control structures. Compliance with existing laws, regulatory programs and General Plan policies would be sufficient to ensure that this impact does not rise to the level of significance.

1. Analysis of Impact 4.11.C

Although there have been several notable floods in Riverside County over the past 10-plus years, there has never been a historical dam failure. Despite this, the risk of dam failure, no matter how remote, must be assumed to exist. In addition, there is a higher probability of failure of some of the other flood control structures, such as levees, debris basins and storm drains. These types of facilities are much more common and numerous within Riverside County than dams and require on-going maintenance to ensure safe and reliable function. And, since these types of facilities are often built on a smaller scale than major dams, they can also be more prone to being damaged or failing due to storm flows (or flooding) exceeding their design capacity.

As detailed in Section 4.11.5, some of the future development accommodated by GPA No. 960 would have the potential to introduce people, property, public facilities, roads and other infrastructure into areas potentially at risk of dam inundation or flooding due to other sources, e.g., failure of a levee or of a debris basin above an alluvial fan. Further, not all dams within Riverside County have designated dam inundation areas. In regards to known (mapped) dam inundation hazards, analysis indicates that approximately 26 parcels (462 acres total) with proposed parcel-specific land use changes would be affected under the project. These parcels fall within the Southwest, Harvest Valley/Winchester, Eastvale, Temescal Canyon and Elsinore Area Plans. Of these 26 parcels, only seven parcels (approximately 293 acres) are proposed for land use designations with the potential to introduce new people, property, roads and infrastructure into mapped dam inundation zones. The remaining designation changes would reduce development density/intensity, lowering the risks. Without measures that reduce flooding risks, this impact would be potentially significant. However, compliance with existing regulations and programs, as described below, would ensure that risks associated with development in dam inundation zones and other areas potentially prone to flooding or inundation hazards due to failure of a flood control facility would be less than significant.

2. Regulatory Compliance for Impact 4.11.C

As detailed and explained below, compliance with the following existing laws, regulatory programs and existing General Plan policies are sufficient to ensure that adverse effects associated with dam inundation risks resulting from GPA No. 960 would be less than significant. No project-specific mitigation is required.

a. Compliance With Federal, State and County Regulations

A variety of federal, state and local regulations address impacts related to dam inundation and other types of flood control improvements and safety. These include, but are not limited to, various Riverside County ordinances

outlined under Impact 4.11.A, above, including in particular Ordinance No. 458 (as it pertains to standards for flood control structures), as well as Ordinances No. 348, 457, 659 and 461, which were discussed under Impact 4.11.B.

b. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.11.3, above, Policies S 4.1, 4.3, 4.4, 4.6, 4.8, 4.9, 4.16, 4.17, 4.18 and 4.19 provide mitigation for impacts related to dam inundation and flooding hazards. Implementation of these General Plan policies in combination with existing federal, state and county regulations would reduce the effects of dam inundation to a less than significant risk. Policy S 4.18 directly reduces the potential exposure of people and structures to flooding risks by requiring street storm drains be designed to handle a variety of flood conditions. Policies S 4.6 and 4.8 further reduce this potential hazard. Other General Plan policies that help reduce potential flooding, safety and other related impacts include: S 4.12, 4.17, 4.19, 4.20, 4.21 and 4.22.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised policy of the Riverside County General Plan would lessen potential dam inundation hazards associated with future development. For the full text of the following policy, see Section 4.11.3.E.

Policy S 4.2: This policy prohibits projects and construction within dam inundation zones under various circumstances, thereby avoiding flooding hazards.

3. Finding on Significance for Impact 4.11.C

Compliance with the above regulations and policies would ensure that any potential dam inundation hazards associated with future development consistent with the proposed project would be less than significant. No project-specific mitigation is required.

D. Would the project substantially alter the existing drainage pattern of a site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Impact 4.11.D – Cause the Adverse Alteration of Drainage Patterns or Substantially Increase Surface Runoff: Development consistent with GPA No. 960 would alter drainage patterns, streams and river courses, in some cases substantially. It would also cause increases in surface runoff through the introduction of non-permeable surfaces (roofs, pavement, roads, etc.). If not properly managed, this would cause hydrological changes that could expose existing people, structures and property, as well as those introduced by the project, to increased flooding risks. Compliance with existing laws, regulatory programs and General Plan policies would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.11.D

Future development accommodated by the proposed project would result in the alteration of drainage patterns during and after construction activities in some locations. This would entail land-disturbing construction activities, such as grading and excavation, construction of new building foundations, roads, driveways and trenches for utilities. In addition to direct drainage alterations, temporary ponding or flooding could also result

from such activities, reducing the water-carrying capacity of drainages, flood control facilities, storm drains, etc. Such drainage alterations and changes in runoff conditions must be reduced to prevent serious flooding risks from resulting. Siltation and debris buildup in these structures as the result of runoff could also decrease their effectiveness for stormwater management.

In addition to construction impacts, future development would also result in new land uses that would convert permeable surfaces (such as undisturbed soils and vacant lands) to impermeable surfaces, such as buildings (rooftops), parking lots and roadways. An increase in impermeable surfaces would substantially alter the existing drainage pattern of a site or area by increasing the amount and rate of surface runoff in a manner that could result in flooding on or off the site. Specific grading and project design measures, including the Best Management Practices (BMPs) required under the NPDES, are necessary to prevent runoff and flooding.

Additionally, impermeable surfaces and development would potentially divert natural runoff patterns potentially resulting in flooding. In undeveloped areas, rainfall collects and is stored by vegetation, in the soil and in surface depressions. When this storage capacity is filled, runoff filters slowly through the soil as subsurface flow. In contrast, developed areas where much of the land surface is covered by roads and buildings have less capacity to store rainfall. Impermeable surfaces such as roads, roofs, parking lots and sidewalks store little water, reduce infiltration of water into the ground and accelerate runoff to ditches and streams. Even in suburban areas where lawns and other permeable landscaping is common, rainfall can saturate thin soils and produce overland flow, which runs off quickly. As a result of accelerated runoff from development or construction activities, the peak discharge, volume and frequency of floods increase in nearby streams. To prevent this urban runoff from creating flood hazards, projects must be designed to direct and channel runoff appropriately into storm drain facilities adequately sized to handle expected flows. Such measures are, in fact, included as Conditions of Approval for implementing projects.

2. Regulatory Compliance for Impact 4.11.D

As detailed and explained below, compliance with the following laws, regulatory programs, General Plan policies and existing EIR No. 441 mitigation measures are sufficient to ensure that adverse effects associated with potential flooding resulting from urban runoff would be less than significant.

a. Compliance With Federal, State and County Regulations

Compliance with the following state, federal and county regulations would further prevent impacts due to alteration of drainage patterns, increased surface runoff and associated flooding risks. These include, but are not limited to, the federal Clean Water Act, the NPDES program and various Riverside County ordinances, as outlined under Impact 4.11.A, including Ordinance No. 457 and Ordinance No. 458. This also includes Ordinance No. 461 and Ordinance No. 754, which were outlined under Impacts 4.11.B and 4.11.C, respectively. Additional mitigating policies include the following:

Clean Water Act (CWA) Section 404: Compliance with this permitting program ensures that projects submit to the Army Corps proof that a development would not result in any illegal fill (that is, placing dirt or other materials) of waters of the U.S. This includes preventing hydrological changes that could result in scouring, vegetation destruction, flooding and other adverse effects that could "pollute" waters of the U.S., which are overseen by the Army Corps. Compliance with this process ensures that no development is allowed to cause flooding or runoff impacts due to illegal or improper fill or construction within existing jurisdictional drainages. Compliance with the 404 permitting process also requires legal and proper fill be properly designed, engineered,

constructed and maintained, including the use of storm runoff systems, to control and properly channel urban runoff.

National Pollution Discharge Elimination System (NPDES): Under the NPDES, programs and permits are enforced by the applicable RWQCB. In particular, the Storm Water Pollution Prevention Program (SWPPP) requires BMPs to reduce potential stormwater and urban runoff impacts, as well as erosion impacts, from construction and developed sites. Accordingly, compliance with permit requirements, including a variety of BMPs, ensures that such adverse impacts are avoid or minimized to less than significant levels. The program is further implemented and monitored by the County of Riverside pursuant to Ordinance No. 754, which was described under the previous impact (4.11.C).

Under the NPDES permit program, Stormwater Pollution Prevention Plans (SWPPP) are required, for construction sites greater than one acre. This includes the identification and implementation of a variety of BMPs to reduce the likelihood of flooding, increased runoff or related impacts. (Sites under an acre are not significant sources of runoff.) Such BMPs can include the following:

a. Clearing of land is limited to that which will be actively under construction in the near term, new land disturbance during the rainy season is minimized and disturbance to sensitive areas or areas that would not be affected by construction is minimized.

b. Temporary stabilization of disturbed soils is provided whenever active construction is not occurring on a portion of the site and permanent stabilization is provided by finish grading and permanent landscaping.

c. Outside of the approved grading plan area, disturbance of natural channels is avoided, slopes and crossings are stabilized and any increase in runoff velocity is managed (through force dissipaters or other mechanisms) to avoid erosion of slopes and channels.

d. Upstream runoff is diverted around or safely conveyed through the site and is kept free of excessive sediment and other constituents.

e. Sediment-laden waters from disturbed, active areas within the site are detained.

b. Compliance with Existing General Plan Policies

The following existing General Plan policies would further prevent impacts related to drainage pattern and runoff alterations that could cause flooding. See Section 4.11.3.E for the full text of these policies.

Policy S 4.4: This policy prohibits the alteration of floodways and channelization, thereby maintaining and preventing the alteration of existing drainage patterns. The policy also allows for incentive provisions such as density transfers to be offered in an effort to maintain natural watercourses and to focus development away from these critical resources.

Policy S 4.5: This policy prohibits substantial modifications to watercourses and subsequently protects existing drainage patterns. When modifications are unavoidable, those modifications must not be detrimental to adjacent properties or adversely affect adjacent wetlands or riparian habitat.

Policy S 4.7: This policy requires potential modifications to watercourses to be done in a manner that is the least damaging to the environment, thereby reducing potential adverse impacts related to drainage pattern and runoff alterations.

Policy S 4.8: This policy allows developments along the floodway fringe only if it has been determined that the proposed structures can be flood-proofed and would not contribute to property damage or risks to public safety, thereby reducing potential adverse impacts.

Policy S 4.9: This policy reduces potential impacts related to drainage pattern and runoff alterations that could cause flooding by requiring those proposed developments that fall within the floodway fringe be capable of withstanding flooding and use a minimum amount of fill for the project, thereby directly reducing potential impacts and protecting developments, such as housing projects, within floodplains and other flood areas.

Policy S 4.10: This policy requires all development proposals to mitigate their potential impacts on the capacity of regional storm drain systems.

3. Finding on Significance for Impact 4.11.D

Compliance with the above regulations and policies would ensure that flooding hazards associated with alterations to existing drainage patterns or increases in surface runoff as a result of future development would be less than significant. No project-specific mitigation is required.

E. Would the project result in or expose people or structures to a significant risk of inundation due to seiche, tsunami or mudflow?

Impact 4.11.E – Cause Inundation Risks Due to Seiche, Tsunami or Mudflow: Future development in areas subject to seiche has the potential to threaten people, structures and property. In terms of seiche hazards, there is no documented significant potential for any of the waterbodies within Riverside County. Based on morphology and hydrology, two waterbodies in Riverside County (Lake Perris and Lake Elsinore) may have the potential for seismically induced seiche. However, setbacks and flood hazard area regulations would be sufficient to protect against significant risks. Thus, for the proposed project, resultant future development along or near lakes and reservoirs is considered to be at minimal risk. Thus, overall, seiche impacts would be less than significant. Due to its inland location, by definition there are no tsunami risks in Riverside County. Mudflow or debris flow can occur in areas with steep slopes, particularly areas with loose soils and/or denuded of vegetation (e.g., fire burn areas) when exposed to large amounts of precipitation. Narrow canyons, arroyos and desert channels are also susceptible to flashfloods which can cause flooding damage directly or indirectly through mudflows. Human activity can also induce a slide, such as when soil becomes saturated from a broken water pipe or the improper diversion of runoff from a developed area. When addressed through proper soil engineering, site design and maintenance, these risks are less than significant.

1. Analysis of Impact 4.11.E

a. Seiche

Seiche, a standing wave in a completely or partially enclosed body of water, can in certain circumstances result in inundation (flooding) of areas located along the shoreline of a lake or reservoir. In Riverside County's semi-arid climate, naturally occurring enclosed water bodies are not common and none have documented seiche risks. For man-made water bodies, such as reservoirs, these are typically built by local municipalities or water districts to provide water service to local residents and businesses. Accordingly, most land around the reservoirs' shorelines is in public holdings, which restrict private land development and minimize risk of inundation from seiche. Moreover, such public land holdings are not within the jurisdiction of unincorporated Riverside County.

In terms of seiche hazards, there are no significant documented hazards for any of the waterbodies within Riverside County. However, based on morphology and hydrology, two waterbodies in Riverside County, Lake Perris and Lake Elsinore, may have the potential for seismically induced seiche (essentially creation of a standing wave that 'sloshes' back and forth along the lake's long axis causing higher than expected waves and potentially even flooding). Seiche risk at Lake Perris, however, is minor due to the lack of significant habitable structures along its shores. In addition, Lake Perris, as with most of the large, man-made reservoirs in Riverside County, has been engineered to prevent seiche risks. The larger, recreational-use lakes are also buffered by public lands and beaches along their shores, adding a further layer of protection from localized flooding.

Development does occur along the shores of Lake Elsinore, in particular the Lakeland Village community. However, seiche risks to future development would be minimized by avoidance of the 100-year floodplain limits surrounding the lake (or engineering sufficient to withstand potential flood hazards, as allowed under law for certain uses). Thus, for the proposed project, resultant future development along or near lakes and reservoirs is considered to be at minimal risk. None of the other land use-related changes proposed under GPA No. 960 are within areas affected by potential seiche hazards. There are no oceanic tsunami risks in Riverside County due to its inland location.

b. Mudflows and Debris Flows

Mudflows and debris flows are shallow water-saturated landslides that travel rapidly down slopes carrying rocks, brush and other debris. A mudflow occurs naturally as a result of heavy rainfall on a slope containing loose soil or debris. There is a high potential for mudflows to occur in some areas of unincorporated Riverside County as a result of large amounts of precipitation in a relatively small time frame. Unincorporated Riverside County contains many areas with steep slopes and mountainous areas that could be subject to mudflows in the event of large amounts or precipitation. Narrow canyons, arroyos, alluvial fans and desert channels are also susceptible to flashfloods which can cause flooding damage directly or indirectly through mudflows. Human activity can also induce a slide, such as when soil becomes saturated from a broken water pipe or the improper diversion of runoff from a developed area.

In terms of mudflow hazards, areas of proposed land use-related changes with the potential for introducing or intensifying future development are generally at risk for mudflow hazards if they are: on or below a steep or unstable slope; within a steep-sided canyon; within an area with flashflood potential; on loose, unconsolidated soils; or in an area denuded of vegetation by recent wildfire, particularly if any of the other factors also occur. Flashflood potential generally exists along any canyon, swale or other low-lying area in which heavy precipitation fall may be channeled rapidly and unexpectedly. Risks to future development as a result of flashflood are minimized through the various regulatory floodplain and drainage flow control measures (as discussed above for Impacts 4.11.A, 4.11.B and 4.11.C, for example).

As with other types of serious flooding, FEMA also designates areas as subject to alluvial fan flooding (as opposed to ordinary riverine flooding). Specifically, NFIP regulations define alluvial fan flooding to be "flooding occurring on the surface of an alluvial fan or similar landform which originates at the apex and is characterized by high-velocity flows; active processes of erosion, sediment transport and deposition; and, unpredictable flow paths." Despite the distinction, alluvial fan flooding is also based on the 100-year flood interval (i.e., a 1% probability of occurrence in a given year). As such, the site design and engineering requirements established for 100-year flood hazard area management, for example under Riverside County Ordinance No. 458, generally provides sufficient measures to ensure the protection of development on alluvial fans.

2. Regulatory Compliance for Impact 4.11.E

The analysis above and in Section 4.11.5 demonstrates that this impact would be less than significant and no project-specific mitigation is needed. Moreover, with the various regulations, programs, plans, General Plan policies and existing mitigation measures from prior EIR No. 441 summarized under the previous four, impacts will further reduce or minimize this already insignificant impact. In particular, General Plan Policy S 4.5 directly reduces potential erosion-related flood hazards, such as surface runoff and mudflow, by prohibiting watercourse modification that could result in seiche hazard. A variety of additional General Plan policies also reduce potential flooding, floodplain management, safety and other related impacts.

3. Finding on Significance for Impact 4.11.E

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts due to seiche. No project-specific mitigation is required. As outlined in this section, plus section 4.12, project design, soils engineering and construction requirements, including NPDES, CWA section 404, Riverside County ordinances and others would be sufficient to ensure that mudflow hazards are less than significant. In addition, compliance with various existing regulatory programs, standards and General Plan policies, as well as existing mitigation measures from EIR No. 441 as outlined elsewhere in this section, would further reduce, minimize or avoid any impacts associated with the project.

4.11.7 Significance After Mitigation for Flood and Dam Inundation Hazards

Implementation of and compliance with the above existing regulations, programs, County General Plan policies and existing mitigation measures from EIR No. 441 would ensure that impacts associated with flooding and dam inundation hazards, as well as related issues outlined herein, are minimized and would prevent any impacts from rising to a potentially significant level. These measures avoid flood hazards by keeping development out of flood-prone areas and requiring adequate engineering and other protective measures be used where necessary to ensure the safety of people and property. They also ensure that any future development designs, constructs and maintains appropriate flood control and safety features. Where such avoidance or engineering is not possible, existing regulations prohibit development. In total, these measures ensure that any adverse impacts associated with flooding, dam inundation and related risks associated with the proposed project, GPA No. 960, would be less than significant. Moreover, no project-specific mitigation is required.

Section 4.12

Geology and Soils

Section 4.12 Geology and Soils

This section assesses the potential impacts on and from geology and soils that could arise from disturbances and impacts resulting from future development consistent with the General Plan as updated by GPA No. 960, the proposed project.

4.12.1 Existing Environmental Setting – Geology and Soils

While the County of Riverside is at risk from many natural and man-made hazards, the event with the greatest potential for loss of life or property and economic damage is an earthquake. This is true for most of Southern California, since damaging earthquakes are frequent, affect widespread areas, trigger many secondary effects and can overwhelm the ability of local jurisdictions to respond. In Riverside County, earthquake-triggered geologic effects that may occur include groundshaking, fault rupture, landslides, liquefaction, subsidence and seiche, all of which are discussed below. Earthquakes can also cause human-made hazards, such as urban fires, dam failure and toxic chemical releases.

Earthquakes are caused by movement of rock along a break called a fault. The movement releases pent up strain energy in the form of waves which travel outward in all directions. These seismic waves cause the earth to vibrate and this shaking is what we feel in an earthquake. Most earthquakes occur along plate boundaries. The outer portion of the Earth consists of enormous chunks of rock called plates, which slowly collide, separate and grind past each other. Frictional forces resist plate movement and the plate edges lock together. Much strain energy builds up as the plates keep trying to move. Eventually, frictional forces are exceeded, the locked edges move and all the stored strain energy is released in seismic waves.

Earthquake risk is very high in the heavily populated western portion of Riverside County due to the presence of three of California's most active faults: the San Andreas, the San Jacinto and the Elsinore. Risk is moderate in the eastern portion of the county which includes the Coachella Valley and Blythe.

In California, recent earthquakes in or near urban environments have caused relatively few casualties. This is due more to luck than design. For example, when a portion of the Nimitz Freeway in Oakland collapsed at rush hour during the 1989 moment magnitude (M_w) 7.1 Loma Prieta earthquake, it was unusually empty because many were watching the World Series. Nonetheless, California's urban earthquakes have resulted in significant economic losses. Riverside County is at risk from larger, more damaging earthquakes than the moderate sized, M_w 6.7 Northridge earthquake, which in 1994 caused 54 deaths and $20 to $30 billion in damage.

A. Baseline Data Sources

The existing setting discussion herein is summarized from Section 5.2 of the 1999 Existing Setting Report prepared for the 2003 RCIP Riverside County General Plan and its Appendix H, "Natural Hazard Mapping, Analysis and Mitigation: A Technical Background Report in Support of the Safety Element of the New Riverside County 2000 General Plan" ("Appendix H" herein). Pursuant to CEQA, the description of the physical environmental conditions provided in this EIR is as they exist at the time the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting constitutes the baseline physical conditions by which the County, as Lead Agency under CEQA, determines whether an impact is significant. However, for geology, soils and seismicity, the 1999 Existing Setting Report and Appendix H remain relevant to existing conditions within the county because geologic conditions change very slowly with time and no major earthquakes have occurred within the study area since the reports were prepared. For this reason, these documents were found to adequately represent the county baseline existing geological and seismic conditions.

The various seismic, soils and geology information presented graphically in this section are from the Riverside County GIS Department, generally the Riverside County Land Information System (RCLIS) database, as updated by various means, including through information provided by the State of California (see discussion under Section 4.12.4) and by direction of the Riverside County Geologist in relation to geologic and seismic studies prepared for proposed development sites within the county and submitted to the Riverside County Geologist. Because they are county specific, these data sources were determined to be the best-supported substantial evidence available and were used herein. The sources for the various land use and environmental data sets used in this section are described in their respective sections.

B. Fault Hazard Zones

Primary ground damage due to earthquake fault rupture typically results in a relatively small percentage of the total damage in an earthquake, but being too close to a rupturing fault can cause profound damage. It is difficult to reduce this hazard through structural design. The primary mitigating technique is to set back from and avoid active faults. The challenge comes in identifying all active faults *that could potentially rupture*. Faults throughout Southern California have formed over millions of years. Some of these faults are generally considered inactive in terms of present geologic conditions. Other faults are known to be active, meaning either they have generated earthquakes in historical times (the last 200 years) or show geologic and geomorphic indications of relatively recent movement. Faults that have moved in the relatively recent geological past are generally presumed to be the most likely candidates to generate damaging earthquakes in the lifetimes of residents, buildings and communities.

Earthquakes in Southern California occur as a result of movement between the Pacific and North American plates. Faults of the San Andreas system are used to mark the boundary between these plates, but the deformation, faulting and associated earthquakes occur in a broadly distributed zone that stretches from offshore to Nevada. Thus, the San Andreas is one of a system of plate-bounding faults. Most of the movement between the plates occurs along the San Andreas Fault, which bisects Riverside County. The rest of the motion is distributed among northwest-trending, strike-slip faults of the San Andreas system (principally the San Jacinto, Elsinore, Newport-Inglewood and Palos Verdes faults), several east-trending thrust faults that bound the Transverse Ranges and the Eastern Mojave Shear Zone (a series of faults east of the San Andreas, responsible for the 1992 Landers and the 1999 Hector Mine earthquakes).

Pursuant to state law (see Section 4.12.2), Alquist-Priolo (A-P) Earthquake Fault Zones have been designated by the California Geologic Survey for the Elsinore, San Jacinto and San Andreas fault zones in Riverside County (see Figure 4.12.1 (Alquist-Priolo Fault Zones)). Additionally, the County of Riverside has developed and applied

special studies zone criteria for the Agua Caliente fault zone between the Elsinore and the San Jacinto faults in southwestern Riverside County. All of these faults have high rates of displacement and are rapidly accumulating strain energy which will be released in earthquakes. Inevitably, the A-P Zone will expand with time. As faults are studied, more splays are discovered.

C. Groundshaking

For design and environmental analysis purposes, a worst-case scenario earthquake (the maximum credible earthquake [MCE]) for Riverside County is a magnitude 7.9, based on the rupture of the entire southern segment of the San Andreas Fault from the Cajon Pass to the Salton Sea. While other scenarios would expose portions of Riverside County to intense groundshaking that is locally as severe as the MCE, the MCE exposes most of the county to very high-intensity groundshaking.

Groundshaking is simply the movement of the earth resulting from an earthquake. Shaking can cause lateral movement and is the primary reason for collapse of buildings. The strength of seismic groundshaking at any given site is a function of many factors.

Factors of primary importance in groundshaking severity include the size of the earthquake, its distance, the paths the seismic waves take as they travel through the earth, the type of rock or soils underlying the site and topography (particularly whether a site sits in a valley or atop a hill). The amount of resulting damage also depends on the size, shape, age and engineering characteristics of affected structures. Interactions between ground motion and man-made structures are complex. Governing factors include a structure's height, construction and stiffness; a soil's strength and resonant period; and the period of high-amplitude seismic waves. Waves come in different lengths and thus repeat their motions with varying frequency. Long waves are called long-period or low-frequency. Short waves are short-period or high-frequency. In general, long-period seismic waves, which are characteristic of large earthquakes, are most likely to damage long-period structures such as high-rise buildings and bridges. Shorter period seismic waves, which tend to die out quickly, will most often cause damage near the epicenter of the earthquake, damaging structures such as one-story and two-story buildings. Very short period waves are most likely to cause nonstructural damage, such as to equipment. In different situations, ground displacement, velocity and acceleration can all cause damage.

Estimates of several key groundshaking parameters near the fault rupture zone for the Riverside MCE, expressed as a percentage of gravity, are presented in Table 4.12-A (Probable Earthquake Scenarios for Riverside County). Peak ground acceleration, which is the maximum acceleration achieved at a site, often turns out to be the earthquake effect that predicates the most damage to buildings. Wave periods of 0.3 second and 1.0 second are the lengths of seismic waves that commonly damage structures. All of these values are well above the threshold for heavy damage.

Table 4.12-A: Probable Earthquake Scenarios for Riverside County

Event		Maximum Magnitude (M_w)	Chance of Occurring in 30 Years	Comments
Fault	**Segment**			
San Andreas	San Bernardino	7.3	28%	Very high intensity groundshaking throughout the San Bernardino Valley, including north central Riverside County.
San Andreas	Coachella	7.1	22%	Very high intensity groundshaking throughout the Coachella Valley, affecting desert resort communities and agriculture.

Event		Maximum Magnitude (M_w)	Chance of Occurring in 30 Years	Comments
Fault	**Segment**			
San Jacinto	San Jacinto Valley	6.9	43%	Highest probability of occurrence of any Southern California fault. Brought closer to failure as a result of stress field changes caused by the 1992 Landers earthquake.
San Jacinto	Anza Segment	7.2	17%	This event would be very destructive within the communities of Hemet and San Jacinto.
Elsinore	Temecula Segment	6.8	16%	Has not produced any significant earthquakes in historic time.
Elsinore	Glen Ivy Segment	6.8	16%	Would be very destructive in the communities of Lake Elsinore, Murrieta and Temecula.
Whittier	Whittier	6.8	5%	Has not broken in over 1,600 years (WGCEP, 1995). Would cause significant landslide and lifeline damage in the Chino Hills - Corona area.

Notes: Maximum Magnitude: the magnitude of an earthquake event based on the amount of energy released. This measurement is more accurate for large earthquake events.
Source: Riverside County General Plan, Appendix H - Natural Hazard Mapping, Analysis and Mitigation: A Technical Background Report in Support of the Riverside County General Plan, 2000.

A set of design parameters for the MCE are used to estimate the damage and losses that could occur for such an earthquake (see General Plan Appendix H). With horizontal ground displacements as great as 25 feet along the fault and intense groundshaking that could last more than 60 seconds, damage and losses in Riverside County as a result of the MCE or other major San Andreas Fault earthquakes would be extensive. In addition, Riverside County must consider events on several faults. Earthquakes that are likely to occur during the design life of most buildings could be generated by segments of the Elsinore, San Jacinto or San Andreas faults. These have been evaluated by the Working Group on California Earthquake Probabilities (1995), as illustrated in Figure 4.12.2 (Earthquake Probability).

Based on this segmentation, there are seven types of probable earthquakes that threaten Riverside County (see Table 4.12-A). The event with the greatest probability of occurrence in 30 years (43%) is a maximum magnitude (M_w) 6.9 rupture of the San Jacinto Valley segment of the San Jacinto fault. The San Jacinto event is considered the maximum probable event (MPE), the scenario deemed most *likely* to occur for Riverside County (in contrast to the MCE, which is the *worst* expected earthquake).

D. Liquefaction

Liquefaction is a process by which water-saturated materials (including soil, sediment and certain types of volcanic deposits) lose strength and fail during strong groundshaking. Specifically, liquefaction is defined as "the transformation of a granular material from a solid state into a liquefied state as a consequence of increased pore-water pressure." Liquefaction occurs worldwide, commonly during moderate to great earthquakes. Four kinds of ground failure commonly result from liquefaction: lateral spread, flow failure, ground oscillation and loss of bearing strength. In California, liquefaction-related ground failures were major components of the following events:

- 1857 Fort Tejon earthquake
- 1906 San Francisco earthquake
- 1933 Long Beach earthquake

EARTHQUAKE PROBABILITY

This page intentionally left blank

- 1971 San Fernando earthquake
- 1973 Point Mugu earthquake
- 1979 and 1981 Imperial Valley earthquakes
- 1989 Loma Prieta earthquake
- 1994 Northridge earthquake.

In 1997 and 1998, the California Geological Survey (CGS) developed guidelines for delineating, evaluating and mitigating seismic hazards in California. In 1999, a sponsored group published "Recommended Procedures for Implementation of CGS Special Publication 117 Guidelines for Analyzing and Mitigating Liquefaction in California." In it, Liquefaction Hazard Zones are defined as areas meeting one or more of the following criteria:

- Areas known to have experienced liquefaction during historic earthquakes.
- All areas of uncompacted fills containing liquefaction-susceptible material that are saturated, nearly saturated, or may be expected to become saturated.
- Areas where sufficient existing geotechnical data and analyses indicate that the soils are potentially liquefiable.

Areas within Riverside County susceptible to liquefaction hazards are depicted in Figure 4.12.3 (Liquefaction Zones). The characteristics of the various liquefaction hazard zones are detailed in Table 4.12-B (General Liquefaction Potential Zones for Riverside County).

Table 4.12-B: General Liquefaction Potential Zones for Riverside County

Rank	Groundwater Depth[2]	General[3] Sediment Type	Recommended Policies[1]	
			General Construction	Critical[4] Facilities
High	< 30 feet	Very Susceptible	Study Required	Study Required
Moderate	< 30 feet	Susceptible	Study Required	Study Required
	30-50 feet	Very Susceptible	Study Required	Study Required
Low	> 30 feet	Susceptible	None	Study Required
Very Low	30-50 feet	Susceptible	None	Study Required
	50-100	Very Susceptible	None	Study Required
Extremely Low	50-100 feet	Susceptible	None	Study Required
None	> 100 feet	Susceptible	None	None
	No data	Bedrock	None	None

Footnotes:
1. Groundshaking potential in easternmost Riverside County is considered below the threshold for liquefaction and site-specific investigations should not be required for general construction projects.
2. Groundwater depth is based on the historic high measurement.
3. Very susceptible sediment type includes generally granular Holocene sediments; susceptible includes generally granular Pleistocene sediments.
4. Critical facilities are facilities designed to remain functional during and immediately after an earthquake.

Source: Riverside County General Plan, Appendix H - Natural Hazard Mapping, Analysis and Mitigation: A Technical Background Report in Support of the Riverside County General Plan, 2000.

E. Landslides and Rock Falls

Hillsides, generally speaking, can be unstable platforms for development. Unless a landslide is already occurring, a steep slope can generally be thought of as existing in a state of equilibrium. When this equilibrium is disturbed by development in hillside areas, the likelihood of slope failure, soil erosion, silting of lower slopes and downstream flooding increases.

There are predictable relationships between local geology and mass-wasting processes like landslides and rockfall. Slope stability is dependent on many factors and their interrelationships. Rock type and poor water pressure are possibly the most important factors, followed by slope steepness due to natural or man-made undercutting. In addition, many existing landslides and soil slumps have been mapped within Riverside County. Where slopes have failed before, they will fail again. Field investigation enables identification of failure-prone slopes before an earthquake occurs. Factors controlling the stability of slopes include the following:

- Slope height and inclination
- Engineering characteristics of the earth materials comprising the slope
- Intensity of groundshaking

Seismically induced landslides and rockfall would be expected throughout Riverside County in the event of a major earthquake. Factors contributing to the stability of slopes include slope height and steepness, engineering characteristics of the earth materials comprising the slope and intensity of groundshaking. It is estimated that a ground acceleration of at least 0.10 g in steep terrain is necessary to induce earthquake-related rockfall, although exceeding this value does not guarantee that rockfall will occur. Because there are several faults capable of generating peak ground accelerations of over 0.10 g in Riverside County, there is a high potential for seismically-induced rockfall and landslides to occur. Figure 4.12.4 (Steep Slopes) shows areas of steep slopes within Riverside County.

F. Seismically Induced Ground Settlement

Whether or not seismically induced settlement will occur depends on the intensity and duration of groundshaking, and the relative density of the subsurface soils (i.e., the ratio between the in-place density and the maximum density). Sediments in the alluvial valleys of Riverside County were deposited fairly rapidly, which may lead to conditions of low density sediments that can settle in an earthquake. Therefore, many of the valley regions that contain relatively recent sediments may be susceptible to some degree of seismic settlement. The extent of relatively young sediments with moderate to locally high potential for settlement may be correlated with areas of valley fill represented on subsidence susceptibility mapping.

As demonstrated by past earthquakes, seismic settlement is primarily damaging in areas subject to differential settlement. As an example, this can include cut-and-fill transition lots built on hillsides where a portion of the house is built over an area cut into the hillside with the remaining portion of the house on man-made fill. During an earthquake, even slight settlement of the fill (soil) can cause a structure to raise or lower differentially, leading to significant repair costs.

G. Subsidence and Collapsible Soils

Ground subsidence is typically a gradual settling or sinking of the ground surface with little or no horizontal movement, although fissures (cracks and separations) are common. Subsidence can range from small or local collapses to broad regional lowering of the earth's surface. While subsidence typically occurs throughout a susceptible valley, additional displacement and fissures occur at or near the valley margin. Susceptible valleys are those predominantly filled with unconsolidated sand and silty sand that includes thin layers of silt and clayey silt. Fine-grained alluvium and organic matter often underlie the fissure areas. Two types of fissures are associated with subsidence. The first is generally straight and corresponds to the traces of faults, while the second is more curvilinear on the surface and appears to correspond to the alluvium-bedrock contact at valley margins.

The causes of subsidence are as diverse as the forms of failure. They include dewatering of peat or organic soils, dissolution in limestone aquifers, first-time wetting of moisture-deficient, low-density soils (hydrocompaction), natural compaction, liquefaction, crustal deformation, subterranean mining and withdrawal of fluids (groundwater, petroleum, geothermal, etc.). Most of the damaging types of subsidence are induced by the extraction of oil, gas or groundwater from below the ground surface or the organic decomposition of peat deposits, with a resultant loss in volume. Ground subsidence can also occur as a response to natural forces, such as earthquake movements and the evolution of a sedimentary basin as it folds and subsides. And, of course, earthquakes can cause abrupt elevation changes of several feet.

Ground subsidence can disrupt surface drainage, reduce aquifer system storage, form earth fissures and damage wells, buildings, roads and utility infrastructure. Regional subsidence generally damages structures that are sensitive to slight changes in elevations, such as canals, sewers and drainages. In Riverside County, risk of damage or harm due to regional subsidence is greatest at valley margins.

Subsidence and fissuring have been caused by falling groundwater tables and by hydrocollapse when groundwater tables rise in Riverside County. In addition, many fissures have occurred along active faults that bound the San Jacinto Valley and Elsinore Trough. Figure 4.12.5 (Documented Subsidence Areas) depicts areas of documented subsidence and other areas of Riverside County that may be susceptible to subsidence. Subsidence has only been documented in three areas of the county: the Elsinore Trough, including Temecula and Murrieta; the San Jacinto Valley from Hemet to Moreno Valley; and the southern Coachella Valley.

These areas are all potentially sensitive to the withdrawal of groundwater. Depending on the depth and mechanical properties of the aquifer and the overlying sediments, they can subside if groundwater resources are not managed properly. Mitigation of ground subsidence usually requires a regional approach to groundwater conservation and recharge. Such mitigation measures are difficult to implement if the geology of the aquifer and overlying sediment is not well understood. Furthermore, conservation efforts can be quickly offset by rapid growth and attendant heavy water requirements (golf courses, for example, consume about 8 acre-feet of water per acre per year). Further, it is not uncommon for several jurisdictions to utilize a continuous groundwater aquifer. Mitigation requires regional cooperation among all agencies.

Hydroconsolidation, or soil collapse, typically occurs in recently deposited Holocene (less than 10,000 years before present time) soils that were deposited in an arid or semi-arid environment. Soils prone to collapse are commonly associated with man-made fill, wind-laid sands and silts, and alluvial fan and mudflow sediments deposited during flash floods. Particles of these soils, which typically contain minute pores and voids, may be partially supported by clay or silt, or chemically cemented with carbonates. When saturated, collapsible soils undergo rearrangement of their grains and the water removes the cohesive (or cementing) material, and a rapid, substantial settlement may occur. An increase in surface water infiltration (such as from irrigation) or a rise in the

groundwater table, combined with the weight of a building or structure, may initiate settlement, causing foundations and walls to crack.

In Riverside County, collapsible soils occur predominantly at the bases of the mountains, where Holocene-aged alluvial sediments have been deposited during rapid runoff events. Additionally, some windblown sands may be vulnerable to collapse and hydroconsolidation. Typically, differential settlement of structures occurs when lawns or plantings are heavily irrigated in close proximity to a structure's foundation.

H. Expansive Soils

Expansive soils have a significant amount of clay particles that can give up water (shrink) or take on water (swell). The change in volume exerts stress on buildings and other loads placed on these soils. The occurrence of these soils is often associated with geologic units having marginal stability. Expansive soils can be widely dispersed and they can occur in hillside areas as well as low-lying alluvial basins.

Although expansive soils are now routinely alleviated by following the Riverside County Building Code, problems related to past inadequate grading or site preparation practices constantly appear. Expansive soils are not the only cause of structural distress in existing structures. Poor compaction and construction practices, settlement and landslides can cause similar damage, but require different mediation efforts. Once expansion has been verified as the source of the problem, mitigation can be achieved through reinforcement of the existing foundation or through the excavation and removal of the expansive soils in the affected area.

I. Wind Erosion

Wind erosion damages land and natural vegetation by removing soil from one place and depositing it in another. It mostly affects dry, sandy soils in flat, bare areas, but wind erosion may occur wherever soil is loose, dry and finely granulated. It causes soil loss, dryness, deterioration of soil structure, nutrient and productivity losses, air pollution and sediment transport and deposition. The presence of dust particles in the air is a source of several major health problems. Atmospheric dust causes respiratory discomfort, may carry pathogens that cause eye infections and skin disorders, and reduces highway and air traffic visibility. Buildings, sheds, fences, roads, crops, trees and shrubs can all be damaged by blowing soil, which acts as an abrasive.

Wind and windblown sand are an environmentally limiting factor throughout much of Riverside County. Approximately 20% of the land area of Riverside County is vulnerable to high and very high wind erosion susceptibility. The Coachella Valley, the Santa Ana River channel and areas in the vicinity of the City of Hemet have been identified as zones of high wind erosion susceptibility. Areas susceptible to wind erosion hazards throughout Riverside County are identified in Figure 4.12.6 (Wind Erosion Susceptibility Areas).

Windblown sand is a well-recognized hazard for developments in the Coachella Valley. It has even forced abandonment of dwellings and subdivided tracts in the central Coachella Valley. The primary source of sand in the Coachella Valley is the Whitewater River. Increases in the amount of windblown sand are related to episodic flooding of the Whitewater River. A 15-fold increase in wind erosion rates in the Coachella Valley has been documented following heavy flood events. Therefore, mitigation of windblown sand is directly related to mitigation of flood potential on the Whitewater River.

Because windblown sand from the Whitewater River floodplain provides a large component of the sand that sustains dune fields that, in turn, are home to several endangered species, erosion intervention efforts must be cautiously considered.

J. Soil Erosion and Loss of Topsoil

Soil erosion is the process by which soil particles are removed from a land surface by wind, water or gravity. Most natural erosion occurs at slow rates; however, the rate of erosion increases when land is cleared or altered and left in a disturbed condition. The primary factors that influence erosion include soil characteristics, vegetative cover, topography and climate.

Soil characteristics that determine the erodibility of a soil are particle size and gradation, organic content, soil structure and soil permeability. Soils with a high proportion of silt and very fine clays are generally the most erodible. Organic matter creates a favorable soil structure, improves soil stability and permeability, which increases the soil's capacity for the infiltration of water, delays the start of erosion and reduces the amount of runoff. In addition, the less permeable the soil, the higher the likelihood for erosion. Vegetative cover aids erosion control by shielding the soil surface from the impact of falling rain or blowing wind. Vegetation slows the velocity of runoff, permits greater infiltration, maintains the soil's capacity to absorb water and holds soil particles in place.

Topography and the length and steepness of slopes are crucial to determining the volume and velocity of runoff. As slope length and/or steepness increases, the rate of runoff increases and the potential for erosion is magnified. Climate is a fundamental factor affecting the potential for soil erosion. When and where precipitation is frequent, intense or prolonged, the potential for soil erosion is increased.

K. Reducing Earthquake Hazards in Riverside County

Changes in the 1997 Uniform Building Code (UBC), encapsulated in the California Building Standards Code (California Code of Regulations [CCR] Title 24, in particular Part 2 which encompasses the California Building Code [CBC]) represent the most significant increases in groundshaking criteria in the last 30 years. Two changes have special significance for the County of Riverside. The first change is a revision in soil types and amplification factors. The second change incorporates the proximity of earthquake sources in UBC seismic zone 4 (refer to Figure 4.12.7 for the near-source zones that affect Riverside County). Zone 4 is the highest hazard zone and includes most of the County of Riverside. The Riverside County Department of Building and Safety defines the UBC seismic zones in the county as follows:

> *The townships T2SR16E, T3SR17E, T4SR18E, T5SR19E, T6SR20E, T7SR21E, T8SR22E are inclusive to the UBC Seismic Zone-4 and the townships lying east of listed above may be considered in the Seismic Zone-3.*

Low-rise buildings with a short predominant period of groundshaking must also consider soil effects. In the past, only long-period structures (high-rises) were influenced by UBC requirements. The groundshaking basis for code design is more complicated, because of the wide range of soil types and the close proximity of seismic sources. The new soil effects are based on observations made as a result of the Mexico City and Loma Prieta earthquakes, and affect all new buildings in western and central Riverside County. Most of the western and central portions of Riverside County are affected by the new, near-source design factors. The 1997 UBC contains detailed descriptions of the incorporation of the new near-source and soil parameters.

As shown in Figure 4.12.7 (Near Source Zone Regions UBC Zone Boundary), most of the western and central portions of Riverside County are subject to near-source design factors based on the proximity of three major fault systems (Elsinore, San Jacinto and San Andreas), as well as some smaller fault systems (Chino-Central Avenue, Burnt Mountain and Eureka Peak). These parameters, new to the 1997 UBC, address the proximity of potential

earthquake sources (faults). Groundshaking that was far more intense than expected occurred near the fault ruptures at Northridge in 1994 and at Kobe, Japan, in 1995. The 1997 UBC also includes a near-source factor that accounts for directivity of fault rupture. The direction of fault rupture played a significant role in distribution of groundshaking in both quakes. For Northridge, much of the earthquake energy was released into the sparsely populated mountains north of the San Fernando Valley. While at Kobe, however, the rupture directed energy into the city and contributed to extensive damage. Since the rupture direction of a given source cannot be predicted, the UBC requires roughly a 20% general increase in estimated groundshaking to account for directivity.

4.12.2 Policies and Regulations Addressing Geology and Soils

A. State and Federal Regulations

Alquist-Priolo Earthquake Fault Zoning Act (A-P Act): The major state legislation regarding earthquake fault zones is the Alquist-Priolo Earthquake Fault Zoning Act. In 1972, the State of California began delineating "Earthquake Fault Zones" (called "Special Studies Zones" prior to 1994) around and along faults that are "sufficiently active" and "well defined" to reduce fault-rupture risks to structures for human occupancy (Public Resources Code [PRC] Sections 2621–2630). The boundary of an Earthquake Fault Zone is generally 500 feet from major active faults and 200-300 feet from well-defined minor faults. The mapping of active faults has been completed by the State Geologist and these maps are distributed to all affected cities, counties and state agencies for their use in developing planning policies and controlling renovation or new construction.

Before a project can be permitted within an identified earthquake fault zone, cities and counties must require a geologic investigation to demonstrate that proposed buildings would not be constructed across active faults. A site-specific evaluation and written site report must be prepared by a licensed geologist. If an active fault is identified, a structure intended for human occupancy cannot be placed over the trace of the fault and must be set back, generally at least 50 feet from the fault. The A-P Act only addresses the hazard of surface fault rupture and is not directed toward other earthquake hazards.

Seismic Hazards Mapping Act: Passed in 1990, the Seismic Hazards Mapping Act (SHMA) addresses non-surface fault rupture earthquake hazards, including strong groundshaking, liquefaction and seismically induced landslides. The California Geological Survey (CGS) is the principal state agency charged with implementing the SHMA. The law directs the CGS to provide local governments with seismic hazard zone maps that identify areas susceptible to amplified shaking, liquefaction, earthquake-induced landslides and other ground failures. The CGS-delineated seismic hazard zones are referred to as "zones of required investigation" and per the SHMA require site-specific geotechnical hazard investigations when construction projects fall within these areas. SHMA's goal is to minimize loss of life and property by identifying and mitigating seismic hazards.

Natural Hazards Disclosure Act: This 1998 Act requires sellers of real property and their agents to provide prospective buyers with a "Natural Hazard Disclosure Statement" when the property being sold lies within one or more state-mapped hazard areas. These hazard areas include any Seismic Hazard Zone mapping issued by the State Geologist. The seller or the seller's agent must also disclose the mapping to potential buyers.

Building Earthquake Safety Act: This 1986 Act requires all local governments to identify all potentially hazardous buildings within their jurisdictions and to establish a program for mitigation of identified hazards. It is the legislative basis for the inventory of hazardous unreinforced masonry buildings and unreinforced masonry ordinances adopted by most counties and cities in California.

Recovery and Reconstruction Act: This 1986 Act authorizes local governments to prepare for expeditious and orderly recovery before a disaster and reconstruction afterward. It enables localities to prepare pre-disaster plans and ordinances that may include: an evaluation of the vulnerability of specific areas to damage from a potential disaster; streamlined procedures for appropriate modification of existing general plans or zoning ordinances affecting vulnerable areas; a contingency plan of action; organization for post-disaster, short-term and long-term recovery and reconstruction; and a pre-disaster ordinance to provide adequate local authorization for post-disaster activities.

B. Riverside County Regulations

Ordinance No. 457 - Riverside County Building and Fire Codes: Every three years, Riverside County's Building and Fire Codes are adapted from the California Building Standards Code (CCR Title 24), which includes both building and fire codes. These codes establish site-specific investigation requirements, construction standards and inspection procedures to ensure that development authorized by the County of Riverside does not pose a threat to the health, safety or welfare of the public. The California Building Standards Code contains minimum baseline standards to guard against unsafe development. This ordinance also adopts, in some cases with modification to a stricter standard, a number of California State's Title 24 codes (fire, building, plumbing, electrical, etc.). The Riverside County Department of Building and Safety provides technical expertise in reviewing and enforcing these codes.

Ordinance No. 547 - Implementation of the Alquist-Priolo Earthquake Fault Zoning Act: This ordinance establishes the policies and procedures used by the County of Riverside to implement the A-P Act. Among other things, it requires all projects proposed within an "earthquake fault zone," as shown on the maps prepared by the State Geologist to comply with the provisions of the A-P Act. It establishes regulations for construction, including for grading, slopes and compaction, erosion control, retaining wall design and earthquake fault zone setbacks.

Ordinance No. 484 - Control of Blowing Dust: This ordinance establishes requirements for the control of blowing sand within county-designated "Agricultural Dust Control Areas." It defines activities that may contribute to wind erosion, identifies restrictions on activities within these areas, establishes penalties for violation of the ordinance and identifies procedures necessary to obtain a valid permit.

C. Existing Riverside County General Plan Policies

The following existing and proposed General Plan polices address seismic issues, such as fault rupture, seismically induced liquefaction, landslides and rock falls. They also address steep slope risks, such as landslides, rockfall and debris flows, as well as expansive and collapsible soils, subsidence and wind erosion.

1. Safety (S) Element Policies

Policy S 2.5: Require that engineered slopes be designed to resist seismically induced failure. For lower-risk projects, slope design could be based on pseudo-static stability analyses using soil engineering parameters that are

established on a site-specific basis. For higher-risk projects, the stability analyses should factor in the intensity of expected groundshaking, using a Newmark-type deformation analysis.

Policy S 2.6: Require that cut and fill transition lots be over-excavated to mitigate the potential of seismically induced differential settlement.

Policy S 2.7: Require a 100% maximum variation of fill depths beneath structures to mitigate the potential of seismically induced differential settlement.

Policy S 2.8: Encourage research into new foundation design systems that better resist the county's climatic, geotechnical, and geological conditions.

Policy S 3.1: Require the following in landslide potential hazard management zones, or when deemed necessary by the California Environmental Quality Act:

a. Preliminary geotechnical and geologic investigations.

b. Evaluations of site stability, including any possible impact on adjacent properties, before final project design is approved.

c. Consultant reports, investigations, and design recommendations required for grading permits, building permits, and subdivision applications be prepared by State-licensed professionals.

Policy S 3.2: Require that stabilized landslides be provided with redundant drainage systems. Provisions for the maintenance of subdrains must be designed into the system.

Policy S 3.3: Before issuance of building permits, require certification regarding the stability of the site against adverse effects of rain, earthquakes, and subsidence.

Policy S 3.4: Require adequate mitigation of potential impacts from erosion, slope instability, or other hazardous slope conditions, or from loss of aesthetic resources for development occurring on slope and hillside areas.

Policy S 3.5: During permit review, identify and encourage mitigation of onsite and offsite slope instability, debris flow, and erosion hazards on lots undergoing substantial improvements.

Policy S 3.6: Require grading plans, environmental assessments, engineering and geologic technical reports, irrigation and landscaping plans, including ecological restoration and revegetation plans, as appropriate, in order to assure the adequate demonstration of a project's ability to mitigate the potential impacts of slope and erosion hazards and loss of native vegetation.

Policy S 3.7: Support mitigation on existing public and private property located on unstable hillside areas, especially slopes with recurring failures where county property or public right-of-way is threatened from slope instability, or where considered appropriate and urgent by the County Engineer, Fire, or Sheriff Department.

Policy S 3.8: Require geotechnical studies within documented subsidence zones, as well as zones that may be susceptible to subsidence, as identified in [General Plan] Figure S-7 and the Technical Background Report [i.e., General Plan Appendix H], prior to the issuance of development permits. Within the documented subsidence zones of the Coachella, San Jacinto and Elsinore valleys, the studies must address the potential for reactivation of

these zones, consider the potential impact on the project, and provide adequate and acceptable mitigation measures.

Policy S 3.9: Develop a liaison program with all county water districts to prevent water extraction induced subsidence.

Policy S 3.10: Encourage and support efforts for long-term, permanent monitoring of topographic subsidence in all producing groundwater basins, irrespective of past subsidence.

Policy S 3.11: Require studies that address the potential of this hazard on proposed development within "High" and "Very High" wind erosion hazard zones as shown on [General Plan] Figure S-8, Wind Erosion Susceptibility Map.

Policy S 3.13: Require buildings to be designed to resist wind loads.

Policy S 3.14: Educate builders about the wind environment and encourage them to design projects accordingly.

Policy S 7.7: Strengthen the project permit and review process to ensure that proper actions are taken to reduce hazard impacts and to encourage structural and nonstructural design and construction. Damage must be minimized for critical facilities, and susceptibility to structural collapse must be minimized, if not eliminated.

a. Ensure that special development standards, designs, and construction practices reduce risk to tolerable levels for projects involving critical facilities, large-scale residential development, and major commercial and industrial development through conditional use permits and the subdivision review process. If appropriate, impact fees should be assessed to finance required actions.

b. Require mitigation measures to reduce potential damage caused by ground failure for sites determined to have potential for liquefaction. Such measures shall apply to critical facilities, utilities, and large commercial and industrial projects as a condition of project approval.

c. Require that planned lifeline utilities, as a condition of project approval, be designed, located, structurally upgraded, fit with safety shutoff valves, be designed for easy maintenance, and have redundant back up lines where unstable slopes, earth cracks, active faults, or areas of liquefaction cannot be avoided.

d. Review proposed uses of fault setback areas closely to ensure that county infrastructure (roads, utilities, drains) are not unduly placed at risk by the developer. Insurance, bonding, or compensation plans should be used to compensate the County for the potential costs of repair.

Policy S 7.8: Promote strengthening of planned and existing utilities and lifelines, the retrofit and rehabilitation of existing weak structures, and the relocation of certain critical facilities.

Policy S 7.11: Coordinate with the [California] Public Utilities Commission (PUC) and/or utilize the Capital Improvement Program, to strengthen, relocate or take other appropriate measures to safeguard high-voltage lines, water, sewer, natural gas and petroleum pipelines, and trunk electrical and telephone conduits that:

a. Extend through areas of high liquefaction potential.

b. Cross active faults.

c. Traverse earth cracks or landslides.

Policy S 7.13: Develop a system to respond to short-term increase in hazard on the southern San Andreas fault based on probabilities associated with foreshocks.

Policy S 7.16: During countywide earthquake drills, encourage communication and cooperation between emergency response staff and designated contacts at hospitals, high-occupancy buildings and dependent care facilities.

Policy S 7.19: Establish a far-ranging, creative, forward-thinking public education and outreach campaign to inform the community about:

a. The hazards they face.

b. The costs of doing nothing to mitigate the hazards.

c. What is known about each hazard.

d. Why jurisdictions don't have all the answers.

e. Mitigation incentives.

f. What the County does for them.

g. What the County cannot be expected to do for them.

D. Proposed New or Revised Riverside County General Plan Policies

The following revisions to existing General Plan policies are proposed as part of GPA No. 960. The revisions are intended to enhance the policies' implementation and comprehensive use.

1. Safety (S) Element Policies

Policy S 2.1: Minimize fault rupture hazards through enforcement of Alquist-Priolo Earthquake Fault Zoning Act provisions and the following policies:

a. Require geologic studies or analyses for critical structures, and lifeline, high-occupancy, schools, and high-risk structures, within 0.5 miles of all Quaternary to historic faults shown on the Earthquake Fault Studies Zones map.

b. Require geologic trenching studies within all designated Earthquake Fault Studies Zones, unless adequate evidence, as determined and accepted by the County Engineering Geologist, is presented. The County may require geologic trenching of non-zoned faults for especially critical or vulnerable structures or lifelines.

c. Require that lifelines be designed to resist, without failure, their crossing of a fault, should fault rupture occur.

d. Support efforts by the California Department of Conservation, ~~Division of Mining and Geology~~ *California Geological Survey* to develop geologic and engineering solutions in areas of ~~disseminated~~ ground deformation due to faulting *and seismic activity* in those areas where a through-going fault cannot be reliably located.

e. Encourage and support efforts by the geologic research community to better define the locations and risks of county faults. Such efforts could include data sharing and database development with regional entities, other local governments, private organizations, utility agencies or companies, and local universities.

Policy S 2.2: Require geological and geotechnical investigations in areas with potential for earthquake-induced liquefaction, landsliding or settlement ~~as part of the environmental and development review process~~, for any *building* ~~structure~~ proposed for human occupancy and any structure whose damage would cause harm*, except for accessory buildings.*

Policy S 2.3: Require that a State-licensed professional investigate the potential for liquefaction in areas designated as underlain by "Susceptible Sediments" and "Shallow Ground Water" for all general construction projects*, except for accessory buildings* (General Plan Figure S-3).

Policy S 2.4: Require that a State-licensed professional investigate the potential for liquefaction in areas identified as underlain by "Susceptible Sediments" for all proposed critical facilities ~~projects~~ (General Plan Figure S-3).

Policy S 3.12: Include a disclosure about wind erosion susceptibility on property title *for those properties located within "High" and "Very High" wind erosion hazard zones as shown on [General Plan] Figure S-8, Wind Erosion Susceptibility Map.*

2. Land Use (LU) Element Policies

Policy LU *12.1* (Previously 11.1): Apply the following policies to areas where development is allowed and that contain natural slopes, canyons, or other significant elevation changes, regardless of land use designation:

a. Require that hillside development minimize alteration of the natural landforms and natural vegetation.

b. Allow development clustering to retain slopes in natural open space whenever possible.

c. Require that areas with slope be developed in a manner to minimize the hazards from erosion and slope failures.

d. Restrict development on visually significant ridgelines, canyon edges and hilltops through sensitive siting and appropriate landscaping to ensure development is visually unobtrusive.

e. Require hillside adaptive construction techniques, such as post and beam construction, and special foundations for development when the need is identified in a soils and geology report which has been accepted by the County.

f. *In areas at risk of flooding, limit* ~~encourage the limitation of~~ grading, cut and fill to the amount necessary to provide stable areas for structural foundations, street rights-of-way, parking facilities, and other intended uses.

4.12.3 Thresholds of Significance for Geology and Soils Resources

The proposed project would result in a significant impact related to geology or soils if it would:

A. Expose people or structures to potential substantial adverse effects including the risk of loss, injury or death involving the rupture of a known earthquake fault as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.

B. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving strong seismic groundshaking.

C. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving seismic-related ground failure, including liquefaction.

D. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving landslides.

E. Result in substantial soil erosion or the loss of topsoil.

F. Be located on a geological unit or soil that is unstable or that would become unstable as a result of the project and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.

G. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.

H. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for disposal of wastewater.

4.12.4 Effect of GPA No. 960 on the General Plan and on Geology and Soils

The proposed project, GPA No. 960, would have spatial effects where it involves a variety of specific General Plan Land Use Designation (LUD) corrections and changes, several Policy Area, Study Area and overlay changes, proposals for new trail and road alignments and standards, and an incidental commercial policy for rural areas. In addition, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County. In this section, the geology-related changes to the General Plan are outlined and the effects of proposed changes relative to geotechnical hazards are discussed. Specific impacts and mitigation for the project are then evaluated according to identified significance thresholds in the section following this one.

A. Proposed Changes to the General Plan

As part of the project review process, geological and soils-related data in the General Plan was updated and geological policies reviewed and revised where necessary. The existing General Plan addresses geological resources in the Safety (S) Element. GPA No. 960 includes the following geology-related updates; text of the revised General Plan policies is provided in Section 4.12.2.C.

Seismic Hazard Zones: Text was added and policies updated to accommodate State Seismic Hazard Zone Maps as they are released by the State of California. Several related Safety policies were revised as part of this and related exhibits were also updated: Figure S-1, Mapped Faulting in Riverside County, and Figure S-2, Earthquake Fault Study Zones.

Geological Hazard Mapping: As part of GPA No. 960 a variety of geology-related exhibits were updated to include the most recently available data. These include Figure S-3, Generalized Liquefaction (with a detail noting the quad-specific updated information released by the State of California for the Murrieta Quadrangle; specific mapping is provided in the applicable Area Plan maps); and Figure S-4, Earthquake-Induced Slope Instability Map (also with Murrieta Quad details, highlighted in the applicable Area Plans).

In addition to these geological changes, a variety of LUD and policy area changes are proposed, as per the descriptions in Section 3.0 (Project Description) of this EIR and associated Figure 3-1 (and corresponding maps within each Area Plan) that may indirectly affect geological resources. Such changes would lead to either an increase or decrease in development potential (density or intensity); the risks associated with introducing new people and property into areas potentially subject to the various geological hazards outlined herein would be increased correspondingly.

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies, as others as described in Section 3.0 of the EIR. Similarly, new maps for trails and Riverside County roads (GP Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements would be determined based on site assessment of opportunities and constraints, particularly as related to geological hazards, soils and geotechnical suitability to determine environmentally preferred alignments to minimize adverse effects. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines, and such, are also developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need.

Accordingly, specific locations and timing of future infrastructure, including power and natural gas transmission lines, water and sewer lines and pumps, as well as roads, schools and other public services, are not presently foreseeable beyond the master countywide level already depicted in the 2003 General Plan and addressed previously in EIR No. 441. These improvements would require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the General Plan builds out. As such, future impacts and mitigation would be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed at the later individual project stage.

B. Analysis of GPA No. 960 Effects on Geology and Soils

The General Plan is concerned mainly with the physical build out of Riverside County; many of the changes associated with GPA No. 960 would affect planned land usage. In particular, proposed changes affect land use overlays, land use designations and policies that affect the conversion of rural, semi-rural, agricultural and vacant lands to suburban or urban uses in various parts of Riverside County.

Table 4.12-C: Geology Hazard Areas within Riverside County

Geologic Hazard	Riverside County Area (acres)	Areas of Potentially Affected by Project (acres)
Earthquake Zones		
Alquist-Priolo Earthquake Zones	87,490	9,610
County Earthquake Zones	103,640	7,320
Liquefaction Susceptibility

2. Landslide hazards within area mapped as very high, high or moderate.
3. Wind erosion hazard within area mapped as very high, high or moderate.
4. "Poss." denotes possible geologic hazard that may apply depending on future location.
5. Depend on future locations, but due to their linearity, marked geohazards area expected.
6. Development consistent with existing LUDs remains permitted.
7. LUD revisions associated with areas around Blythe, Flabob and Riverside Municipal Airports.

Source: Riverside County GIS Dept., results of GIS mapping analysis, GPA No. 960 project information, 2010.

Table 4.12-C (Geology Hazards within Riverside County) provides an overview of the geologic hazards mapped within the county and those found to exist on or near the locations of specific spatial land use changes proposed under GPA No. 960. The table also indicates how many acres within the areas affected by GPA No. 960 would be directly affected by those same geologic hazards. The region that would be most affected by steep slopes and landslides is the Anza Valley. Of a total of over 74,700 acres in the Anza Valley, 3,600 acres (5%) have a high to very high susceptibility for slope failure. The proposed trail alignments would be most affected by liquefaction (16,300 acres), fault rupture (over 6,850 acres) and wind erosion (over 28,800 acres), but do not include habitable structures. Other areas of principal effect would be Anza Valley (nearly 20,000 acres for wind erosion and 5,300 acres for liquefaction and the Aguanga Rural Village Overlay region, with 1,540 acres within fault rupture hazard areas).

For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), geohazards cannot be delineated at present. Likewise, the potential for future development occurring within the proposed revised policy areas and overlays has been generalized for this EIR, but due to the large scale of Riverside County and these policy areas, site-specific geohazards cannot be accurately assessed at this time. More generally, future development accommodated by the updated General Plan could be affected by a variety of geologic hazards depending upon location. These include fault rupture, groundshaking, liquefaction, lateral spreading and landslide hazards associated with seismic activity, as well as subsidence and soil erosion from wind or water. Where not foreseeable at this time, such affects must be addressed programmatically, as outlined in the subsequent section.

4.12.5 Geology and Soils - Impacts and Mitigation

A. Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Impact 4.12.A – Expose People or Structures to Substantial Adverse Effects Due to Rupture of a Known Earthquake Fault: Future development accommodated by the proposed project would increase rural, suburban and urban uses in Riverside County. This may increase the potential for property loss, injury or death resulting from development where it occurs on or adjacent to known or as of yet undetected earthquake fault zones. Compliance with existing laws, regulatory programs, General Plan policies and existing (EIR No. 441) Mitigation Measure 4.10.1A would be sufficient to ensure that fault rupture impacts to future development accommodated by GPA No. 960's proposed General Plan changes would be less than significant.

1. Analysis of Impact 4.12.A

Known and unknown fault zones crisscross the County of Riverside. As indicated in Table 4.12-C, within unincorporated Riverside County as a whole, there are a total of roughly 103,700 acres of County Earthquake Zones and 87,500 acres of Alquist-Priolo Earthquake Zones (note, these two categories are *not* mutually exclusive). Where project changes affect county fault hazard areas and Alquist-Priolo earthquake fault hazard zones, future development on or near these faults would increase the potential for property loss, injury or death. Table 4.12-C indicates the portions of the proposed project with known spatial impacts as they relate to the mapped seismic and geologic hazards.

As detailed in Figure 4.12.1, Alquist-Priolo earthquake fault hazard zones have been established along the traces of the Elsinore, San Jacinto and San Andreas Faults. Some lands within existing Alquist-Priolo zones or County-designated fault zones would be designated "Community Development" or "Rural" in GPA No. 960. Future development on these lands may result in the construction and occupation of structures, critical facilities and pipelines adjacent to known and/or as yet undetected earthquake fault zones. Such development would increase the number of people and the amount of developed property exposed to fault rupture hazards.

To lessen the potential for property loss, injury or death that could result from rupture of faults during earthquake events, the State of California has provided strict regulations (see below) that each county and city must follow to ensure impacts from fault rupture are reduced to less than significant levels. In addition, Riverside County ordinances, policies and mitigation measures have been identified to reduce potential impacts associated with fault rupture hazards to a less than significant level. With adherence to these regulatory measures, project impacts related to fault zones would be less than significant.

2. Regulatory Compliance for Impact 4.12.A

As detailed and explained below, compliance with the following existing laws, regulatory programs, General Plan Policies and Mitigation Measure No. 4.10.1A from EIR No. 441 are sufficient to ensure that impacts related to fault rupturing associated with future development resulting from GPA No. 960 changes to the General Plan are less than significant.

a. Compliance with Riverside County Regulations

Local regulations that would reduce impacts related to fault rupture include, but are not limited to, the following:

Ordinance No. 547 - Implementing the Alquist-Priolo Earthquake Fault Zoning Act: This ordinance establishes that all applicants for a project located within an earthquake fault zone, as shown on the maps prepared by the State Geologist, shall comply with all of the provisions of the A-P Act and the adopted policies and criteria of this ordinance. This ordinance is applicable to all grading, building and structures, and regulates numerous aspects of design to ensure that structures and facilities are designed with the appropriate level of seismic safety warranted by the geology of their location. Among other things, it addresses grading, slopes and compaction, erosion control, retaining wall design and earthquake fault zones. In addition to the requirements of this ordinance, all applicants for a building permit for a structure used for human occupancy that lies within an earthquake fault zone delineated by the State Geologist pursuant to PRC Section 2621 *et seq.* and which is subject to Ordinance No. 547, shall comply with all the provisions of this ordinance prior to issuance of a building permit. Compliance with these regulations would ensure that no habitable structure, critical facility or infra-structure is built on an active fault, minimizing the potential for fault rupture to affect the structure and cause harm to occupants and possessions. Implementation of, and compliance with, these measures would ensure potential seismic impacts, such as fault rupture risks, are reduce to less than significant.

b. Compliance with Existing and Proposed New or Revised General Plan Policies

Compliance with Policy S 2.1 (including its proposed revisions – see Section 4.12.2.C for full text of the policy) would ensure that future development complies with the Alquist-Priolo Earthquake Fault Zoning Act through the provisions of a geologic study for any project within one-half mile of any Quaternary through historic faults shown on the Earthquake Fault Studies Zones map. Based on the study, development projects may be required to adhere to specific setbacks from faults, engineer structures to specific tolerances, engineer soils, etc. This policy ensures that no habitable structure, critical facility or infrastructure is built on an active fault. Thus, revised Policy S 2.1 would contribute to ensuring that fault rupture impacts on future development are less than significant.

In addition, General Plan policies that would also contribute to avoiding, reducing or minimizing seismic risks, such as faulting hazards, include: S 2.5, 2.6, 3.1, 3.3, 3.4, 3.8, 7.7, 7.8, 7.11; as well as proposed revised Policies S 2.2, 2.3 and 2.4.

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measure 4.10.1A was imposed to reduce impacts from fault rupture to less than significant by requiring geotechnical studies in areas that are within fault zones and using the resultant information to ensure that no habitable structure is built on an active or potentially active fault. Although the potential impacts of this project would be reduced to less than significant through regulatory compliance as per above, this measure was programmatic in nature and thus remains applicable to this project.

Existing Mitigation Measure 4.10.1A: Before a project is approved or otherwise permitted within an A-P Zone, County Fault Zone, within 150 feet of any other active or potentially active fault mapped in a published United States Geologic Survey (USGS) or CGS reports, or within other potential earthquake hazard area (as determined by the County Geologist), a site-specific geologic investigation shall be prepared to assess potential

seismic hazards resulting from development of the project site. The site-specific geotechnical investigation shall incorporate up-to-date data from government and non-government sources.

Based on the site-specific geotechnical investigation, no structures intended for human occupancy shall be constructed across active faults. This site-specific evaluation and written report shall be prepared by a licensed geologist and shall be submitted to the County Geologist for review and approval prior to the issuance of building permits. If an active fault is discovered, any structure intended for human occupancy shall be set back at least 50 feet from the fault. A larger or smaller setback may be established if such a setback is supported by adequate evidence presented to and accepted by the County Geologist.

3. Finding on Significance for Impact 4.12.A

Compliance with the above regulations, General Plan policies and existing mitigation measure would ensure that significant impacts related to fault rupture are less than significant.

B. Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving strong seismic groundshaking?

Impact 4.12.B – Expose People or Structures to Substantial Strong Seismic Groundshaking: Like all of Southern California, Riverside County has experienced and will continue to face groundshaking resulting from activity on local and regional faults. Future development consistent with GPA No. 960 may increase the potential for property loss, injury or death resulting from this groundshaking hazard. Compliance with existing laws, regulatory programs, General Plan policies and existing EIR No. 441 mitigation measures would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.12.B

The Federal Emergency Management Agency (FEMA), in association with the National Institute of Building Sciences, utilizes a standardized methodology based on GIS for earthquake loss estimation. This methodology, the United States Hazards system (HAZUS), is designed to produce loss estimates for use by state, regional and local governments in planning for earthquake loss mitigation, emergency preparedness and response and recovery operations. This methodology deals with nearly all aspects of the built environment and with a wide range of different types of losses. HAZUS estimations are based on current scientific and engineering knowledge and may incorporate data on soil type, liquefaction and landslide susceptibility and building inventory. A complete accounting of HAZUS data are provided in Appendix H of the existing General Plan.

The provisions of the California Building Standards Code (CCR Title 24) regulate the design and construction of a building's structural, plumbing, electrical and mechanical systems to ensure seismic safety, as well as fire safety, energy conservation and accessibility. In addition, Riverside County Municipal Code Chapter 15.60 adopted pursuant to the requirements of the Alquist-Priolo Earthquake Fault Zoning Act and the policies of the State Mining and Geology Board regulates all permit applications for development projects.

Increases in population and residential and non-residential development as a result of GPA No. 960's General Plan changes would increase the exposure of persons and property to groundshaking hazards. The measures identified below would mitigate potential groundshaking effects to less than significant levels.

2. Regulatory Compliance for Impact 4.12.B

As detailed and explained below, compliance with the following existing laws, General Plan policies and existing EIR No. 441 mitigation measures are sufficient to ensure that seismic groundshaking impacts to future development accommodated by the project would be less than significant.

a. Compliance with State and County Regulations

Compliance with the following State of California and County of Riverside regulations would aid in preventing significant impacts related to seismic groundshaking.

California Building Standards Code, Section 1613: This portion of the Code addresses structural design for earthquake loads, to ensure new structure meet necessary seismic safety and protection standards, thereby reducing potential impacts from earthquakes.

Riverside County Municipal Code Chapter 15.60 - Earthquake Fault Area Construction Regulations: As indicated above, the County of Riverside implements the seismic regulations via its Municipal Code Chapter 15.60 (Earthquake Fault Area Construction Regulations) and Sections 15.60.010 through 15.60.070 which are applicable to all construction in Riverside County. These regulations ensure new construction adheres to the necessary seismic standards to protect against groundshaking.

b. Compliance with Existing and Proposed New or Revised General Plan Policies

Compliance with Policy S 7.7 (see Section 4.12.2.C for text of policy) would ensure that development standards, designs and construction practices are implemented to reduce groundshaking risk to tolerable levels for projects involving critical facilities, large-scale residential development and major commercial and industrial development. Thus, Policy S 7.7 would contribute to ensuring that groundshaking impacts on future development are less than significant.

Proposed revised Policy S 2.2 would also contribute to reducing seismic risks for the reasons mentioned in the prior impact discussion. Other General Plan polices that would also contribute to avoiding, reducing or minimizing seismic risks, such as groundshaking hazards, include: S 2.5, 2.6, 3.1, 3.3, 3.4, 3.8, 7.8, 7.11; as well as proposed revised Policies S 2.2, 2.3 and 2.4.

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, which was certified for the 2003 RCIP General Plan it was determined that in order to reduce impacts associated with seismic groundshaking, mitigation would be necessary. The mitigation measures listed below are from EIR No. 441 and shall also apply as part of the mitigation for programmatic EIR No. 521. Existing Mitigation Measures 4.10.2A, 4.10.2B and 4.10.2C were imposed to provide adequate mitigation for potential groundshaking hazards and to reduce impacts due to seismically induced groundshaking to less than significant. The measures also provided flexibility for the County of Riverside when requiring site-specific seismic assessments for developments potentially subject to groundshaking and complying with Riverside County design standards. Although the potential impacts of this project would be reduced to less than significant through regulatory compliance as per above, this measure was programmatic in nature and thus remains applicable to this project.

Existing Mitigation Measure 4.10.2A: The design and construction of structures and facilities shall adhere to the standards and requirement detailed in the California Building Code (California Code of Regulations, Title 24), County Building Code, and/or professional engineering standards appropriate for the seismic zone in which such construction may occur. Conformance with these design standards shall be enforced through building plan review and approval by the Riverside County Department of Building and Safety prior to the issuance of building permits for any structure or facility.

Existing Mitigation Measure 4.10.2B: As determined by the County Geologist, a site-specific assessment shall be prepared to ascertain potential groundshaking impacts resulting from development. The site-specific groundshaking assessment shall incorporate up-to-date data from government and non-government sources and may be included as part of any site-specific geotechnical investigation required in [existing EIR No. 441] Mitigation Measure 4.10.1A. The site-specific groundshaking assessment shall include specific measures to reduce the significance of potential groundshaking hazards.

This site-specific groundshaking assessment shall be prepared by a licensed geologist and shall be submitted to the County Geologist for review and approval prior to the issuance of building permits.

Existing Mitigation Measure 4.10.2C: The standards stated in [existing EIR No. 441] Mitigation Measures 4.10.2A and 4.10.2B shall apply to any structure of facility that undergoes expansion, remodeling, renovation, refurbishment or other modification.

3. Finding on Significance for Impact 4.12.B

Compliance with the above regulations, General Plan policies and existing EIR No. 441 mitigation measures would ensure that significant impacts of strong seismic groundshaking on future development accommodated by the proposed project are reduced to less than significant.

C. Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving seismic-related ground failure, including liquefaction?

Impact 4.12.C – Expose People or Structures to Substantial Adverse Effects Due to Seismic-Related Ground Failure, Including Liquefaction: Portions of unincorporated Riverside County are susceptible to liquefaction, a destructive secondary effect of strong seismic shaking. Future development associated with GPA No. 960 within Riverside County would increase the potential for the placement of structures and facilities in or near areas susceptible to liquefaction. Impacts associated with seismic-related ground failure and liquefaction would be reduced through compliance with existing laws, General Plan policies and existing EIR No. 441 mitigation measures. Compliance with the regulations described below would ensure that seismic-related ground failure and liquefaction risks to future development accommodated by the project would be less than significant.

1. Analysis of Impact 4.12.C

Liquefaction is a process by which water-saturated materials (including soil, sediment and certain types of volcanic deposits) lose strength and may fail during strong groundshaking. Liquefaction is defined as "the transformation of a granular material from a solid state into a liquefied state as a consequence of increased pore-water pressure." Liquefaction occurs worldwide, commonly during moderate to great earthquakes. Four kinds of ground failure commonly result from liquefaction: lateral spread, flow failure, ground oscillation and loss of bearing strength.

Areas of "very high" or "high" susceptibility to liquefaction have been identified adjacent to the Santa Ana River, in the vicinity of Hemet and San Jacinto, in the southern Coachella Valley and along the eastern boundary of Riverside County adjacent to the Colorado River. As indicated in Table 4.12-C, within unincorporated Riverside County as a whole, there are a total of roughly 150,000 acres of "very high" and 123,500 acres of "high" liquefaction susceptibility. At roughly 1,559,300 acres, the largest share of Riverside County is at moderate risk for liquefaction. Lastly, roughly 627,200 acres have a low or very low liquefaction risk. Increases in population and the residential and non-residential development accommodated by GPA No. 960 would increase the exposure of persons and property to liquefaction hazards. Table 4.12-C indicates the portions of the proposed project with known spatial impacts as they relate to the mapped liquefaction potential and other seismic and geologic hazards. The measures identified below would reduce the potentially significant seismic impacts to future development to less than significant.

2. Regulatory Compliance for Impact 4.12.C

As detailed and explained below, compliance with the following existing laws, regulatory programs and General Plan policies are sufficient to ensure that impacts to seismic-related ground failure and liquefaction as a result of GPA No. 960 would be less than significant.

a. Compliance with County Regulations

Compliance with the following Riverside County regulation would further prevent significant impacts to seismic-related ground failure including liquefaction.

Ordinance No. 547: As mentioned for the prior two impacts, this ordinance addresses design and construction for development within earthquake fault zones and Alquist-Priolo Act compliance, among other things. Compliance with these regulations would ensure that no habitable structure, critical facility or infrastructure is built on an active fault, minimizing the potential for fault rupture to affect the structure and cause harm to occupants and possessions. Implementation of, and compliance with, these measures would ensure that potential seismic impacts, including seismically-induced ground failure and liquefaction, are reduced to less than significant.

b. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.12.2.C, Policies S 2.2 through 2.7 in particular provide mitigation for impacts associated with seismic ground failure and liquefaction. Implementation of these General Plan policies would reduce the seismic risks posed to future growth and development within Riverside County accommodated by the project. Specifically:

Policies S 2.5, 2.6 and 2.7: These policies directly address reducing seismic-related ground failure, including liquefaction, by requiring specific grading standards for those development projects that involve grading.

Other General Plan polices that would also contribute to avoiding, reducing or minimizing seismic risks, such as ground failure and liquefaction, include: S 3.1, 3.3, 3.4, 3.8, 7.7, 7.8 and 7.11.

c. Compliance with Proposed New or Revised General Plan Policies

Policies S 2.2, 2.3 and 2.4: These policies directly address potential seismically induced ground failure and liquefaction by requiring developments and construction proposed in those areas that have been identified as having a

potential for liquefaction to be reviewed by State-licensed professionals in order to ensure any potential hazards are mitigated through appropriate design and engineering.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.10.3A and 4.10.3B were imposed to mitigate potential liquefaction hazards. The measures ensure that areas subject to liquefaction are studied by a qualified geologist and that the resultant study recommendations are implemented as part of project conditions of approval. Although potential impacts would be reduced to less than significant through regulatory compliance as per above, these measures are programmatic in nature and thus remains applicable to future development accommodated by this project as well.

Existing Mitigation Measure 4.10.3A: As determined by the County Geologist, a site-specific assessment shall be prepared to ascertain potential liquefaction impacts resulting from development. The site-specific liquefaction assessment shall incorporate up-to-date data from government and non-government sources and may be included as part of any site-specific geotechnical investigation required in [existing EIR No. 441] Mitigation Measure 4.10.1A. This site-specific groundshaking assessment shall be prepared by a licensed geologist and shall be submitted to the County Geologist for review and approval prior to the issuance of building permits.

Existing Mitigation Measure 4.10.3B: Where development is proposed within an identified or potential liquefaction hazard area (as determined by the County Geologist), adequate and appropriate measures such as (but not limited to) design foundations in a manner that limits the effects of liquefaction, the placement of an engineered fill with low liquefaction potential, and the alternative siting of structures in areas with a lower liquefaction risk, shall be implemented to reduce potential liquefaction hazards. Any such measures shall be submitted to the Riverside County Geologist and the County Department of Building and Safety for review prior to the approval of the building permits.

3. Finding on Significance for Impact 4.12.C

Compliance with the above regulations, General Plan policies and existing EIR No. 441 mitigation measures would ensure that significant impacts from seismic ground failure and liquefaction are avoided or minimized to less than significant.

D. Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving landslides?

Impact 4.12.D – Expose People or Structures to Substantial Adverse Effects Due to Landslides: Landslides and rockfall can occur throughout Riverside County as a result of seismic activity and other natural processes, as well as resulting from human activity. Future development within Riverside County accommodated by GPA No. 960 would increase the potential for structures and facilities in areas susceptible to landslides or rockfall. Compliance with existing laws and General Plan policies would reduce potential landslide and rockfall impacts to less than significant levels.

1. Analysis of Impact 4.12.D

Areas highly susceptible to landslides and rockfall occur in and adjacent to mountainous areas throughout the county. Thus, as delineated in Table 4.12-D (Potential Project Areas Affected by Geologic Hazard Areas), some

of the development accommodated by the project would occur in areas highly susceptible to this hazard. Table 4.12-C indicates that within unincorporated Riverside County, there are a total of roughly 94,700 acres at "very high" landslide potential; of which, roughly 500 acres are within areas changed under GPA No. 960. Another 301,700 acres have a "high" potential; the project area includes roughly 4,100 acres of this.

Development in susceptible areas would increase the potential for injury, death or loss of property. Table 4.12-C indicates the portions of the proposed project with known spatial impacts as they relate to mapped seismic and geologic hazards, including landslides and rockfall. Riverside County policies have been identified to lessen the potential for property loss, injury, or death resulting from landslides or rockfall.

2. Regulatory Compliance for Impact 4.12.D

As detailed and explained below, compliance with the following existing laws, regulatory programs and General Plan policies would aid in avoiding or reducing potentially significant impacts to landslides and rockfall as a result of GPA No. 960.

a. Compliance with State and County Regulations

Compliance with the following state and county regulations would aid in preventing significant landslide and rockfall impacts.

Title 24 - California Building Standards Codes: All development in Riverside County is required to comply with the California Building Standards Codes in Title 24. Prior to any construction of structures, including roadways and infrastructure, in areas of steep slopes or landslide potential, a geotechnical assessment is required by a certified geologist. This report includes recommendations as to the stability of the site and outlines requirements for grading, site preparation and building foundations. Grading regulations implemented by the County of Riverside require that grading plans be prepared and reviewed by the County of Riverside prior to the issuance of grading permits and are consistent with the geotechnical study; these regulations are in place to ensure that landslide hazards are reduced to less than significant.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would further prevent significant impacts related to landslides and rockfall.

Policies S 2.5 - 2.8: For future development associated with the GPA No. 960, the County of Riverside would require implementation of Policies S 2.5 through S 2.8 to minimize the effects of landslides and rockfall on new development and infrastructure to less than significant levels.

Policies S 3.1 - 3.7: These policies require landslide potential hazard management zones, including geotechnical and geologic investigations, site stability evaluations and design recommendations, as well as adequate mitigation, against potential hazardous slope conditions.

Proposed Revised Policies S 2.2 - 2.4: For future development associated with the GPA No. 960, the County of Riverside would require implementation of Policies S 2.2 through S 2.4 to minimize the effects of landslides and rockfall on new development and infrastructure to less than significant levels. Other General Plan polices that would also contribute to avoiding, reducing or minimizing rockfall and landslide risks include: S 3.8, 7.7, 7.8 and 7.11.

3. Finding on Significance for Impact 4.12.D

Compliance with the above regulations and General Plan policies would ensure that significant impacts related to landslides and rockfall are avoided and minimized to less than significant.

E. Would the project result in substantial soil erosion or the loss of topsoil?

Impact 4.12.E – Result in Substantial Soil Erosion or Topsoil Loss: Areas exposed during future development activities accommodated by GPA No. 960 revisions to the General Plan would be prone to erosion and loss of topsoil. Wind and water are the two biggest factors in soils erosion. Human activities that remove vegetation or disturb soil are the biggest contributor to erosion potential. Compliance with existing laws, General Plan policies and existing EIR No. 441 mitigation measures help reduce potential soil erosion impacts and ensure that future development would have a less than significant impact on soils.

1. Analysis of Impact 4.12.E

The future growth and development accommodated by GPA No. 960 would result in an increase in both residential and non-residential structures, as well as infrastructure, roads and facilities. Such development would result in alteration of existing topography, removal of existing vegetation layers and exposure of topsoil. Soil erosion potential, either by wind or water, is substantially increased upon the exposure of underlying soils during grading activities or other landform modifications.

Erosion by wind and windblown sand is an environmentally limiting factor throughout much of Riverside County, especially in the Coachella Valley and eastern Riverside County. Measures identified below mitigate potentially significant erosion impacts from future development accommodated by GPA No. 960. As shown in Table 4.12-C, a total of roughly 21,700 acres of Riverside County are at "very high" potential for wind erosion and nearly 840,000 acres are at "high." A large portion of Riverside County, nearly 2,900,000 acres, is at "moderate" wind erosion risk, while roughly 900,000 acres are at "low" risk.

The table also indicates the portions of the proposed project with known spatial impacts as they relate to mapped wind erosion and blowsand potential. Riverside County policies and regulations have been identified to lessen potential hazards associated with blowsand and loss of topsoil due to erosion, particularly wind erosion. Implementation of these policies and regulations would ensure that future development accommodated by the project does not result in significant erosion or impacts to topsoil.

2. Regulatory Compliance for Impact 4.12.E

As detailed and explained below, compliance with the following existing laws, regulations and General Plan policies would aid in avoiding or reducing potentially significant impacts to soil erosion and loss of topsoil to less than significant levels.

a. Compliance with County Regulations

Compliance with the following Riverside County regulation would aid in preventing significant impacts to soil erosion and the loss of topsoil.

Ordinance No. 484 – Blowing Sand Control: This ordinance establishes requirements for the control of blowing sand within County-designated Agricultural Dust Control Areas. It defines activities that may contribute

to wind erosion, places restrictions on erosive activities within these areas, establishes penalties for violations and identifies procedures necessary to obtain permits. In addition, it specifies that prior to grading, developments must have an approved erosion control plan that outlines how the site would be protected from soil run-off during rain events and erosion hazards.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would further prevent significant impacts to soil erosion and the loss of top soil. See Section 4.12.2.C for full text of each of these policies. The implementation of these General Plan policies would also aid in reducing the effect of soil erosion to less than significant.

Policies S 3.5 and 3.6: For any development associated with the implementation of GPA No. 960, the County of Riverside would be required to implement Policies S 3.5 and S 3.6 to minimize the effects of soil erosion by identifying and encouraging mitigation of onsite and offsite slope instability, debris flow and erosion hazards on land undergoing substantial improvements.

Policies S 3.11, 3.13 and 3.14: These policies further reduce significant wind erosion impacts by requiring studies to determine the potential of hazardous impacts from wind erosion and identify the necessary best management practices to prevent the erosion. They also require wind erosion susceptibility to be disclosed for all parcels with high susceptibility. Compliance with these policies would aid in reducing potential adverse impacts of wind erosion to less than significant levels.

c. Compliance with Proposed New or Revised General Plan Policies

Compliance with Policy S 3.12 (see Section 4.12.2.C for full text of policy) would ensure that those parcels susceptible to wind erosion are so noted on their property titles, thereby notifying existing or future property owners of potential development issues related to wind erosion early on. Early awareness would aid in reducing potential adverse impacts related to wind erosion, helping less potential wind erosion effects.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.10.9A, 4.10.9B and 4.10.9C were imposed to reduce impacts from soil erosion and loss of topsoil to less than significant. And, Mitigation Measure 4.10.8A was proposed to address wind erosion specifically. Although potential impacts would be reduced to less than significant through regulatory compliance as per above, EIR No. 441 was programmatic and thus these measures remain applicable to future development accommodated by this project as well.

Existing Mitigation Measure 4.10.8A: New development within identified or potential (as determined by the County Geologist) wind hazard areas shall adhere to applicable provisions of Riverside County Ordinance No. 484.2 or other local, State, or federal requirements established to control or limit the windborne erosion of soil. Prior to the approval of development permits, the County Building and Safety Department shall confirm that the design of any proposed structure, facility, or use incorporates appropriate features to control and/or limit the windborne erosion of soil.

Existing Mitigation Measure 4.10.9A: Riverside County, where required, and in accordance with issuance of a National Pollutant Discharge Elimination System (NPDES) permit, shall require the construction and/or grading

contractor for individual developments to establish and implement specific Best Management Practices (BMPs) at time of project implementation.

Existing Mitigation Measure 4.10.9B: Prior to any development within the county, a Grading Plan shall be submitted to the Riverside County Building and Safety Department and/or Riverside County Geologist for review and approval. As required by the County, the grading plan shall include erosion and sediment control plans. Measures included in individual erosion control plans may include, but shall not be limited to, the following:

a. Grading and development plans shall be designed in a manner which minimizes the amount of terrain modification.

b. Surface water shall be controlled and diverted around potential landslide areas to prevent erosion and saturation of slopes.

c. Structures shall not be sited on or below identified landslides unless slides are stabilized.

d. The extent and duration of ground disturbing activities during and immediately following periods of rain shall be limited, to avoid the potential for erosion which may be accelerated by rainfall on exposed soils.

e. To the extent possible, the amount of cut and fill shall be balanced.

f. The amount of water entering and exiting a graded site shall be limited though the placement of interceptor trenches or other erosion control devices.

g. Erosion and sediment control plans shall be submitted to the County for review and approval prior to the issuance of grading permits.

Existing Mitigation Measure 4.10.9C: Where required, drainage design measures shall be incorporated into the final design of individual projects on site. These measures shall include, but will not be limited to:

a. Runoff entering developing areas shall be collected into surface and subsurface drains for removal to nearby drainages.

b. Runoff generated above steep slopes or poorly vegetated areas shall be captured and conveyed to nearby drainages.

c. Runoff generated on paved or covered areas shall be conveyed via swales and drains to natural drainage courses.

d. Disturbed areas that have been identified as highly erosive shall be (re)vegetated.

e. Irrigation systems shall be designed, installed, and maintained in a manner which minimizes runoff.

f. The landscape scheme for projects within the project site shall utilize drought-tolerant plants.

g. Erosion control devices such as rip-rap, gabions, small check dams, etc., may be utilized in gullies and active stream channels to reduce erosion.

3. Finding on Significance for Impact 4.12.E

Compliance with the above regulations, General Plan policies and existing EIR No. 441 mitigation measures would ensure that significant impacts related to soil erosion and loss of top soil, including wind erosion, are reduced and mitigated to less than significant.

F. Would the project be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Impact 4.12.F – Result in Development on Unstable Geological Units or Soils: Unstable geological units and soils occur throughout Riverside County. Additionally, both natural and human activities have the potential to cause geologic instability. If improperly engineered or constructed, some types of development, particularly those involving heavy loads (concrete dams, for example) or affecting subsurface water levels (e.g., groundwater pumping or replenishment facilities), have an increased potential to cause ground or soil failures. These types of failures are in addition to those triggered by seismic events, as described in earlier impacts above. Future development accommodated by GPA No. 960 would increase the potential for landslides, liquefaction, lateral spreading and subsidence as a result of placement on unstable geological units or soils. However, compliance with existing laws and General Plan policies discussed below would reduce potential impacts related to development on or affected by unstable geological units or soil. Compliance with these would ensure that future development accommodated by the project would have a less than significant impact.

1. Analysis of Impact 4.12.F

As the result of its varied geology, areas subject to landslide hazards, subsidence and liquefaction are found throughout Riverside County. Soils susceptible to subsidence, hydroconsolidation or soil collapse may be affected by a variety of natural or human activities, including earthquakes and the withdrawal of subsurface fluids. Documented subsidence has occurred in the San Jacinto Valley, the Elsinore Trough and the southern Coachella Valley.

Table 4.12-D indicates the components of GPA No. 960 which would be subject to these particular geologic hazards and Table 4.12-C shows the acreage of each hazard type within Riverside County, as well as the portion of the project's known spatial components that occur within these mapped areas. Also, liquefaction and landslide potential were analyzed in Impacts 4.12.C and 4.12.D, respectively.

Past construction of structures and facilities in areas of unstable geologic units and soils may increase the potential for structure damage or interruption of utility service (through disruption of the facility). As a group, the regulatory compliance measures identified below would ensure that future development accommodated by GPA No. 960 does not result in any potentially significant impacts.

2. Regulatory Compliance for Impact 4.12.F

As detailed below, compliance with the following existing regulations and General Plan policies would aid in avoiding or reducing potentially significant impacts resulting from future development on unstable geological units or soils.

a. Compliance with State and County Regulations

Compliance with the following State of California and County of Riverside regulations would further prevent significant impacts related to unstable geology and soils.

Title 24 of the California Building Standards Code: All development within Riverside County is required to be compliant with Title 24 of the California Building Standards Code which, among other things, addresses construction of structures and facilities in areas subject to subsidence and lateral spreading. Prior to any construction in areas on unstable soils, a geotechnical assessment of the site is required by a certified geologist and the resultant recommendations must be implemented as a condition of project approval. These measures address site-specific geology, slopes and soil stability, as well as the requirements for grading, site preparation and building foundations. Also, grading regulations implemented by the County of Riverside require that approved grading plans be consistent with the geotechnical study. Compliance with these regulations would ensure that impacts due to unstable geology or soils are reduced to less than significant.

b. Compliance with Existing General Plan Policies

Compliance with Policies S 3.8, 3.9 and 3.10 (see Section 4.12.2.C for full text of each policy) would ensure future development neither causes unstable geology or soils, nor introduces people and property to sites at significant risk of such. Compliance with these policies would require geotechnical studies be performed and the resultant recommended geotechnical measures be implemented as a condition of project approval to reduce any subsidence or soil collapse risks to less than significant levels.

Other General Plan polices that would also contribute to avoiding, reducing or minimizing risks associated with unstable geology and soils, such as landslide, lateral spreading, subsidence, liquefaction or collapse, include: S 2.5, 2.6, 2.7, 3.1, 3.2, 3.3, 3.4, 3.5, 3.7, 3.8, 3.9, 3.10 and 7.7; as well as proposed revised Policies S 2.1, 2.2, 2.3 and 2.4.

3. Finding on Significance for Impact 4.12.F

Compliance with the above regulations and General Plan policies would ensure that significant impacts related to future development being located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse are mitigated and reduced to less than significant.

G. Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Impact 4.12.G – Result in Development on Expansive Soils: Expansive soils are widely distributed throughout Riverside County. Future development associated with GPA No. 960 would increase the potential for the placement of structures and facilities in areas susceptible to damage resulting from expansive soils. Compliance with existing laws and mitigation measures from EIR No. 441 help reduce potential impacts related to expansive soils and ensure that they are less than significant.

1. Analysis of Impact 4.12.G

Expansive soils are those soils with a significant amount of clay particles that have the ability to take on water (swell) or give up water (shrink). When these soils swell, the change in volume exerts significant pressures on loads (such as buildings) that are placed on them. Within Riverside County, expansive soils are widely dispersed and can be found in hillside areas as well as low-lying alluvial bases. Future development accommodated by GPA No. 960 could result in construction and occupation of structures in areas underlain by expansive soils. Additionally, the past construction of structures and facilities on these soils may increase the potential for structure damage or, through the disruption of utility facilities, an interruption of utility service. Measures are identified below to mitigate potentially significant impacts associated with future development accommodated by GPA No. 960.

2. Regulatory Compliance for Impact 4.12.G

As detailed below, compliance with the following existing regulations and General Plan policies would reduce potential significant impacts resulting from expansive soils.

a. Compliance with State and County Regulations

Compliance with the following state and county regulations would reduce potentially significant impacts due to expansive soils to less-than-significant levels.

California Building Standards Code (CCR Title 24): All development within Riverside County is required to be compliant with the California Building Standards Code in Title 24, as related to the construction of structures and facilities on expansive soils. Prior to any construction in areas on expansive soils, a geotechnical assessment of the site is required by a certified geologist. This report must make recommendations as to the stability of the site and the requirements for grading, site preparation and building foundations. As a condition of approval, prior to the issuance of any grading permit, the County of Riverside requires grading plans satisfactorily address the geotechnical assessment's recommendations. These measures ensure that impacts from expansive soils are reduced to less than significant.

b. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measure 4.10.7A was imposed to reduce impacts associated with expansive soils to less than significant. Although potential impacts would be reduced to less than significant through regulatory compliance as per above, EIR No. 441 was programmatic and thus this mitigation measure remains applicable to future development accommodated by this project as well.

Existing Mitigation Measure 4.10.7A: Proponents of new development within Riverside County shall adhere to applicable policies and standards contained in the most recent version of the [California] Building Code related to the construction of structures and facilities on expansive soils.

3. Finding on Significance for Impact 4.12.G

Compliance with the above regulations and mitigation would ensure that significant impacts related to expansive soils are less than significant.

H. Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for disposal of wastewater?

Impact 4.12.H – Result in Development on Soils Incapable of Supporting Septic Tanks or Alternative Wastewater Disposal Systems: Future development accommodated by GPA No. 960, particularly in areas outside of existing water and sewer service providers, would increase the potential for placement of structures and facilities in areas where soils are incapable of adequately supporting septic tanks or alternative wastewater disposal systems. However, due to laws, regulations and Riverside County policies addressing sewer requirements, potential impacts associated with these types of soils would be avoided or reduced to less than significant levels.

1. Analysis of Impact 4.12.H

Extensive areas of unincorporated Riverside County lie outside of existing special districts that provide sewer services. As a result, development of these lands must rely on the use of septic tanks or alternative wastewater disposal systems. Septic systems are normally designed to function onsite and their proper functioning depends upon specific soil characteristics. For example, liquids must be able to leach (flow out of) the septic system and into the surrounding soil in order to work properly. Also, the septic system cannot be within the groundwater table nor located where it would flow into or otherwise affect nearby streams or other drainages. Thus, in some areas, soils have moderate to severe limitations on the use of septic tanks or alternative wastewater disposal systems. To the extent GPA No. 960 accommodates development in such areas, there is the potential for effects to soils that cannot adequately support the use of septic tanks or alternative wastewater disposal systems.

All septic-using development within Riverside County, however, has to comply with the provisions of the CBC (CCR Title 24, Part 2), Chapters 18 and 18A, which address soils and foundations; and Chapters 16 and 16A, as well as 17 and 17A, which address structural design, structural test and inspections. The provisions of Chapter 18 and 18A apply to all building and foundation systems. All construction, including that of septic tanks is required to have an appropriate geotechnical investigation conducted pursuant to CBC standards. Such investigation includes an assessment as to whether or not the site's soils are suitable for onsite wastewater disposal systems. Pursuant to County of Riverside enforcement of the CBC, no development utilizing onsite septic disposal shall be approved unless the geotechnical study for the site determines that onsite soil conditions are suitable for septic disposal. Developments proposing septic systems must also comply with the Regional Water Quality Control Board Basin Plan, the Riverside County Department of Environmental Health's Technical Guidance Manual and applicable Riverside County ordinances. Compliance with these existing codes, plans and ordinances would ensure that the effects of unsuitable soils on septic systems and alternative wastewater disposal systems are avoided or minimized to less than significant levels.

2. Regulatory Compliance for Impact 4.12.H

Compliance with the following regulations, policies and existing mitigation measures from prior EIR No. 441 would ensure this impact is less than significant.

a. Compliance with State and County Regulations

State and county regulations regarding required geotechnical investigations (studies) as outlined in the California Building Standard Code (Part 2, Volume CBC, Chapters 18 and 18A, "Soils and Foundations;" Chapters 16 and 16A, "Structural Design;" and Chapters 17 and 17A, "Structural Tests and Special Inspections"), as implemented by the County of Riverside, would ensure that a site's soil type, permeability, structural loads, design and integrity,

as well as overall acceptability for a septic or alternative wastewater system are sufficiently established and verified prior to project approval. This process would prevent significant impacts because project's that cannot verify acceptable septic disposal characteristics would not be allowed to be developed.

b. Compliance with Existing County General Plan Policies

Policy S 3.3 of the Riverside County General Plan would further reduce the impact associated with wastewater disposal systems, such as septic tanks and other onsite facilities. See Section 4.12.2.C for full text of this policy. Specifically, this policy requires an applicant prove to Riverside County Building Officials that the proposed building site has soils sufficient to support septic or other wastewater system onsite prior to the issuance of a building permit.

3. Finding on Significance for Impact 4.12.H

The analysis presented above indicates that future development accommodated by the project, GPA No. 960, would have less than significant impacts resulting from septic tanks or alternative wastewater systems placed on unsuitable soils. State laws and Riverside County regulations bar the issuance of building permits for facilities relying on onsite septic wastewater disposal or other alternative onsite disposal, unless geotechnical study verifies the suitability of the soils, geology and hydrology onsite. In this way, the County of Riverside would avoid any significant impacts due to septic placed on unsuitable soils.

4.12.6 Significance After Mitigation for Geology and Soil Resources

Implementation of existing regulations, General Plan policies, mitigation measures and existing requirements would reduce potential impacts associated with fault rupture hazards, groundshaking, liquefaction, landslides and rockfall, seismically induced settlement, subsidence and collapsible soils, soil erosion and loss of topsoil are either avoided or minimized to less-than significant levels. Compliance with existing laws would also ensure structures, people and property are protected from geologic hazards through engineering designed according to the applicable seismic and geological risks or that development is not permitted where such risks are excessive (i.e., higher than typical for the given area or geology) and cannot be avoided. Compliance with existing and proposed General Plan policies, as well as the EIR-specific CEQA mitigation measures presented above, would ensure that any future development activities accommodated by the proposed project, GPA No. 960, appropriately identify any known geologic hazards and fully mitigate, minimize or avoid the associated impacts. As such, project impacts associated with soils and geology would be less than significant.

Section 4.13

Hazardous Materials and Safety

Section 4.13
Hazardous Materials and Safety

4.13.1 Introduction

Riverside County is vulnerable to a wide range of threats or hazards to public safety and property. This section focuses on the risks posed by hazardous materials (hazmat) and safety hazards, including airports and wildfires. Safety hazards relating to landslides, wind erosion, earthquakes and other geotechnical constraints are discussed in Section 4.12 (Geology and Slopes) of this EIR, while hazards related to flooding and dam inundation are discussed in Section 4.11 (Flooding and Dam Inundation). Also, in terms of wildfire, this section focuses on the hazards and fire prevention; for specifics on the entities providing fire services in Riverside County, as well as their equipment, staffing, response times, etc., see Section 4.17 (Public Facilities).

At the outset of this section, it should be noted that there is a difference between "hazard" versus "risk." As described by the State of California in its 2010 Multi-Hazard Mitigation Plan (MHMP), page 243: Hazard is the physical condition that can lead to damage to a particular asset or resource. For example, the term "fire hazard" is related to those physical conditions related to fire and its ability to cause damage, specifically how often a fire burns in a given locale and what the fire is like when it burns (its fire behavior). Thus, "fire hazard" only refers to the potential characteristics of the fire itself.

"Risk," on the other hand, is the "likelihood of a fire occurring at a given site (burn probability) and the associated mechanisms of fire behavior that cause damage to assets and resources." This includes the impact of fire brands (embers) that may be blown some distance igniting fires well away from the main fire. Thus, in this section, for example, fire "hazards" are addressed through identification (mapping), land use restrictions, building code requirements, etc., to minimize the hazard on a regional basis. Fire "risks" are generally addressed at the site-specific level through requirements for roofing types, fire-fuel modification zones, weed abatement and the like. As with fire, most of the safety hazards discussed in this section are addressed through programmatic, regional policies and regulations, since they have the greatest ability to reduce risks to future development and are the principal means under the control and jurisdiction of Riverside County and subject to the Riverside County General Plan.

A. Background on Hazardous Materials

Our modern world, with its myriad of urban and suburban land uses, contains a vast number of facilities that routinely generate, utilize, store and transport a wide variety of hazardous materials through and within Riverside County. At present, there are thousands of different chemical compounds in regular use, and new or modified chemicals are being introduced every day. Large quantities of these materials are refined, manufactured, transported, stored and disposed of in Riverside County. Many of these compounds are also potentially hazardous and can contaminate the soil, air or water upon which human life and activity depends. If improperly handled,

transported, stored, used or disposed of, these materials can exert harmful effects to humans and the environment. Potential contaminants can enter the environment through a variety of pathways, such as improper application or use, improper storage or disposal, or accidental discharge. Hazardous materials are commonly used by all segments of society including manufacturing and service industries, commercial enterprises, agriculture, military installations, hospitals, schools and households. The General Plan indicates that anticipated residential, commercial and industrial growth within Riverside County in the coming years would make dealing with potential problems associated with the handling, transport, storage and disposal of hazardous materials an increasingly important consideration.

B. Background on Airports and Aircraft Hazards

Airports and air-related facilities represent a potential safety hazard to the public and to property due to aircraft accident risks. Public airports are required to maintain airport land use compatibility plans (ALUCPs) to promote compatibility between airports and surrounding land uses (within an established influence area) for the purpose of public safety. The Riverside County Airport Land Use Commission (ALUC) is responsible for reviewing private development and public works projects near airports to make sure they are consistent with approved ALUCPs. In 2004**,** ALUC adopted the Riverside County Airport Land Use Compatibility Plan policy document that establishes land use compatibility planning and policies near airports throughout Riverside County.

The guidelines and operating parameters for the ALUC come from the California Aeronautics Act (California Public Utility Code [CPUC] Section 21670, *et seq.*). The fundamental purpose of ALUC is to promote land use compatibility around airports and to "protect public health, safety and welfare by ensuring the orderly expansion of airports and the adoption of land use measures that minimize the public's exposure to excessive noise and safety hazards within areas around public airports to the extent that these areas are not already devoted to incompatible uses."

The statutes give ALUC two primary powers by which to accomplish this objective. First, it must prepare and adopt ALUCPs. Second, its staff must review the plans, regulations and other actions of local agencies and airport operators for consistency with that plan. ALUC has no authority over either existing land uses [CPUC Section 21674(a)] or the operation of airports [CPUC Section 21674(e)]. There is little guidance in the statute on airport land use compatibility criteria; however, the law refers that issue to the Airport Land Use Planning Handbook published by the California Division of Aeronautics. Specifically, the statutes say that when preparing compatibility plans (i.e., ALUCPs) for individual airports, an ALUC shall be guided by the information contained in the Handbook. The policies in the ALUCP, including the individual airport compatibility maps, incorporate guidance in the current Handbook.

C. Background on Wildfire Hazards

Wildland fires are a serious and growing hazard in Riverside County, as development slowly encroaches on outlying hills and grasslands. At present, more than 8 million people have homes and businesses in California's wildland areas. As wildland fires meet structural developments, vegetation ceases to burn, but catastrophic fire can continue, sustained by structures igniting. Major wildland and earthquake-induced fires can overwhelm local emergency response resources and cause substantial loss of life and property damage. In Riverside County, more and more people are living in areas of wildland-urban interface, which pose the most danger for wildfire conditions because of the complex mix of fuels (vegetation), topography (hills), accessibility (roads) and structures (homes). This mixture creates the perfect situation for a serious threat to the safety of both the public and firefighters.

Wildland fires are a natural part of the ecological processes in Southern California. In the past, it was presumed that all wildland fires should be extinguished promptly. This has caused "protected" vegetation to grow denser, weakening vegetation in a struggle for living space and increasing destruction by pests and disease. Dead and dying plants add fuel for fire. In addition, the absence of fire can alter or disrupt the cycle of natural plant succession and the associated habitats that form. Recognizing this, land management agencies are now committed to finding ways, such as prescribed burning, to reintroduce fire into natural ecosystems.

Wildland fires are more costly to control and create greater risk of losses to the people, resources and improvements than urban or more isolated fires in outlying areas. In addition, many other factors contribute to making wildfires hotter and more destructive. California has extended droughts, which increase dead and dying vegetation, dry fuel per acre volumes and many days of low humidity. Furthermore, federal policy that sets aside federal lands without requiring an aggressive pre-fire management program, further limits fuel management and increases ignition sources. In some parts of Riverside County, fire danger can be worsened by steep, rugged topography, which would allow wildland fire to spread quickly and make it more difficult to fight.

Santa Ana winds also greatly increase fire danger. These hot, dry winds typically develop when a strong, but stalled, high-pressure system between Idaho and Utah's Salt Lake (the Great Basin High) meets a weak low-pressure system just offshore in Southern California. In these conditions, the easterlies (winds from the east) are turned north and south, where they are channeled and strengthened by the many canyons in the Great Basin. The result is hot, powerful and very dry winds that blow across Southern California and especially through the mountain passes.

The greatest demands on fire suppression resources occur when there are multiple ignitions. For example, widespread fires following an earthquake coupled with Santa Ana winds would constitute a worst-case fire suppression scenario. Because of dry vegetation and recurring Santa Ana winds, the fire danger for Riverside County is considered extremely high during 25% of each year, throughout the months of August, September and October. Because of many large active faults in Riverside County, the probability of a major earthquake is high year-round. Therefore, there is a statistically significant chance that this worst-case fire suppression scenario could occur.

D. Baseline Data Sources

Pursuant to CEQA, the descriptions of the physical environmental conditions provided in this EIR are as they generally existed at the time the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting constitutes the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant. Because of the countywide scope and nature of this project and its programmatic EIR, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence is used.

For the hazardous materials baseline data presented and used herein, the following sources were determined to be the best-supported and most current substantial evidence available in the preparation of this section:

- Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, California Government Code (GC) Section 56377; California Department of Toxic Substances Control (DTSC) database, searched March 10, 2011.

- EnviroStor Database, DTSC. Listings for federal Superfund and State Response sites, including Cortese List sites, searched March 10, 2011.

- GeoTracker Database, California Water Resources Control Board (WRCB), searched March 11, 2011.

For the airport and aircraft-related baseline data presented and used herein, the following sources were determined to be the best-supported available and were used in this section:

- Airport Land Use Compatibility Plans (2004 or 2009, as applicable) for the 13 public-serving airports and air facilities in Riverside County and the Chino Airport in San Bernardino County (see Table 4.13-C (Air Facilities In and Around Riverside County) for full listings).

- For military airspace and safety information, the U.S. Department of the Navy's Draft Legislative Environmental Impact Statement (Draft LEIS), dated August 2012, for the Chocolate Mountain Aerial Gunnery Range (CMAGR) Land Withdrawal Renewal. (The Draft LEIS assesses the potential environmental effects of continuing to use CMAGR for military training activities for another 25 years beyond 2014.)

For the wildland fire and emergency planning baseline data presented and used herein, the following sources were determined to be the best evidence available and were used for this section:

- Riverside Unit Strategic Fire Plan. California Department of Forestry and Fire Protection (CalFire). 2012.

- Riverside County Multi-Jurisdictional Local Hazard Mitigation Plan (MHMP). California Emergency Management Agency (CalEMA), March 2005.

- Riverside County Operational Area Emergency Operation Plan. CalEMA, February 2006.

- State of California Multi-Hazard Mitigation Plan. CalEMA, October 2010; source for information on natural disasters, such as fires, earthquakes, etc., and for regulatory background.

4.13.2 Existing Environmental Setting – Hazardous Materials and Safety

A. Hazardous Materials

1. Major Areas of Known Hazardous Materials Contamination

Search of federal and state databases identified 36 major sites of hazmat contamination in Riverside County; i.e., federal Superfund or National Priorities List (NPL), State Response or Cortese List sites. Figure 4.13.1 (Locations of Major Hazardous Material Sites) shows the locations of these major hazmat sites in Riverside County as per the State of California EnviroStor database, and Table 4.13-A (Major Hazardous Material Sites in Riverside County) provides descriptions for each of these major sites. Riverside County contains four "Superfund" or federally-listed hazmat sites, 26 "State Response" sites and 19 contaminated sites on the "Cortese List" (some of which overlap with Superfund and State Response sites).

These hazmat sites may represent potentially significant impacts for any areas of future development accommodated by the proposed project, GPA No. 960, if they are proximate to these hazmat sites. In addition,

information from the Riverside County Department of Environmental Health (RCDEH) and Planning Department indicates there are nearly 9,000 individual sites in Riverside County permitted to transport, generate, handle or dispose of hazardous materials. Many of these are concentrated along major freeways (e.g., SR-91, I-10, I-215, SR-60, etc.). Many are located within the hundreds of industrial business parks or in the large expanses of land dedicated for medium to heavy industrial uses within the county. According to state records, there are also 15 voluntary cleanup sites, 14 school cleanup sites, 12 corrective action sites and 21 tiered permit sites, although some of these include the 36 major sites identified in Table 4.13-A (EnvironStor 2011). With the extensive distribution of hazmat sites throughout Riverside County, it is therefore reasonable to assume that some of the future development resulting from the project would be near sites or facilities where hazardous materials are present.

The following subsections describe various categories of uses and facilities that transport, generate, utilize or dispose of hazardous materials throughout Riverside County.

Table 4.13-A: Major Hazardous Material Sites in Riverside County

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
(1A) March Air Reserve Base (MARB): 3,545 acres total; 3430 Bundy Avenue, Riv., CA 92518 MARB was renamed the March Air Reserve Base (MARB) in 1996. It is on the federal Superfund list as an active cleanup site. Operations at the base include: maintenance and repair of aircraft, vehicles and equipment; operation of a photo lab and printing plant; and fuel management. MARB has historically generated the following hazardous wastes: petroleum, oil and lubricants (POLs), chlorinated and non-chlorinated solvents, corrosives, antifreeze, paint and paint strippers, carbon removers and photographic chemicals. Past activities which have resulted in contamination at the base include burning waste in fire fighting training exercises and discharges to sanitary sewers and storm drains. Groundwater, the primary source of potable water in the area, has been contaminated with trichloroethylene (TCE). There is potential for contamination of soils and surface water. This base was included on the National Priority List (NPL or Superfund) in 1989. A Federal Facilities Agreement (FFA) was signed between the Environmental Protection Agency (US-EPA), California Department of Health Services (DHS), the Santa Ana Regional Water Quality Control Board (RWQCB) and the Air Force in September 1990 to provide for the remediation of the base. MARB was divided into three groups, or operable units, similar to the State of California's removal actions, for remediation. These groups are: 1) groundwater and soil for areas along the east boundary and off-base contamination plume; 2) groundwater and soil for areas not included in units 1 & 3; and 3) groundwater and soil in Area 33. Parcel G is a sector located near MARB's southern boundary that consists of approximately 75 acres of open land with remnants of surface streets from World War II-era military activities.	Federal Superfund Listed	Active – Land Use Restrictions and included on Cortese List
1B) March [Joint] Air Reserve Base (MARB): This facility is an active U.S. Air Reserve Base and part of the Air Mobility Command (AMC). The base's mission is to maintain an effective air-to-air refueling operation capability. For current operations and remediation activities, see 1A above.	Federal Superfund Listed	Active and included on Cortese List
(2) Stringfellow Acid Pits: 3450 Pyrite Street, Riverside, CA 92509 This site operated as a Class I industrial waste disposal site from 1955 to 1972, taking wastes from metal finishing, electroplating, DDT production and aerospace propulsion. The site was composed of unlined ponds placed on alluvium encompassing approximately 17 acres. Quarrying and blasting on the adjacent property have been ongoing throughout the site's existence. Predominant compounds of concern at the site include TCE, heavy metals, pesticides, chloroform and perchlorate. During its life, the site accepted over 34 million gallons of industrial waste, primarily from metal finishing, electroplating and pesticide production, that was deposited in to the evaporation ponds. Spray evaporation procedures were used to accelerate the reduction of pond content volume. In 1969, heavy rainfall caused the disposal ponds to overflow and resulted in the contamination of Pyrite Creek. In 1978, heavy rains caused the RWQCB to authorize the controlled release of 800,000 gallons of wastewater from the site to prevent further wastewater pond overflow and more massive releases. An additional 500,000 gallons of liquid waste were removed to a federally approved facility. In 1979 and 1980, heavy rains again threatened releases from the waste ponds. Between the years 1975 and 1980, approximately 6.3 million gallons of liquid wastes and materials contaminated with pesticides were removed from the site. Groundwater in the vicinity of the Stringfellow site contains various volatile organic compounds (VOCs) and heavy metals such as cadmium, nickel, chromium and manganese. Soil at the site is also contaminated with pesticides, PCBs, sulfates and heavy metals. In 1981, the site was drained and capped. A plume of contaminated groundwater has migrated south from the site approximately four miles towards the Santa Ana River. As it travels southward, the plume reaches neutral acidity and most	Federal Superfund Listed	Active - Land Use Restrictions and included on Cortese List

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
contaminants are stopped within the first 3,000 feet, near the 60 Freeway. Farther south, the only site-related contaminants still detectable are TCE and perchlorate. There are approximately 80 extraction wells and 400 monitoring wells throughout the plume. The extraction wells have been effective in reducing plume migration and removing contamination.		
(3) Alark Hard Chrome: 2777 Main Street, Riverside, CA 92501 This facility was an industrial machining and plating shop where plating solutions were disposed of or spilled onto soils from tanks. The site encompasses approx. 10,000 square feet (0.23 acres) and is located in a light industrial area. Operations at the site ceased in 1985 and the facility has since remained unoccupied. The facility used an electroplating process that involved plating metal parts using chemical baths containing cadmium, chromium and nickel. Grinding equipment and chemical rinse baths were also used during the electroplating process, contributing to the contamination. The soil at the site was contaminated as a result of spills, drips and possible discharge of plating bath solutions during the 14 years of operation. A preliminary investigation completed in 1983 included soil sampling under the building and found higher than normal levels of the three metals. Exposure to these hazardous metals can occur from inhalation, ingestion or direct contact. The contaminated area is inside a secured building and thus no general exposure is anticipated. In February 1987, a Remedial Order (RAO) was issued to the responsible parties (RPs) requiring characterization and remediation of the hazardous substances at the site. In July 1989, a Final Determination of Noncompliance was issued for failure to submit required documents. Although the RPs were briefly in compliance, the California DTSC ultimately conducted the remediation activities. Because of the RP's noncompliance, this case was referred to the State Attorney General's office for enforcement. In July 1990, the DTSC conducted a soil investigation to determine the extent of the remaining contamination. The investigation confirmed high levels of chromium and lead. In June of 1994, DTSC conducted a removal action excavating the highest concentration of heavy-metal contaminated soil from the facility's middle room. A total of 1,810 tons of contaminated soil were excavated and transported to a treatment and disposal facility. The excavated area was backfilled and a temporary cap was constructed. DTSC conducted a groundwater investigation in January of 1995. Groundwater monitoring wells were constructed around the Alark facility, and initial results of the groundwater investigation detected hexavalent chromium in the groundwater. DTSC conducted an additional groundwater investigation; constructing monitoring wells and sampling from 1995 on. Due to the site's high threat to human health and a lack of state and PRP funds to perform necessary work, DTSC requested the U.S. EPA become lead agency and conduct the necessary remedial activities at the site. As a result, U.S. EPA is now the lead agency and the site is on EPA's National Priorities List (NPL). The EPA is conducting a Remedial Investigation and Feasibility Study (RI/FS) and the RI is being performed in several phases.	Federal Superfund Listed	Active and included on Cortese List
(4) Camp Haan Rifle Range: Southwest of MARB west of SR-215, CA 92518 The camp was developed in November 1940 as the Coast Artillery Antiaircraft Replacement Training Center on property adjacent to March Army Air Field. The military reservation was a trapezoidal area about four miles long and three miles wide, encompassing some 8,058 acres.	~~State Response~~ *Military Evaluation*	~~Active~~ *Backlog* and included on Cortese List
(5) Camp Haan - Site Y (J09CA029): West and north of the intersection of Nandina Ave. and SR-215, CA 92518 Firing range associated with Camp Haan; it is being remediated for lead contamination, plus explosives (Unexploded (UXO) and Munitions and Explosives of concern (MEC)) and copper.	State Response	Active and included on Cortese List
(6) Foster-Gardner: 1577 1st Street, Coachella, CA 92236 This property covers approximately 3 acres and is surrounded by a vacant lot to the north and west, a residential area to the south and southeast, and a concrete septic tank/pipe manufacturing and storage yard to the east. The site includes a truck-loading area, a service shop, a fertilizer blending room, an equipment-cleaning pad, two main storage sheds, an open area to the north of the storage sheds, two fertilizer tank farms and a sales office. From 1959 through the early 1970s, operations at this site included formulation of base fertilizer and repackaging and mixing (blending) of pesticides and fertilizers. From the early 1960s to 1990, this company formulated aqueous ammonia at the facility by mixing anhydrous ammonia with water. The company ceased mixing pesticides in the early 1970s. Currently, this company stores herbicides, soil and grain fumigants, insecticides, nematocides, fungicides and fertilizers onsite. Fertilizers are stored and sold in bags and as bulk liquids. Other agricultural chemicals are stored and sold in the original bags and in small metal containers. Operation and maintenance is on-going at the site for natural attenuation. Past manufacturing uses has left pesticides as the contaminant of concern for the site. DTSC is evaluating if monitored natural attenuation is working at the site.	State Response	Active - Land Use Restrictions ~~and included on Cortese List~~
(7) Lockheed – Propulsion, Beaumont No. 1: Highland Springs Road, Beaumont, CA 92223 Historically, the predominant activity at this site was ranching. In the 1950s, the Grand Central Rocket	State Response	Active and included on

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
Company purchased the land and began a remote testing facility for space and defense programs. The Lockheed Propulsion Company purchased the property in 1960 and began operations at the testing facility in 1963. The Beaumont facility is comprised of two sites. Site #1 consists of approximately 9,100 acres where the majority of the testing activities were conducted. Site #2 consists of 2,500 acres and is located approx. 5 miles from Site #1. The two sites were used for the processing, testing and disposal of solid rocket propellant, among other products, in the 1960s and early 1970s. Operations at the facility ceased in 1974. Between 1974 and 1986, portions of the overall site were used for sheep ranching and training heavy equipment operators. These practices were ceased when the potential for contamination was discovered. Hazardous substances that were stored or released onsite during Lockheed's operations include: solvents, purgable organics, TCE, 1,1-dichloroethylene (1,1-DCE), 1, 1-dichloroethane (1,1-DCA), 1,1,1-trichloroethane (1,1,1-TCA) and beryllium. Initial sampling in 1986 confirmed the presence of solvents used to clean and degrease metals in the upper groundwater aquifer. These solvents included DCE, DCA, trichloroethane (TCA), TCE, 1,2-DCA and 1,2-DCE. This relatively small reservoir of groundwater, which is used only for dust control and fire protection, is thought to be separated from the deeper aquifer by a layer of rock, so it is unlikely that the chemicals have entered the deeper aquifer. In June 1989 an Assessment/Site Inspection and limited remedial investigation was conducted at the site. It was agreed by both Lockheed and the DTSC to split the facility into two separate sites. In September 1989, samples were collected from the burn pits, landfill and an area of onetime low-level radioactive waste burial. Laboratory analysis of samples from the burial pit area found very low, nonhazardous (background) levels of two radioactive materials: carbon-14 and tritium (H-3). Sulfur-35, a third radioactive compound suspected to be present, was not detected (it has a short half-life). Principal areas of concern at Site #1 are the pits where various wastes were burned and also a permitted sanitary landfill. The main of exposure risks--inhalation from soil vapors and through consumption of groundwater--are considered very low because the site is located in a very remote area and is currently vacant. The Current Riverside County General Plan designation is Specific Plan–Residential; Current zoning consists of a variety of industrial zoning designations for Riverside County. Future development proposed for the site includes: a proposed master planned community of 11,870 dwelling units with supporting commercial, office, civic, recreational, educational and open space uses. In 2002, perchlorate and 1,4-dioxane were also identified as potential groundwater chemicals of concern. Appropriate treatment technologies being identified to remediate both chemicals.		Cortese List
(8) Lockheed – Propulsion, Beaumont No. 2: Jack Rabbit Trail, Beaumont, CA 92223 See description for Site #1 above.	State Response	Active *and included on Cortese List*
(9) MARB – Poorman Gunnery Range: Located two miles east of MARB near Lake Perris, in Sections 28, 29, 32 and 33 of Township 3 South, Range 2 West, Moreno Valley, CA Firing range associated with MARB, it is being remediated for lead contamination, plus explosives (UXO and MEC) and copper.	State Response	~~Active and included on Cortese List~~ *No further action*
(10) Temecula Bomb Target #107: "Via Carlotta," 5 mi. west of downtown Temecula, CA 92593 The Navy acquired use of the 160-acre property prior to October 1945 and established a bombing target for rocket firing. Temecula Bombing Target No. 1 is located east of downtown Temecula in southern Riverside County, on Via Carlotta. Disposal information for this site is neither complete nor specific. The termination date of the lease is unknown but the Navy had restored the property (implying termination of use) by March 1946. The property is now located in a rural residential area of Temecula. No evidence of military improvements remains on the property.	State Response	~~Active~~ *Backlog* and included on Cortese List
(11) Thomas Ranch: South of Palisades Drive, West of Serfas Club Drive, Corona, CA 91720 This site consists of four former disposal ponds for oil field and refinery wastes, believed to have been in operation from about the 1930s to 1950s. Sampling of the former ponds indicated naphtha, benzene, xylene, ethyl benzene and acids in the tarry materials present. Groundwater has been found to contain thiopenes, an odiferous substance found in crude oil fractions and refinery wastes. The four ponds are fenced, but may present a threat of direct contact with acidic substances. Disturbances of the pits can release volatile aromatic hydrocarbons to the atmosphere. The non-potable groundwater is contaminated. A residential development is located within 300 feet of the site. The site is currently fenced to preclude public access and direct contact with pond materials. Signs are posted on the fences to warn the public against unauthorized entrance to the site. A Remedial Action Order was issued by DHS in August 1986. Onsite investigation and remediation continued in 1990 along with groundwater sampling to clarify prior groundwater information. By the end of 1994, RP maintained the site and had sampled the groundwater. RP filed a lawsuit in Los Angeles against five oil refinery companies as generators responsible for disposal of the waste at the site and in 1995 a Settlement Agreement was signed between the DTSC and the RP.	State Response	~~Active - Land Use Restrictions and included on Cortese List~~ *Certified and Operational*

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
(12) Wyle Labs – Norco Facility: 1841 Hillside Avenue, Norco, CA 92860 This site encompasses 429 acres of land. Wyle started operation in 1957 on the western portion of the site and then developed the site eastwards over time. The site is divided into several areas identified by letters (Areas A, B, etc.). Each typically consists of one or more small buildings, structures and/or outdoor testing areas built for specific testing procedures and to house specific testing apparatus. Testing for the defense, aerospace and manufacturing industries occurred on the site. Components and systems tested include: pumps, valves, piping, propulsion systems, electronic equipment, ordnance and weapons systems. Generally, Wyle's activities were restricted to the central portion of the site; and the edges were left undeveloped to act as a buffer zone between test areas and residential areas located beyond the site boundaries. Adjacent properties include residences to the south, west and north, and a golf course to the east. The site lies in a westward sloping drainage basin, with considerable topographic relief. An ephemeral stream runs through the site and exits near its southwestern corner. Surface water, present in the stream only during and after rainfall events, generally flows from east to west in the ephemeral stream channel. Groundwater on the site is limited to areas adjacent to the stream channel and within a few feet below ground surface.	State Response	Active and included on Cortese List
(13) Techalloy: 2500 A Street, Perris, CA 92370 This site contains unspecified sludge waste, pesticide containers and more than 30 gallons of unspecified contaminants.	State Response	Refer: RCRA
14) Cadiz Lake Sonic Target #7: 68 miles east of 29 Palms, Cadiz, CA 92277 The site encompasses 2,560 acres in eastern Riverside County, owned by the Bureau of Land Management (BLM) and known or suspected to contain military munitions and explosives of concern (e.g., unexploded ordnance), which may present an explosive hazard. The site was used for desert warfare training and Department of Defense (DoD) activities as early as 1942. The site was also used by the Fourth Air Force stationed at March Field, California. Some of this training involved use of live ordnance. No known DoD improvements to site were documented.	State Response	Inactive – Action Required
(15) Camp Young (J09CA029600): 25 miles east of Indio (SR-195/I-10) Camp Young is located on approx. 3,280 acres in the Mojave Desert, east of Indio, and was headquarters for the California-Arizona Maneuver Area (CAMA) during WWII. It was used to train conventional ordnance, ammunition units and several chemical units. The camp is known or suspected to contain military munitions and explosives of concern (unexploded ordnance) and may present an explosive hazard. The Army Corps of Engineers is responsible for the investigation.	State Response	Inactive – Action Required
(16) Corona Annex (J09CA112000): Fifth Street and Hamner Ave., Corona, CA 91720 The 714-acre site was used by the Navy for testing and targeting activities during the 1940s, and included land in-fee and direct purchased for the former Corona Naval Hospital, located north of the City of Corona. The site is bounded by Fifth Street to the north and Hamner Avenue to the east. A former hospital site, it was transferred to Bureau of Naval Weapons for use by the Naval Ordnance Laboratory in 1959. In 1962, 92 acres were transferred to the State of California for use as a Narcotics Rehabilitation Center. In 1962, 14.6 acres were transferred to the Corona Unified School District. Approx. 219 acres were transferred to Lewis Homes and Crestwood Homes development, and 142 acres were also subsequently purchased by other housing developers. The Seal Beach Naval Weapons Station currently owns 245.75 acres. Military munitions were produced or demilitarized at this location and therefore may present an explosive hazard. Facilities known to have existed as part of Corona Annex include a missile evaluation building, fuse assembly examination lab, fuse detonator magazine, high-explosive magazine and an explosive disposal incinerator. An identified burn pit/ordnance disposal incinerator, along with a nearby disposal area (landfill) have minor potential for remaining munitions and explosives of concern (MEC). In 1990, the Riverside Community College undertook a cleanup activity with oversight from the DTSC and removed incinerator ash material.	State Response	Inactive – Action Required
(17) Rice Valley Sand Dunes: Rice Valley, CA 92277 The 5,000-acre site is located in the Rice Valley Sand Dunes and the West Riverside, Riverside and Big Maria Mountains. Current information indicates the site is owned and maintained by the Department of Interior (DoI). This property is known or suspected to contain military munitions and explosives of concern (e.g., unexploded ordnance) and therefore may present an explosive hazard. During World War II, the site was used for practice strafing and bombing runs as part of the Rice Army Airfield and Rice Divisional Camp installation created as part of the CAMA Desert Training Center. The northwestern third of the site is believed contaminated with subsurface unexploded ordnance. A handful of deteriorated 5-gallon cans marked as automotive grease were also found on site.	State Response	Inactive – Action Required
(18) Gavilan Plateau – Maneuver Area: Section 35, Township 4 S, Range 5 W, Perris, CA 92507 This is a former defense site with potential ordnance and explosives contamination. The site will remain idle until the Army Corps of Engineers receives funding to start site investigations with DTSC oversight.	State Response	Inactive – Action Required

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
(19) Riverside Community College – Norco Campus: 2001 3rd Street, Norco, CA 92860 This Formerly Used Defense Site (FUDS) was part of the Corona Annex facility (see Site #16 above).	~~State Response~~ *Voluntary Clean Up*	~~Inactive – Needs Evaluation~~ *Active*
(20) State Lands Commission – Norco: Tract 23507, Sections 11-14, Township 3S, Range 7W, Norco, CA 91760 This State Lands Commission (SLC) property was once part of the U.S. Naval Fleet Analysis Center, Corona Annex (see Site #16 above). In 1984, more than 300 acres of the Corona Annex, including the SLC property, were declared excess by the U.S. Navy and transferred to the General Services Administration. The Navy retained about 129 acres of the Corona facility, which are currently still in operation. An Initial Assessment prepared in 1985 by the U.S. Navy identified various activities involving hazardous materials at the site, including: use of chemicals in a research laboratory, painting and printing operations, auto shops, pesticide application and testing of mechanical and electrical fuses. Lewis Homes of California is in escrow to purchase the SLC property and plans to develop it into single-family dwellings. In 1989, a Preliminary Site Assessment was performed, and subsurface and near-surface soil samples were collected and analyzed for priority pollutants. Results did not indicate the presence of hazardous substances at the site. Therefore, no further action is required at the site.	State Response	De-Listed
(21) University of California Riverside (UCR): 1060 Pennsylvania Avenue, Riverside, CA 92521 Site consists of seven pits in UCR's Agricultural Operations yard on-campus. The pits were used from the mid-1950s to late 1960s for disposal of agricultural wastes. The site was also used for research on experimental pesticides; a wide variety of organic chemicals have been identified at the pit, including organo-chlorine pesticides, chlorinated herbicides, solvents, hydrocarbons and polychlorinated biphenyls (PCBs). The disposal pits are not lined and there is potential for contamination of groundwater used for domestic supply. The pits are covered and there is little potential direct exposure. The first stage of a two-stage RI/FS, which identified the types of soil contamination and location of the pits, has been completed.	State Response	Certified Operation and Maintenance – Land Use Restrictions Only
(22) Certainteed – Riverside: 2100 Avalon Street, Riverside, CA 92509 The facility is a former cement pipe manufacturing plant that routinely used raw asbestos to produce cement pipes and fittings. During its operation, it was suspected through neighbor complaints that asbestos was being improperly disposed and stored at the site. Contamination of soil onsite was confirmed from improper cleaning of a storage area and storing bags of asbestos on the ground instead of immediately transporting waste to a landfill. Facility operations did not contribute to contamination. The site was investigated in 1983 and asbestos soil contamination was found. In 1984, it was confirmed by DHS that the site had been cleaned up properly and a certification was issued.	~~State Response~~ *Corrective Action*	~~Certified~~ *Inactive*
(23) Crossroads Investors III, LLC: 24250 Adams Avenue, Murrieta, CA 92562 The approx. 20-acre site is a vacant lot bounded by a private elementary school to the southeast, Jefferson Ave. to the northeast, single-family dwellings to the northwest and Adams Ave. to the southwest. In the 1950s, part of the site was used for a lead acid battery reclamation and processing facility. Some buildings were used as a Christian school between 1960-1977. Due to lead contamination from the battery recycling operation, in 1988 the U.S. EPA conducted site investigation and emergency remediation at the request of RCDEH. The emergency remediation work included scraping up contaminated soil and capping it beneath an asphalt cover onsite. A draft Removal Action Workplan proposes removal of all contaminated soil posing health risk and offsite disposal at a regulated facility. Some less-contaminated soil posing a lower health risk will also be removed from the site and may be processed elsewhere for reuse.	State Response	Certified
(24) Liston Aluminum Company Site: 9107 Cajalco Road, Corona, CA 92881 The site is adjacent to a stream bed and near drinking water wells. Approximately 25 tons of hazardous waste were deposited at Liston Aluminum Company site in June 1984. This material was sampled, tested and found to contain hazardous levels of zinc and lead.	State Response	Certified
(25) MARB – Site 24: 7,123 acres, east of Riverside, CA 92518 This is a former landfill at West March Air Reserve Base. The landfill occupied an area of approx. 4 acres and received approximately 12,000 cubic yards of waste ash from the Camp Haan solid waste incinerator between 1941 and 1965. The southwestern portion of the landfill also received domestic solid waste, shop waste and demolition debris. There is no apparent remaining threat to groundwater, public health or the environment. Site 24 has been clean closed. Future land use for Site 24 is industrial.	State Response	Certified
(26) MARB – Site 40: 7,123 acres, east of Riverside, CA 92518 This is a former landfill used for disposing wastes from March ARB. It occupies approximately 18 acres of rolling land and a pond in the central portion of the property accumulates surface runoff. Buried drums at this landfill were filled with sodium hydroxide, roofing tar, asphalt solids and waste as well as oil and grease.	State Response	Certified

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
There is potential contamination of surface water and storm water due to exposure to the drums and debris. March ARB was included on the NPL in 1989. An FFA was signed between the U.S. EPA, DHS, Santa Ana RWQCB and U.S. Air Force in September 1990 to provide for the remediation of the base. For details on other efforts at March AFB refer to March ARB site IDNUM 33970002.		
(27) Riverside National Cemetery: East of Riverside, CA 92518 Formerly a part of March Air Reserve Base, this site is part of Operable Unit #2, which is an inactive landfill that overlaid Site 20 and received lime and soda ash precipitate between 1941 and 1984, from Colorado River water treated at settling and evaporation impoundments. The landfill was located on a relatively thin zone of soil or unconsolidated sediments overlying decomposed granitic bedrock. Monitoring results indicate no apparent degradation of groundwater quality at the site. The clean-up required the complete removal of contaminated soil and waste to other sites. And, as confirmed by sampling results, no additional remedial work is necessary at the site. The site is clean and closed.	State Response	Certified
(28) Parkside Drive Site: Parkside Drive and American Canal North Shore, North Shore, CA 92254 The site was formerly referred to as part of the All-American Canal and consisted of approx. one acre with scattered, deteriorated drums and spilled chemical materials thought to be from plating operations. In 1985, the site underwent removal of drums and soil. Post-cleanup soil sampling and field screenings indicated that cleanup was completed to acceptable levels.	State Response	Certified
(29) Universal Propulsion: Pyrite Canyon, Riverside, CA 92509 The site first came to DTSC attention as a result of illegal dumping of hazardous materials there. After investigations it was concluded that wastes, including barium nitrates, phosphates and borates, had been disposed of in a pond on the site. In 1983, a cleanup program was begun at the site, but stopped when bomb casings were uncovered. After investigations determined that the casings did not contain explosive materials, cleanup resumed. Universal Propulsion Company leased the site from 1965 to 1980. In 1984, the DTSC issued Universal Propulsion Company an order to pay for civil penalties and the cost of the investigation and cleanup of the site.	State Response	Certified
(30) Banning Rifle Range: Sections 13 and 14 of Township 3S, Range 1E, Banning, CA 92222 The Banning Rifle Range (RR) is a Formerly Used Defense Site (FUDS) located in the City of Banning along the Interstate 10 corridor in Riverside County. The approximately 84-acre site was used by the U.S. Army as a small arms (rifle) firing range during World War II. The exact location of the rifle range could not be confirmed from available documents or maps. According to the 1994 INPR, 30.3 acres of the site is undeveloped land owned by private individuals. The remaining 63.44 acres is owned by the City of Banning and used for the Banning Wastewater Treatment Plant (WWTP) operations.	Military Evaluation	~~Active and included on Cortese List~~ *Inactive- Requires Action*
(31) Camp Coxcomb: East side of SR-177 approx. 24 miles SW of Freda Camp Coxcomb encompassed 11,520 acres in an undeveloped region of Riverside County, approx. 24 miles west of Freda, California, and 16 miles northeast of Desert Center. The site was established in 1942 as one of several division camps dedicated to training and conditioning troops and testing military equipment. Seven firing ranges were used on the site. Camp Coxcomb was declared surplus in 1944, at which time 10,560 acres were transferred to the DoI. At present, approx. 8,563 acres of the site are owned by the U.S. DoI and under the jurisdiction of the BLM. Approximately 2,957 acres of the site are owned by the Metropolitan Water District of Southern California and various private parties. In addition, approx. 50 mining claims occur on the Camp Coxcomb site. As a result of it former military use, the property is known or suspected to contain military munitions and explosives of concern (e.g., unexploded ordnance) and therefore may present an explosive hazard.	Military Evaluation	~~Active and included on Cortese List~~ *Inactive- Requires Action*
32) Thermal Ground Air Support Base: Approx. 6 miles south of Highways 86 and 111 This 2,555-acre site was acquired by the War Department in the 1940s. The airfield was improved with approximately 250 buildings, heating, lighting, telephone, sewer, water and power systems. In 1948, approx. 2,473 acres were transferred to the County of Riverside for use as a municipal airport (now known as the Jacqueline Cochran Regional Airport). Approx. 40 acres were deeded to the Coachella Valley Water District and approx. 39 acres were deeded to the United Date Growers of California. Currently, the site encompasses 17 parcels totaling 2,549 acres of land owned by both public and private entities. The balance is used for agriculture and airpark development.	Military Evaluation	~~Active and included on Cortese List~~ *Inactive- Requires Action*
(33) Torney General Hospital: 1150 North Indian Canyon Blvd., Palm Springs, CA 92262 The site is a Formerly Used Defense Site (FUDS) that involved conversion of the El Mirador Hotel in Palm Springs to a temporary military hospital. However, no records of survey or potential contamination were on file in the DTSC database.	Military Evaluation	*Backlog* ~~Active and included on Cortese List~~
(34) Blythe Army Air Field – Bombing Target #1: Approx. 7 miles west of Blythe The approximately 1,570-acre Blythe Army Air Field (AAF) is a Formerly Used Defense Site (FUDS). Also	Military Evaluation	~~Active and included on~~

(Map #)* Facility Name-Description-Address	Facility Type	Cleanup Status
known as the Blythe Army Air Base, it is currently part of the Blythe Municipal Airport, located 7 miles west of the City of Blythe. The Blythe AAF was used to train heavy bombardment squadrons as part of a CAMA training field. The Blythe AAF later became a sub-base of Muroc Army Air Field (now Edwards Air Force Base). In 1948, the site was declared excess and the lease with Riverside County was terminated. Only a few of the military improvements still remain on site, including five buildings, two runways and the parking apron. The City of Blythe currently owns the former Blythe AAF and operates it as the Blythe Municipal Airport. Explosives and munitions debris are contaminants of concern for the site.		~~Cortese List~~ *Inactive-Requires Action*
(35) Palm Springs Regional Airport: 3400 East Tahquitz Canyon Way, Palm Springs, CA 92262 The Palm Springs Regional Airport, located in Palm Springs, is a former Army Air Force installation that provided an air field, unit logistic and housing support. Constituents of potential concern at the site are petroleum hydrocarbons, solvents and metals.	Military Evaluation	~~Active and included on Cortese List~~ *No Further Action*

* See Figure 4.13.1
Source: California Department of Toxic Substances Control "EnviroStor" Database, *November 2014* ~~March 2011~~.

2. Hazardous Waste Generators

According to the State of California's EnviroStor database, the five largest generators of production-related hazardous materials in Riverside County produce over 15 million pounds of these materials, including: lead compounds, ammonia, hydrochloric, sulfuric and phosphoric acids and xylene. These hazardous waste generators include food and beverage processors as well as battery, semi-conductor and metal container manufacturers. Although hazardous waste generators are scattered throughout Riverside County, most of the large producers of these materials are located in the western portion. Of the five largest generators described above, two are located in Corona. The other three are located in Riverside, Temecula and Mira Loma, respectively.

3. Commercial and Industrial Uses

Many types of retail businesses within Riverside County commonly store and sell hazardous materials. These materials may be subject to uncontrolled release during an earthquake, fire or other upset. Typical hazardous materials sold at retail outlets includes paints, solvents, cleaning fluids and garden pesticides and fertilizers. The adverse effects produced by the accidental release of hazardous materials may be compounded by the release and co-mingling of several different hazardous materials during such an event. In addition, retail establishments that provide propane or other compressed fuels to the public represent a potentially significant explosive hazard. Hazardous materials are also typically encountered in a number of common businesses. Automotive repair shops and auto parts stores commonly use or carry halogenated cleaning solvents, antifreezes (ethylene glycol), freon and various oils and greases. Auto body shops commonly use a variety of paints, paint solvents and thinners in their operations. Although changes in dry-cleaning processes have reduced the number of hazardous material incidents within this industry, the potential for misuse of materials, including chlorinated solvents, remains.

4. Underground Storage Tanks (USTs)

These are most often associated with automotive service stations, airports and truck stops and represent a risk for the accidental release of hazardous materials into the environment. The effect of such a release may be compounded by the presence of a high groundwater table in the area surrounding the tank. USTs may leak gasoline, diesel or waste oil. Recent and increasingly stringent government regulations for USTs, such as double-walled construction, leak detection systems and protective coatings, continue to reduce UST leaks in the future.

5. High-Tech Industries

Many "high-tech" industries are moving to Riverside County, with more plants predicted to open in the future. To support these industries, the County of Riverside is beginning to experience a considerable increase in the transportation of highly toxic and corrosive materials into and out of the county. Along with these hazardous materials comes the problem of hazardous waste management and disposal. The closing of hazardous waste disposal sites are also forcing the transportation of these materials over greater distances, making these types of waste a continuing hazard.

6. Agriculture

There is a long history of agricultural production in Riverside County. Agricultural activities typically include the storage and periodic application of pesticides, herbicides and fertilizers, as well as the storage and use of toxic fuels and solvents. Pesticides and herbicides vary widely in toxicity and persistence in the soil. Pesticides that degrade slowly over time may leave undesirable residues on crops or in the soil, resulting in higher levels of pesticides in the food chain. These substances may also leach into local groundwater supplies, presenting an elevated risk of groundwater contamination. The over-application of chemical substances such as fertilizers, herbicides and pesticides in agricultural production has resulted in the localized contamination of top soils and groundwater. Increased salinity and nitrate levels caused by agricultural runoff are problems throughout Riverside County where dairy farming, crop raising and citrus groves are prevalent.

In addition to chemical substances applied to agricultural crops, large-scale dairies, feed lots or poultry farms pose a potential environmental hazard. Animal waste from these uses could, if not properly disposed of (or otherwise managed), affect the quality of local and regional groundwater; increasing nitrate levels in local drinking water supplies, for example. An examination of groundwater quality has determined that agriculture-induced groundwater contamination occurs primarily in the dairy preserve of Norco, the San Jacinto Valley and the Colorado River Basin.

7. Household Uses

Nearly all Riverside County residents have some type of hazardous material in their homes; for example, motor oil, paints, cleaners and pesticides. Household hazardous materials pose serious health issues for people who improperly use or dispose of these materials. Adverse environmental impacts can occur when household hazardous materials are disposed of in unlined sanitary landfills, where they can leach through the soil and contaminate groundwater. Rural home sites, removed from community natural gas distribution networks often rely upon propane or other compressed fuels for heating and cooking purposes. Fuels of this type are often stored in onsite aboveground tanks, which are periodically replenished by mobile propane (or other compressed gas) providers. These tanks pose potentially significant explosive and fire hazards if improperly maintained.

8. Illegal Dumping

The dumping of household hazardous wastes and unreported industrial wastes in municipal landfills is not uncommon. This illegal disposal may contribute to the degradation of soil and groundwater quality, thereby increasing the potential for adverse effect on humans and the environment. Illegal dumping of hazardous wastes is a widespread problem that occurs in a variety of forms, including disposal of hazardous substances on unimproved land (including illegal disposal outside of landfills).

9. Wastewater Treatment

Wastewater treatment plants process millions of gallons of effluent daily within Riverside County. Although they are subject to stringent regulations, the improper design, installation, maintenance or operation of these facilities could allow the release of untreated or partially treated sewage with high pathogen concentrations and/or toxic compounds, posing a threat to public health or natural resources. Monitoring of wastewater treatment facilities is the responsibility of the local RWQCBs. Within rural communities, wastewater treatment is accommodated by individual septic systems. Riverside County maintains regulations for the design of septic systems and leach fields to ensure their proper operation. However, if not properly maintained, septic systems could potentially contaminate groundwater with nitrates, ammonia, salts, metals, organic solvents, grease and oil, and other substances, impairing the beneficial uses of local water supplies.

10. Landfills

Landfills are classified according to the disposal site's ability to contain waste based on an analysis of various criteria, including the site's underlying geology, hydrology, topography and climatology. The principal goal of classifications is the protection of surface and subsurface water quality. There are three main categories of landfills:

Class I Landfills: These landfills are qualified to accept and manage hazardous waste. The primary objective at a Class I landfill is the protection of surface and subsurface water quality. A Class I landfill is required to be located where natural geographic features provide optimum conditions for the isolation of wastes from surface and subsurface waters.

Class II Landfills: Waste facilities under the Class II designation are required to be located where site characteristics and containment structures isolate waste from surface and subsurface waters. Select types of hazardous materials may be deposited at Class II facilities, provided a special variance from standard hazardous waste management procedures is granted.

Class III Landfills: This class of landfill is required to have adequate separation between nonhazardous solid wastes and surface and subsurface waters. They are not permitted to accept hazardous waste.

There are currently seven active landfills within the unincorporated Riverside County. Of these, six are operated by the Riverside County Waste Management Department, while one (El Sobrante) is privately owned and operated. All landfill facilities conditionally accept waste from outside of Riverside County.

All of the landfills currently located in Riverside County are Class III landfills and accept only nonhazardous solid waste. Hazardous waste generated within Riverside County must be disposed of in Kern County or Santa

Barbara County, which have active Class I landfills. Some waste, such as low-level radioactive materials, is also transported out of state for disposal. See Section 4.17.4 for more on landfills.

11. Power Plants and Electrical Substations

These facilities are located near urban areas, providing potential for hazardous materials to come in contact with the public. Hazardous materials commonly found at power plants and substations include fuels used to operate the facility (e.g., gasoline or diesel) and also polychlorinated biphenyls (PCBs), formerly used for insulation. These persistent chlorinated organics are often found in the transformer oil at the base of power transformers. PCBs can enter the soil and groundwater and do not easily deteriorate in the environment. Studies have linked PCBs to cancer in laboratory animals. There are dozens of electrical substations located throughout Riverside County.

12. Military Installations

The County of Riverside contains a number of military installations, the largest is the March Joint Air Reserve Base (MARB, formerly March Air Force Base) located adjacent to the cities of Moreno Valley and Perris, approximately nine miles from downtown Riverside. Contaminated sites exist on the base as a result of the storage, use and disposal of household refuse, construction debris, hazardous substances and petroleum products and their derivatives over the course of the installation's nearly 100-year history. A total of 43 "Installation Restoration Program" (IRP) sites have been identified on MARB. Of these, 16 are located on lands proposed to be released for non-military uses, three additional sites are located on Air Force Village West property and two are located on National Cemetery lands. See Table 4.13-A for full details on each of these sites.

MARB also has 31 active and three inactive underground storage tanks. The majority of these are located in the northeastern portion of the base. In addition, MARB has numerous aboveground storage tanks. A bulk fuel storage area in the northern portion of the base and two hydrant fueling systems utilize the largest of these tanks. The bulk storage consists of three aboveground tanks with a total capacity of 5.88 million gallons of jet fuel (JP-8). This fuel is delivered via an 8-inch pipeline running from Colton in southwestern San Bernardino County. Maintenance and monitoring of this system is conducted by the Air Force Reserves in compliance with the Aboveground Petroleum Storage Act.

An Environmental Baseline Survey (EBS), Base Realignment and Closure (BRAC) and Cleanup Plan (BCP) have been prepared for MARB. These Air Force documents outline the status, management and response strategy, and action items related to the cleanup of on-base contaminated and hazardous sites. These programs outline the cleanup of hazardous materials contamination and restoration of the base, as well as selected areas surrounding the base; a necessary step for eventual property disposal and reuse.

The IRP process for MARB commenced September 1993, with the majority of the cleanup sites completed or near completion at time of base realignment in April 1996. There remain some areas where jet fuel byproducts have contaminated groundwater offsite. These plumes of contamination are likely to require several more years to clean up.

In addition to MARB, the only other active military site in use in Riverside County is the Chocolate Mountain Aerial Gunnery Range (CMAGR), a military training facility located in the desert east of the Salton Sea. See Section 4.15 (Noise) for a full description of the activities occurring at CMAGR, plus additional discussion of the other military sites in or affecting Riverside County. The CMAGR spans nearly 460,000 acres, of which roughly 25% (approximately 108,400 acres) are within Riverside County; the remainder is in Imperial County. Public access is restricted within the range, protecting the public from both the hazards of live-fire exercises and from

unexploded ordnance, hazardous materials (such as depleted uranium and other heavy metals used in munitions, for example) and other safety threats.

According to the Draft Legislative EIS (Draft LEIS) prepared for the continued operation of the CMAGR (page 3-105), in 1992 the Navy performed a Preliminary Assessment of the CMAGR to look for signs of hazardous waste disposals or spills. Of seven sites identified, one (an open burn pit for scrap metal) was eliminated through range operations and maintenance. Another site was cleaned up through the excavation and proper disposal of roughly 45 cubic yards of diesel-fuel contaminated soil. The remaining five sites were trash and debris (empty drums, paint cans, glass bottles, construction materials and old bombing vehicles) disposal sites that occurred in a portion of CMAGR where Navy SEAL training activities had taken place. After research and testing, no hazardous materials were identified, so debris from the site was consolidated and disposed of properly off site. To prevent future spills or contamination, particularly due to petroleum products associated with vehicles and equipment, a number of standard operating procedures (SOPs) are in place for the CMAGR. These SOPs also address stormwater management and ammunition and explosives safety.

Lastly, Riverside County also contains a host of former military bases, camps, facilities, etc., as outlined in Table 4.13-A. The most significant hazardous material found on or near these facilities is unexploded ordnance (e.g., bombs).

13. Medical Facilities

These facilities include clinics, hospitals, professional offices, blood and plasma centers and medical research facilities, which collectively generate a wide variety of hazardous substances in the form of "medical wastes," which may also be biohazardous. These substances may include contaminated medical equipment or supplies, infectious biological matter, prescription medicines, laboratory chemicals, cleaning products and radioactive materials used in medical procedures and for research. Major medical facilities in Riverside County include Riverside County Regional Medical Center (Moreno Valley), Riverside Community Hospital (Riverside) and Eisenhower Medical Center (Rancho Mirage) as well as nearly two dozen other hospitals and major care centers located throughout the county.

14. Medical Waste

Virtually every medical facility, including doctors' offices, surgery centers, health clinics, dental offices and other health professional offices, laboratories, medical research facilities laboratories, and even veterinary offices and clinics, generate medical wastes to one degree or another. Pursuant to the State of California's Medical Waste Management Act (MWMA) (Sections 117600-118360 of the California Health and Safety Code [HSC]), a "large quantity generator" is defined as a "medical waste generator, other than a trauma scene waste management practitioner, that generates 200 or more pounds of medical waste in any month." Small-quantity generators fall under 200 pounds per month.

Pursuant to HSC Sections 119735 and 117960, medical waste generators (both "large" and "small") are required to file a "medical waste management plan" with the County of Riverside. The plan serves to disclose the types and amounts of medical waste generated by a site, as well as specify the onsite waste treatment methods used to render the waste non-hazardous prior to disposal (if applicable), for example through steam sterilization, incineration, etc. The plan must also address the storage and disposal of sharps, biohazardous substances, radioactive waste, chemotherapeutics, human tissues, etc., as well as mixed wastes (containing both medical and non-medical waste types).

The disposal of medical waste is normally performed by on-site autoclaving of red-bagged waste (any medical waste that could possibly transmit a pathogen) to render it inert with subsequent transport to a Class III landfill. The RCDEH has regulatory control over the disposal of medical and biological waste. Needles, syringes and other sharp objects containing blood, body fluids, human or animal body parts as well as clothing stained with blood and/or body fluids generated from non-regulated sources, such as crime scenes, traffic accidents and private residences, are not classified as regulated waste under the MWMA (i.e., HSC Sections 117935 and 117960). However, as these materials may be potentially infected with pathogens, care should be utilized in handling and disposing of such materials.

15. Radioactive Waste

The Riverside County Hazardous Waste Management Plan does not address the management of radioactive waste because the handling, treatment, storage and disposal of these wastes involve complex issues above and beyond those involving general hazardous wastes. The use and disposal of radioactive materials used, produced or otherwise associated with medical procedures is regulated by the RCDEH and the State of California. Disposal of these substances takes place outside of Riverside County under the jurisdiction of the federal government (e.g., the Nuclear Regulatory Commission).

16. Hazmat Transport

Rail and highway transportation routes, and the varied industries that use them, create the potential for hazardous materials incidents within Riverside County. The accidental release of a hazardous material into the environment could have serious consequences on the environment, property and human health depending upon the size, location, type and quantity of the release. Although incidents can happen almost anywhere, certain areas of Riverside County are at higher risk for inadvertent release of hazardous materials. Locations near freeways and roadways that are frequently used for transporting hazardous materials (e.g., SR-91, I-15) and locations near industrial facilities that use, store or dispose of these materials all have an increased potential for a release incident, as do locations along Riverside County's freight railways.

Releases of explosive and highly flammable materials have the potential to cause fatalities and injuries, necessitate large-scale evacuations and destroy both public and personal property. Toxic gas releases could cause injury and fatalities among emergency response personnel and passers-by. Serious health and environmental effects may result from the release of toxic materials into either surface or groundwater supplies. Releases of hazardous materials may be particularly serious if they occur in highly populated areas and/or along heavily traveled transportation routes.

17. Highways

The amount of hazardous materials transported over county roadways on a daily basis is unknown, but is estimated to be steadily increasing due to the growth of overall traffic and industry in Riverside County. In addition to the accidental release of gasoline, diesel, oil and other automotive products during vehicle collisions, the transport of hazardous materials on highways within Riverside County presents a risk of upset and/or release of these substances. Besides the immediate effect of a truck-related hazardous material incident, there are also ancillary effects such as the impact on water and drainage systems, the evacuation of schools, business districts and residential areas, and the effect on traffic in the area. Several major highways traverse Riverside County, including I-10, I-15, I-215, SR-60 and SR-91. These highways provide regional access, as well as access to industrial operations throughout Riverside County, thereby allowing for the transport of a wide variety of

hazardous materials. The areas most vulnerable to accidents along these routes are generally considered to be the on/off ramps and interchanges, where vehicles accelerate and merge.

Of major concern in the trucking industry is the safe operation of the trucks. With the regulation of the trucking industry, spot checks of trucks in many states, including California, have shown that at least 25% of trucks currently in service are not considered safe enough to operate on public highways. The California Highway Patrol (CHP) is responsible for the general enforcement of motor carriers hauling hazardous materials. Truck scales are located on I-10 in Banning, I-15 in the Cajon Pass and on SR-91 in Orange County. Scale masters at these locations issue "compliance ratings," which monitor maintenance, vehicle code, safety and cargo compliance with federal, state and local laws. In addition to inspections at these scales, the CHP Motor Carrier Safety Units also conduct inspections at areas or yards where trucks are parked temporarily between trips. "Mobile Road Enforcement" entails the patrol and inspection of vehicles on city and county roadways, as well as state highways.

The growth of high-tech industry in Riverside County requires the transport of increasing quantities of toxic and corrosive materials into and out of the County of Riverside. The transportation of chlorine is also a concern in Riverside County. Chloride is a particularly hazardous material commonly transported and used for water treatment. Used to purify/treat water, the Metropolitan Water District of Southern California (MWD) operates one of the largest fleets of chlorine-transport trucks in the state, with trucks in daily operation throughout Riverside County.

18. Rail Transport

The many rail lines running through Riverside County often carry hazardous cargoes. Although hazmat transport on railroads is not as prevalent as on truck routes, the substantially greater volumes involved in rail transport pose a greater hazard when an accident does occur. In particular, if there are volatile or flammable substances on the train, and the train is in a highly populated or densely forested area, death, injuries and damage to homes, infrastructure and the environment could occur in the event of a train accident, derailment or fire.

Major rail lines which cross Riverside County are shown in Section 4.18 (Transportation and Traffic). The most common hazardous material incidents involving rail transport are due to train wrecks and derailments. A number of incidents have occurred in Riverside County within the last decade including a trail derailment in Palm Springs in 1999 where 10,000 gallons of diesel oil into the San Gorgonio River and a railcar fire in Beaumont in 2003 which leaked white sand. These types of incidences allow quantities of hazardous materials to enter the soil and groundwater. The location of rail corridors in the vicinity of natural gas and/or petroleum pipelines presents a potential risk of catastrophic release of these fuels in the event of a rail derailment or similar incident. These potential impacts are addressed in Section 4.13.6.

19. Pipelines

Because it spans over 200 miles from east to west, and lies in between Arizona and the Los Angeles metropolis, Riverside County is home to an extensive network of pipeline distribution systems. In particular, Southern California Gas Company (SCGC) has three high-pressure natural gas transmission pipelines that pass through the San Gorgonio Pass (including crossing the San Andreas Fault), supplying a major portion of Southern California's non-transportation energy supply (roughly 28% of the energy consumed annually in the state, according to the MHHP, page 353). Most of the natural gas used in California comes from out of state. The SCGC pipeline system delivers natural gas from the southwestern states into Southern California. A more detailed discussion of natural gas pipelines, including a map of their general locations across Riverside County, may be found in Section 4.10 (Energy Resources).

SCGC transports high-pressure natural gas through two types of lines: transmission ("backbone") and distribution lines. Natural gas is delivered through the utilities' backbone pipeline systems into local transmission and distribution pipeline systems, or to natural gas storage fields. The backbone lines connect to local systems at regulation stations where changes in pressure (from high to low and vice versa) take place. Natural gas for domestic and commercial uses is delivered via underground in-street pipelines. The rupture of these facilities, either during a natural disaster or by an accidental breach caused by human activity, could potentially result in explosive consequences. Such an accident occurred in Pedley in 2002 and resulted in 131 structures being evacuated and 150 people being displaced. No release or accident in Riverside County has reached such devastating proportions. However, all areas with natural gas pipelines are at risk for potential pipeline failure and gas-release hazards.

Petroleum products are also stored and distributed at many major points throughout Riverside County. Of particular interest are the aviation fuel tanks and pipelines located at March Air Reserve Base (MARB). A jet fuel (JP-8) pipeline runs from Colton in southwestern San Bernardino County to the fuel storage facilities at MARB.

Increased urbanization is resulting in more and more people living and working closer to existing gas transmission pipelines that were built prior to adoption of some of the modern land use and pipeline safety regulations that exist today. According to the State MHHP (page 353), compounding the potential risk is the age and gradual deteriorating of the gas transmission system due to natural causes. Significant failure, including pipe breaks and explosions, can result in loss of life, injury, property damage and environmental impacts. Causes and contributors to pipeline failures include construction errors, material defects, internal and external corrosion, operational errors, control system malfunctions, outside force damage (e.g., accidental excavation, vehicle crashes, etc.), subsidence and earthquakes. Growth in population, urbanization and land development near transmission pipelines, together with the addition of new facilities to meet new demands, increase the likelihood of pipeline damage due to human activity and the exposure of people and property to pipeline failure hazards.

20. Airports

Riverside County is host to municipal airports, a military air base and an aerial gunnery range, as well as home to a number of private fields and airstrips. Most of the twelve public-use airports in Riverside County (including cities) are small and serve the needs of local residents for civilian light aircraft flights.

See Section 4.13.2.B, below, for additional details on airport facilities throughout Riverside County. The transport of hazardous materials onboard aircraft is regulated by the DoT. These regulations prohibit the transport of certain categories of hazardous materials, restrict the amount of material transported per flight and establish appropriate safeguards for transport of hazardous materials. Yet, even with stringent regulations on hazardous materials, accidents still occur. Air transport aside, the types of incidents most commonly occurring at airports in Riverside County are illegal disposal of hazardous materials, fuel spills and leaking underground storage tanks (USTs); that is, activities related to aircraft and airport maintenance, rather than air transport.

21. Leaking Underground Storage Tanks

Based on data from the State Water Resources Control Board's "Leaking Underground Storage Tank Information System" (LUSTIS), there are currently 1,190 open or active cases of leaking "Underground Storage Tanks" (USTs) in Riverside County. The majority of UST releases are of vehicular fuels, either diesel or gasoline of various formulations. The most common constituents that are found in gasoline are benzene, toluene, ethylbenzene and xylene (collectively referred to as BTEX) and also methyl tertiary butyl ether (MTBE). These organic compounds pose a threat to groundwater due to the benzene and MTBE's carcinogenic effects on

humans. In addition, MTBE's pervasiveness in groundwater adds to its risk potential. A small percentage of UST releases involve chlorinated industrial solvents, which are suspected carcinogens. The majority of the sites where UST releases have occurred are automotive service stations, with tanks from industrial facilities contributing a smaller, but significant, minority. To date, fuel-related groundwater contamination has not grown to a point where drinking water supply wells are significantly affected. However, the Regional Water Quality Control Boards maintain and periodically update the LUSTIS database with data for their localities.

B. Airports and Aircraft Hazards

Aircraft, airspace and air travel are predominantly regulated by the Federal Aviation Administration (FAA) and the U.S. Department of Defense (DoD) for military aircraft and airspace. Specific public airports and airspace within Riverside County are also addressed by the Riverside County Airport Land Use Commission (ALUC), a regional entity that oversees many of the safety and operational issues associated with airports (including their physical development, configurations and safety). As such, the jurisdictional authority of the County of Riverside lies mainly with land use decisions for unincorporated lands surrounding the air facilities. This sub-section focuses on safety hazards associated with airports and air travel. For specifics on land use and compatibility issues, see Section 4.2 (Land Use).

1. Airport Safety Issues

Statistically, the greatest safety risks associated with aircraft and air travel occur at takeoff and landing (i.e., the first and last two minutes in the air). Accordingly, this translates into the greatest safety hazards being located closest to the airport runways. For this reason, airport master plans and airport land use compatibility plans are created to ensure that people and property are kept out of the most dangerous portions of the runways and that land uses permitted in proximity to the airport are compatible with the air hazards. For example, the Riverside County ALUC's Riverside County Airport Land Use Compatibility Plan Policy Document ("Policy Document") establishes safety zones that limit building heights, restrict hazardous materials and fuel tanks, bird-attracting industries, etc., from close proximity to airport runways. As per the Policy Document (page 2-25), "the intent of land use safety compatibility criteria is to minimize the risks associated with an off-airport aircraft accident or emergency landing." Table 4.13-B (Airport Compatibility Zone Safety and Airspace Protection Factors), below, shows the safety factors associated with various standards compatibility zones used by ALUC. For further discussion on land use compatibility, see Section 4.2.

Risks to People and Structures on the Ground: According to ALUC, "the principal means of reducing risks to people on the ground is to restrict land uses so as to limit the number of people who might gather in areas most susceptible to aircraft accidents" (Policy Document, page 2-25). With this in mind, there are certain land uses of "special concern" because of occupants having reduced effective mobility or being unable to respond to emergency situations. Such uses include children's schools and day care centers, hospitals, nursing homes and other similar uses for young, elderly or handicapped people. Other land uses with restrictions or limitations include: multi-story buildings (because of the increased difficulty in evacuating them), hazardous materials storage facilities (due to the risk of fire or explosion in the event of an air accident) and critical community infrastructure (power plants, electrical substations, communications facilities, etc.) due to the importance of uninterrupted utilities.

Airspace Hazards: Tall structures, trees, towers and other objects, particularly when located near airports or on high terrain, may constitute hazards to aircraft in flight. Federal regulations establish the criteria for evaluating potential obstructions in the development of airspace protection policies by ALUC. Ideally, ALUC, the local government(s), and the state work together to ensure that hazardous obstructions to the navigable airspace do not

occur. The ALUC Policy Document sets out a number of height criteria and restrictions to ensure airspace and avigation safety. Care must also be taken in certain areas to avoid creating electrical interference, glare or other potential flight hazards.

Other Flight Hazards: The ALUC Policy Document (page 2-30) states that, "new land uses that may cause visual, electronic or increased bird strike hazards to aircraft in flight shall not be permitted within any airport's influence area." This also includes avoiding things like: glare or distracting lights which could be mistaken for airport runway lights; sources of dust, steam or smoke which may impair a pilot's visibility; sources of electrical interference with aircraft communications or navigation equipment; and, uses such as landfills and certain agricultural uses that could attract large flocks of birds.

2. Airport Land Use Compatibility

Airports in Riverside County provide an important function for passengers as well as benefit regional economies. Future population growth in Riverside County would create additional demand for air transportation. At the same time, growth and urbanization can also threaten existing as well as future airports by introducing incompatible land uses, people and property into airports' vicinities. To protect airports' future expansion needs from encroaching incompatible land uses and to ensure the public is protected from excessive noise and air-related safety hazards, the State Aeronautics Act (Public Utilities Code Section 21670 *et seq.*) calls for the adoption of airport land use compatibility plans by the Riverside County ALUC to ensure that existing and future land uses planned around public use airports are compatible and safe.

As defined by ALUC, all of the public airports listed in Table 4.13-C, except Palm Springs International and Perris Valley, have influence areas that affect lands within unincorporated areas of Riverside County. These are mapped in the General Plan; for more details, refer to the appropriate Area Plan's Airport Influence Area section for the airport in question.

Table 4.13-B: Airport Compatibility Zone Safety and Airspace Protection Factors

Zone	Zone Name / Type	Safety Risk Level and Airspace Protection Factors
A	Runway Protection Zone and Within Building Restriction Line	**Risk Level:** Very High • Lateral to runways, zone boundary defined by the Building Restriction Line as depicted on adopted Airport Layout Plan drawing. • Length set to include Runway Protection Zones as indicated on Airport Layout Plan drawing. • Nearly 40% of off-runway general aviation accidents near airports occur in this zone.
B1	Inner Approach / Departure Zone	**Risk Level:** High • Encompasses areas overflown by aircraft at low altitudes, typically only 200 to 400 feet above the runway. • Some 10% to 20% of off-runway general aviation accidents near airports take place here. • Object heights restricted to as little as 50 feet.
B2	Adjacent to Runway	**Risk Level:** Low to Moderate • Area not normally overflown by aircraft; primary risk is with aircraft (especially twins) losing directional control on takeoff. • About 3% of off-runway general aviation accidents near airports happen in this zone. • Object heights restricted to as little as 35 feet.
C	Extended Approach / Departure Zone	**Risk Level:** Moderate • Includes areas where aircraft: o Turn from base to final approach legs of standard traffic pattern and descend from traffic pattern altitude. o On departure, normally complete transition from takeoff power and flap settings to climb mode and begin turns to en route heading.

Zone	Zone Name / Type	Safety Risk Level and Airspace Protection Factors
		○ On an instrument approach procedure, have descended below about 500 feet AGL [above ground level]. • Some 10% to 15% of off-runway general aviation accidents near airports occur in this zone. • Object heights restricted to as little as 50 feet.
D	Primary Traffic Patterns	**Risk Level:** Low • Aircraft on instrument approaches below 1,000 feet. • About 20% to 30% of general aviation accidents take place in this zone, but the large area encompassed means low likelihood of accident occurrence in any given location. • Risk concern is primarily with uses for which potential consequences are severe (e.g., very-high intensity activities in a confined area). • Object height limits generally at least 100 feet.
E	Other Airport Environs	**Risk Level:** Low • Only 10% to 15% of near-airport accidents occur here. • Risk concern only with uses for which potential consequences are severe (e.g., very-high intensity activities in a confined area).
*	Height Review Overlay	**Risk Level:** Moderate • Modest risk because high terrain constitutes an airspace obstruction. • Concern is tall single objects (e.g., antennas).

Source: Riverside County Airport Land Use Commission, Riverside County Airport Land Use Compatibility Plan Policy Document, October 2004, Table 3A, page 3-3.

Since 2004, the Riverside County ALUC has adopted new airport land use compatibility plans for all but three of the fourteen airports addressed in the General Plan (see Table 4.13-C). March Air Reserve Base, Hemet-Ryan and Perris Valley Airports do not yet have completed land use compatibility plans. The specific airports covered by the Riverside County ALUC adopted the Riverside County Airport Land Use Compatibility Plan Policy Document ("Policy Document") and the date when each plan was adopted with respect to each airport are listed in Table 4.13-C. As required by state law, either this plan or an earlier one has been adopted for all of the public use and military airports in Riverside County, while preparation of compatibility plans for private use airports is at the option of ALUC. It should be noted that the Chino Airport is located in San Bernardino County, but is included in Table 4.13-C because part of that airport's influence area extends into Riverside County. Similarly, the LA-Ontario International Airport and the Chocolate Mountain Aerial Gunnery Range are also included in the table because associated airspace from these facilities occur in Riverside County. Private air facilities are also included in the table; they are not required to have ALUCPs, but still must conform to FAA requirements regarding airspace and airport operations. The location of the public-serving airport facilities in Riverside County are shown in Figure 4.13.2 (Location of Public Airports in Riverside County).

3. Commercial Aircraft Overflight

The western part of Riverside County has some of the busiest air traffic in the United States, including very heavy commercial, as well as military, air traffic. The airspace in Riverside County is constantly occupied by aircraft arriving and departing from other airports in the region. Frequently, overflights experienced in the communities near Riverside County airports are from distant, rather than nearby, airports. The number of near misses reported by pilots underscores the increasing possibility of a mid-air collision over Riverside County. Accordingly, the use of airspace and aircraft overflight represents a remote hazard to many portions of Riverside County.

There are two major airports in Riverside County, March Joint Air Reserve Base and Palm Springs International, a military air bombing range (the Chocolate Mountain Aerial Gunnery Range), 13 smaller public commercial airports and dozens of private airstrips throughout the county. Airport planning information on these facilities is provided in Table 4.13-C. Four major out-of-county airports also have substantial flight paths over Riverside County:

- John Wayne Airport (Orange County)
- Long Beach Airport (Los Angeles County)
- Los Angeles International (LAX) Airport (Los Angeles County)
- Ontario Airport (San Bernardino County)

4. Military Air Facilities

With its large expanses of open land, Riverside County is home to a number of military bases, including three active facilities: the Chocolate Mountain Aerial Gunnery Range (part of the Bob Stump Training Range Complex), March Joint Air Reserve Base and the Naval Surface Warfare Center (in Corona). The Naval Warfare Center provides technical operations, testing and assessment, and engineering support for the Navy and is not associated with aircraft, munitions or other significant military safety issues. Thus, it is not discussed further in this chapter.

Table 4.13-C: Air Facilities In and Around Riverside County

Air Facility	Location (City)[1]	Date of Adopted Compatibility Plan
Larger Public Airports		
March Global Port / Joint Air Reserve Base (Joint Use)	Moreno Valley	May 29, 1986
Palm Springs International	Palm Springs	March 10, 2005
LA / Ontario International [2]	Ontario, San Bernardino County	NA
Smaller Public Use Airports		
Banning Municipal	Banning	October 14, 2004
Bermuda Dunes	Bermuda Dunes (Riv. Co.)	December 9, 2004
Blythe	Blythe	October 14, 2004
Chino [2]	Chino	March 20, 2000
Chiriaco Summit	Chiriaco Summit (Riv. Co.)	October 14, 2004
Jackie Cochran (formerly Desert Resorts Regional)	Thermal (Riv. Co.)	June 9, 2005
Corona Municipal	Corona	October 14, 2004
Flabob [3]	Jurupa Valley	December 9, 2004
French Valley Airport	Murrieta/Temecula	December 9, 2004
Hemet-Ryan	Hemet	March 18, 1992
Perris Valley	Perris	October 23, 1975
Riverside Municipal [3]	Riverside	March 10, 2005
Private Air Facilities (No Public Use)		
Lake Riverside Estates	Anza	NA
AHA-Quin	Blythe (Colorado River Tribes)	NA
Blythe Service Center, Southern California Edison Company	Blythe	NA
Clayton	Blythe	NA
CYR Aviation	Blythe	NA
W R Byron	Blythe	NA
SCE Palm Springs District, Southern California Edison Co.	Cathedral City	NA
Chapin Medical Pad	Corona	NA
Corona Regional Medical Center	Corona	NA
Desert Center	Desert Center (Riv. Co.)	October 14, 2004
Julian Hinds Pump Airstrip, Metro. Water Dist. of So. Cal.	Desert Center (Riv. Co.)	NA
Devers Substation, Southern California Edison Company	Desert Center (Riv. Co.)	NA
Landells	Desert Hot Springs	NA
Ernst Field	Hemet	NA

Air Facility	Location (City)[1]	Date of Adopted Compatibility Plan
Hemet Valley Hospital Helistop	Hemet	NA
John F Kennedy Memorial Hospital	Indio	NA
Skylark	Lake Elsinore	NA
University Medical Center	Moreno Valley	NA
Tenaja Valley	Murrieta	NA
Desert Air Sky Ranch	North Shore, Salton Sea (Riv Co.)	NA
Desert Regional Medical Center	Palm Springs	NA
Castle	Perris	NA
Eisenhower Medical Center	Rancho Mirage	NA
Riverside Community Hospital	Riverside	NA
Johnson	Riverside	NA
Lake Mathews, Metropolitan Water District of So. California	Riverside	NA
Riverside Metro Center	Riverside	NA
Southern California Edison San Jacinto Valley Service Center	Romoland	NA
Billy Joe	Temecula	NA
Wolf Ranch	Temecula	NA
Inland Valley Regional Medical Center	Wildomar	NA
Pines Airpark	Winchester	NA
Military Air Facilities		
Chocolate Mountain Aerial Gunnery Range[4]	East of Salton Sea (Riv. Co.)	NA
March Joint Air Reserve Base / Global Port (Joint Use)	Moreno Valley	May 29, 1986

Footnotes:
1. Closest city or community to the air facility location. Public facilities in unincorporated areas noted with "Riv. Co."
2. Facility located outside of Riverside County, although affected airspace does occur within Riverside County.
3. Due to incorporation, airport now located within a municipality and does not affect unincorporated Riverside County.
4. Aerial bombing range with restricted military airspace; not an airport per se.

Source: Riverside County, Riverside County Airport Land Use Compatibility Plan, October 14, 2004, as amended.

Bob Stump Training Range Complex: Spanning over 1.2 million acres in southwest Arizona and southeast California, including a portion of Riverside County, the Bob Stump Training Range Complex (BSTRC) is the largest military training facility in the world. The U.S. Marine Corps complex encompasses the CMAGR in Riverside and Imperial counties, the El Centro Range Complex (in southern Imperial County, near the Mexico border), the Air Ground Combat Center at Twenty-nine Palms in San Bernardino County, the Barry M. Goldwater Range in Yuma County, Arizona, and also the U.S. Army's Yuma Proving Ground also in Arizona. See Figure 4.13.3 (Military Airspace Over Riverside County) and Figure 4.13.4 (Military Training Airspace and Training Routes Over Riverside County).

In addition to providing territory for various wide-ranging ground force and surface-fire activities, the BSTRC is used for training exercises that frequently also involve jet and other military aircraft flying high speeds at low altitudes. Thus, in addition to aircraft overflight over and near airports and the military bases and training facilities themselves, portions of the western U.S., particularly the remote desert regions around the Bob Stump Range Complex, may be subject to military jet and helicopter overflight, as well as other military uses of airspace across much of Riverside County, particularly the eastern desert half.

Chocolate Mountain Aerial Gunnery Range: The CMAGR is the other most notable source of military noise in Riverside County. The northern tip of CMAGR is located in Riverside County immediately east of the Salton Sea. In total, the range encompasses nearly 460,000 acres, roughly half of which is public land administered by the U.S. Bureau of Land Management (BLM) and half is federal land administered by the Department of the Navy. A total of 108,363 acres of CMAGR are within Riverside County; the remainder (roughly 75% of the site) is in Imperial County.

Since the 1940s, CMAGR has provided support training that is essential to the readiness of the nation's Marine Corps and Naval Air Forces. CMAGR is a live-fire tactical aviation training range that takes advantage of the area's desert mountain terrain, which is ideal for air-to-ground attack and air-to-air combat training. According to the Navy (Draft LEIS, page 3-10), "25 types of tactical aviation training activities currently occur on a regular basis at the CMAGR and its adjacent MTRs." Tactical military exercises at CMAGR involve live explosives and large force-on-force aviation training, including bombing, rocketry and strafing practice. Artillery, demolitions, small arms and Naval Special Warfare training are also conducted within the range, as well as parachute air drops and helicopter operations. Aircraft use the CMAGR as well as the special use airspace associated with it. According to the Navy Draft LEIS, CMAGR sees 6,000-7,000 training sorties annually for fixed wing aircraft (one sortie represents one flight by one aircraft from takeoff to landing, but may include any number of bombing, strafing or other training runs). Sorties per day tend to average between five and roughly 20 for most CMAGR airspace areas.

In terms of ordnance operations, in a Final EIS issued for the West Coast Basing of the F-35B (jets), the Navy reports that an average of 204,000 rounds of large caliber munitions are expended annually and "approximately 42,000 of those rounds were high explosives" (Final EIS, page 6-18). It also notes that "approximately 80% of all rounds fired are associated with air-to-ground activity on the range and 15% and 2% of the total expenditure were during the CNEL evening and nighttime periods, respectively." Based on the data provided, the Final EIS notes that CMAGR range use occurs 305 days per year.

March Joint Air Reserve Base: March is one of the oldest airfields operated by the U.S. military, having been established as Alessandro Flying Training Field in 1918. March Field's primary mission was pilot training, then in 1931 it became used as an operations base. (It was also home to Bob Hope's first USO show in 1941.) After World War II, the base became part of the Air Force's Tactical Air Command, later the Strategic Air Command (until 1992). Since 1996, March has been an Air Reserve Base under the Air Force Reserve Command (renamed a Joint Air Reserve Base in 2003). The base is still an active military airport, hosting operational flying missions, particularly humanitarian missions, the 4th Air Force of the Air Force Reserve Command and multiple California Air National Guard units. It is also to be used for air cargo (as part of the adjacent March Global Port) in the future.

5. Military Airspace and Overflight

A variety of military airspace uses can lead to conflicts between military and civilian aircraft if an error is made by one or more pilots, mechanical failure, etc. Such operations can take place over vast stretches of public and private lands outside of the military facilities. Because of the speed and power of the aircraft involved, these airspaces can stretch a hundred or more miles from the associated military facility. As a result, there is a very small risk of accident for the thousands of people and properties on the ground below these routes.

The Draft LEIS (page 3-101) states that the FAA is responsible for ensuring safe and efficient use of airspace by military and civilian aircraft and supporting national defense requirements. To do so, the FAA has established regulations for airspace safety, developed airspace management guidelines, implemented a civil-military common system and coordinates cooperative activities between the FAA and DoD. The military schedules all or portions of seven restricted areas associated with the CMAGR and has adopted specific air safety rules to protect users of the airspace above and surrounding the range. In addition, all aircraft operating within the CMAGR are issued specific "rules of engagement" to ensure air activities are conducted safely.

Military Operations Areas: A "military operations area" (MOA) is defined in the Code of Federal Regulations [CFR] (Title 14, Section 1.1) as "airspace established outside Class A airspace to separate or segregate certain non-hazardous military activities from IFR traffic [i.e., aircraft navigating by instrument, such as commercial jetliners]

and to identify for VFR traffic [i.e., aircraft navigating visually, such as civilian light planes, etc.] where these activities are conducted." MOAs are designed for routine training or testing maneuvers. Areas above military bases, near actual combat or other military emergencies are generally designated as "restricted airspace." MOAs have restrictions or prohibitions that occur periodically, rather than continuously, and apply only to the aircraft not participating in the military operation. Typically, MOAs restrict non-military aircraft to certain elevations or speed, but do not prohibit them entirely.

MOAs are often positioned over isolated, rural areas to provide ground separation for any noise nuisance or potential accident debris. Each designated MOA appears on the relevant air avigation sectional charts, along with its normal hours of operation, lower and upper altitudes of operation, controlling authority contact and using agency. Although live-fire training with aircraft weapons can only occur within restricted airspace, the adjacent MOAs enhance the versatility and realism of this training by expanding the airspace available for tactical maneuvers before or following ordnance delivery actions, for example at the CMAGR (Draft LEIS, page 3-8). MAOs in Southern California, including portions of eastern Riverside County, are shown in Figure 4.13.3 (Military Airspace Over Riverside County).

Military Training Routes: As shown in Figure 4.13.4 (Military Training Airspace and Training Routes Over Riverside County), a number of "military training routes" (MTRs) link the various facilities of the Bob Stump Complex, as well as providing routes across the country. MTRs are aerial corridors established jointly by the FAA and DoD in which military aircraft can operate below 10,000 feet mean sea level (MSL) at speeds exceeding the 250 knot limit (nearly 290 miles per hour) that all other aircraft are normally restricted to when below that elevation (the exception is when a craft is instructed otherwise by an air traffic controller, e.g., for hazard avoidance reasons, emergencies, etc.). These runs are conducted as part of military low-altitude, high-speed training and at times may exceed the 10,000 foot MSL level. Military craft are supposed to, however, stay at or below Mach 1 (the speed of sound). According to the U.S. Marine Corps, aircraft using these military training routes may fly as low as 200 feet above ground level at speeds up to, but not exceeding, the speed of sound. As with any dangerous exercise, such as flying so close to the ground, there is an increased risk of accident associated with the activity in the event of mechanical failure, bird strike or other air mishap. However, due to the infrequency of these flights and the distances these military aircraft cover, the overall risk of any single person being harmed by such a mishap is very small.

Military Airspace and Routes Over Riverside County: Thirteen MTRs, which share nine centerlines, are currently located within five nautical miles of the restricted airspace at CMAGR (see Figure 4.13.4). Three of these MTRs are used for training missions at the CMAGR, providing entry to the CMAGR and allowing aircrews to practice long-distance, low-level, terrain following, high-speed flight as a tactic for attacking a target while using terrain to mask their approach and evade detection. Four other MTRs transit airspace near the CMAGR, but do not directly support its operations. Others link the southeastern California bases with other military facilities further north (such as the Twenty-nine Palms Air Ground Combat Center north of Riverside County) and in Arizona to the east (e.g., Yuma Proving Ground and Laguna Army Airfield) and southeast (such as the Yuma Air Station and the Barry M. Goldwater Range). All of these facilities are within 100 miles of CMAGR (Draft LEIS, page 3-8).

As shown in Figure 4.13.4, a number of military facilities are associated with "special use airspace" where limitations exist for non-military aircraft. These include "restricted airspace" (combat zones, roughly directly over the facilities) where civilian and unauthorized aircraft are not allowed and "military operation areas" that are "airspace established outside Class A airspace to separate or segregate certain nonhazardous military activities from IFR Traffic and to identify for VFR traffic where [those] activities are conducted" (14 CFR Section 1.1). The MOAs also provide ground separation for any noise nuisance or potential accident debris associated with

military air and ground training activities. Although MOAs do not restrict VFR operations, pilots operating under VFR should exercise extreme caution while flying within, near or below an active MOA.

According to the Riverside County ALUC, per its 2004 Riverside County Airport Land Use Compatibility Plan Policy Document (page I-3), there are also military and restricted flight areas in Riverside County associated with the Quail Military Operations Area, located north of Blythe Airport and the Kane and Abel Military Operations Areas (part of the CMAGR). Additionally, there is a restricted flight area associated with Camp Pendleton (a U.S. Marine Corps Air Station in San Diego County) located southwest of French Valley Airport.

6. Other Military Safety Hazards

According to the CMAGR Draft LEIS (page 3-101), only about 5% of the range supports "surface uses that cause or may cause moderate to complete levels of physical disturbance." The balance of the site is used for various safety zones to ensure a "99.9999% level of containment." This is a probability of munitions (for inert ordnance) or a hazardous fragment (of live ordnance) escaping the containment area of one in a million, per the Draft LEIS. Figure 4.13.5 (Weapon, Laser and Surface Danger Safety Zones at CMAGR) shows the various weapon and surface danger zones associated with the CMAGR.

To protect the general public from intentional or accidental entry onto the CMAGR, warning signs are posted along the range perimeter in both Spanish and English. The range boundaries are patrolled by both local and federal law enforcement officials, as well as the military. Procedures are in place to terminate any live fire exercises immediately if unauthorized personnel or vehicles (most often "scrappers" looking for recyclable metal) are found within range boundaries or spotted by airborne crew.

Lastly, the U.S. Marine Corps routinely performs explosive ordnance disposal (EOD) to "neutralize hazards from live fire training exercises" (Draft LEIS, page 3-103). Despite these, unexploded ordnance (bombs, rockets, cannon rounds, etc.) can be found scattered throughout the CMAGR lying anywhere, on the ground or partially to fully buried due to impact and the resultant explosion. Since it is impossible to tell if ordnance is safe from its appearance, it must be treated as if it were live and must not be touched. The military provides EOD personnel with a 24-hour first-response capability for both CMAGR and civil authorities in the event unexploded ordnance is encountered anywhere on or off the CMAGR.

C. Wildland Fires

Among California's three primary hazards, wildfire, and in particular, wildland-urban interface fires, represent the third-most destructive source of hazard, vulnerability and risk. Within California, ten of the 20 largest wildland fires on record have occurred in the last decade alone. Together, these ten fires consumed over 1.7 million acres (an area larger than the entire state of Delaware), over 5,000 structures and, sadly, took 31 lives. See Table 4.13-D (Largest Fires in California Over the Past Decade), below.

As people and developed areas encroach further into wildlands, the risk for wildfires increases. In addition, increasingly dry years in California due to climate change, insect predation and other factors has led to record amounts of dead and dying vegetation accumulating in the state's wildlands. The MHMP (page 234) notes that since 2000, the total annual average acres burned is nearly twice that burned in the pre-2000 period. Hence, both in terms of recent state history and the probability of future destruction of greater magnitudes than previously recorded, the State of California and Riverside County face steep challenges in preventing wildfire losses.

WEAPON, LASER AND SURFACE DANGER SAFETY ZONES AT CMAGR

This page intentionally left blank

In Riverside County, the most severe fire disaster to-date occurred during the *2006 Esperanza Fire* ~~Station Fire in August 2009~~, which burned *43,000* ~~160,000~~ acres and killed *five* ~~six~~ firefighters. In October 1993, power lines knocked down by Santa Ana winds started a fire that destroyed 107 homes and burned 25,100 acres in Riverside County. The Governor proclaimed a state of emergency and the President issued a "Major Disaster Declaration" during these events as well as other fire events in Riverside County.

Table 4.13-D: Largest Fires in California Over the Past Decade

	Fire Name (Cause) [1]	Date	County	Acres [2]	Structures	Deaths
1	Rush Fire (lightning)	Aug. 2012	Lassen[3]	315,600	1	0
2	Cedar (human)	Oct. 2003	San Diego	273,200	2,820	15
4	Zaca (human)	July 2007	Santa Barbara	240,200	1	0
5	Witch (power lines)	Oct. 2007	San Diego	198,000	1,650	2

1. Fire Threats

a. Types of Fires

As delineated by the State MHMP (page 236), there are three types of fires. The first are urban fires, the type of fire most people think of when considering the topic. Urban fires tend to be of limited extent - a single building or block - except in the more rare case of an urban conflagration. (A 'conflagration' is generally used to describe extraordinarily destructive or extensive fires, usually with a moving rather than stationary fire front.) The second type are wildland fires, which generally occur in open lands, vegetated and undeveloped. Wildland fires are the 'classic' wildfire or forest fire that may burn across fields, hills and other natural areas. As shown in Table 4.13-F (Housing Density Classes for Defining Types of Fire Hazard Lands), below, wildlands can have some homes associated with them, though at a lower density than in 'interface' areas. This last type of fires, wildland-urban interface (WUI) fires, occur in the most hazardous and risky areas in which the urban environment extends into open areas, resulting in a complex mixture of fuels, properties and threats. Because of the severe risk to people and property associated with WUI fires, they are the focus of the most extensive fire planning and prevention efforts.

According to the MHMP (page 236), California experiences an average of 5,000 WUI fires each year. The wildland-urban interface is defined by the State of California as "the area or zone where structures and other human development meet or intermingle with undeveloped wildland or vegetative fuels." Most WUI fires are controlled, limiting their damage and acreage. The remainder cause extensive damage. Wildland-urban interface fires represent a widespread vulnerability for counties like Riverside in which population growth and development pressure continue to push humans into previously vacant, undeveloped wildlands. With the homes, private property and other structures present, WUI fires are the most damaging and even small fires can cause substantial losses. Such losses include damage to infrastructure, the built environment, loss of socioeconomic values and injuries to people.

In addition to homes, businesses and possessions, WUI fires can also cause damage to critical infrastructure, such as electrical transmission towers, railroads, water reservoirs and tanks, communications relay facilities and other assets. In addition to direct fire losses for humans, as well as direct habitat loss for plant and animal species, there may also be secondary negative impacts from the wildland fire related to air quality; loss of prey, foraging, dens, nesting and roosting sites for wildlife; soil erosion resulting in siltation of streams and lakes; mudslides and also downstream flooding. (Non-interface wildland fires also can cause these types of habitat and wildlife impacts.)

According to data released by CalFire, over a five-year average (2000-2005), within CDF's jurisdiction, causes of wildfires included the following: equipment use (27%), vehicles (14%), undetermined (14%), miscellaneous (13%), debris burning (10%), arson (7%), lightning (5%), campfires (3%), power lines (3%) smoking (2%), playing with fire (2%) and railroad activities (<1 %). The State of California notes that "the most common extreme fire behavior factor is high wind, such as Santa Ana winds, that follow a predictable location and seasonal pattern."

Table 4.13-F: Housing Density Classes for Defining Types of Fire Hazard Lands

Class	Description	Lot Size	Density
Wildland	Less than one housing unit per 20 acres.	> 20 acres	> 0.05 du/ac
Rural	From 1 housing unit per 5 acres to 1 housing unit per 20 acres.	5 - 20 acres	0.05 - 0.20 du/ac
Interface	From one housing unit per acre to one housing unit per 5 acres.	1 - 5 acres	0.20 - 1.00 du/ac
Urban	Greater than one housing unit per acre.	< 1 acres	> 1.00 du/ac

Source: State of California Multi-Hazard Mitigation Plan, October 2010, Table 5.Y, page 247.

b. Conflagrations

An urban conflagration is a large, disastrous fire in an urban area, as the result of a wildfire, earthquake, gas leak, chemical explosion or arson, among many possible causes. As noted by the State MHMP, the urban conflagration that followed the 1906 San Francisco Earthquake did more damage than the earthquake itself. Historically, a huge source of danger to cities throughout human history, urban conflagration has been reduced as a general source of risk to life and property through improvements in community design, construction materials and standards, and fire protection systems and services. Although the frequency of urban conflagration fires has been reduced, as noted by the MHMP, they still remain a risk to human safety, particularly because of the current trend toward increased urban density and infill in areas adjacent to the wildland-urban interface. As growth pressures create ever-growing demand for housing close to jobs and urban centers, areas previously left as open space due to steep slopes and high wildfire risk are being reconsidered as infill areas for high-density housing.

2. Wildfire Potential Associated with Vegetation

a. Fire and Vegetation Relationship

As reported by the State of California (MHMP, page 250), "Fire is a natural and critical ecosystem process in most of California's diverse terrestrial ecosystems, dictating in part the types, structure and spatial extent of native vegetation in the state." Many of California's ecosystems are adapted to a historic 'fire regime,' which characterizes historic patterns of fire occurrence in a given area. Fire regimes include temporal attributes (e.g., frequency and seasonality), spatial attributes (e.g., size and spatial complexity) and magnitude attributes (e.g., intensity and severity), each of which have ranges of natural variability (MHMP, page 250).

Ecosystem stability is threatened when any of the attributes for a given fire regime diverge from its range of natural variability, which currently is prevalent throughout California. In general, when compared to historic fire regimes, many mixed-conifer forests now experience fires that are more intense and severe, while chaparral shrublands experience fire at a greater frequency. Both trends have profound impacts on ecosystem stability throughout California.

A principal cause of intensifying wildfire severity in mixed-conifer forest types in the state is the mounting quantity and continuity of forest fuels that have been brought about by a century of fire exclusion. Fire exclusion in California and throughout the western U.S. has been attributed largely to fire suppression, elimination of Native American ignitions and introduction of grazing that removed fine fuels necessary for fire spread in and between forested stands. Conifer forests that historically experienced frequent but low-intensity surface fires, which are prevalent throughout California, are now predisposed to high-intensity, high-severity crown fires (because of the greater infrequency of fires due to greater fire suppression efforts).

Conversely, native chaparral shrublands, which typically burn in high-intensity stand-replacing events, are threatened due to too-frequent ignitions, which are leading to a type conversion to non-native grasslands. This trend is particularly acute in Southern California where burgeoning population growth in fire-prone areas has resulted in increased ignitions through accident or arson. As a result, this has contributed to the conversion of much of the original sage scrub habitats, particularly in flatlands and low hills, to non-native grasslands and ruderal (weedy) fields.

b. Fire-prone Vegetation and Fuels in Riverside County

In Riverside County, as well as in San Bernardino and San Diego counties, there have been dramatic and historic changes in the montane chaparral and timber fuel types in the last few years. The persistent drought, insect damage, frost damage and disease have killed huge stands of timber and brush over tens of thousands of acres in wildland areas, particularly in the local mountain ranges. Wildland fires can also occur in suburban and rural areas of the county, as well as vacant weedy land in developed areas, timber or forestland, range land, watershed, brush or grasslands.

Much of Riverside County is considered to have a moderate to high potential for wildland fires according to CalFire. In these areas, special state statutes govern development. The CalFire Riverside Unit categorizes wildfire risk by vegetation type, moisture content, terrain and topography, among other factors. The following descriptions of the vegetative fuel types occurring within Riverside County, and the relative fire risks associated are from the Riverside Unit's 2012 Strategic Fire Plan.

Generally, Battalion 1 (Perris) consists of a light grasses in the more populated areas, with medium fuels found in the hills of the more sparsely populated areas, such as along Santa Rosa Mine Road and in the Juniper Flats area. The Battalion 2 (Lake Elsinore) area east of Interstate 15 (I-15) is comprised mainly of open grasses and weeds, typically providing greater than 50% ground cover and having a significant fire history. The west portion of the battalion consists of a mix of SRA, LRA and USFS lands in a CalFire Direct Protection Area (DPA) and USFS lands in a federal DPA. This area is known collectively as the Ortega Front country and is bordered on the south by La Cresta and to the north by the border between Battalions 2 and 4. This area poses one of the greater fire risks in Riverside County and consists primarily of coastal chaparral (heavier brush). There are portions of this area with significant fire history and areas that have no recorded fire history.

Battalion 4 covers the Corona area, including the Santa Ana River, which features a continual bed of fuels in the river bottom from just east of the Van Buren Boulevard Bridge in Pedley extending west to Highway 71 along the county line. The river bottom fuel load is made up of annual grasses, bamboo (arundo) and various species of brush and trees. In the Chino Hills area, annual grasses are abundant, with small patches of brush and a few oak and sycamore trees in the canyons. Most of this area was burned in the 2008 Freeway Fire. In the Dawson Canyon and Spanish Hills area further down the Temescal Valley, the fuels are annual grasses and light brush. With the exception of a few canyons, these hills have been burned numerous times over many years. Because of the light fuel load, the large fires in this area have been predominantly wind driven. In the foothills that run along the Cleveland National Forest (on the west side of the valley) the fuels are generally light grasses with heavy brush (chaparral). CalFire and USFS have been maintaining the fuel breaks that run along the Main Divide Truck Trail and down several main ridge lines into the Temescal and Corona Valleys.

In the Beaumont (Battalion 3) region, fuels vary widely, ranging from grass, coastal sage scrub, chemise and Russian thistle to scrub oaks. In the area north of Cherry Valley, manzanita (a tall chaparral shrub species) is the predominate fuel. The south area of the battalion, on the northern slopes of the San Jacinto foothills, has been primarily reduced to annual grasses due to conversion from recent fires. However, some larger pockets of coastal sage and chaparral still remain.

In the San Jacinto (Battalion 5) region, below 2,000 feet elevation fuels consist mostly of grasses and coastal sage scrub. Above 2,000 feet, the fuel type is dictated by the length of time since the last fire. Areas burned less than 20 years ago feature grass and medium brush; those that have burned over 20 years ago are composed of heavier mixed brush and tall chaparral. Due to the persistent drought conditions over the last few years, the mature chaparral fuels in the San Jacinto region show a high dead-to-live ratio.

The five stations comprising Battalion 11 in the San Jacinto Mountains encompass: Station 23 (Pine Cove), Station 29 (Anza), Station 30 (Pinyon), Station 53 (Garner Valley) and Station 77 (Lake Riverside). In the Pine Cove/Idyllwild area covered by Station 23, fuels are composed of mature chaparral with a mixed conifer forest overstory. The predominant understory species include manzanita, chaparral whitethorn, deer brush and chemise. The area has a persistent grass understory of 12 to 18 inches high and often matted down, which adds to the fuel loads. The overstory consists of mixed stands of Jeffery pine, ponderosa pine, Coulter pine, incense cedar, white fir and sugar pine. There is no recorded fire history for the area since fire records started being kept around 1924, therefore it is assumed the vegetative community is at least 75 years old. In the Anza area (Station 29), the fuel types consist of approximately 25% grass groundcover, mostly located on the valley floor on the Cahuilla Indian Reservation and along the Cooper Cienaga Truck Trail to the south. Heavier mixed brush and chaparral cover roughly 30% of the area, intermixed through the valley. Grass and medium brush cover approximately 45% of the area and include larger stands of manzanita and red shank averaging 10-15 feet high. The Station 30 (Pinyon) area features brush of varying thickness and height, with patches of grass intermixed throughout. Along Highway 74 and some of the communities, a fuel reduction project has helped thin and remove fuels to allow safe egress from the mountain. In the Garner Valley (Station 53), the extended drought has left an abundance of dead and downed fuels as well as a high dead-to-live ratio in the chaparral fuels and an extensive grass understory. Fuel reduction projects have helped thin and remove fuels near transportation corridors, local communities and camping areas. Lastly, the Lake Riverside (Station 77) area, near Aguanga, consists mainly of tall grasses near Highways 79 and 371. Further to the northeast along Highway 371 the fuels change into medium brush and tall chaparral at the slightly higher elevations.

Battalion 15 (Temecula) covers the southwestern portion of Riverside County and includes Station 12 (Temecula), Station 75 (Bear Creek), Station 92 (Wolf Creek) and Station 96 (Glen Oaks). The region displays the classic fuel pattern of inland Riverside County with annual grasses and weeds predominant in the flatter areas, trending to brush, such as chamise, sage, buckwheat and similar sage scrub species, in the less disturbed areas and hills. In the higher hills, the brush tends towards chaparral species. Battalion 13 (Menifee), which covers roughly 42 square miles, is located north of the cities of Murrieta and Wildomar, south of the City of Perris, west of the Winchester area and northeast of the City of Lake Elsinore. Fuels in this area consist of light native brush, i.e., classic Riversidean sage scrub species. The area is surrounded and interspersed with extensive grass understory, particularly in disturbed areas. Lastly, Battalion 17 (Cajalco) lies between Perris Valley to the east and Temescal Valley to the west. It encompasses two ecological reserves: Lake Matthews-Estelle Mountain Reserve and Harford Springs Reserve. Fuels in the area consist mostly of annual grasses and coastal sage scrub with some pockets of chaparral species in canyons and on the northern slopes.

3. Fire Responsibility Areas

a. Types of Fire Responsibility Areas

In the 2010 MHMP (page 239), the State of California notes that "There are literally hundreds of agencies that have fire protection responsibility for wildland and WUI fires in California." Often the primary responsibility for a parcel will come down to two organizations, one for wildland fire protection and the other for structural or 'improvement' fire protection. Thus, in order to ensure that these layers of responsibilities, as well as the myriad of rules, regulations, policies and ordinances addressing fire, do not cause conflict or confusion, in 1981 the State of California established specifically defined "Federal Responsibility Areas," "State Responsibility Areas" and "Local Responsibility Areas." Under California State law, each of these areas is specifically defined and the lands falling within each are explicitly mapped as well. The MHMP (page 239) describes each of these areas as follows. See Section 4.13.3.C for specifics on related regulations.

Federal Responsibility Areas: Federal Responsibility Areas (FRAs) are fire-prone wildland areas that are owned or managed by a federal agency such as the U.S. Forest Service, National Park Service, BLM, U.S. Fish and Wildlife Service or DoD. On FRA lands, primary financial and rulemaking jurisdictional authority rests with the federal land agency. In many instances, FRAs are interspersed with private land ownership or leases. Fire protection for developed private property is usually *not* the responsibility of the federal land management agency; structural protection responsibility is that of a local government agency.

State Responsibility Areas: State Responsibility Areas (SRAs) are those lands within California that meet specific geographic and environmental criteria (see below). In these are areas CalFire has legal and financial responsibility for wildland fire protection. CalFire also administers the fire hazard classifications and building standard regulations that apply. Specifically, SRAs are defined as lands that 1) are county unincorporated areas; 2) are not federally owned; 3) have wildland vegetation cover (forest, brush, grasslands, etc.) rather than agricultural or ornamental plants; 4) have watershed, range, forage or other such value; and, 5) have housing densities not exceeding three units per acre. Similar to the FRAs, where SRAs contain built environment or development, the responsibility for fire protection of those improvements (non-wildland) is that of a local government agency. Essentially, SRAs are private lands in WUI areas within the unincorporated county. SRA wildlands also require disclosure for real estate transactions and owners of properties in wildland areas are subject to the maintenance requirements of California Public Resources Code (PRC) Section 4291. SRA maps are updated by the State of California every five years.

Local Responsibility Areas: Local Responsibility Areas (LRAs) include land within incorporated cities, cultivated agriculture lands and non-flammable areas (e.g., deserts) and those lands that do not meet the criteria for SRA or FRA. LRA fire protection is typically provided by city fire departments, fire protection districts and counties. *Many cities in Riverside County receive fire protection by CalFire, under contract to local governments.* ~~Or, in some cases, such as for many of the cities in Riverside County, by CalFire under contract to local governments.~~ LRAs may include flammable vegetation and wildland-urban interface areas where the financial and jurisdictional responsibility for improvement and wildland fire protection is that of a local government agency.

b. Fire Responsibility Areas in Riverside County

As shown in Figure 4.13.6 (Fire Responsibility Areas in Riverside County), in Riverside County, SRAs comprise the largest portion of unincorporated territory. LRAs are associated mostly with the cities, and there are large swaths of FRAs within Riverside County as well. As calculated by the Riverside County GIS Department, the acreage for each of these jurisdictional areas is as follows:

- **State Responsibility Areas (CalFire):** 544,180 acres of unincorporated Riverside County. (In addition to the unincorporated Riverside County territory, the CalFire Riverside Unit also encompasses 2,630 acres of adjacent San Diego County and 620 acres of Orange County.)
- **Local Responsibility Areas (CalFire):** 13,206 acres of unincorporated Riverside County through wildland contract with the County of Riverside. Plus the incorporated cities contracted to use CalFire as their local firefighting service.
- **Local Responsibility Areas (Local Agencies):** 572 acres of unincorporated Riverside County are under the jurisdiction of other agencies (e.g., city fire departments, etc.).
- **Federal Responsibility Areas (BLM):** 52,650 acres of Riverside County are under BLM jurisdiction.
- **Federal Responsibility Areas (USFS):** 62,520 acres of Riverside County are under USFS jurisdiction.

4. Fire Hazard Legislation and Severity Zones

Since the early 1990s, a number of regulations have been promulgated by the state to address fire hazards within the wildland-urban interface, in which the risk of fire hazards is substantial. To ensure land use and building standards adequately reflect and protect a region's fire hazard in WUIs, the State (CalFire) has prepared, and periodically updates, sets of "fire hazard severity zone" maps. These fire hazard severity zones (FHSZs) are defined under Section 4702.1 of the 2007 California Fire Code (CFC) as "geographical areas designated pursuant to [PRC] Sections 2401 through 4204 and classified as Very High, High or Moderate in State Responsibility Zones or as Local Agency Very High Fire Hazard Severity Zones designated pursuant to [GC] Sections 51175 through 51189."

Each of these zones is described below. These zones are used to determine the appropriate construction materials for new buildings within the WUI. Specifically, the regulations of the California Building Code (CBC) Chapter 7A ~~(as amended via Riverside County Ordinance No. 787)~~ are mandatory in SRA FHSZs and LRA very high FHSZ areas.

The FHSZs also dictate when a natural hazard disclosure must be prepared when a property is sold. Specifically, since 1991 each seller of real property in an SRA is required to disclose to any prospective purchaser that the property for sale is in a wildland area that may be subject to wildfire risks and hazards. Each seller must also disclose that the property must meet the flammable vegetation clearance requirements of PRC Section 4291. The seller must also disclose that it is *not* the state's responsibility to provide fire protection services to any building or structure located within the wildland unless that state has entered into an agreement with the local government to provide structure fire protection. Since 1998, all SRA lands pursuant to PRC 4125 are included on the Natural Hazard Disclosure maps and very high FHSZ areas in LRAs are also on the Natural Hazard Disclosure maps.

a. Types of Hazardous Fire Severity Zones

The fire hazard severity zone (FHSZ) mapping effort is done under authorities defined in PRC Section 4201 and GC Section 51175. The effort incorporates wildland fire behavior science, data sets and engineering information on structure ignition mechanisms during conflagrations. As noted in the code (PRC Section 4202), the zones are based on "fuel loading, slope, fire weather and other relevant factors present."

State Responsibility Areas: For SRAs, CalFire completed and adopted new FHSZ maps in late 2007. Per the California Code of Regulations (CCR), Section 701A.3.2, new buildings located in any FHSZ within an SRA are subject to the WUI building standards of the 2008 (or later) California Building Code. Within SRAs, CalFire maps a range of fire hazard severities (moderate, high, very high); these maps are updated every five years.

Local Responsibility Areas: As noted above, CalFire is also tasked with identifying the very high fire hazard severity zones for LRA so that public officials for the local agencies can identify appropriate measures to "mitigate the rate of spread and reduce the potential intensity of uncontrolled fires that threaten to destroy resources, lives and property" (PRC Section 4201). Once received from the state, the local agency is required to designate, by ordinance, the very high fire hazard severity zones in its jurisdiction. As outlined further below, the County of Riverside has accomplished this for its LRAs via Riverside County Ordinance No. 787.

b. Mapped Hazardous Fire Severity Zones in Riverside County

Much of the hilly portions of unincorporated Riverside County are mapped as having substantial fire risks; being designated as SRAs with moderate, high or very high fire hazard. See Figure 4.13.7 (Fire Hazard Severity Zones

in Riverside County), which shows the fire hazards in Riverside County broken down by SRA and LRA, as well as severity level (moderate, high or very high). Since the hillside terrain of Riverside County is predominantly mapped as having a substantial fire risk, much of the County of Riverside is subject to PRC Sections 4291-4299 which require property owners in these areas to conduct maintenance to reduce the fire danger. These sections affect all buildings and structure in or adjoining any mountainous area or forest-, brush- or grass-covered land, or any land covered with flammable material.

5. Fire Protection Services in Riverside County

The County of Riverside contracts with the State (i.e., CalFire) for fire protection. Under CalFire management, the Riverside County Fire Department (RCFD) operates 95 fire stations in 17 battalions. Fifty-one of these stations, as well as three stations operated directly by CalFire, are located in the unincorporated portion of Riverside County (see Table 4.17.2-A in Section 4.17.2 for full details).

RCFD provides fire suppression, emergency medical, rescue and fire prevention services and is equipped to fight both urban and wildland emergency conditions. Equipment in the RCFD inventory includes: structural engines, rural engines, brush engines, telesquirts, trucks, paramedic units, a helicopter, hazardous materials unit, incident command units, water tenders, fire crew vehicles, mobile communications centers, breathing support units, lighting units, power supply units, fire dozers, mobile training vans and emergency feeding units.

For fighting wildfires, CalFire has extensive ground forces, including volunteer firefighters from prisoner populations and an air force that includes (statewide): fifteen Grumman S-2A 800-gallon airtankers, four S-2T 1,200-gallon airtankers, two 2,000-gallon contract airtankers, eleven Super Huey Bell UH-1H helicopters, six O-2A air attack aircraft, eleven OV-10A air attack craft and one C-26B fire mapping airplane. In operation, the air attack planes fly overhead directing the airtankers and helicopters to critical areas of the fire for retardant and water drops. The retardant used to suppress fires is diammonium phosphate plus iron oxide, which acts as a fertilizer as well as fire suppressant.

In addition to serving Riverside County's unincorporated areas, the RCFD provides fire protection services to 18 cities and one Community Service District (Rubidoux CSD) on a contractual basis providing fire protection specialists to review plans for all new developments, commercial and industrial buildings located within the contract cities and unincorporated areas of Riverside County. More information on RCFD services and facilities is provided in Section 4.17.2 of this EIR.

6. Standards for Ensuring Fire Protection

a. California Fire Codes and Wildland-Urban Interface Codes

In late 2005, the California Building Commission adopted the Wildland-Urban Interface Codes, with an effective date of January 2008, as part of a set of new California Fire Codes. The new WUI Codes included provisions for ignition-resistant construction standards in WUI areas. As noted above, the WUI codes apply to new building applications in three specific areas:

- All State Responsibility Areas (any Fire Hazard Severity Zone).
- Local Responsibility Areas (only the Very High Fire Hazard Severity Zone).
- Any wildland-urban interface fire area designated by the enforcing agency (i.e., County of Riverside).

RIVERSIDE COUNTY PLANNING DEPARTMENT

WILDLAND FIRE HAZARD SEVERITY ZONES

\\agency\ltmaps\Projects\Planning\SafetyElement\Fire_Susceptibility.mxd

This page intentionally left blank

As noted by CalFire, "the broad objective of the WUI Fire Area Building Standards is to establish minimum standards for materials and material assemblies and provide a reasonable level of exterior wildfire exposure protection for buildings in WUI areas." It further notes that "The use of ignition resistant materials and design to resist the intrusion of flame or burning embers projected by a vegetation fire (wildfire exposure) will prove to be the most prudent effort California has made to try and mitigate the losses resulting from our repeating cycle of interface fire disasters." (WUI Building Standards Information Bulletin, CalFire, Sept. 2007)

b. Ordinance No. 787 - Fire Code Standards

This ordinance addresses implementation of the California ~~Building~~ Fire Code, based on the International ~~Conference of Building Officials~~ *Code Council*. The codes prescribe performance characteristics and materials to be used to achieve acceptable levels of fire protection and include the WUI fire area building standards mentioned above. Collectively, the ordinance establishes the requirements and standards for fire hazard reduction regulations within Riverside County (including additions and deletions to the California Fire Code) to fully protect the health, safety and welfare of existing and future residents and workers of Riverside County.

Among other things, this ordinance assures that structural and nonstructural architectural elements of the building do not: a) impede emergency egress for fire safety staffing/ personnel, equipment, and apparatus; nor b) hinder evacuation from fire, including potential blockage of stairways or fire doors. In addition, for the purposes of CFC implementation, the ordinance also adds a statement noting: "In accordance with Government Code sections 51175 through 51189, Very High Fire Hazard Severity Zones are designated as shown on a map titled Very High Fire Hazard Severity Zones, dated April 8, 2010, and retained on file at the office of the Fire Chief and supersedes other maps previously adopted by Riverside County designating high fire hazard areas." It also defines a "hazardous fire area" as: "Private or public land not designated as state or local fire hazard severity zone (FHSZ) which is covered with grass, grain, brush or forest and situated in a location that makes suppression difficult resulting in great damage. Such areas are designated on Hazardous Fire Area maps filed with the office of the Fire Chief."

c. Fire Flow Standards

Included in Riverside County Ordinance No. 787 are the California Fire Code, *Part 4, Appendix B* ~~Division III, Appendix III-A~~, for establishing fire flow, duration and pressure requirements for fire flow; as summarized in Table 4.13-G (Minimum Fire Protection Flows), below. The requirements are based on building size, type, materials, purpose, location, proximity to other structures and the type of fire suppression systems installed. The various water districts in Riverside County are required to test fire protection capability for the various land uses per the flow requirements of the Fire Code. In addition, areas of Riverside County not served by water districts are required to meet similar requirements as outlined in PRC Sections 4290-4299.

Table 4.13-G: Minimum Fire Protection Flows

Fire Flow Calculation Area (Square Feet)					Fire-Flow (Gallons per Minute) [b]	Flow Duration (Hours)
Type IA and IB[a]	Type IIA and IIIA[a]	Type IV and V-A[a]	Type IIB and IIIB[a]	Type V-B[a]

-	-	191,401-Greater	138,301-Greater	85,101-Greater	8,000	

Types of Construction are based on the California Building Code.
Measured at 20 psi residual pressure
Note: Table 4.13G was replaced in its entirety in order to reflect information from the 2013 fire code. The amended table was developed with the assistance of the Riverside County Fire Department. The information contained within the table is intended as an aid to the user, and as such is non-regulatory. Standards noted within the table are subject to change at the discretion of the Riverside County Fire Department pursuant to updates to the California Fire Code.
Source: State of California, California Fire Code, 2013.

The County of Riverside also requires a development within a high fire hazard area to design and implement fuel modification programs for the interface between developed and natural areas within and adjacent to the proposed project area. Such fuel modification plans shall be subject to approval by the Riverside County Fire Department. The fuel modification programs shall be achieved through graduated transition from native vegetation to irrigated landscape. The program shall also establish parameters for the percent, age, extent, and nature of native plant removal necessary to achieve Riverside County fire prevention standards to protect human lives and property, while preserving as much natural habitat as practicable.

d. Ordinance No. 695 – Hazardous Vegetation

As expected, hillsides throughout Riverside County are predominantly mapped as having a substantial fire risk; thus, much of Riverside County is subject to PRC Sections 4291-4299 and Riverside County Ordinance No. 695. This ordinance requires property owners in such areas to reduce fire danger through mowing and other fuel modification methods. This ordinance affects anyone who "owns, leases, controls, operates or maintains any building or structure in, upon or adjoining any mountainous area or forest-covered lands, brush-covered lands or grass-covered lands or any land covered with flammable material."

Among other measures, Ordinance No. 695 requires the abatement of "hazardous vegetation," which is defined in the ordinance as vegetation that is flammable and endangers the public safety by creating a fire hazard. The type of abatement can depend on the location, terrain and vegetation present, but typically includes the mowing or disking (plowing up) of vegetation, such as seasonal and recurrent weeds, stubble, brush, dry leaves and

tumbleweeds. Abatement is generally required along roadways and habitable structures either on or adjacent to the property.

Each spring, the CDF and RCFD distribute hazard abatement notices. These notices, which currently go to about 30,000 Riverside County residents, requires property owners to reduce the fuels around their property. Requirements for hazard reduction around improved parcels (those with structures) are set forth in Riverside County Ordinance No. 787 (and PRC Section 4291). A minimum 30-foot clearance is required around all structures, which can be extended to 100 feet in areas where severe fire hazards exist. For unimproved parcels adjacent to a roadway, a 100-foot wide strip of abated land at the parcel boundary is required. According to the ordinance, the determination for appropriate clearance distances are made based upon a visual inspection of the parcel and consideration of all factors that place the property or adjoining structures at risk from an approaching fire. These factors include local weather conditions, fuel types, topography and the environment where the property or adjoining structures is located. Where the parcel's terrain is such that it cannot be disked or mowed, the Riverside County Fire Chief may require or authorize that other means of removal be used.

Prior to development, the County of Riverside requires a development within a high fire hazard area (SRA or VHFHSZ LRA) to design and implement fuel modification programs for the interface between developed and natural areas within and adjacent to the proposed project area. Such fuel modification plans shall be subject to approval by the Riverside County Fire Department. The fuel modification programs shall be achieved through graduated transition from native vegetation to irrigated landscape. The program shall also establish parameters for the percent, age, extent, and nature of native plant removal necessary to achieve Riverside County fire prevention standards to protect human lives and property, while preserving as much natural habitat as practicable.

~~As outlined in Riverside County Ordinance No. 659, the County of Riverside also has the ability to require development applicants to pay established fire protection mitigation fees that are to be used by the Riverside County Fire Department to construct new fire protection facilities or provide facilities in lieu of the fee as approved by the Riverside County Fire Department. The Riverside County standard for the establishment of a new fire station is the development of 2,000 dwelling units or 3.5 million square feet of commercial or industrial uses. Riverside County also requires the payment of mitigation fees to collect revenue for the establishment of new stations. Riverside County currently requires new development proponents to pay mitigation fees to help offset the cost of providing new fire facilities. The current Riverside County fire fees are $400.00 per single family dwelling unit and $0.25 per square foot for all other types of development. These fees, however, have not been collected since 1999 (per Tracy Hobday, pers. comm., Feb. 17, 2011). In recent years, however, the State of California has implemented an annual "fire protection fee" for properties with habitable structures on them within SRAs (see below).~~

e. Fire Closures

Based on drought and other conditions, it may become necessary to close an area to the public due to extreme fire hazard potential. Towards this end, Riverside County Ordinance No. 695 outlines the procedures for managing "Hazardous Fire Area" designated lands as follows:

> *The chief is given the authority to officially determine and publicly announce the closure of any hazardous fire area or portion thereof. However, any closure by the chief for a period of more than 15 days must be approved by the Board of Supervisors within 15 days of the chief's original order of closure. No person is permitted in any hazardous fire area, except on public roadways and inhabited areas, during such time as the area is closed to entry. This shall not prohibit residents or owners of private property within any closed area, or their invitees, from going in or being upon their lands. This does not apply to any entry, in the course of duty by a peace officer or any other duly authorized public officer, members of any fire department or member*

of the CDF, nor does it apply to National Forest Land in any respect. During periods of closure, the chief shall erect and maintain at all entrances to the closed areas sufficient signs giving adequate notice of closure.

f. Defensible Space

Pursuant to GC Section 51182, a person who "owns, leases, controls, operates or maintains an occupied dwelling or occupied structure in, upon or adjoining a mountainous area, forest-covered land, brush-covered land, grass-covered land or land that is covered with flammable material" in a very high fire hazard severity zone designated by the local agency pursuant to GC Section 51179, shall at all times do all of the following:

Maintain Defensible Space: Maintain defensible space of 100 feet from the front, rear and each side of the structure. The amount of fuel modification necessary shall take into account the flammability of the structure as affected by building material, building standards, location and type of vegetation. Fuels shall be maintained in a condition so that a wildfire burning under average weather conditions would be unlikely to ignite the structure. (Exceptions may be made for "single specimens of trees or other vegetation that are well-pruned and maintained so as to effectively manage fuels and not form a means of rapidly transmitting fire.") The intensity of fuels management may vary within the 100-foot perimeter of the structure, the most intense being within the first 30 feet around the structure. Consistent with fuels management objectives, steps should be taken to minimize erosion.

Required Defensible Space Distances: A greater distance than that required above may be required by state law or local ordinance or rule. Clearance beyond the property line may only be required if the state law, local ordinance or rule includes findings that the clearing is necessary to significantly reduce the risk of transmission of flame or heat sufficient to ignite the structure, and there is no other feasible mitigation measure possible to reduce the risk of ignition or spread of wildfire to the structure. Clearance on adjacent property shall only be conducted following written consent by the adjacent landowner. A greater distance may also be required by an insurance company providing fire insurance for an occupied dwelling or structure.

Removal of Trees: Remove that portion of a tree that extends within 10 feet of the outlet of a chimney or stovepipe. Maintain trees, shrubs or any other plant adjacent to or overhanging a building free of dead or dying wood. Also, the roof structure must be maintained free of leaves, needles or other vegetative materials.

Certification of New Buildings: Prior to constructing a new dwelling or occupied structure, or rebuilding one damaged by a fire, the owner shall obtain a certification from the local building official that the dwelling or structure, as proposed to be built, complies with all applicable state and local building standards, including those of GC Section 51189(b). Upon the completion of construction or rebuilding, the owner shall obtain from the County of Riverside building official, a copy of the final inspection report that demonstrates that the dwelling or structure was constructed in compliance with all applicable state and local building standards, including those of GC Section 51189(b).

The CalFire website also has a guidance document on fuels management, which discusses: regionally appropriate vegetation management that preserves and restores native species, minimizes erosion, minimizes water consumption and permits trees near homes for shade, aesthetics and habitat. It also provides suggestions to minimize or eliminate the risk of flammability of non-vegetative sources of combustion such as woodpiles, propane tanks, decks and outdoor lawn furniture.

D. Disaster Planning

To adequately protect public health and safety relative to wildland fires and other disaster conditions, the County of Riverside has established the Riverside County Operational Area Emergency Operation Plan (EOP) which addresses planned responses to extraordinary emergency situations, such as natural disasters, technological incidents and national security emergencies in or affecting Riverside County. The EOP describes the operations of the Riverside County Emergency Operation Center (EOC), which is the central management entity responsible for directing and coordinating the various Riverside County departments and other agencies in their emergency response activities.

The EOP also establishes the framework for implementation of the California Standardized Emergency Management System (SEMS) for Riverside County, which is located within Mutual Aid Region VI, as defined by the Governor's Office of Emergency Services (State OES). By extension, the plan also implements the National Incident Management System (NIMS) to facilitate multi-agency and multi-jurisdictional coordination, particularly between Riverside County and local governments, including special districts and State agencies, in emergency operations. The County of Riverside also has mutual aid agreements with local jurisdictions (24 cities), as well as a number of special districts and other governmental entities (e.g., school districts, water districts, Soboba Indian Tribe, etc.).

The Riverside Operational Area developed the Riverside County Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP) which identifies and analyzes an extensive list of the hazards (natural and technical) faced by the County of Riverside. Each hazard is assigned a severity rating, indicating the amount of damage to Riverside County and its population should the hazard occur, and a probability rating, indicating the likelihood that the hazards may occur within Riverside County.

4.13.3 Policies and Regulations Addressing Hazardous Materials and Safety

A. Hazardous Materials

1. Federal Regulations

Comprehensive Environmental Response, Compensation and Liability Act (CERCLA): Discovery of environmental health damage from disposal sites, such as the Stringfellow acid pits in western Riverside County, prompted the U.S. Congress to pass the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA or "Superfund Act") (42 United States Code [USC] Sections 9601-9675). The purpose of CERCLA is to establish requirements for identifying and cleaning up chemically contaminated sites that pose a significant environmental health threat. A "Hazard Ranking System" is used to determine whether a site should be placed on the National Priorities List for cleanup activities.

Superfund Amendments and Reauthorization Act (SARA): The Superfund Amendments and Re-authorization Act (SARA) pertains primarily to emergency management of accidental releases. It requires for-mation of state and local emergency planning committees which are responsible for collecting material handling and transportation data for use as a basis for planning. Title III of SARA is also known as the Emergency Planning and Community Right-to-Know Act (EPCRA), which was established to encourage and support emer-gency planning efforts at the state and local levels. Among other things, chemical inventory data is made available

to the community at large under this provision of the law. In addition, SARA also requires annual reporting of continuous emissions and accidental releases of specified compounds. These annual submissions are compiled into a nationwide Toxic Release Inventory prepared by the U.S. Environmental Protection Agency (US-EPA).

Resource Conservation and Recovery Act (RCRA): RCRA Subtitle C (USC Title 42, Chapter 82) addresses hazardous waste generation, handling, transportation, storage, treatment and disposal. It includes requirements for a system that uses hazardous waste manifests to track the movement of waste from its site of generation to its ultimate disposition. Amendments to RCRA in 1984 created a national priority for waste minimization. Subtitle D establishes national minimum requirements for solid waste disposal sites and practices. It requires states to develop plans for the management of wastes within their jurisdictions. Subtitle I requires monitoring and containment systems for underground storage tanks that hold hazardous materials. Owners of tanks must demonstrate financial assurance for the cleanup of a potential leaking tank.

In addition to specific materials produced by industry, hazardous wastes are often generated as by-products of industrial, manufacturing, agriculture and other uses. RCRA defines a hazardous waste as any solid, liquid or contained gaseous material that is disposed, incinerated or recycled. A hazardous material may also become hazardous waste through its accidental or inadvertent release into the environment. Both hazardous materials and hazardous waste pose potential risks to health, safety and welfare in Riverside County if handled inappropriately. All hazardous waste must be discharged at a Class I facility (see discussion below on landfills).

Small-scale hazardous waste generators are businesses that generate less than 2,205 pounds (1,000 kilograms) of hazardous waste per month (that is, 13.23 tons per year). A majority of the hazardous waste generators under Riverside County's purview are classified as small-quantity generators. Collectively, small businesses generate a very large portion of the hazardous waste produced in the County of Riverside. This information is also a part of the U.S. EPA's TRI information provided by individual facilities, which documents the release and transfer of hazardous materials resulting from manufacturing processes. This database describes the type of hazardous material generated and the method of disposal, either through onsite release, offsite disposal or offsite recycling.

Hazardous Materials Transportation Act (HMTA): The HMTA (49 USC Sections 5101-5127) is the statutory basis for an extensive body of regulations aimed at ensuring the safe transport of hazardous materials via water, rail, highways, air and pipelines. It includes provisions for material classification, packaging, marking, labeling, warning placards and shipping documentation.

The U.S. Department of Transportation (DoT) has a system of numerical designations (the International Classification System) that may be displayed on placards, labels and/or shipping papers. The shipper of any hazardous material must classify the material according to its hazardous properties. This system categorizes hazardous materials into nine different classes (1-9) based on a number of characteristics and includes explosives, gases, flammable liquids and solids, oxidizers, poisons, etc. In addition to the numerical classification system for hazardous materials, the DoT has established a placard system for identifying hazardous materials during transport. The U.S. EPA requires their use on all shipments of hazardous materials. These placards are large in size and similar in shape (typically diamond) and are required to be displayed on all sides on any truck or railcar that transports hazardous materials. When a truck or railcar is transporting more than one hazardous material or more than 5,000 pounds of a material, a placard indicating "DANGEROUS" must also be displayed. Some placards also include a four-digit code indicating the type of material being transported. This four-digit identification number is required on any tank truck or rail tank car and provides precise identification in an emergency.

Occupational Safety and Health Act: Enacted in 1970, this federal law, like its namesake enforcement agency, OSHA (the Occupational Safety and Health Administration), governs the occupational health and safety of the private sector and the federal government. Codified under United States Code (USC) Title 29, Chapter 15, the

OSH Act ensures that employers provide employees with an environment free from "recognized hazards," such as exposure to toxic chemicals, excessive noise, mechanical dangers, heat or cold stress, and unsanitary conditions. The Act also created the Occupational Safety and Health Review Commission to review enforcement priorities, actions and cases, and the National Institute of Occupational Safety and Health, an independent research institute under the Centers for Disease Control. The Act covers all broadly-defined "employers" other than those covered by other federal laws (e.g., mining, railroads, airlines, weapon manufacturers, etc.), family farms, the self-employed and also state and local governments. Section 18 of the OSH Act permits and encourages states to adopt their own occupational safety and health plans, provided the state's standards and enforcement programs are as effective as the OSH Act or "will be at least as effective in providing safe and healthful employment." The State of California is an "OSHA State" in that it has such a plan; see additional information under state program, below.

Section 5 of the OSH Act contains a "general duty clause" that requires employers to: maintain conditions or adopt practices reasonably necessary and appropriate to protect workers on the job; be familiar with and comply with standards applicable to their establishments; and, ensure that employees have and use personal protective equipment when required for safety and health. OSHA may act under the general duty clause when four criteria are met: First, there must be a hazard. Second, the hazard must be a recognized hazard (e.g., the employer knew or should have known about the hazard, the hazard is obvious or the hazard is a recognized one within the industry). Third, the hazard must be sufficient to cause, or be likely to cause, serious harm or death. And, lastly, the hazard must be correctable (OSHA recognizes not all hazards are correctable).

Toxic Substances Control Act: Codified under 15 USC Sections 2601-2692, this federal act regulates the introduction of new or already existing chemicals (which are mostly grandfathered in). Chemicals not on a list (the TSCA Inventory) or subject to an exemption may not be manufactured or imported into the U.S. The US-EPA reviews all "new" chemicals (i.e., those not on the inventory) and regulates (or bans) those found to be an "unreasonable risk to human health or the environment." The TSCA also addresses exposure to specific chemicals, or classes of chemicals, in various subchapters of the law, including: asbestos, (indoor) radon levels, lead (such as in paints and toys), dioxin, hexavalent chromium and PCBs. It also bans the use of chlorofluorocarbons in manufacturing.

2. State Regulations

Cal/OSHA and the California State Plan: Under an agreement with OSHA, since 1973 California has operated an occupational safety and health program in accordance with Section 18 of the federal OSH Act of 1970. The State of California's Department of Industrial Relations administers the California Occupational Safety and Health Program, commonly referred to as Cal/OSHA. The State of California's Division of Occupational Safety and Health (DOSH) is the principal agency that oversees plan enforcement and consultation. In addition, the California State program has an independent Standards Board responsible for promulgating State safety and health standards, and reviewing variances. It also has an Appeals Board to adjudicate contested citations and the Division of Labor Standards Enforcement to investigate complaints of discriminatory retaliation in the workplace.

Pursuant to 29 CFR 1952.172, the California State Plan applies to all public and private sector places of employment in the state, with the exception of federal employees, the United States Postal Service, private sector employers on Native American lands, maritime activities on the navigable waterways of the United States, private contractors working on land designated as exclusively under federal jurisdiction and employers that require federal security clearances. Cal/OSHA is the only agency in the state authorized to adopt, amend or repeal occupational safety and health standards or orders. In addition, the Standards Board maintains standards for certain things not covered by federal standards or enforcement, including: elevators, aerial passenger tramways, amusement rides, pressure vessels and mine safety training. The Cal/OSHA enforcement unit conducts inspections of California workplaces in response to a report of an industrial accident, a complaint about an occupational safety and health

hazard, or as part of an inspection program targeting industries with high rates of occupational hazards, fatalities, injuries or illnesses.

California Hazardous Waste Control Law: The Hazardous Waste Control Law (HWCL) (HSC, Division 20, Chapter 6.5, Article 2, Section 25100, *et seq.*) is the primary hazardous waste statute in California. The HWCL implements RCRA as a "cradle-to-grave" waste management system in the state. It specifies that generators have the primary duty to determine whether their wastes are hazardous and to ensure its proper management. The HWCL also establishes criteria for the reuse and recycling of hazardous wastes used or reuse as raw materials. The HWCL exceeds federal requirements by mandating source reduction planning and broadening requirements for permitting facilities that treat hazardous waste. It also regulates a number of waste types and waste management activities not covered by federal law (RCRA).

California Code of Regulations (CCR), Titles 22 and 26: A variety of CCR titles address regulations and requirements for generators of hazardous waste. Title 22 contains detailed compliance requirements for hazardous waste generators, transporters and facilities for treatment, storage and disposal. Because California is a fully-authorized state according to RCRA, most regulations (i.e., 40 CFR 260, *et seq.*) have been duplicated and integrated into Title 22. However, because the DTSC regulates hazardous waste more stringently than the U.S. EPA, the integration of state and federal hazardous waste regulations that make up Title 22 does not contain as many exemptions or exclusions as does 40 CFR 260. As with the HSC, Title 22 also regulates a wider range of waste types and waste management activities than does RCRA. To aid the regulated community, California has compiled hazardous materials, waste and toxics-related regulations from CCR, Titles 3, 8, 13, 17, 19, 22, 23, 24 and 27 into one consolidated listing: CCR Title 26 (Toxics). However, the hazardous waste regulations are still commonly referred to collectively as "Title 22."

California Unified Program (HSC, Title 27): According to the 2010 MHMP (page 342), California law established the Unified Program to consolidate, coordinate and make consistent the administrative requirements, permits, inspections and enforcement activities of six environmental and emergency response programs: the Hazardous Materials Business Plan/Emergency Response Plan, Hazardous Waste/Tiered Permitting, Underground Storage Tanks, Above-Ground Storage Tanks, California Accidental Release Prevention Program and the Uniform Fire Code Hazardous Materials Management Plan. The state agencies responsible for these programs set the standards for their individual program while local governments implement and enforce the standards. Cal/EPA oversees the implementation of the program as a whole pursuant to CCR Title 27, Division I, Subdivision 4, Chapter 1, Sections 15100-15620. The Unified Program is implemented at the local level by government agencies (called Certified Unified Program Agencies (CUPAs)) certified by the Secretary of Cal/EPA. For the County of Riverside, the Hazardous Materials Management Division of the RCDEH acts as CUPA.

Hazardous Materials Business Plans and Emergency Response Plans: At the state level, Hazardous Materials Business Plan/Emergency Response Plans (HSC Chapter 6.95) seek to prevent or minimize the damage to public health and safety and the environment from a release or threatened release of hazardous materials and to satisfy community right-to-know laws. This is accomplished by requiring businesses that handle hazardous materials in quantities equal to or greater than 55 gallons, 500 pounds or 200 cubic feet of gas or extremely hazardous substances above the threshold planning quantity (as outlined in 40 CFR, Part 355, Appendix A) to: inventory their hazardous materials, develop an emergency plan and implement a training program for employees.

Hazardous Waste Source Reduction and Management Review Act: This 1989 act, also sometimes referred to as Senate Bill 14, requires hazardous waste generators to use source reduction as the preferred method of managing hazardous waste. Source reduction is preferable to recycling and treatment options because source reduction avoids waste generation costs and management liability. It also provides the best protection for public health and the environment. Under SB 14, facilities generating more than 12 kilograms of hazardous waste or

extremely hazardous waste are required to do source reduction planning. Hazardous waste generators subject to SB 14 are each required to prepare and implement a Source Reduction Evaluation Review and Plan, a Hazardous Waste Management Performance Report and submit annual Summary Progress Reports.

Medical Waste Management Act: This act, chaptered in HSC Sections 117600 through 118630, sets regulations for ensuring the safe handling, storage, processing and disposal of medical wastes within California. Among other things, it addresses medical waste generators, as well as medical waste treatment facilities, defines medical wastes, biohazards and related materials, and also requires medical waste management plans of all generators of medical waste (both "large" and "small"). It also addresses the establishment and actions of a "medical waste management program" for local agencies, such as the County of Riverside. Such programs encompass the issuance of "medical waste registrations," medical waste management plans, inspection of large-quantity medical waste generators, medical waste treatment facilities and medical waste haulers, as well as the investigation of violations of the HSC and enforcement of these regulations.

3. County Regulations

Ordinance No. 348 - Land Use, Section 18.44 - Hazardous Waste Facility Permits: This section of the Riverside County land use ordinance provides specific requirements applicable to the siting or expansion of a hazardous waste facility in order to safeguard life, health, property and the public welfare.

Ordinance No. 615 – Hazardous Waste Generation, Storage, Handling and Disposal: This ordinance was promulgated for the purpose of monitoring establishments where hazardous waste is generated, stored, handled, disposed, treated or recycled and to regulate the issuance of permits and the activities of establishments where hazardous waste is generated. This ordinance designates RCDEH to enforce the provisions of HSC Division 20, Chapter 6.5, Section 25100, *et seq*., and the "Environmental Health Standards for the Management of Hazardous Waste," as specified in CCR Title 22, Division 4.5, pertaining to the generation, storage, handling, disposal, treatment and recycling of hazardous waste.

Ordinance No. 617 - Underground Storage Tanks Containing Hazardous Substances: This ordinance implements Section 25280 *et seq.* of the California Health and Safety Code to ensure that hazardous substances stored in underground tanks are done so safely and in a manner that prevents contamination. It does so by establishing appropriate construction standards for new underground storage tanks and requiring maintenance, monitoring and inspection of existing tanks. The ordinance also establishes a Local Oversight Program for "unauthorized releases of petroleum and petroleum-related materials from leaking underground tanks systems which require remedial action...to prevent long-term threats to the public health, water quality and environment." The RCDEH manages these programs.

Ordinance No. 651 - Disclosure of Hazardous Materials and Business Emergency Plans: This ordinance implements the State of California's "Hazardous Materials Release Response Plans and Inventory Law" (HSC, Chapter 6.95), to establish a system for permitting businesses handling hazardous materials. It serves to enforce minimum material standards and designates the Riverside County Community Health Agency as the agency responsible for administering and enforcing HSC Chapter 6.95. The RCDEH may require compliance with the applicable articles of the most-current Fire Codes. Pursuant to HSC Section 25500, the Riverside County Board of Supervisors may also impose additional, more stringent requirements on businesses that handle hazardous materials.

Ordinance No. 718 - Generation, Storage and Transportation of Medical Waste: This ordinance implements a medical waste management program in accordance with the Medical Waste Management Act, HSC

Division 14, Part 14. It establishes requirements for the management of medical waste and makes provisions for its enforcement.

Riverside County Fire Department (RCFD): The RCFD maintains a hazardous material (hazmat) team to respond to hazardous materials spills and leaks as well as provide expertise in the safe handling, abatement and documentation of hazmat emergencies. The RCFD implements its program through its Hazardous Materials Response Plan, which is required under CCR Title 8. Riverside County's team is a two-part company consisting of a hazmat unit and a support unit. All team members are trained to the California Specialized Training Institute "technical specialist" level. The RCFD also administers compliance with Ordinance No. 615 (hazardous waste) and Ordinance No. 718 (medical waste) regulations, as well as Section 18.44 of Ordinance No. 348 regarding hazardous waste facilities.

4. Existing County General Plan Policies for Hazardous Materials

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval.

a. Safety (S) Element Policies

Policy S 7.2: Encourage the utilization of multilingual staff personnel to assist in evacuation and short-term recovery activities, and meeting general community needs.

Policy S 7.3: Require commercial businesses, utilities and industrial facilities that handle hazardous materials to: install automatic fire and hazardous materials detection, reporting and shut-off devices; and install an alternative communication system in the event the power is out or telephone service is saturated following an earthquake.

Policy S 7.6: Improve management and emergency dissemination of information using portable computers with geographic information systems and disaster-resistant Internet access, to obtain:

a. Hazardous Materials Disclosure Program Business Plans regarding the location and type of hazardous materials;

b. Real-time information on seismic, geologic or flood hazards; and

c. The locations of high-occupancy, immobile populations, potentially hazardous building structures, utilities and other lifelines.

Policy S 7.14: Regularly review and clarify emergency evacuation plans for dam failure, inundation, fire and hazardous materials releases.

5. Proposed New or Revised General Plan Policies for Hazardous Materials

a. Safety (S) Element Policies

Policy S 6.1: Enforce the *land use* policies and siting criteria *related to hazardous materials and wastes through continued implementation of* ~~and implement~~ the programs identified in the County of Riverside Hazardous Waste Management Plan, ~~which~~ includ*ing* the following:

a. *Ensure county businesses* ~~C~~*c*omply with federal, ~~and~~ State *and local* laws pertaining to the management of hazardous wastes and materials**,** *including*~~s~~ *all Certified Unified Program Agency (CUPA) programs*.

b. Ensure active public participation in hazardous waste and hazardous materials management decisions in Riverside County *through the County's land use and planning processes*.

~~c. Coordinate hazardous waste facility responsibilities on a regional basis through the Southern California Hazardous Waste Management Authority (SCHWMA).~~

c ~~d~~. Encourage and promote the programs, practices and recommendations contained in the County Hazardous Waste Management Plan, giving the highest waste management priority to the reduction of hazardous waste at its source.

Policy S 7.1: Continually strengthen the *Riverside County Office of Emergency Services' Response Plan and Multi-Jurisdictional Local Hazard Mitigation Plan* ~~Multi Hazard Functional Plan~~ and maintain mutual aid agreements with federal, State, local agencies and the private sector to assist in:

a. Clearance of debris in the event of widespread slope failures, collapsed buildings or structures, or other circumstances that could result in blocking emergency access or regress.

b. Heavy search and rescue.

c. Fire suppression.

d. Hazardous materials response.

e. Temporary shelter.

f. Geologic and engineering needs.

g. Traffic and crowd control.

h. Building inspections.

b. Circulation (C) Element Policies

Policy C *20.12* (Previously C 20.10): Review ~~and monitor~~ proposals for expansion of pipelines for the transport of suitable products and materials. ~~, and require mitigation of environmental impacts. In particular, require mitigation of~~ *Any project proponent of such a pipeline shall mitigate impacts, particularly* the potential for hazardous chemical or gas leakage and explosion *in accordance with local, State and federal regulations*.

c. Land Use (LU) Element Policies

NEW **Policy LU 7.9:** *Require buffers between urban uses and adjacent solid waste disposal facilities.*

B. Airport and Aircraft Hazards

1. Federal and State Regulations

It should be noted that the operation of airports and aircraft on airport property and in flight are the sole responsibility of the FAA. The proposed project has no bearing on those activities. However, the interaction of airports to surrounding land uses and the potential environmental effects of aircraft accidents are within the purview of the County of Riverside to evaluate under CEQA, as discussed herein.

State Aeronautics Act: This act (Public Utilities Code [PUC] Section 21001 et seq.) requires that the ALUC prepare airport land use compatibility plans (ALUCPs). ALUCPs promote compatibility between airports and the land uses that surround them to the extent that these uses are not already developed with incompatible land uses. They are intended to protect the safety of people, property and aircraft on the ground and in the air in the vicinity of the airport. They also address measures to ensure noise protection through land use planning and other measures.

California Environmental Quality Act (CEQA): The operation of airports and aircraft is the responsibility of the FAA, but the requirement to document potential hazards related to airports and air activities when a new project (i.e., GPA No. 960) is proposed is contained in CEQA, specifically PRC Section 21096, which states:

> *"(a) If a lead agency prepares an environmental impact report for a project situated within airport land use compatibility plan boundaries, or, if an airport land use compatibility plan has not been adopted, for a project within two nautical miles of a public airport or public use airport, the Airport Land Use Planning Handbook published by the Division of Aeronautics of the Department of Transportation, in compliance with section 21674.5 of the Public Utilities Code and other documents, shall be utilized as technical resources to assist in the preparation of the environmental impact report as the report relates to airport-related safety hazards and noise problems.*
>
> *(b) A lead agency shall not adopt a negative declaration for a project described in subdivision (a) unless the lead agency considers whether the project will result in a safety hazard or noise problem for persons using the airport or for persons residing or working in the project area."*

2. County Regulations

Ordinance No. 269 – Establishing Height Limits of Structures Within Certain Distances of March Field: This ordinance establishes maximum building and structure height limits within proximity to March ARB in order to avoid the introduction of aviation hazards to the airspace surrounding the facility. Among other things, the ordinance specifies that, "No person, partnership, firm, association or corporation shall hereafter maintain, permit, allow or cause to exist any smoke stack, flag pole, power line, power pole, tank, radio tower, derrick, tower, silo, barn, building or any other structure or thing whatsoever, in any manner so that the same shall exceed the following height within the following distances from the exterior boundaries of March Field [as defined therein]: 15 feet within 500 feet of the said exterior boundaries; 25 feet within 500 to 1,000 feet of the said exterior boundaries; 40 feet within 1,000 to 1,500 feet of the said exterior boundaries; 60 feet within 1,500 to 2,000 feet of the said exterior boundaries; 75 feet within 2,000 to 3,000 feet of the said exterior boundaries; 90

feet within 3,000 to 5,000 feet of the said exterior boundaries." The purpose of these restrictions is to ensure air safety and the safety of people and property surrounding the air field.

Ordinance No. 448 - Airport Operations: This Riverside County ordinance establishes airport operating areas and regulates height standards and limits therein. The ordinance is adopted pursuant to the "Airport Approaches Zoning Law," CGC Sections 50485-50485.14.

Ordinance No. 576 - Regulating County Airports: This ordinance establishes minimum standards for airports, heliports or Short Take Off and Landing airports (STOLports) to safeguard life, limb, property and public welfare. Among other things, for facilities owned or operated by the County of Riverside, it empowers the Director of Airports to prescribe regulations necessary for public airport use. In addition, all prescribed regulations are reviewed by ALUC and must ultimately go before the Board of Supervisors for approval.

3. Existing County General Plan Policies for Airports and Aircraft Safety

The following Land Use (LU) Element policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside uses contractual "Conditions of Approval" (COAs) adopted as part of a project's approval to legally require that certain steps occur as part of a project's development and implementation. The COAs ensure that applicable legal requirements and Riverside County policies are imposed once triggered by a development proposal milestone. (For example, a COA might require a specific environmental permit be obtained by the applicant prior to the County of Riverside issuing a grading permit for the development site.) The need for specific policies is determined through the individual CEQA analyses performed for site-specific projects on a case-by-case basis.

Policy LU 1.8: As required by the Airport Land Use Law, submit certain proposed actions to the Riverside County Airport Land Use Commission for review. Such actions include proposed amendments to the general plan, area plans or specific plans, as well as proposed revisions to the zoning ordinance and building codes.

Policy LU *15.1* (Previously LU 14.1): Allow airport facilities to continue operating in order to meet existing and future needs respecting potential noise and safety impacts.

Policy LU *15.7* (Previously LU 14.5): Allow the use of development clustering and/or density transfers to meet airport compatibility requirements as set forth in the applicable airport land use compatibility plan.

Policy LU *15.8* (Previously LU 14.6): In accordance with FAA criteria, avoid locating sanitary landfills and other land uses that are artificial attractors of birds within 10,000 feet of any runway used by turbine-powered aircraft and within 5,000 feet of other runways. Also avoid locating attractors of other wildlife that can be hazardous to aircraft operations in locations adjacent to airports.

Policy LU *15.9* (Previously LU 14.7): Ensure that no structures or activities encroach upon or adversely affect the use of navigable airspace.

4. Proposed New or Revised General Plan Policies for Airports and Aircraft Safety

a. Land Use (LU) Element Policies

Policy LU *15.2* (Previously LU 14.2): Review all proposed projects and require consistency with any applicable airport land use compatibility plan [ALUCP] as set forth in Appendix L*-1* [of the General Plan] and as summarized in the Area Plan's Airport Influence Area section for the airport in question.

Policy LU *15.3* (Previously LU 14.3): Review all subsequent amendments to any airport land use compatibility plan and either *amend the General Plan to be consistent with the compatibility plan* ~~adopt the plan as amended~~ or overrule the Airport Land Use Commission as provided by law (Government Code section 65302.3).

Policy LU *15.4* (Previously LU 14.4): Prior to the adoption or amendment of this General Plan or any specific plan, or the adoption or amendment of a zoning ordinance or building regulation within the *Airport Influence Area* ~~planning boundary~~ of any airport land use compatibility plan, refer such proposed actions *to the ALUC* for *review* and determination as provided by the Airport Land Use Law.

***NEW* Policy LU 15.5:** *If the General Plan has not been found consistent with the applicable Airport Land Use Compatibility Plan, and the County has not overruled the ALUC, refer all actions, regulations, or permits within the Airport Influence Area to the ALUC for review and determination as provided by the Airport Land Use Law.*

***NEW* Policy LU 15.6:** *If the General Plan has been found consistent with the applicable Airport Land Use Compatibility Plan (ALUCP), the County may elect to voluntarily submit proposed actions, regulations, or permits to the ALUC for an advisory review if:*

a. There is a question as to the purpose, intent or interpretation of an ALUCP; or

b. Assistance is needed in airport land use matters.

Policy LU *31.2* (Previously LU 25.2): Protect major public facilities, such as landfill and solid waste ~~disposal~~ *processing* sites and airports, from the encroachment of incompatible uses.

Policy LU *35.1* (Previously LU 30.1): Require that proposed projects on properties designated with the Closed Landfill *Policy Area* ~~Overlay~~ be reviewed by the [County] Department of Waste Management and the Department of Environmental Health to ensure that future development is designed to protect public health and safety.

b. Circulation (C) Element Policies

Policy C 6.6: Consider access implications associated with adjacent development and circulation plans. ~~, and~~ Promote efficient and safe access ~~improvements on~~ *for* airport facilities.

C. Wildland Fire Hazards

1. Federal and State Regulations

Health Forest Restoration Act of 2003 – Communities at Risk: This act defines "communities at risk" as those "wildland urban interface communities within the vicinity of federal lands that are at high risk from

wildfire." For California, CalFire has expanded this definition to include all communities (regardless of distance from federal lands) for which a significant threat to human life or property exists as a result of a wildland fire event. According to the 2010 California Strategic Fire Plan (page E-1), factors used to determine at-risk communities include: high fuel hazard, probability of a fire and proximity of intermingles wildland fuels and urban environments near fire threats.

Public Resources Code (PRC) Sections 4290-4299: This section establishes minimum statewide fire safety provisions pertaining to: roads for fire equipment access; signs identifying streets, roads and buildings; minimum private water supply reserves for emergency fire use; and fire fuel breaks and greenbelts. With certain exceptions, all new construction after July 1, 1991, in potential wildland fire areas is required to meet these statewide standards. The state requirements, however, do not supersede more restrictive local regulations.

As defined by CalFire, wildland areas defined as SRAs may contain substantial wildfire risks and hazards. They consist of lands exclusive of cities and federal lands regardless of ownership. The primary financial responsibility for preventing and suppressing fires within wildlands belongs to the State of California. However, it is not the State of California's responsibility to provide fire protection services to buildings or structures located within the wildlands unless CalFire has entered into a cooperative agreement with a local agency for those purposes pursuant to PRC Section 4142. As such, wildland areas require disclosure of these fire hazards in real estate transactions, and owners of properties in wildland areas are subject to PRC Section 4291 maintenance requirements (see below). The law requires CalFire every five years (1991, 1996, 2001, etc.) to provide maps identifying the boundaries of lands classified as SRAs to the Riverside County Assessor. CalFire is also required to notify Riverside County of any changes to SRAs within the county resulting from periodic boundary modifications.

PRC Section 4213 - Fire Prevention Fees: Pursuant to PRC Section 4213, in July of 2011, the State of California began assessing an annual "Fire Prevention Fee" for all habitable structures within SRAs to pay for fire prevention services. SRAs are the portions of California where the State of California is financially responsible for the prevention and suppression of wildfires. The SRA does not include lands within incorporated city boundaries, Tribal or federally owned land. As of 2013, the fee is up to $150 per habitable structure (i.e., a building that can be occupied for residential use, which does not include incidental buildings such as detached garages, barns, outdoor bathrooms, sheds, etc.).

California Government Code Section 51178: This section specifies that the Director of CalFire, in cooperation with local fire authorities, shall identify areas that are Very High Fire Hazard Severity Zones (VHFHSZ) in Local Responsibility Areas (LRAs), based on consistent statewide criteria and the expected severity of fire hazard. Per CGC Section 51178, a local agency may, at its discretion, exclude from the requirements of Section 51182 an area within its jurisdiction that has been identified as a VHFHSZ, if it provides substantial evidence in the record that the requirements of Section 51182 are not necessary for effective fire protection within the area. Alternatively, local agencies like Riverside County may include areas not identified as VHFHSZ by CalFire, following a finding supported by substantial evidence in the record that the requirements of Section 51182 are necessary for effective fire protection within the new area. According to Section 51182, such changes made by a local agency shall be final and shall not be rebuttable by CalFire.

GC Section 51182 - Defensible Space: Pursuant to this code, a person who "owns, leases, controls, operates or maintains an occupied dwelling or occupied structure in, upon or adjoining a mountainous area, forest-covered land, brush-covered land, grass-covered land or land that is covered with flammable material" in a very high fire hazard severity zone designated by the local agency pursuant to Section 51179, shall at all times maintain a specified amount of "defensible space" to protect structures in high fire hazard areas.

CCR Title 14 – Natural Resources: These regulations constitute the basic wildland fire protection standards of the California Board of Forestry. They were prepared and adopted to establish minimum wildfire protection standards in conjunction with building, construction and development within SRAs. Among other things, Title 14 requires the design and construction of structures, subdivisions and developments in an SRA provide for basic emergency access and perimeter wildfire protection measures (fire fuel modification zones, etc.).

CCR Title 24, Parts 2 and 9 – Fire Codes: Part 2 of Title 24 of the CCR refers to the California Building Code which contains complete regulations and general construction building standards of state adopting agencies, including administrative, fire and life safety and field inspection provisions. Part 2 was updated in 2008 to reflect changes in the base document from the Uniform Building Code to the International Building Code. Part 9 refers to the California Fire Code, which contains other fire safety-related building standards. In particular, Chapter 7A, "Materials and Construction Methods for Exterior Wildfire Exposure," in the 2010 California Building Code addresses fire safety standards for new construction. In addition, Section 701A.3.2, "New Buildings Located in Any Fire Hazard Severity Zone," states:

> *"New buildings located in any Fire Hazard Severity Zone within State Responsibility Areas, any Local Agency Very-High Fire Hazard Severity Zone, or any Wildland-Urban Interface Fire Area designated by the enforcing agency for which an application for a building permit is submitted on or after January 1, 2008, shall comply with all sections of this chapter."*

Assembly Bill (AB) 6 - Real Estate Disclosures: This law requires disclosure in real estate transactions for two types of fire hazard areas: "Wildland Fire Areas," which may contain substantial forest fire risks and hazards, and VHFHSZ areas. CalFire prepares and updates fire maps as needed to comply with AB 6. In addition, Civil Code Section 1103(c)(6) requires real estate sellers to inform prospective buyers whether or not a property is located within a Wildland Fire Area that could contain substantial fire risks and hazards. PRC Section 4136 also requires this disclosure. Once the State Board of Forestry identifies those lands where CalFire has the primary duty for wildland fire prevention and suppression (i.e., SRA lands), CalFire sends the maps to the affected counties and county officials must post notices to indicate where these CalFire maps are available for viewing.

California Emergency Services Act: The California Emergency Services Act (CGC Section 8550-8551) mitigates the impacts of emergencies within the state through proper preparation and coordination with necessary agencies including the federal government. The Act is also responsible for establishing CalEMA which aims to improve safety and preparedness within the state.

Statewide Standardized Emergency Management System (SEMS): SEMS serves as the foundation of the State of California's emergency response system. SEMS provides the basis for the responses and actions of managing an emergency. As required by the California Emergency Services Act, SEMS manages the responses to emergencies in California when multiple agencies and jurisdictions are involved. The system incorporates all elements of the emergency management community into a single system. Local agencies are required to use SEMS in order to maintain eligibility for potential reimbursement of response-related costs.

CalFire Riverside Unit 2012 Strategic Fire Plan: This plan is used by the CalFire Riverside Unit to direct and guide its fire management activities for its service area. The plan emphasizes "pre-fire" management, which is a process to assess alternatives to protect assets from unacceptable risk of wildland fire damage and focus on those actions that can be taken in advance of a wildland fire to potentially reduce the severity of the fire and ensure safety. Pre-fire "project alternatives" may include a combination of fuels reduction, ignition management, fire-safe engineering activities and forest health improvement to protect public and private assets. In addition to its main emphasis on the San Jacinto Mountains and its at-risk communities, pre-fire projects have also been planned and implemented on SRA lands in and adjacent to the Cleveland National Forest. A number of cooperative

projects have taken place with many more being planned. The Riverside Unit also treats fuels within the region's Multi-Species Preserves and other public lands within SRAs, but not in National Forests.

The overall goal of the plan is to reduce total government costs and citizen losses from wildland fire in the Riverside Unit by protecting assets at risk through focused pre-fire management prescriptions and increasing initial attack success. The Fire Plan has five strategic objectives:

- Create wildfire protection zones that reduce the risks to citizens and firefighters.
- Include all wildland, not just the State Responsibility Areas. Analysis will ultimately include all wildland fire service providers - federal, state, local government and private. This is the long-term strategy. This plan is primarily focused on the CalFire Direct Protection Area (DPA) of the Riverside Unit, however the current extreme fuel conditions existing in the San Jacinto Mountains require the Unit to include the SRAs within USFS DPA [area in which the USFS is responsible for fire protection] also.
- Identify and analyze key policy issues and develop recommendations for changes in public policy. Analysis will include alternatives to reduce total costs and/or increase fire protection system effectiveness.
- Describe the wildland fire protection system in fiscal terms. This can include all public/ private expenditures and potential economic losses.
- Translate the analysis into public policy.

2. County Regulations

Riverside County Fire Department Strategic Plan: The County of Riverside has developed a strategic fire plan that details the department's goals and strategies for proactively coordinating fire facility, service and equipment needs for 2009-2029. It incorporates CalFire's management plan for several sub-zones within Riverside County. The plan is aimed at ensuring that existing and future development maintain adequate service levels throughout Riverside County.

Ordinance No. 659: *Under this ordinance, the County of Riverside has the ability to require development applicants to pay established fire protection mitigation fees that are to be used by the Riverside County Fire Department to construct new fire protection facilities or provide facilities in lieu of the fee as approved by the Riverside County Fire Department. The Riverside County standard for the establishment of a new fire station is the development of 2,000 dwelling units or 3.5 million square feet of commercial or industrial uses. Riverside County also requires the payment of mitigation fees to collect revenue for the establishment of new stations. Riverside County currently requires new development proponents to pay mitigation fees to help offset the cost of providing new fire facilities. The current Riverside County fire fees are $400.00 per single family dwelling unit and $0.25 per square foot for all other types of development. These fees, however, have not been collected since 1999 (per Tracy Hobday, pers. comm., Feb. 17, 2011).*

Ordinance No. 695 - Abatement of Hazardous Vegetation: Under this ordinance, the RCFD distributes hazard abatement notices, roughly 30,000 each year, requiring property owners to reduce the fuels around their property. These notices order property owners to reduce fuels (e.g., flammable grass, brush, etc.) around their property. Requirements for hazard reduction around improved parcels (i.e., those with structures) are set forth in Ordinance No. 787. A minimum 30-foot clearance is required around all structures; it may be extended up to 100 feet in areas with severe fire hazards. On unimproved parcels, the property owner is required to disc or mow 100 feet around the property perimeter. Again, this may be increased (or decreased) from the initial 100-foot width

based on visual inspection by the Fire Chief or Chief's designee. The County of Riverside also requires new development within high fire hazard areas to include a fuel modification program for its WUI interface, subject to approval by the Riverside County Fire Department. Lastly, this ordinance also allows the Fire Chief or designee entry onto any real property to inspect when there is reasonable cause that hazardous vegetation exists.

Ordinance No. 787 - Fire Code Standards: This ordinance adopts and, where necessary amends, the California Fire Code (FC) to safeguard lives and property from fire, explosion hazards and hazardous conditions within Riverside County. It also governs the issuance of fire permits and the collection of fees. The ordinance helps ensure that structural and nonstructural architectural elements of buildings do not impede emergency egress for fire safety personnel, equipment or apparatus and do not hinder evacuation from fires, including potential blockages of stairways or fire doors. During adoption of the Fire Code, the Riverside County Board of Supervisors also included additional requirements and standards for fire hazard reduction in order to ensure the health, safety and welfare of existing and future residents and workers in Riverside County, based on demands of climate, geography, topography and geology.

3. Existing County General Plan Policies for Wildland Fire Hazards

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval.

a. Land Use (LU) Element Policies

Policy LU *10.1* (Previously LU 9.1): Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities.

Policy LU 5.2: Monitor the capacities of infrastructure and services in coordination with service providers, utilities and outside agencies and jurisdictions to ensure that growth does not exceed acceptable levels of service.

b. Safety (S) Element Policies

Policy S *5.9* (Previously S 5.2): Reduce fire threat and strengthen firefighting capability so that the County could successfully respond to multiple fires.

Policy S *5.10* (Previously S 5.3): Require automatic natural gas shutoff earthquake sensors in high-occupancy industrial and commercial facilities, and encourage them for all residences.

Policy S *5.12* (Previously S 5.5): Conduct and implement long-range fire safety planning, including stringent building, fire, subdivision and municipal code standards, improved infrastructure and improved mutual aid agreements with the private and public sector.

Policy S *5.13* (Previously S 5.7): Develop a program to utilize existing reservoirs, tanks and water wells in the county for emergency fire suppression water sources.

Policy S 7.3: Require commercial businesses, utilities and industrial facilities that handle hazardous materials to: install automatic fire and hazardous materials detection, reporting and shut-off devices; and install an alternative communication system in the event power is out or telephone service is saturated following an earthquake.

4. Proposed New or Revised General Plan Policies for Wildland Fire Hazards

a. Land Use (LU) Element Policies

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and ~~child~~ day care centers ~~(i.e. infant, toddlers, preschool and school age children),~~ transportation systems and fire/ police/medical services.

NEW **Policy LU 7.8:** *Require new developments in Fire Hazard Severity Zones to provide for a fuel clearance/modification zone, as required by the Fire Department.*

b. Safety (S) Element Policies

Policy S 5.1: Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:

a. All proposed development and construction within Fire Hazard Severity Zones shall be reviewed by the County Fire and Building and Safety Departments.

~~a~~ *b.* All proposed *development and* construction shall meet minimum standards for fire safety as defined in the Riverside County Building or County Fire Codes, or by County zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy and use.

~~b~~ *c.* In addition to the standards and guidelines of the California ~~Uniform~~ Building Code and California ~~Uniform~~ Fire Code fire safety provisions, continue *to implement* additional standards for high-risk, high-occupancy, dependent and essential facilities where appropriate under the Riverside County Fire *Code (Ordinance No. 787).* ~~Protection Ordinance.~~ These shall include assurance that structural and nonstructural architectural elements of the building will not: impede emergency egress for fire safety staffing/ personnel, equipment and apparatus; nor hinder evacuation from fire, including potential blockage of stairways or fire doors.

~~c~~ *d.* Proposed development *and construction* in *Fire Hazard Severity Zones* ~~Hazardous Fire areas~~ shall provide secondary public access, ~~unless determined otherwise by the County Fire Chief.~~ *in accordance with County ordinances.*

~~d~~ *e.* Proposed development *and construction* in *Fire Hazard Severity Zones* ~~Hazardous Fire areas~~ shall use single loaded roads to enhance fuel modification areas, unless otherwise determined by the County Fire Chief.

f. Proposed development and construction in Fire Hazard Severity Zones shall provide a defensible space or fuel modification zone(s) to be located, designed and constructed so as to provide adequate defensibility from wildfires.

NEW **Policy S 5.2:** *Encourage continued operation of programs for fuel breaks, brush management, controlled burning, revegetation and fire roads.*

NEW **Policy S 5.3:** *Monitor fire-prevention measures (such as fuel reduction) through a site specific fire-prevention plan to reduce long-term fire risks in the Fire Hazard Severity Zones.*

NEW **Policy S 5.4:** *Limit or prohibit development or activities in areas lacking water and access roads.*

NEW **Policy S 5.5:** *Encourage proposed development in Fire Hazard Severity Zones to develop where fire and emergency services are available or planned.*

NEW **Policy S 5.6:** *Demonstrate that the proposed development can provide fire services that meet the minimum travel times identified in Riverside County Fire Department Fire Protection and EMS Strategic Master Plan.*

NEW **Policy S 5.7:** *Minimize pockets of flammable vegetation that increases likelihood of fire spread through conceptual landscaping plans to be reviewed by the Planning and Fire Departments in the Fire Hazard Severity Zones. The conceptual landscaping plan of the proposed development shall at a minimum include:*

a. Plant palette suitable for high fire hazard areas to reduce the risk of fire hazards.

b. Retention of existing natural vegetation to the maximum extent feasible.

c. Removal of onsite combustible plants.

NEW **Policy S 5.8:** *Design to account for topography of a site and reduce the increased risk from fires in the Fire Hazard Severity Zones located near ridgelines, plateau escarpments, saddles, hillsides, peaks, or other areas where the terrain or topography affect its susceptibility to wildfires by:*

a. Providing fuel modification zones with removal of combustible vegetation, but minimizing visual impacts and limiting soil erosion.

b. Replacing combustible vegetation with fire resistant vegetation to stabilize slopes.

c. Submitting topographic map with site specific slope analysis.

d. Submitting erosion and sedimentation control plans.

e. Providing a minimum 30 foot of setback from the edge of the fuel modification zones.

f. Minimizing disturbance of 25% or greater natural slopes.

Policy S *5.11* (Previously S 5.4): Utilize ongoing brush clearance fire inspections to educate homeowners on fire prevention tips *by implementing annual countywide weed abatement program*.

Policy S *5.14* (Previously S 5.8): Periodically review inter-jurisdictional fire response agreements and improve firefighting resources as recommended in the *Riverside* County *Fire Department* Fire Protection ~~Master~~ Plan *and EMS Strategic Master Plan* to keep pace with development, including construction of additional high-rises, mid-rise business parks, increasing numbers of facilities housing immobile populations and the risk posed by multiple ignitions, to ensure that:

a. Fire reporting and response times do not exceed *the goals* ~~those~~ listed in the *Riverside* ~~–~~County *Fire Department* Fire Protection ~~Master –~~Plan *and EMS Strategic Master Plan* identified for each of the development densities described.

b. Fire flow requirements (water for fire protection) are consistent with ~~Insurance Service Office (ISO) recommendations~~ *Riverside County Ordinance No. 787*.

c. The planned deployment and height of aerial ladders and other specialized equipment and apparatus are sufficient for the intensity of development desired.

Policy S *5.15* (Previously S 5.10): Continue to utilize the Riverside County *Fire Department* Fire Protection Plan *and EMS Strategic* Master Plan as the base document to implement the goals and objectives of the Safety Element.

***NEW* Policy S 5.16:** *Encourage property owners to utilize clustering and transfer of development rights (TDR) program when developing lands within Fire Hazard Severity Zones by:*

- *Restricting the development of a property through placement of conservation easement.*
- *Acquiring the conservation easements similar to that of MSHCP Program.*

***NEW* Policy S 5.17:** *Identify, map and update on an as-needed continual basis, the Fire Hazard Severity Zone maps [see General Plan Figure S-11].*

***NEW* Policy S 5.18:** *Ensure that the Fire Department has appropriate municipal staffing and fire protection planning staff that meet the needs of development pressure and adequately respond to long range fire safety planning.*

***NEW* Policy S 5.19:** *Implement a coordination program with fire protection and emergency service providers to reassess fire hazards after wildfire events and to adjust fire prevention and suppression needs, as necessary.*

***NEW* Policy S 5.20:** *Implement a regional coordination program to increase support for coordination among fire protection and emergency service providers.*

***NEW* Policy S 5.21:** *Implement a long-term training and education program among government agencies and communities about fire protection.*

Policy S 7.1: Continually strengthen the *Riverside County Office of Emergency Services' Response Plan and Multi-Jurisdictional Local Hazard Mitigation Plan* ~~Multihazard Functional Plan~~ and maintain mutual aid agreements with federal, state, local agencies and the private sector to assist in:

a. Clearance of debris in the event of widespread slope failures, collapsed buildings or structures, or other circumstances that could result in blocking emergency access or regress.

b. Heavy search and rescue.

c. Fire suppression.

d. Hazardous materials response.

e. Temporary shelters.

f. Geologic and engineering needs.

g. Traffic and crowd control.

h. Building inspections.

4.13.4 Thresholds of Significance for Hazardous Materials and Safety

Hazardous Materials: The proposed project would result in a significant impact related to hazardous materials if it would:

A. Create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials.

B. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

C. Emit hazardous emissions or involve the handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

D. Be located on a site which is included on a list of hazardous materials compiled pursuant to California Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment.

Airports/Aircraft Hazards: The proposed project would result in a significant safety hazard related to airport or aircraft impacts if it would:

E. Result in a safety hazard for people residing or working within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.

F. Result in a safety hazard for people residing or working within the vicinity of an airport land use plan or, where such plan has not been adopted, within two miles of a private airstrip or public use airport.

Wildland Fires and Safety: The proposed project would result in a significant safety hazard if it would:

G. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

H. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

4.13.5 Effect of GPA No. 960 on the General Plan and on Hazardous Materials and Safety

The proposed project, GPA No. 960, would have land use-related effects because it involves a variety of specific General Plan Land Use Designation corrections and changes, several Policy Area, Study Area and overlay changes, proposals for new trail and road alignments and standards, and an incidental commercial policy for rural areas. This section analyzes how the project affects, or is affected by, the safety issues in this section: hazardous materials, airports and aircraft hazards, and wildland fire hazards. The subsequent section (4.13.6) evaluates the project relative to each of the specific significance thresholds identified in Section 4.13.4 in terms of impacts and mitigation needed, if any.

Notwithstanding the specific spatial changes discussed below, a variety of LUD and policy area changes are proposed, as per the descriptions in Section 3.0 (Project Description) of this EIR and associated Figure 3-1 (and corresponding maps within each Area Plan) that may indirectly be affected by hazmat or safety issues. Such changes would lead to either an increase or decrease in development potential (density or intensity); the risks associated with introducing new people and property into areas potentially subject to the various safety hazards outlined herein would be increased correspondingly.

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies, and others as described in Section 3.0 of the EIR. Similarly, new maps for trails and county roads (GP Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements would be determined based on site assessment of opportunities and constraints, including as related to hazmat, fire and safety hazards to determine environmentally preferred alignments to minimize adverse effects. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines, and such are also developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need.

Accordingly, specific locations and timing of future infrastructure, including power and natural gas transmission lines, water and sewer lines and pumps, as well as roads, schools and other public services are not presently foreseeable beyond the master countywide level addressed previously in EIR No. 441. These improvements would require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the General Plan builds out. As such, future impacts and mitigation would be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed at the later individual project stage.

A. Hazardous Materials

The proposed project includes a number of land use designation changes and corrections. Spatial analysis of these land use sites relative to the federal and state hazmat databases indicates that only one of the 36 major hazmat sites identified in Table 4.13-A (and shown on Figure 4.13.1) is near any known spatial location associated with GPA No. 960. The Blythe Army Air Field Bombing Target #1 site (Site 34 in Figure 4.13.1) is near some of the parcels proposed for LUD revisions near the Blythe Airport. The proposed sites are outside the airport's property, while the hazmat site is within the boundaries of the airport. According to records, the contaminants of

concern are either in groundwater or in sub-surface soils, but are not easily entrained as dust. Thus, there would be negligible indirect impacts to area residents as a result of any remediation activities. There is little to no potential for contamination of parcels with revised LUDs, nor would any future remediation activities associated with the hazmat site affect them.

In general, where GPA No. 960 proposes LUD changes from vacant to developed, development would introduce new people, property and facilities into areas that could be subject to impacts from hazardous materials through accidental release or ongoing operations. In addition, properties that are changing from vacant or open space to some type of development would incrementally increase the population of a given area and, therefore, incrementally increase the routine uses of hazardous materials, such as cleaners, solvents, pesticides and such, as well. Accordingly, such development would result in increased risks of hazardous material accidents during routine transport or use. The project also proposes changes to a number of Policy Areas, Study Areas and Overlays. A review of the applicable databases (see Table 4.13-A) and Figure 4.13.1 indicate that no hazmat sites are located within any of the proposed policy or overlay areas.

GPA No. 960 includes revised trail maps for new pedestrian and multi-use trails, as well as trail connections, throughout Riverside County. Some of these trail alignments may run through or near the major hazmat sites listed below. In these areas, there is a potential for trail users to be exposed to hazardous materials if remediation activities cause contaminants to become windborne. However, strict rules for remediation activities would tend to limit such risks, as would the brief and occasional nature of normal trail usage. In addition, trail alignments are not fixed and are subject to site review for opportunities and constraints to ensure the trails are placed so as to minimize environmental impacts.

A comparison of the planned locations of new roadways and road segments with the hazmat site location data in Table 4.13-A and Figure 4.13.1 indicate there are no major hazmat sites adjacent to any new roads or segments proposed as part of GPA No. 960. However, as shown in Table 4.13-H (Hazmat Sites Potentially Near Future Development), some of the new roads would be located near facilities or land uses that transport, use or dispose of hazardous materials.

Table 4.13-H: Hazmat Sites Potentially Near Future Development

Map*	Site	Map*	Site
1	March Air Force/Reserve Base	22	Certainteed Riverside
6	Foster-Gardner Site	23	Crossroads Investors Site
8	Lockheed Propulsion Beaumont No. 2	24	Liston Aluminum
10	Temecula Bomb Range Target #107	25	March AFB Site 24
16	Corona Annex	26	March AFB Site 40
18	Gavilan Plateau	28	Parkview Drive Site
19	Riverside Community College-Norco Campus	33	Torney General Hospital

* See Figure 4.13.1
Source: California Department of Toxic Substances Control "EnviroStor" Database, March 2011.

There are several hazmat sites that are located in rural vacant areas, so it is possible conflict may occur between a future rural commercial use developed pursuant to the proposed Incidental Commercial policy, since the specific location of future commercial uses is not known or knowable at this time. It should be noted, however, that any future uses would have to comply with the various federal, state and local (Riverside County) regulations as part of Riverside County's development review process, particularly for any land uses that would generate, transport, use or dispose of hazardous materials.

B. Airports and Aircraft Hazards

Since the adoption of the RCIP General Plan in 2003, the Riverside County ALUC has adopted revised ALUCPs for various airports that affect Riverside County to address noise and safety related concerns with airport operations. As such, the existing General Plan policies and land use designations within these Airport Influence Areas were examined to ensure that they are consistent with, and appropriate for, the area's air operations. During this exercise, all parcels within unincorporated Riverside County that fall within an Airport Influence Area were reviewed in order to determine the level of consistency between that parcel's current General Plan land use designation and the respective Airport Influence Area zone. As a result, various map, policy and parcel-specific land use changes must occur in the General Plan to ensure consistency with these newly adopted plans. In addition, the updated Land Use Element airport policies (LU 15.1-15.9) require development to be consistent with any applicable airport plans, as does General Plan Table LU-3 (Relationship of ALUC Compatibility Plans to County Area Plans). Table 4.13-I (Potential Conflicts with Public-Serving Airports) summarizes the potential impacts of changes proposed by GPA No. 960 on public-serving airports.

Table 4.13-I compares Riverside County's public-serving airport locations to the various policy areas and overlay changes proposed in GPA No. 960 and identifies any potential conflicts. As shown in the table, none of the proposed policy areas or overlays conflict with any Airport Influence Area policy areas. Applicable Area Plans and Land Use Element portions would be updated as needed to reflect the adopted ALUCPs. For related discussion, see Section 4.2 (Land Use).

As part of GPA No. 960, two parcel-specific land use changes affecting 36 acres are proposed to ensure consistency. The first parcel-specific change is a 0.39-acre site located in unincorporated Indio just south of Mandeville Road within "Zone D" of the Bermuda Dunes Airport Influence Area. This change is classified as a technical mapping error and would adjust the site from Open-Space: Recreation (OS-R) to Community Development: Medium-Density Residential (CD-MDR); the OS-R designation was inadvertently applied to a portion of the site due to an adjacent golf course. The second parcel change is for a 35-acre site located in Reinhart Canyon, just west of California Avenue, within the Hemet-Ryan Airport Influence Area. This site is proposed to change from Community Development: Low-Density Residential (CD-LDR) to Rural Residential (RUR-RR), as the Rural Foundation and RR LUD was found to be more appropriate for the area.

As outlined in Table 4.13-I, new proposed trail alignments would pass through planning areas at the following airports: March ARB, Palm Springs, Blythe, Chino, Chiriaco Summit, Corona, Flabob, Riverside Municipal, Jackie Cochran, French Valley and Bermuda Dunes. Due to the low intensity of use expected along trail segments (i.e., no large concentrations of persons), no significant risks from GPA No. 960 on trails or trail users are expected relative to airport activities. Table 4.13-I also notes that new roads or road segments would not conflict with any airports within Riverside County. Lastly, there would not be any conflicts between future incidental rural-commercial policy areas, nor any airport planning zones within Riverside County, because the locations and height limits allowed under the new policy would prevent any conflict with an airport's operations.

Likewise, no changes proposed as part of GPA No. 960 would adversely affect the CMAGR. There are no land use (LUD) changes proposed within two miles of the base. Proposed new policies would further protect the public from adverse effects from military activities on the base, as well as protect the base from conflicts with future land use development offsite.

Table 4.13-I: Potential Conflicts with Public-Serving Airports

Air Facility	Location	Compatibility or Potential Conflict with GPA No. 960
Public-Serving Airports (facilities not listed have no conflicts)		
Banning Airport	Banning	No overlap of unincorporated Riverside County territory (city only). No changes proposed and no effects resulting from GPA No. 960.
Bermuda Dunes Airport[2]	Riverside County	No changes proposed under GPA No. 960. Potential LUD inconsistencies surrounding airport. No overlap of any other Policy Area or Overlay. Some trails overlap, but would not conflict. No new roads overlap.
Blythe Airport[1]	Blythe	GPA No. 960 LUD changes in this area (north, south and east of the airport) proposed to ensure ALUP consistency. No overlap of Policy Area or Overlays. Very minor amount of trails overlap, but no conflict. No new roads would overlap.
Chino Airport[3]	Chino; Riv. County	No LUD changes affected. No overlap of any Policy Areas or Overlays. Some proposed trail overlap, but no conflict. No new roads overlap.
Chiriaco Summit Airport	Riverside County	No LUD changes affected. No overlap of any Policy Areas or Overlays. Some proposed trails overlap, but no conflict. No new roads overlap.
Jackie Cochran[2] Regional Airport *(formerly Desert Resorts Regional Airport)*	Thermal/ Riverside County	No changes proposed under GPA No. 960. Potential LUD inconsistencies in area northeast of airport. No overlap of any other Policy Area or Overlay. Some trails overlap, but would not conflict. No new roads overlap.
Corona Municipal Airport	Corona	No LUD changes affected. No overlap of any Policy Areas or Overlays. Some proposed trails overlap, but no conflict. No new roads overlap.
Flabob Airport	Jurupa Valley	GPA No. 960 LUD changes (mostly south of the airport) proposed to ensure ALUP consistency. No overlap of any other Policy Areas or Overlays. Some proposed trails overlap, but no conflict. No new roads overlap.
French Valley Airport[2]	Murrieta/ Temecula	No LUD changes affected. No overlap of any Policy Areas or Overlays. Some proposed trails overlap, but no conflict. No new roads overlap.
Hemet-Ryan Airport	Hemet/Riverside County	No changes to ALUP since RCIP General Plan issuance. No changes proposed and no effects resulting from GPA No. 960.
Palm Springs International Airport	Palm Springs	No LUD changes affected, although a large ALUP is associated with this airport. No overlap of any other Policy Areas or Overlays. Some proposed trails would overlap, but not conflict. No new roads would overlap.
Perris Valley Airport	Perris	No overlap of unincorporated Riverside County territory (cities only). No changes proposed and no effects resulting from GPA No. 960.
Riverside Municipal	Jurupa Valley	GPA No. 960 LUD changes (mostly west of the airport) proposed to ensure ALUP consistency. No overlap of any other Policy Areas or Overlays. Some proposed trails overlap, but no conflict. No new roads overlap.
Private Air Facilities		
32 airstrips and helipads, (Including private Skylark and Desert Center Airports)	Various	No LUD areas overlap or inconsistent. No overlap of any Policy Areas or Overlays. No proposed trails or new road overlap or conflict.
Military Air Facilities		
March Air Reserve Base (U.S Military)	Moreno Valley	No changes to ALUP since RCIP General Plan issuance. No changes proposed and no effects resulting from GPA No. 960. No overlap of any other Policy Areas or Overlays. Some proposed trails would overlap, but not conflict. No new roads overlap.
Chocolate Mountain Aerial Gunnery Range	Salton Sea	No ALUP (military only). New policies proposed for vicinity around the CMAGR. No new land uses, roads, trails or other uses overlapping or affecting the CMAGR. The two closest proposed LUD changes (within the Eastern Coachella Valley Area Plan) are outside the two-mile buffer area around the CMAGR.

Footnotes:
1. GPA No. 960 includes LUD revisions to parcels around this airport to ensure consistency with the applicable ALUP.
2. No changes proposed as part of GPA No. 960; future ALUC consistency action(s) would, however, likely be necessary.
3. Located in San Bernardino County (Chino), but some of the ALUP falls within 2 miles of Riverside County territory.

C. Wildland Fire Hazards

1. Effects of Fire on the Built Environment

The General Plan is concerned mainly with the physical build out of Riverside County; many of the changes associated with GPA No. 960 would affect planned land usage. The proposed project's update to the General Plan includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in areas throughout the county. As with the current General Plan, future development accommodated by GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas; all of which would require adequate fire protection services to ensure their safety. The result of this growth would be the introduction of people and structures into previously vacant wildlands, increasing the extent of the wildland-urban interface and the risk of fire.

Table 4.13-K (Fire Responsibility Classifications for Project Components) provides a summary of the proposed project components relative to the degree of fire hazard (Fire Hazard Severity Zones) associated with the specific area. Table 4.13-J (Fire Hazard Overlay Zones for Project Components) summarizes the proposed project components relative to the fire responsibility agency (SRA, LRA, etc.). As noted in Table 4.13-J, there are proposed LUD changes in all fire hazard zones.

As noted earlier in Table 4.13-F, the State of California defines various types of lands subject to fire hazards according to the housing density present. To compare the potential fire hazards related to General Plan build out, Table 4.13-L (Countywide Residential Fire Risks, Existing and Build Out), below, categorizes the residential land uses as they would occur under both the existing (current) General Plan and the General Plan as updated pursuant to GPA No. 960. Although "plan-to-plan" in its comparison, the purpose of Table 4.13-L is to show the relative increase or decrease in types of development proposed in Riverside County relative to their assumed fire risk.

Lastly, Table 4.13-M (Residential Fire Risks at Build Out, GPA No. 960 Components Only) shows the change in acreages of the various residential land use classes associated with potential fire hazards (that is, as defined by the State; see Table 4.13-F). This table is based on the build out of the known spatial components or locations addressed by GPA No. 960 (i.e., site-specific LUD changes, policy area and study area changes, etc.). It should be noted that the following projections are based on the assumption that all of the changes proposed under the existing General Plan or the General Plan as amended per GPA No. 960 actually result in future development and fully build out. That is, it is a theoretical, worst-case scenario that likely over-states the actual development potential in the real world. The actual future development of the individual parcels and areas are subject to the discretion of many hundreds to thousands of individual property owners, including private individuals, business entities and even various public agencies and other entities.

Table 4.13-J: Fire Hazard Overlay Zones for Project Components

Project Components	Fire Hazard Overlay Zones*				Compatibility or Potential Conflicts
	Very High	High	Moderate	Non-Hazard	
Parcel-Specific Land Use Designation Changes					
Various Individual Land Use Designation Changes	X	X	X	X	Parcels overlap different fire hazard zones, but would be governed by specific uses developed within specific zone(s)
Policy & Overlays					
OS-CH Changes	X	X	X	X	Hazard depends on location
Aguanga RVSA	X	X	X		Large overlap with Very High zone

Project Components	Fire Hazard Overlay Zones*				Compatibility or Potential Conflicts
	Very High	High	Moderate	Non-Hazard	
Anza Valley Policy Area	X	X			Large overlap with Very High zone and some overlap with High zone
El Cariso RVSA	X				In Very High zone
Fish Farms				X	Parcels all in Non-Hazard Zone
Good Hope RVLUO	(X)	(X)		X	Property in Non-Hazard zone, but adjacent to High zone to the S and Very High zone to the N
Lakeland Village	(X)			X	Property in Non-Hazard zone (Lake Elsinore) to east, but site adjacent to Very High zone to west
Meadowbrook RVLUO	X	X			Large overlap with Very High zone and some overlap with High zone
Northeast Business Park				X	In Non-Hazardous zone with small amount of Medium zone to northwest and southeast
RCA Acquired Lands (to OS-CH)	X	X	X	X	Conditions vary depending on slope, with steeper outlying areas in Very High to High zones, while flatter areas in Medium to Non-Hazardous zones
San Jacinto Agri. Potential Development Study Area		(X)	(X)	X	Property in Non-Hazardous zone but almost surrounded by High zone with some Medium zone to the south
Sky Valley RVO		(X)		X	Property in Non-Hazardous zone but adjacent to High zone to the northeast
Other Items					
New Trail Alignments	X	X	X	X	Conditions vary depending on slope, with trails in steeper outlying areas in the High to Very High zones, while trails in flatter areas in Medium High to Non-Hazardous zones
Road Alignments				X	Hazard levels depend on street location
Incidental Commercial Policy					Conditions vary but outlying areas in Medium to High zones, while others in Non-Hazardous zones

*(X) = Property adjacent to but not actually in fire hazard zone

		Totals	**18,790**	**91,690**	**80,830**	***- 10,860***

Footnotes:
1. Classes as defined per State of California Multi-Hazard Mitigation Plan, October 2010, Table 5.Y, page 247.
2. General Plan Land Use Designations (LUDs). See General Plan Table LU-3 for specifics.
3. "Existing GP" = LUDs as per the existing (2007) General Plan. "Updated GP" = LUDs as per the General Plan updated pursuant to GPA No. 960. "Gen. Plan Change" is the difference between these two General Plan scenarios.
4. Encompasses LUDs from both the Rural Community (RC) and Community Development (CD) Foundations.
5. Conservatively assumes 100% of LUD acreage to residential use.
6. Based on SCAG and RCCDR existing use of land data.
7. Land uses categorized (per nearest associated densities): wildland – agriculture; rural – rural residential; interface – single-family residential (sfr); and, urban – multi-family residential (mfr), mobile home parks and mfr apartments.
8. Change for Updated General Plan versus Existing Uses of Land: +16,230; +34,990; +10,220; and +600 for a total of +62,040 acres.

Source: Riverside County Planning Dept., Project application information, 2012.

The County of Riverside has little to no control over the decision to propose development (new or re-developed) on a given site (though the County of Riverside is the entity with discretion for review and approval of such development applications for most cases within unincorporated Riverside County). Demand for additional development is often a result of many interrelated factors, including population growth and economic demand, as well as location, local supply (i.e., existing home inventory) and even infrastructure availability (water supply, electricity, etc.). For land use policy changes without known locations (Indian fee lands, incidental rural commer-

cial, etc.), specific effects on fire needs cannot be delineated at present since they are location dependent. For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), specific effects on fire hazards cannot be quantified at present since they are location dependent. However, the risks and hazards delineated for known locations would also apply to any other development occurring in fire-prone areas.

As shown in Table 4.13-M, the net effect of the land use designation (LUD) changes proposed in GPA No. 960 would be to decrease the amount of land potentially at risk of wildfire. This is mainly due to the reduction in development potential from the Aguanga and Anza areas, in addition to other study area reductions and LUD changes.

In terms of changes from the baseline, from Table 4.13-M, it can be determined that build out of the updated General Plan (per GPA No. 960) would result in the introduction of approximately 16,230 acres of 'wildland' uses (20-acre-plus lots), roughly 8,100 homes, compared to the existing condition (roughly 8,600 acres). Build out would also result in roughly 35,000 additional acres of 'rural' lands (i.e., homes on 5- to 20-acre lots) throughout Riverside County and another 10,200 acres of 'interface' lands on lots of one to five acres in size. The 'interface' total represents a twenty-fold increase in the amount of people and property that would be at risk for WUI fires. Total build out of the updated General Plan would increase the amount of residential developed land within unincorporated Riverside County by just over 62,000 acres. (By contrast, the existing General Plan would result in nearly 73,000 acres of additional residential development.)

2. Effects of Fire on Natural Resources

As reported in the State MHMP (pages 252-254), a forest and range assessment performed in 2010 assesses the risk of fire within various ecosystems. In it, some of the detrimental effects of fire on various ecosystem components were identified. The analysis focused primarily on impacts that follow high-intensity stand-replacing events outside the range of natural variability in conifer stands. Forests can contain a greater mass of fuel, especially when trees are dead or drought-stressed. These detrimental effects that were identified are described below.

Fire Effects on Timberlands: Timberlands, defined as conifer-dominated habitat types that likely support 20 cubic feet of volume growth per year and are not in reserved status, are a significant economic resource in California and are the primary economic base in some rural areas (particularly in Northern California). Fire can pose significant risk to timber assets through direct loss from combustion, mortality of growing stock, and fire-induced susceptibility to insect, pathogen and decay mechanisms. The actual loss of timber value associated with a given fire event is a function of tree structure, fire severity and post-fire salvage opportunity. Roughly three-quarters of California's timberland face a high fire threat or greater and over half of these lands have very high or extreme fire threat conditions. Only about one-fifth of California's timberlands face a moderate fire threat, where expected losses to timber assets are likely to be low. While some of the standing timber value can be salvaged following a wildfire, much of California's timber assets are exposed to significant risk from wildland fire.

Fire Effects on Woodlands: California's extensive distribution of woodland vegetation, especially hardwood woodlands, provide key habitat for many species. The risk of habitat loss associated with fire in woodland areas is highly variable, due both to varying habitat quality and the unique fuel and vegetation response characteristics of specific areas. Habitat characteristics such as tree canopy height and closure, presence or absence of a developed shrub understory, and occurrence of special habitat elements – such as snags and downed logs – are important determinants of habitat quality for many species. Roughly two-thirds of California's hardwood woodlands are exposed to very high or extreme fire threat. While many areas may respond favorably to wildland fire, initial changes in the post-fire environment may cause temporary habitat loss and species dislocation.

Fire Effects on Recreation and Open Space: After a wildfire, significant alteration of watershed lands and the associated stream systems is noticeable for periods varying from a few years to decades. In the short term, the presence of partially burnt vegetation reduces recreational and open space values. Fires can also destroy campgrounds, trails, bridges and other recreational facilities within the stricken area. Increased amounts of downstream sedimentation may significantly affect streams and lakes, which tend to be the most heavily used spots within larger recreational areas. As the vegetation grows back and damaged recreational infrastructures are replaced, the recreational and open space values would increase. However, it may take decades before vegetation types such as mature forests return to their pre-burn character. Grasslands and shrublands, on the other hand, can return to their pre-burn character within a decade.

Fire Effects on Waterbodies and Watersheds: Wildfires can have significant adverse effects on watershed lands, watercourses and water quality. Large, hot fires cause serious, immediate damage from which a watershed can take decades to recover. By burning off vegetation and exposing mineral soil, fire impairs the ability of a watershed to hold soil in place and to trap sediment before it enters stream systems. Loss of vegetation also means less water being absorbed by plants, causing a short-term increase in the quantity and the delivery rate of water entering streams. This can have significant effects downstream from the site of a fire, such as with the fire-flood cycle commonly experienced in Southern California. This increased runoff and its large sediment load can cause costly damage to downstream assets such as homes, roads, debris basins and other infrastructure. It can also result in the loss of human life when at-risk residents and visitors are not evacuated.

Fire Effects on Soils: Fire presents a significant risk to soil, especially in denuded watersheds, through accelerated erosion potential in the immediate post-fire environment, particularly when subjected to severe rainstorms prior to any vegetation recovery. The Fire and Resource Assessment Program has developed a statewide risk assessment based on the expected marginal increase in surface erosion from a potential fire. Erosion is a natural process that occurs across a watershed at varying rates, depending on soils, geology, slope, vegetation and precipitation. The intensity of a fire and the subsequent removal of vegetative cover increase the potential rate of soil erosion and new sediment sources. Wildfires affect surface erosion in a watershed by altering detachment, transport and deposition of soil particles. Most wildfires create a patchwork of burned areas that vary in severity. Severely burned areas suffer increased erosion due to loss of the protective forest floor layer and creation of water-repellent soil conditions that can cause flooding, downstream sedimentation and threats to human life and property.

Fire Effects on Riparian and Aquatic Habitats: Wildfire can produce a wide range of water quality and aquatic habitat outcomes, from beneficial to catastrophic. Wildfire outcomes are determined by weather, fuels, terrain and, to a lesser extent, suppression efforts. Large wildfires pose the greatest risk to water quality and riparian habitat. If a wildfire encounters fuel levels that have been reduced through prescribed burning and/or mechanical means, there is a good chance the fire would produce conditions more favorable to maintaining good water quality and aquatic habitat. Highly destructive fires are thus minimized. Fire can also dramatically affect aquatic habitat. Increased erosion and sediment deposition can result in channel aggradations (i.e., wider, shallower channels), filling of pools that provide important fish habitat, increased turbidity that makes it harder for fish to find food and can damage gills and cause changes in water chemistry.

Fire Effects on Water Quality: Wildfires can potentially affect water quality through increased sedimentation and increased turbidity and through increases in nutrient loadings. Concentration of nutrients (phosphorous and nitrogen) are increased from burned vegetation and delivered to streams through surface runoff. Stream temperatures often increase after fire occurs, typically through the removal of overhead protective vegetation. Elevated stream temperatures are detrimental to most coldwater fish species.

4.13.6 Hazardous Materials and Safety – Impacts and Mitigation

A. Would the project create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials?

Impact 4.13.A – Create a Significant Hazard Through the Routine Transport, Use or Disposal of Hazardous Materials: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, which could result in some adverse effects from facilities that transport, use or dispose of hazardous materials. However, compliance with existing laws and regulatory programs would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.13.A

Every home, business and industry uses or produces, to some extent, flammable, hazardous or toxic materials. Accordingly, the potential for accidental explosion or release of hazardous substances from existing and future industries within Riverside County exists, but is not anticipated to be higher than is typical for any other location in Southern California. Within Riverside County, the highest probability for an inadvertent hazardous substance release is through a vehicular accident on heavily traveled freeways and highways. Some of the proposed LUD changes would be from planned developed uses to open space; potential impacts would be minimal for these areas as they would not result in additional buildings, residents or employees. However, the LUD changes that convert vacant or agricultural uses to some developed use (e.g., residential, commercial, etc.) would result in a small increase in the potential for humans and developed facilities to be impacted by hazardous materials. Similar conditions would occur from proposed changes within Policy Areas and Overlays, additional trails, new roads and the incidental rural commercial policy areas.

GPA No. 960 would incrementally increase potential hazmat impacts in this regard over existing conditions and those conditions anticipated under the approved General Plan. However, the use, storage and manufacture of hazardous materials are highly regulated by the state and federal governments, as well as by the RCDEH and Fire Departments. Thus, future development accommodated by GPA No. 960 is not predicted to result in significant environmental impacts from the routine transport, use or disposal of hazardous materials or hazardous wastes.

2. Regulatory Compliance for Impact 4.13.A

As detailed and explained below, compliance with the following existing laws, regulatory programs and General Plan policies would be sufficient to ensure that impacts related to routine handling of hazardous materials as a result of GPA No. 960 would be less than significant.

a. Compliance with Federal, State and County Regulations

Compliance with the following federal, state and county regulations would further prevent significant impacts related to the routine handling of hazardous materials.

Comprehensive Environmental Response, Compensation and Liability Act (CERCLA): This regulation provides broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. Riverside County contains three facilities that are being remediated under the federal CERCLA program, which would prevent public health and safety impacts from

hazardous materials that could be released by these facilities on any future development accommodated by GPA No. 960.

Resource Conservation and Recovery Act (RCRA): Enacted by Congress in 1976, RCRA governs the management of hazardous waste to protect human health and the environment from the potential hazards of waste disposal, to conserve energy and natural resources, to reduce the amount of waste generated and to ensure that wastes are managed in an environmentally sound manner. RCRA regulates the management of solid waste, hazardous waste and underground storage tanks holding petroleum products or certain chemicals. Riverside County contains 35 facilities that are being evaluated and/or cleaned up under the federal RCRA program and remediation consistent with that program would prevent any hazmat impacts from these facilities from affecting future development accommodated by GPA No. 960. In addition, there are thousands of facilities in Riverside County that must obtain and maintain permits to handle hazardous materials under RCRA (see HMTA below). As with the residents and visitors today, compliance by those facilities with RCRA protects public health and safety for current and future land uses under GPA No. 960.

Hazardous Materials Transportation Act (HMTA): The objective of the HMTA is to protect lives and property from risks associated with the transportation of hazardous materials. Any business or facility that transports hazardous materials must comply with the requirements of the federal HMTA, as administered by the California Highway Patrol. Compliance with HMTA would help to reduce potential impacts to future land uses, policy areas, trails, roads, etc., accommodated by GPA No. 960 relative to hazmat spills along major roadways.

Hazardous Waste Control Law (HWCL): The State HWCL implements the federal RCRA program as a "cradle-to-grave" waste management system in California. There are thousands of facilities in Riverside County that must obtain and maintain permits to handle hazardous materials under RCRA and HWCL. Compliance with RCRA and HWCL would help ensure that potential risks to public health and safety from future development accommodated by GPA No. 960 would be effectively managed and monitored to minimize hazards.

CCR Title 22 and Title 26: CCR Titles 22 and 26 echo the HWCL's requirements for "cradle-to-grave" management over the generation, use, transport and disposal of hazardous materials in the state. Compliance by facilities that handle hazardous materials would help ensure that potential hazmat risks to future uses accommodated by GPA No. 960 would be reduced to the extent possible and practical under State of California management programs.

Ordinances No. 615 and No. 651: These ordinances establish the program and procedures for the County of Riverside to monitor facilities that handle hazardous materials, according to applicable state and federal laws and regulations. As long as facilities that handle hazardous materials comply with these ordinances, potential hazmat impacts on future developed uses resulting from GPA No. 960 would be managed to protect public health and safety.

Ordinance No. 718: Similar to Ordinances No. 615 and No. 651, Ordinance No. 718 applies to medical wastes. Compliance by medical facilities with this ordinance would help ensure that potential hazmat risks to future uses resulting from GPA No. 960 relative to medical wastes would be managed and controlled to less than significant hazard levels.

Ordinance No. 348: Section 18.44 of this ordinance regulates the allowable locations and expansions of hazmat facilities to health, safety and protection of the public. The ordinance limits those zones that hazardous waste facilities are allowed in with an approved hazardous waste siting permit and also prescribes standards and development criteria for such sites. Compliance with the ordinance by new and expanded facilities would help ensure that potential hazmat risks to future developed uses resulting from GPA No. 960 would be reduced.

b. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policy 7.3, in particular, provides mitigation for impacts associated with the routine handling of hazardous materials. Implementation of this General Plan policy will help reduce risks to future growth and development. See Section 4.13.3 for full text of the policy.

Policy S 7.3: This policy requires all entities that handle hazardous materials to take the necessary actions such as installing hazardous material detection devices, alternative communication systems, etc., in preparation for possible hazardous material accidents.

c. Compliance with Proposed New or Revised General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies S 6.1, S 7.1 and S 9.1, in particular provide mitigation for impacts associated with the routine handling of hazardous materials. Implementation of these General Plan policies would reduce the impacts of future growth and development consistent with GPA No. 960. See Section 4.13.3 for full text of each of these policies.

Policy S 6.1: This policy enforces the policies and programs prescribed within the County of Riverside Hazardous Waste Management plan which includes, but is not limited to, requiring compliance with federal and state laws pertaining to the management of hazardous wastes and materials and active public participation in hazardous waste management.

Policy S 7.1: This revised policy ensures that the County's Emergency Services' Response Plan and the Multi-Jurisdictional Local Hazard Mitigation Plan are reviewed for considerations that would strengthen the plans. The policy also encourages the maintenance of mutual aid agreements with federal, state, local agencies and the private sector that would assist in hazardous materials response.

Policy LU 7.9: This new policy requires buffering be used to mitigate any potential hazardous materials impacts on urban uses from adjacent solid waste disposal facilities.

3. Finding on Significance for Impact 4.13.A

Compliance with the above existing regulations, programs and policies would ensure that impacts related to the routine handling of hazardous materials associated with future development accommodated by GPA No. 960 would have a less than significant impact.

B. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Impact 4.13.B – Create a Significant Hazard Through the Accidental Release of Hazardous Materials: Future development accommodated by the project would increase the number of people and properties potentially at risk for upsets or accidental hazmat releases. However, while the potential for accidental explosion or release of hazardous substances from existing and future industries, transportation or disposal within Riverside County exists, it is not, nor would it be, any higher than is typical for any other region of Southern California. Within Riverside County, the highest probabilities for inadvertent releases of hazardous substances are through a vehicular accident on heavily traveled freeways, during remediation or grading of a contaminated site, or from an industrial accident at a facility that handles large amounts of hazardous materials. Compliance with existing

regulatory programs and General Plan policies would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.13.B

Future development accommodated by the proposed project would introduce various future land uses throughout Riverside County; uses that may be affected by accidental releases of hazardous materials or hazardous wastes at some time. A hazardous material spill or release can pose a risk to life, health or property. An incident can result in the evacuation of a few people, a section of a facility or an entire neighborhood. There is also the potential for previously unknown hazardous materials contamination from historical use of a property, including currently vacant properties, being released during future development activities (i.e., grading, remodeling, remediation, etc.). Should a release occur, existing federal, state and local policies and procedures require action from the applicable enforcement agency. It is unlikely that any such activities would be extensive and beyond the capacities of typical containment or safe remediation. Furthermore, such risks are no different than those for existing uses. Therefore, no significant impacts from the accidental release of hazardous materials within Riverside County are anticipated as a result of the proposed project with implementation of existing laws and regulations**.** No project-specific mitigation is required.

2. Regulatory Compliance for Impact 4.13.B

As discussed above, under Impact 4.13.A, a number of federal, state and local regulations exist that would ensure that any future risks from the accidental release hazardous materials would be less than significant. There are a number of federal laws that regulate hazardous materials, including federal laws such as SARA addressing Superfund sites, RCRA and HMTA for hazardous waste disposal, tracking and transportation, OSHA, TSCA and also the federal Clean Air Act. Implementation of and compliance with CCR Titles 22, 26 and 27, as well as Riverside County Ordinances No. 615, 617, 651, 718 and 348 would help monitor and reduce the potential risks to future development resulting from GPA No. 960 for the reasons discussed under Impact 4.13.A, above.

a. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies S 6.1 and S 7.2 and 7.3, in particular, provide mitigation for impacts associated with the accidental release of hazardous materials. Implementation of these General Plan policies would reduce the risks to future development resulting from GPA No. 960. See Section 4.13.3 for full text of each of these policies.

Policies S 7.2 and 7.3: These policies would also help further lower potential risks or impacts of hazardous materials on future land uses, trails, roads and other minor changes proposed by GPA No. 960. The existing General Plan contains a number of policies regarding hazardous materials, specifically Policies 7.1-7.3 (see Section 4.13.3). Implementation of these existing General Plan policies would help further reduce the risks of accidental releases of hazardous materials in Riverside County.

b. Compliance With Proposed New or Revised General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies S 6.1, S 7.1 and LU 7.9, in particular provide mitigation to further lower potential risks or impacts of hazardous materials on future land uses and provide mitigation for impacts associated with the accidental release of hazardous materials. Implementation of these General Plan policies would help reduce risks to future development resulting from GPA No. 960. See Section 4.13.3 for full text of each of these policies.

Policy S 6.1: This policy enforces the policies and programs prescribed within the County of Riverside Hazardous Waste Management plan which includes, but is not limited to, requiring compliance with federal and state laws pertaining to the management of hazardous wastes and materials and active public participation in hazardous waste management.

Policy S 7.1: This policy ensures that Riverside County's Emergency Services' Response Plan and the Multi-Jurisdictional Local Hazard Mitigation Plan are reviewed for considerations that would strengthen the plans. The policy also encourages the maintenance of mutual aid agreements with federal, state, local agencies and the private sector that would assist in hazardous materials response.

Policy LU 7.9: This new policy requires buffering be used to mitigate potential hazardous materials risks to urban uses from adjacent solid waste disposal facilities.

3. Finding on Significance for Impact 4.13.B

Compliance with the above existing regulations, programs and policies, would ensure that impacts related to the accidental release of hazardous materials as a result of future development consistent with GPA No. 960 would have a less than significant impact.

C. Would the project cause hazardous emissions or handle hazardous or acutely hazardous materials, substances or waste within one-quarter mile of an existing or proposed school?

Impact 4.13.C – Result in Hazardous Emissions or Related Hazards Within One-Quarter Mile of a School: Within Riverside County, there are 25 separate school districts for primary grades (K-12), four Community College Districts and a number of public and private colleges and universities. While no schools would be planned or built under GPA No. 960, the eventual build out of the General Plan would require additional schools, one or more schools of which may be located in the vicinity of a major hazmat site (see Table 4.13-A and Figure 4.13.1). In addition, school sites themselves contain hazardous materials of various types (such as pesticides, paints, cleaners and other commonly used substances). The use of such materials is governed by the schools and various regulations. The General Plan contains policies designed to protect the public and properties against hazardous material risks. However, the siting of school facilities is determined by individual school districts, based on criteria established by the California Department of Education (CDOE). While Riverside County can regulate the location of industrial uses within unincorporated areas, it cannot control the actions of individual school districts within the county, or the CDOE, in siting new schools. As a result, the potential exists for significant impacts on school facilities resulting from hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or wastes within a quarter-mile of a school, but not as a result of the proposed project. School siting is also subject to review and approval by the California Department of Toxic Substances Control to help ensure school sites are not located on or near identified hazmat sites. Implementation of regulations and General Plan policies would ensure that future development consistent with GPA No. 960 would have less than significant hazmat impacts on schools.

1. Analysis of Impact 4.13.C

Future development accommodated by the proposed project would introduce various developed land uses throughout Riverside County that could be proximate to one or more existing or future schools. Therefore, there is a potential that schools could be affected by hazardous materials related to future development. Further discussion of school facilities is presented in EIR Section 4.17.5. However, federal, state and local school district

policies and procedures would be sufficient to minimize risks to school facilities, students and faculty, as well as the general public. Therefore, no significant impacts related to the possible future proximity of schools to land uses or other changes resulting from GPA No. 960 are anticipated. No project-specific mitigation is required.

2. Regulatory Compliance for Impact 4.13.C

As discussed above, under Impacts 4.13.A and 4.13.B, a number of federal, state and local regulations would help ensure that project-related hazardous materials risks to schools would be less than significant. For the reasons discussed above, compliance with CERCLA, RCRA, HMTA, HWCL and CCR Titles 22 and 26, as well as Ordinance No. 617, would help monitor and reduce the potential impacts from the potential proximity of schools to future land uses accommodated by GPA No. 960 and any attendant hazmat risks.

a. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies S 6.1 and S 7.2-7.3, in particular, provide mitigation for impacts associated with hazmat impacts on schools. As discussed under Impacts 4.13.A and 4.13.B, implementation of these General Plan policies would further reduce the hazmat risks to schools as a result of future development resulting from GPA No. 960. See Section 4.13.3 for full text of each of these policies.

b. Compliance with Proposed New or Revised General Plan Policies

Safety Policy S 7.1, proposed as part of GPA No. 960, would further prevent significant impacts related to hazardous materials and schools. See Section 4.13.3 for full text of the policy. Policy S 7.1 would ensure that the County's Emergency Services Response Plan and the Multi-Jurisdictional Local Hazard Mitigation Plan are reviewed for considerations that would strengthen the plans. The policy also encourages the maintenance of mutual aid agreements with federal, state, local agencies and the private sector that would assist in hazardous materials response.

3. Finding on Significance for Impact 4.13.C

Compliance with the above existing regulations, programs and policies, would ensure that hazardous material risks to schools resulting from GPA No. 960 would be less than significant.

D. Would the project be located on a site which is included on a list of hazardous materials compiled pursuant to California Government Code section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

Impact 4.13.D – Result in a Significant Hazard Due to Development on a Cortese List Hazardous Material Site: According to the California Department of Toxic Substances Control database, there are 19 sites within Riverside County that are on the Cortese list, as shown in Table 4.13-A. However, none of the proposed GPA No. 960 sites are adjacent to or in the immediate vicinity of any properties on the Cortese list. Compliance with applicable federal, state and county regulations would reduce the potential risks of public exposure to hazardous materials to less than significant levels.

1. Analysis of Impact 4.13.D

The following six hazmat sites on the Cortese list are proximate to proposed trail segments but not located directly within any proposed trail segment: March AFB/ARB; Foster-Gardner; Lockheed Beaumont No. 2; Temecula Target #107; and Torney Hospital. Similar to the impacts identified and analyzed in the previous subsections for Impacts 4.13.A, 4.13.B and 4.13.C, there is a potential that new or revised trails alignments or segments proposed under GPA No. 960 could be affected by existing hazardous materials sites. However, existing federal, state and local regulations and policies would reduce the risks. Therefore, no significant impacts related to the location of existing hazardous material sites are anticipated. Moreover, no project-specific mitigation is required.

2. Regulatory Compliance for Impact 4.13.D

As per above, under Impacts 4.13.A, 4.13.B and 4.13.C, a number of federal, state and local regulations would ensure the risk of accidental release of hazardous materials would be less than significant. Per the reasons above, compliance with CERCLA, RCRA, HMTA, HWCL and Titles 22 and 26 would help reduce risks from hazardous material sites on future development resulting from GPA No. 960.

a. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies S 7.3, 7.6 and 7.14, in particular, provide mitigation for impacts associated with hazardous material sites. As discussed under Impacts 4.13.A and 4.13.B, implementation of Policy S 7.3 would further reduce the impacts of future development as it relates to hazardous material sites through reinforcement of the County of Riverside Hazardous Waste Management Plan. This plan ensures the coordination of regional hazardous waste facility responsibilities and requires those businesses that handle hazardous materials. Policy S 7.6 ensures the continued improvement of emergency information dispersal through technology that tracks locations and types of hazardous materials. Policy S 7.14 also requires that emergency evacuation plans for hazardous materials release events are reviewed on a regular basis. Through regular review of evacuation plans, necessary updates can be made in order to maintain the efficiency of the plan, thereby further reducing potential hazardous impacts. See Section 4.13.3 for policy texts.

b. Compliance With Proposed New or Revised General Plan Policies

Safety Policies S 6.1 and S 7.1 would further prevent significant impacts related to hazardous material sites. See Section 4.13.3 for the full policy texts. The policies would further reduce the impacts of future development as it relates to hazardous material sites through reinforcement of the County of Riverside Hazardous Waste Management Plan, require the continued strengthening of Riverside County's Response Plan and Multi-Jurisdictional Local Hazard Mitigation Plan and ensure the continued coordination of various agencies in order to assist in a number of activities including hazardous materials response, thereby maintaining the efficiency of the plans and any mutual agency agreements.

3. Finding on Significance for Impact 4.13.D

Compliance with the above existing regulations and policies would ensure the risk of accidental release of hazardous materials resulting from future development accommodated by GPA No. 960 would be less than significant.

E. Would the project result in a safety hazard for people residing or working in the project area within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport?

Impact 4.13.E – Result in a Safety Hazard for People Within Two Miles of a Public or Public Use Airport: Future development accommodated by the project has the potential to introduce additional people and property within two miles of public airports. However, GPA No. 960 proposes changes within three Airport Influence Areas to improve safety by ensuring consistency between the General Plan and these airports' Airport Land Use Plans. Future proposed development in a Riverside County Airport Influence Area would be subject to review by the Riverside County Airport Land Use Commission (ALUC) to ensure safety and minimize risks both to people and property on the ground. This would also help ensure air travel safety and protect the functioning of the public air facilities. In addition, the General Plan includes provisions to minimize safety hazards for people living and working in proximity to these airports. However, due to the nature of air travel, potential safety hazards around airports, such as aircraft accidents, would remain. An unforeseeable air accident could result in substantial loss of life or property damage, even within the safety zones outlined in the General Plan and the Riverside County Airport Land Use Compatibility Plan (ALUCP). However, compliance with applicable County of Riverside and ALUC regulations would ensure that air hazard risks to the areas affected by GPA No. 960, including any resultant future development, would be minimized to less than significant levels.

1. Analysis of Impact 4.13.E

As noted above, GPA No. 960 includes a variety of specific Land Use Designation (LUD) changes to land surrounding three airports: Flabob, Riverside Municipal and Blythe Airports. These changes are designed to ensure any future development occurring on the sites is consistent with the applicable General Plan Airport Influence Area (AIA) and the sites' Airport Land Use Plans (ALUPs). Such proposals are also reviewed by the Riverside County ALUC for consistency. Other areas in AIA in the county are either already deemed consistent with ALUC plans or would require future consistency determinations (outside the scope of GPA No. 960). In addition, future development accommodated by GPA No. 960 would introduce various land uses to locations across Riverside County, including some that may be affected by activities at airport or air facilities, as well as accidents involving aircraft. The potential risk of death or injury from aircraft accidents could rise to unacceptable levels if land uses surrounding an airport: introduce large numbers of residents to the area; allow businesses to introduce large numbers of workers; or, permit buildings that are too tall or too close to primary air hazard zones (e.g., landing and takeoff areas at either end of a runway) or secondary air hazard zones (areas adjacent to a runway or directly under approach zones for landing or takeoff). The project does not directly propose these sorts of land uses and, further, implementation of existing laws and regulations would help reduce to less-than-significant levels the potential safety impacts on any future land development occurring around an airport as a result of GPA No. 960.

2. Regulatory Compliance for Impact 4.13.E

As detailed and explained below, compliance with the following existing laws and regulatory programs and policies outlined in Section 4.13.3 would help reduce potential safety impacts related to airports and air travel (e.g., aircraft accidents) for future land uses near airports, including any resulting from GPA No. 960 implementation.

a. Compliance with Riverside County Regulations

Local regulations exist that would reduce impacts related to public airport safety and hazards. These include Ordinance No.'s 269, 448 and 576. Through these regulations, development near public airports with the potential to adversely affect, or be affected by, hazards are regulated through Riverside County's review process (as described under Policies LU 15.3, 15.5 and 15.6, below).

Ordinance No. 448 - Airport Operations: This Riverside County ordinance establishes airport operating areas and regulates height standards and limits therein. The ordinance is adopted pursuant to the "Airport Approaches Zoning Law," CGC Sections 50485-50485.14. Through use of strict development standards, potential adverse impacts related to public airport safety and hazards would be reduced.

Ordinance No. 576 - Regulating County Airports: This ordinance establishes minimum standards for airports, heliports or Short Take Off and Landing airports (STOLports) to safeguard life, limb, property and public welfare. Among other things, for facilities owned or operated by the County of Riverside, it empowers the Director of Airports to prescribe regulations necessary for public airport use. In addition, all prescribed regulations are reviewed by ALUC and must ultimately go before the Board of Supervisors for approval. Through this review and regulation, potential adverse public airport safety risks and air travel hazards would be reduced to less-than-significant levels for any future development resulting from GPA No. 960.

Ordinance No. 269 – Height Limits Around March Field: This ordinance addresses safety of both air operations at and people and property surrounding March Field through the establishment of maximum height limits around the air base. Though ALUC and other March-related land use plans also apply, this ordinance also helps assure the necessary safety measures are in place. Thus, compliance with this ordinance by any land use proposals associated with GPA No. 690 would ensure potential adverse public airport safety risks and air hazards would be reduced to less-than-significant levels around March Air Field.

b. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies LU 1.8, 15.1, 15.2, 15.7, 15.8, 15.9 and 31.2, in particular, provide mitigation for impacts associated with public airport and safety hazards. Implementation of these General Plan policies related to public airport and safety hazards would reduce the impacts of future growth and development within Riverside County to less than significant levels. In particular, Policy LU 1.8 mitigates airport-related safety hazards by requiring review of land use proposals around airports involving general plan or zoning amendments, etc., to ensure that potential safety concerns are addressed. Policy LU 15.1 mitigates airport-related safety hazards by allowing airports to continue to operate while an operator addresses safety impacts, which in turn, reduces risks to surrounding land uses by providing an incentive to encourage airport operators to maintain adequate safety systems. Policies LU 15.1, 15.2, 15.7-15.9 and 31.2 mitigate airport-related safety hazards by requiring that development proposals located within the boundaries of an ALUP be consistent with said plan prior to approval in an effort to prevent land use conflicts and reduce potential impacts.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised and proposed policies of the Riverside County General Plan would further prevent significant impacts related to public airport and safety hazards. See Section 4.13.3 for full text of these policies. Policy LU 15.3 requires amendments to an ACLUP be reviewed against the General Plan to ensure planning consistency. (When inconsistencies are found, either the General Plan must be amended or the Board of Supervisors must overrule the ALUC, as provided by law (Government Code section 65302.3).) Policy LU 15.4

calls for the referral of development-level projects (General Plan amendments, specific plans, changes of zone, etc.) within the Airport Influence Area of an ALUCP to the ALUC for review and determination per the State of California's Airport Land Use Law. Policy LU 15.5 requires development applications within an ALUCP to go before ALUC if the applicable compatibility plan has not been found consistent with the General Plan. Policy LU 15.6 gives the County of Riverside the option of whether or not to submit development applications that fall within an ALUCP to ALUC for review if the applicable compatibility plan has been found consistent with the General Plan. Both of the proposed policies would further ensure that development applications are consistent with the General Plan and any applicable ALUCPs.

3. Finding on Significance for Impact 4.13.E

Compliance with the above existing regulations and policies, would ensure that impacts related to public airport and safety hazards as a result of future development accommodated by GPA No. 960 would have less than significant impacts.

F. Would the project result in a safety hazard for people residing or working in the project area for a project within the vicinity of a private airstrip or heliport?

Impact 4.13.F – Result in a Safety Hazard for People in the Vicinity of a Private Airstrip or Heliport: Future development resulting from implementation of GPA No. 960 has the potential to introduce additional people and property within the vicinity of private airports, airstrips and heliports. However, the General Plan includes provisions to minimize safety hazards for people living or working in proximity to these facilities. Due to the nature of air travel, however, potential safety hazards around these facilities, particularly due to aircraft accidents, would remain, although usage levels of these types of facilities tend to be very low. Nevertheless, an air accident could result in substantial loss of life or property damage, even when development conforms to the standards for acceptable levels of risk, as outlined in the General Plan, ALUC standards, this EIR and Riverside County's safety plans. However, compliance with existing regulations and General Plan policies would ensure that this impact is less than significant.

1. Analysis of Impact 4.13.F

Future development accommodated by GPA No. 960 would introduce various land uses throughout Riverside County that could be affected by activities at private air facilities, as well as accidents involving aircraft. The potential risk of death or injury from aircraft accidents may rise to unacceptable levels if land uses surrounding an airport: introduce large numbers of residents; allow businesses that introduce large numbers of workers; or, allow buildings that are too tall or too close to primary hazard zones (e.g., runaway landing zones) or secondary hazard zones (airport approach zones). The project does not directly propose these sorts of land uses, however, and implementation of existing laws and regulations would reduce potential safety impacts on land uses around airports within Riverside County to less than significant levels.

2. Regulatory Compliance for Impact 4.13.F

As detailed and explained below, compliance with the following existing laws and regulatory programs outlined in Section 4.13.3 would help reduce potential safety impacts related to air facilities or aircraft accidents related to land uses around these facilities to the maximum extent possible.

a. Compliance With Riverside County Regulations

Local regulations would reduce impacts related to safety around private air facilities. These include Riverside County Ordinances No. 448 and No. 576. Through these regulations, development near private air facilities that would have the potential to adversely affect or be affected by air hazards are addressed through Riverside County's review process.

Ordinance No. 448: This ordinance establishes airport operating areas and regulates height standards and limits therein. The ordinance is adopted pursuant to the Airport Approaches Zoning Law, CGC Sections 50485-50485.14. Through the use of strict development standards, potential risks due to air travel and operations associated with private air facilities would be reduced.

Ordinance No. 576: This ordinance establishes minimum standards for airports, heliports or Short Take Off and Landing airports (STOLports) to safeguard life, limb, property and public welfare. Among other things, for facilities owned or operated by the County of Riverside, it empowers the Director of Airports to prescribe regulations necessary for public airport use. In addition, all prescribed regulations are reviewed by ALUC and must ultimately go before the Board of Supervisors for approval. Through additional review and increased regulation, potential risks associated with private air facilities and safety associated would be reduced.

b. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies LU 1.8, 15.2, 15.9 and 31.2, in particular, provide mitigation for risks associated with private air facilities and air safety. Implementation of these General Plan policies would reduce the risks to future development within Riverside County to less than significant levels. Specifically, Policy LU 1.8 mitigates airport-related safety hazards by requiring review of land use proposals around airports involving General Plan or zoning amendments, and other development-level project applications, to ensure that safety concerns are adequately addressed. Policies LU 15.2, 15.9 and 31.2 mitigate airport-related safety hazards by requiring development proposals within the boundaries of an ALUP be found consistent with the ALUP prior to County of Riverside approval in an effort to prevent land use conflicts and reduce potential impacts.

3. Finding on Significance for Impact 4.13.F

Compliance with the above existing regulations and General Plan policies would ensure that air safety and airport operation risks around private air facilities affecting future development accommodated by GPA No. 960 would have less than significant impacts.

G. Would the project impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?

Impact 4.13.G – Impair or Interfere With an Adopted Emergency Response Plan or Emergency Evacuation Plan: Future development accommodated by the project has the potential to interfere with safety or evacuation plans if not consistent with these existing emergency plans. However, the overall level of future development accommodated by the General Plan would be slightly less under the proposed revisions of GPA No. 960 than it would under the existing General Plan, slightly lowering the populations needing potential evacuation. In addition, the construction of the new roads and connecting road segments proposed under GPA No. 960 would actually improve access to and from some of the more remote portions of the county, facilitating evacuations and emergency responses. Thus, overall, the proposed improvements associated with GPA No. 960

would have beneficial impacts on, and help reduce potential hazards related to, future increased populations. Further, compliance with existing regulations and General Plan policies would ensure that this impact is less than significant.

1. Analysis of Impact 4.13.G

Future development consistent with GPA No. 960 would introduce various land uses throughout Riverside County and may require existing emergency response and evacuation plans to be updated as inadequate infrastructure and access could result in the loss of life, property and county resources. GPA No. 960 does not directly propose any changes or updates to existing emergency response or evacuation plans; however, the proposal would actually lessen the amount of future development allowed within Riverside County when compared to existing allowable development levels. Therefore, conflicts with existing emergency response and evacuation plans are not anticipated.

Future development projects would be required to be reviewed for adequate infrastructure and access as well as consistency amongst Riverside County emergency and evacuation plans among many other environmental issues in order to ensure the safety of Riverside County residents and the physical environment. In addition, various elements within the General Plan contain policies that relate to emergency response and evacuation plans which would further reduce potential impacts of development on safety plans. Implementation of existing laws and regulations would also help reduce potential emergency response and evacuation plan impacts as a result of future development accommodated by GPA No. 960 to less than significant levels.

2. Regulatory Compliance for Impact 4.13.G

As detailed and explained below, compliance with the following existing laws and regulatory programs outlined in Section 4.13.3 would help reduce potential fire safety impacts related to land uses under GPA No. 960, but possibly not to less than significant levels; thus, the additional regulatory measures outlined below would also be needed.

a. Compliance with Federal and State Regulations

Compliance with the following federal and state regulations would further prevent significant impacts to evacuation plans.

California Codes: A variety of state codes, particularly PRC Sections 4290-4299 and GC Section 51178, require minimum statewide fire safety standards pertaining to: roads for fire equipment access; signage identifying streets, roads and buildings; minimum private water supply reserves for emergency fire use; and, fire fuel breaks and greenbelts. They also identify primary fire suppression responsibilities among the federal, state and local governments. In addition, any person who owns, leases, controls, operates or maintains a building or structure in or adjoining a mountainous area or forest-covered, brush-covered or grass-covered land, or any land covered with flammable material, must follow procedures to protect the property from wildland fires. This regulation also helps ensure fire safety and provide adequate access to outlying properties for emergency responders and safe evacuation routes for residents.

California Emergency Services Act: This law reduces the potential impacts of development on emergency response and evacuation plans through proper preparation and coordination with necessary agencies, including the federal government, and manages multiagency and multijurisdictional responses to emergencies within the state. The Act is also responsible for maintaining CalEMA which oversees this coordination.

Statewide Standardized Emergency Management System (SEMS): SEMS reduces potential impacts of development on emergency response and evacuation plans by coordinating agencies within the emergency management community through one system accessible to jurisdictions statewide.

b. Compliance with County Regulations

Compliance with the following Riverside County regulations would further prevent significant impacts to evacuation plans.

Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan: The County of Riverside has developed this plan to proactively plan facility, service and equipment needs for fire protection, and it incorporates the CDF Management Plan for several sub-zones within Riverside County. This plan outlines evacuation routes and plans for access for emergency vehicles.

Ordinance No. 787 - Fire Code Standards: This ordinance adopts the Uniform Fire Code and adds requirements that help ensure that buildings have adequate emergency access for fire safety personnel, equipment and apparatus, and do not hinder evacuation from fire, including potential blockage of stairways or fire doors.

c. Compliance with Existing Riverside County General Plan

Compliance with the federal and state laws and regulatory programs outlined above, would help reduce potential fire safety impacts related to land use and policy changes in GPA No. 960. However, implementation of the following existing Riverside County General Plan Safety (S) Element policy is necessary to reduce (mitigate) potential impacts to less than significant levels.

Policy S 5.12: This policy requires the County of Riverside to conduct and implement long-range fire safety planning, including improved mutual aid agreements with the private and public sector that assist with evacuation of residents as well as access for emergency responders.

d. Compliance with Proposed New or Revised General Plan Policies

Policy S 5.14: This policy requires review of inter-jurisdictional fire response agreements, and improvements to firefighting resources as recommended in the Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan to keep pace with development, and ensure adequate fire reporting and response times per the Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan. It also requires adequate fire flows of water, etc., to provide adequate fire safety for residents of fire-prone areas (i.e., routes to evacuate and allow emergency access).

New and revised Policy 5.14 of the Riverside County General Plan would further prevent significant impacts related to evacuation plans. See Section 4.13.3 for full text of these policies.

3. Finding on Significance for Impact 4.13.G

Compliance with the above regulations and General Plan policies would ensure that impacts related to emergency response and evacuation plans as a result of future development accommodated by GPA No. 960 would have less than significant impacts.

H. Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Impact 4.13.H – Expose People or Structures to Significant Risk Due to Wildland Fires: Areas of high fire hazard exist within unincorporated portions of Riverside County, including rural, mountainous terrain, as well as areas adjacent to, or covered by, natural grasslands or brush. Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and industrial development, as well as the associated population, expected to occur within Riverside County over the next 50 years. Nevertheless, GPA No. 960 would accommodate future development in previously undeveloped areas, including some with high or very-high fire hazards. This would increase both the number of people and amount of property potentially exposed to fire hazards. Additionally, there is the potential for an increase in the occurrence of fires, particularly in urban-wildland interface areas, due to increasing human encroachment. Compliance with existing regulations and General Plan policies would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.13.H

Future development accommodated by GPA No. 960 would introduce various developed uses throughout Riverside County; uses that may be affected by fire or the potential risk of fire. The risk of death, injury or property damage from fire may rise to unacceptable fire risks if land uses are allowed into areas of high or unacceptable risk without proper planning or protection, or if roads are inadequate for fire access and evacuation.

Specifically, as shown in Table 4.13-J, above, land use changes associated with GPA No. 960 would result in future development that encroaches into or intermingles with wildlands in which fire hazard risks are high to very high. The Goodhope and Meadowbrook RVLUOs are within SRAs. Meadowbrook overlaps both the High and Very High fire hazard zones, while Goodhope is in a non-hazard zone but adjacent to High and Very High hazard areas. The rest of the affected policy areas and overlays are divided among the federal, SRAs and LRAs. However, none of these proposed changes would result in significant impacts related to wildland fires as long as new development is reviewed by the RCFD and CalFire as appropriate, and "fire safe" design, consistent with Riverside County requirements (such as Ordinance No. 787) and the Uniform Fire Code (as amended and adopted by the County of Riverside) are used to plan and construct property improvements.

The trails are divided among the federal, SRAs and LRAs. There are proposed trail segments in all fire hazard zones and many, if not most, in the more flat areas are in non-hazardous zones. Due to the nature of trails, there would be no adverse impacts that require mitigation for any of these locations. In addition, trails actually provide minor fire or fuel breaks and routes for firefighters to access areas with wildland fires. Therefore, these improvements may be beneficial in limiting wildland fire damage.

The locations for the proposed roads or road segments in very high or high fire hazard zones vary and in the more flat areas of Riverside County, most are in non-hazardous zones. Due to the relatively fire-proof nature of roads, there would be no adverse impacts that require mitigation for any of these locations. In addition, roads provide fire or fuel breaks and routes for firefighters to access areas with wildland fires. Therefore, these improvements would be beneficial to reducing wildland fire hazards. There are proposed commercial land use designations in all fire hazard zones, which vary by slope and vegetation characteristics. Future development of these sites would not result in significant wildland fires risks as long as the new proposed development meets

RCFD and CalFire standards, as applicable, and "fire safe" design, consistent with the Fire Code (as amended per Riverside County ordinance).

Overall, implementation of existing laws and regulations, including standards for roadways and access, development siting and ignition-resistant building materials, among other things, would reduce potential fire safety impacts on land uses within Riverside County to less than significant levels.

2. Regulatory Compliance for Impact 4.13.H

As detailed and explained below, compliance with the following existing laws and regulatory programs would help reduce potential fire safety impacts related to land uses accommodated by GPA No. 960 to less than significant levels.

a. Compliance with State and County Regulations

To achieve fire protection for all residents of Riverside County, the Riverside County Department of Building and Safety and the Riverside County Fire Department enforce fire standards as they review building plans and conduct building inspections. Additional programs implemented to ensure compliance with established fire standards include: the maintenance of a Countywide Information Map, showing high fire hazard areas, and sighting and construction methods that reduce fire risks to structures developed within high fire hazard areas; the provision of uniform fire improvement standards for various land uses that ensure appropriate fire protection measures are incorporated into the design, construction and operation of these land uses; and the continued updating and use of the Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan to ensure new fire protection facilities are added when demand increases warrant them.

The County of Riverside requires a development within high fire hazard areas to design and implement fuel modification programs for the interface between developed and natural areas within and adjacent to the proposed project area. Such fuel modification plans shall be subject to approval by the Riverside County Fire Department. The fuel modification programs shall be achieved through graduated transition from native vegetation to irrigated landscape. The program shall also establish parameters for the percent, age, extent and nature of native plant removal necessary to achieve the Riverside County fire prevention standards to protect human lives and property, while preserving as much natural habitat as practicable.

The County of Riverside also actively enforces Ordinance No. 695, which requires the abatement of "hazardous vegetation;" defined in the ordinance as vegetation that is flammable and endangers the public safety by creating a fire hazard. The type of abatement can depend on the location, terrain and vegetation present, but typically includes mowing or disking (plowing) vegetation, such as seasonal and recurrent weeds, stubble, brush, dry leaves and tumbleweeds. Abatement is generally required along roadways and habitable structures either on or adjacent to the property. For unimproved parcels adjacent to a roadway, a 100-foot wide strip of abated land at the parcel boundary is required. A similar strip is required around structures on an adjacent improved parcel.

According to the ordinance, determination of the appropriate clearance distances are based on visual inspection of the parcel and consideration of all fire risk factors for the property or adjoining structures. These factors include local weather conditions, fuel types, topography and the local environment. Where the parcel's terrain cannot be disked or mowed, the Riverside County Fire Chief may require or authorize the use of other means of removal. In addition, the County of Riverside requires all new structures in unincorporated areas comply with the construction requirements of Ordinance No. 787, including use of fire-retardant roofing material as per the California Building Code.

California Codes: A number of California regulations, including PRC Sections 4290-4299 and CGC Section 51178, address fire safety. In particular, these sections require minimum statewide fire safety standards pertaining to: roads for fire equipment access; signage for identifying streets, roads and buildings; minimum private water supply reserves for emergency fire use; and, fire fuel breaks and greenbelts. They also identify primary fire suppression responsibilities among the federal, state and local governments. In addition, it sets fire safety standards for all buildings and structures in, or adjoining, mountainous areas, or forest-, brush- or grass-covered lands or any land covered with flammable material to protect property from wildland fires.

Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan: The County of Riverside has developed this plan to proactively plan facility, service and equipment needs for fire protection. It also incorporates the CDF Management Plan for several sub-zones within Riverside County. Implementation of this plan helps reduce potential risks of fire for residents in areas of moderate to high fire danger.

Ordinance No. 787 - Fire Code Standards: This ordinance adopts the Uniform Fire Code and adds requirements to further protect people and structures from fire risks, and ensures that building would not impede emergency egress for fire safety personnel, equipment and apparatus would not hinder evacuation from fire, including potential blockage of stairways or fire doors.

Ordinance No. 695 - Abatement and Notices for Hazardous Vegetation: Each spring, the CDF and RCFD distribute hazard abatement notices. These notices, which currently go to about 30,000 Riverside County residents, instruct property owners to reduce fuels (flammable vegetation) around their property. A minimum 30-foot clearance is required around all structures; this can be extended to 100 feet in areas where severe fire hazards exist. On unimproved parcels, the property owner is required to disc or mow 100 feet along the perimeter of the property. These requirements substantially improve public safety and property protection for fire-prone areas by removing fire fuels.

b. Compliance with Existing Riverside County General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies LU 10.1 and S 5.12 in particular, provide mitigation for impacts associated with wildland fire risks. Implementation of these General Plan policies would aid in reducing fire risks to future development accommodated by the project to less than significant levels. Specifically:

Policy LU 10.1: This policy requires that future developments contribute a fair amount for the funding of infrastructure, public facilities such as police and fire facilities in order to ensure adequate availability of such infrastructure and services, thereby, reducing potential hazards.

Policy S 5.12: This policy encourages the practice and implementation of long-range fire safety planning as well as more stringent codes and improved infrastructure aimed at the reduction of fire hazards including wildland fire hazards.

Policies LU 5.2 and 10.1: These policies ensure that new development contribute funds to be used to provide necessary fire and emergency response services and that such facilities are constructed in a timely manner to ensure adequate protection of the people and property of Riverside County.

Policies S 5.9, 5.12 and 5.15: These policies require development be constructed to various building and fire code standards that are designed to ensure structures provide appropriate levels of fire resistance and are situated

in a manner that provides adequate emergency access and evacuation, and allows for maintaining of appropriate fire fuel modification zones.

Policy S 5.13: Several policies direct the County of Riverside in how and when and to what standards to provide appropriate fire protective services. This policy, in particular, addresses water connections and reservoirs used for firefighting purposes.

c. Compliance with Proposed or Revised General Plan Policies

Of the General Plan policies listed in Section 4.13.3, above, Policies LU 5.1 and LU 7.8, S 5.1-5.8, S 5.11 and S 5.14-5.21, in particular, provide mitigation for impacts associated with wildland fire risks. Implementation of these General Plan policies would aid in reducing the impacts of future growth and development within Riverside County to less than significant levels. Specifically:

Policies LU 5.1 and 7.8: These policies ensure that future development would not overburden infrastructure and public services and that such infrastructure and services would continue to operate at adequate levels. Policy LU 7.8 also requires future development located within designated Fire Hazard Severity Zones to provide for fuel modification as determined by the Fire Department.

Policies S 5.1-5.8 and 5.14-5.21: These policies mitigate wildland fire risks through construction design standards and requirements; coordination amongst various Riverside County agencies, water agencies and surrounding jurisdictions to implement long-range fire safety planning; improved infrastructure, fire response agreements and adequate water supply and flow with coordination driven by Riverside County's Fire Protection Strategic Master Plan and the General Plan Safety Element; limiting development potential in areas that lack water and access roads; continued usage of fuel breaks, brush management, controlled burnings, revegetation and fire roads including clearance inspections; encouraging future development located within fire hazard zones to develop where adequate fire and emergency services already exist or are being planned; providing services that meet minimum travel times for fire; frequent updates of fire hazard maps; and fire mitigation through landscaping. These policies help protect structures and ultimately Riverside County residents from fire damage, injury or loss of life.

Policy S 5.11: This policy addresses brush clearance and fire inspections of properties. It is, in essence, implemented through Ordinance No. 659, as described above. By ensuring hazardous vegetation is abated around structures and property, this policy helps protect structures and ultimately Riverside County residents from fire damage, injury or loss of life.

3. Finding on Significance for Impact 4.13.H

Compliance with the above existing regulations and General Plan policies would ensure that impacts related to wildland fire risks as a result of future development accommodated by GPA No. 960 would have less than significant impacts.

4.13.7 Significance After Mitigation – Hazardous Materials and Safety

The aforementioned policies mandate compliance with local, state and federal regulations regarding hazardous materials, airports and aircraft hazards, wildland fires and emergency evacuations, and establish procedures for safe planning around airports and air facilities. Therefore, implementation of applicable federal, state and local regulations, in addition to the stated General Plan policies, would ensure impacts related to hazardous materials, airport and aircraft hazards, and wildland fire hazards and emergency evacuation plans are less than significant. No additional mitigation is required.

Section 4.14

Mineral Resources

Section 4.14 Mineral Resources

4.14.1 Introduction

Minerals are defined as any naturally occurring chemical elements or compounds formed from inorganic processes and organic substances. Minable minerals or "ore deposits" are defined as a concentration of ore or minerals having a value materially in excess of the cost of developing, mining and processing the mineral and reclaiming the area. Regulating this resource, the County of Riverside implements the State of California's Surface Mining and Reclamation Act (SMARA) at the local level. This section assesses potential impacts associated with mineral resources that could occur as a result of future development accommodated by the proposed project, GPA No. 960.

4.14.2 Existing Environmental Setting - Mineral Resources

Mineral resources are an integral part of the development and economic well-being of the County of Riverside. The conservation, extraction and processing of mineral resources is essential to meeting the needs of Riverside County and supporting the continued growth of the region. Mineral resources serve various public, commercial, scientific and recreational purposes benefiting both the private and public sectors. In Riverside County, minerals are a foremost natural resource, important not only to the economic health of Riverside County, but to the many industries outside the county that depend on them as well. The non-renewable characteristic of mineral deposits necessitates careful and efficient management to prevent waste, careless exploitation and uncontrolled urbanization. Most of the economically valuable mineral deposits known to occur in Riverside County are located along Interstates 15, 215 and 10.

A. Economically Important Minerals in Riverside County

Riverside County has a rich history of over 175 years of mining, starting with the California Gold Rush. Over the years, diverse mineral resources, including extensive deposits of clay, limestone, iron, sand and aggregates have been influential in the development of the region and have served as an important component of Riverside County's economy. Minerals commercially extracted from Riverside County in the past included a number of valuable minerals refined directly or used in industry, such as:

- Gold
- Copper, iron and tin
- Lead, silver, zinc and arsenic
- Rare earth elements (monazite, xenotine)

- Antimony
- Mica and gypsum
- Fluorite
- Coal
- Magnesite and tungsten
- Feldspar, quartz and silica
- Wollastonite and other asbestos-like minerals
- Gemstones (tourmaline, beryl, agate, etc.)

In the present century, the region's most economically valuable mineral resources are those used as building materials and in their manufacture. Roughly 80% of California's mineral production now consists of such "industrial" minerals. Industrial minerals occurring and extracted in Riverside County currently include:

- Clay (used to make brick, pipe, tiles and other building products)
- Limestone (used to make Portland cement and other cement products)
- Sand and gravel (collectively, "aggregates," used as road base and in concrete)
- Specialty sands (such as those used for glass-making and foundry molds)
- Rock commodities (broken and crushed stone products, as well as stone slabs used for cemetery markers, building facings, countertops, etc.)

Rapid urbanization in Riverside County produces intense competition for land, as well as increases the need for industrial commodities. The long-term viability of mines producing industrial building commodities, such as aggregate, sand and clays, could easily become threatened by the urban communities that they enable to expand. Expanding urban areas typically force resource production away from its core. However, it is the urbanizing areas that most need an affordable source of mineral resources for continued growth. For example, the State of California estimates that on average, 229 tons of aggregate are used in the construction of a single house.

Some minerals can be marketed worldwide; however, the marketability of most industrial commodities is directly dependent on the distance of transport. When hauling sand and gravel, for instance, the cost of the commodity doubles for every 50 miles of truck transport. Additionally, when urban and suburban development encroaches on existing mining operations, new residents can come into conflict with the effects of mining operations, such as noise and vibration, dust and heavy truck traffic. For these reasons, Riverside County must continue to be active in balancing the delicate issues of conservation of these non-renewable resources and expansion of the communities they are mined to serve.

B. Mineral Resource Zones

High demand for mineral commodities perpetuates the need for access to mineral deposits for current and future extraction. To protect the resources that serve this demand, the State Geologist is tasked with classifying land according to the presence or absence of significant mineral deposits according to a priority list established by the State Mining and Geology Board (SMGB).

The SMGB uses "Mineral Resource Zones" (MRZs) to classify lands that contain valuable mineral deposits. Use of MRZs can help identify mineral deposits to be protected from encroaching urbanization and land uses incompatible with mining. The MRZ classifications reflect varying degrees of mineral significance, determined by

available knowledge of the presence or absence of mineral deposits, as well as the economic potential of the deposits. In this process, it is important to recognize that mineral-bearing lands classified by the State Geologist are not explicitly reserved for mining. Nor do they take into account existing land uses. Rather, the State of California only develops and presents the data to planning agencies, which must make decisions concerning mineral resources and mining at the local level. Accordingly, the SMGB uses the following MRZ classifications:

MRZ-1: Areas where available geologic information indicates no significant mineral deposits are present or that there is little likelihood for their presence.

MRZ-2a: Areas where available geologic information indicates that there are significant measured or indicated mineral deposits present. According to the SMGB, land included in this category is of "prime importance" because it contains known economic mineral deposits.

MRZ-2b: Areas where available geologic information indicates that significant inferred mineral resources are present. This includes discovered deposits that are inferred to occur in economically viable concentrations, as well as those currently occurring at sub-economic levels based on limited samples. More importantly, MRZ-2b areas are considered potentially suitable for upgrade to MRZ-2a status, should future conditions warrant.

MRZ-3a: Areas where the available geologic information indicates that mineral deposits exist, however, the significance of the deposit is undetermined. Additional exploratory work would be needed to determine specific categorization. MRZ-3a areas are considered to have moderate potential for the discovery of economic mineral resources (the discovery of which could lead to upgrading to MRZ-2, for example).

MRZ-3b: Areas where the available geologic information indicates that mineral deposits are likely to exist, however, the significance of the deposit is undetermined. This class denotes areas where presence of the mineral is inferred and/or not visible from the surface geology. Further exploration would be needed to ascertain full potential of the area.

MRZ-4: Areas where there is not enough information available to determine the presence or absence of mineral deposits. For land use purposes, it should be noted that MRZ-4 differs from MRZ-1 in that it denotes areas lacking enough *information* for a more specific classification to be made, rather than lacking the mineral deposits themselves.

After an area has been classified into MRZs, the SMGB then determines if the "classified" mineral resource deposit warrants "designation" as being of either "regional" (multi-community) or "statewide economic significance." In contrast to classification, which inventories mineral deposits without regard to existing land use, the purpose of designation is to identify those areas that are of prime importance in meeting the future needs of the study region and that remain available from a land use perspective. Once completed, the SMGB transmits the information to the affected counties and cities for mandated incorporation into their land use planning processes.

Figure 4.14.1 (Mineral Resource Areas Map) identifies the areas within Riverside County with potential mineral resource deposits, according to State of California MRZ classifications. At present, Riverside County is classified into a total of roughly 83,267 acres of MRZ-1, 71,270 acres of MRZ-2 (including 22,114 acres MRZ-2a and 7,428 acres MRZ-2b), 1,336,723 acres of MRZ-3 and 1,751,892 acres of MRZ-4. Within the MRZ-2 class, approximately 11,853 acres have been designated "regionally significant" by the SMGB. (See Table 4.14-A (Changes Affecting State Mineral Resource Areas).) In addition, roughly 6,371 acres within the Palm Springs region have been approved by the SMGB for designation as being of regional significance and are currently awaiting rulemaking to codify the decision. There are no sites within Riverside County designated as "locally important mineral recovery sites."

C. Aggregate Resources

California is the nation's leading producer of construction aggregate, with a total production of 235 million tons in 2005. This is roughly 6.5 tons of aggregate per person in the state in 2005. Over the next 50 years, it is estimated that California will need approximately 13.5 billion tons of aggregate. However, the industry is highly vulnerable to land use issues on two fronts. Aggregate resources located too close to urban or environmentally sensitive areas can limit or stop their development. Secondly, a mineral resource may be too far from a potential market to be economically viable.

Beyond geological viability, MRZ-2 areas are evaluated to determine if current land uses would preclude mining. Areas currently permitted for mining and areas the State of California finds to have land uses compatible with possible mining are identified as "Sectors." To protect construction aggregate resources, in addition to being classified MRZ-2a or MRZ-2b, lands known to contain "significant aggregate resources" are assigned to Sectors. The State of California uses these Sectors to estimate aggregate resources available for the next 50 years.

In defining economic viability, the State of California uses large, multi-county "Production-Consumption Regions" as their boundaries for study areas for aggregate production and their associated market areas. As part of the classification process, the State of California has calculated both the fifty-year aggregate demand forecast and the amount of aggregate resource available for the given area. The status of each aggregate resource area relevant to Riverside County is provided below.

1. Temescal Valley – Orange County Production-Consumption Region

This region is the largest within the greater Los Angeles metropolitan area. It spans Orange County from Seal Beach to San Onofre and stretches northeast into Riverside County along the Santa Ana River to encompass portions of Norco and Corona, and also runs south into upper Temescal Canyon. In addition to serving western Riverside County, it also provides Orange County and northern San Diego County with aggregate exports.

The TV-OC Region contains a number of resource Sectors State-designated as being of "regional significance," as well as "regionally significant construction aggregate resource areas" (ARAs) in portions of the Santa Ana River within the Prado Basin and also behind Mount Rubidoux. Significant aggregate resources also occur south of Corona within and along Temescal Wash and south towards Lake Elsinore. The SMGB established land designations for the region in 1984 (SMARA Designation Report No. 3), and the most recent SMGB classification occurred in 1991 (Special Report No. 165). Although two focused areas have been addressed in recent years, as per Special Report No. 200 and No. 212 (see discussion below), the State of California has not *systematically* updated either classifications or designations since 1991. Figure 4.14.2 (Riverside County Aggregate Resources of the Temescal Valley-Orange County and San Bernardino Production-Consumption Regions) shows current mapped mineral resource information for the area.

In 2007, the State of California reported that the active mines in Orange County are "nearly exhausted" and that the fast-growing county now "relies on Temescal Valley for much of its aggregate needs." As a result, the Temescal Valley Production District has become the largest sand and gravel production district in the United States, having produced about 12 million tons of aggregate in 2005. Per a 2007 report issued by the California Geological Survey, the region's 50-year aggregate demand is 1,122 million tons. As of 2007, a total of approximately 355 million tons were being supplied by permitted aggregate resources; 32% of the forecast demand. Data indicate that approximately 6,000 million tons of mineral resources are secured within the region.

New Location – Proposed Quarry Site: In 2007, the State Geologist investigated and subsequently reclassified a portion of Riverside County within the Temescal Valley-Orange County Production-Consumption Region at the petition of Granite Construction Company. Specifically, the State found that aggregate materials present on the site meet specifications for use in Portland cement concrete (PCC) and that the resource exceeds the minimum economic viability threshold value of $16.41 million established by the SMGB. As a result, approximately 290 acres of the 310-acre Granite Construction Company "Liberty Quarry" site were reclassified by the SMGB from MRZ-3a to MRZ-2a for PCC-grade aggregate. This new State MRZ-2 designation is reflected in Figure 4.14.2. It should be noted that this classification is a State of California action that occurred without regard to any future Riverside County or City of Temecula actions.

New Location – Day Street Aggregate Site: In 2009, the State Geologist investigated and subsequently reclassified a portion of Riverside County within the Temescal Valley-Orange County Production-Consumption Region at the petition of First Industrial Realty Trust for a site off Day Street in the Perris/Cajalco Road area. Specifically, the State found that aggregate materials present on the site meet specifications for use in Portland cement concrete (PCC) and that the resource exceeds the minimum economic viability threshold value established by the SMGB. As a result, the 500-acre site was reclassified by the SMGB from MRZ-3 to MRZ-2 for PCC-grade aggregate. This new State MRZ-2 designation is reflected in Figure 4.14.2 (and also Figure 4.14.1). Again, this classification change is a State of California action taken without regard to any future Riverside County actions.

2. San Bernardino Production-Consumption Region

This region includes much of southwestern San Bernardino County, plus portions of western Riverside County not in the Temescal Valley P-C Region. In Riverside County, this specifically includes significant aggregate resources along the San Gorgonio River in the Cabazon area, several localities in Lake Elsinore, portions of Day Creek in the northwest corner of the county and areas along the Santa Ana River between the cities of Colton and Riverside.

Classification of the region occurred in 1984 (Special Report No.143, Part VII) and the SMGB designated lands within the region as being of "regional significance" in 1987 (SMARA Designation Report No. 5). The classification was updated in 2008 (Special Report No. 206), as described later in this section. No designation changes have occurred for this region since the 1987 report. Figure 4.14.2 shows current mapped mineral resource information for the area, including data updated since the 2003 adoption of General Plan Figure OS-5.

Within this region, Sector E-24, located in the Santa Ana River channel north of Mount Rubidoux and the City of Riverside, encompassed approximately 114 acres as of 2008. This is down from the 1987 report indicating 208 acres were available, reflecting the general cessation of mining as urban development engulfs the region. As of 2008, the Sector was estimated to possess approximately 16.7 million tons of available aggregate resources.

According to the 2008 report, since 1987 approximately 18% of the San Bernardino Production-Consumption Region's designated lands have been lost to incompatible land uses; a loss of approximately 959 million tons of aggregate resources. The 50-year consumption demand for the region, however, was estimated at 1,131 million tons of which 735 million tons must be Portland cement concrete-grade (PCC) aggregate. This is more than double the previous State forecast. In addition to supplying both San Bernardino County and western Riverside County, materials are also exported to northern San Diego County.

3. Palm Springs Production-Consumption (P-C) Region

This region generally includes the eastern portion of Riverside County running from Cabazon through Coachella Valley and into the Thermal area. It encompasses roughly a dozen aggregate resource areas, including the eastern end of the San Gorgonio River and part of Whitewater River, small areas in Little Morongo Canyon and the Thousand Palms area, alluvial fans in the Thermal area, Thermal Canyon, Fargo Canyon, Berdoo Canyon and, lastly, a wide stretch of the North Indio Hills generally above Dillon Road. In addition to supplying both Riverside County and portions of San Bernardino County, the region also exports sand by rail to the Los Angeles metropolitan area. Figure 4.14.3 (Aggregate Resources of the Palm Springs Production-Consumption Region) shows current mapped mineral resource information for the region, including data updated since the 2003 adoption of General Plan Figure OS-5.

Since 1985, permitted Portland cement concrete-grade (PCC) aggregate reserves (lands subject to mining permits) have increased from 67 million tons to 167 million tons, extending the P-C region's projected depletion date from 2012 to 2038. The anticipated 50-year consumption demand for the region was estimated by the State at 307 million tons, of which 138 million tons must be PCC aggregate; nearly double the previous (1988) State forecast. As of 2007, the State of California estimates that the region contains roughly 1,300 million tons of available aggregate resources. Included in this total is Sector J-1, encompassing 2,633 acres in the North Indio Hills area, which is estimated to have 191 million tons of aggregate resources.

Classification of the region occurred in 1988 (Special Report No. 159) and the SMGB designated lands within the P-C region as being of "regional significance" in 1989 (SMARA Designation Report No. 10). The classification was updated in 2007 (Special Report No. 198), as described later in this section. In October 2010, the SMGB approved these areas for designation and they are currently awaiting rulemaking to adopt the designation of mineral lands of regional significance within the Palm Springs Production-Consumption Region. Accordingly, since such a designation is assumed to be reasonably foreseeable, pending only formal rulemaking, this EIR treats lands mapped as "proposed for regional significance designation" the same as those with an adopted designation.

D. Baseline Changes - Resource Mapping Updates

Pursuant to PRC Section 2762, the Surface Mining and Reclamation Act (SMARA) provides that a city or county, upon receipt of a mineral land Classification Report prepared by the State Geologist or a mineral land Designation Report from the SMGB, must prepare and incorporate into its general plan the new information, as well as a set of "Mineral Resource Management Policies" (MRMPs). These MRMPs must be submitted to and reviewed by the SMGB for comment prior to adoption by the city or county. GPA No. 960 and this EIR are intended to fulfill these requirements.

Since the preparation of the 1999 Existing Settings Report and EIR No. 441 for the 2003 General Plan, additional information on environmental conditions related to mineral resources has been released. The California Geological Survey has issued several reports between 2003 and 2009 relevant to Riverside County, as described below. The following State of California reports affect Riverside County's known mineral resources and are reflected in both the revised baseline conditions for this EIR (Figures 4.14.2 and 4.14.3) and the resultant updated General Plan Figure OS-5 (which is based on Figure 4.14.1 herein):

MINERAL RESOURCE ZONES - PALM SPRINGS PRODUCTION-CONSUMPTION REGIONS

This page intentionally left blank

Special Report No. 198: This 2007 report updated the 1988 mineral land classification for Portland cement-grade aggregate in the Palm Springs Production-Consumption Region. In the update, 22,011 acres previously classified as MRZ-2 were reclassified as MRZ-2a, and 7,487 acres previously classified as MRZ-3 were reclassified as MRZ-2b. Extensive areas containing aggregate deposits, "the significance of which cannot be evaluated from available data," were classed MRZ-3. And, a number of areas were classed MRZ-1. In total, this report addressed 15,692 acres of PCC-grade aggregate resources in Sectors, including the addition of 6,638 acres in new Sectors and the loss of 911 acres to infrastructure development deemed incompatible with mining activities. See Figure 4.14.3 for changes.

Special Report No. 206: This 2008 report updated the 1984 mineral land classification for Portland cement-grade aggregate in the San Bernardino Production-Consumption Region. The only change in this report affecting Riverside County was the reclassification of a 90-acre crushed-stone deposit (Sector K) within the Gavilan Hills north of the City of Lake Elsinore that was reclassified from MRZ-3 to MRZ-2. See Figure 4.14.2 for changes.

Special Report No. 200: This new classification report for the Granite Construction Company Liberty Quarry site was released in 2007. In it, the State Geologist investigated (independent from the County of Riverside) and subsequently reclassified a portion of Riverside County at the petition of the Granite Construction Company. As a result, approximately 290 acres of the 310-acre "Liberty Quarry" site was reclassified from MRZ-3a to MRZ-2a for PCC-grade aggregate. See Figure 4.14.2 for changes.

Special Report No. 212: This 2009 report from the State Geologist evaluated the aggregate potential of the 500-acre First Industrial Realty Trust Day Street site based on geologic and materials testing data provided by the petitioner. In response, the State Geologist reclassified the site, a 500-acre portion of Steele Peak 7.5-minute Quadrangle in the Perris region of Riverside County, from MRZ-3 to MRZ-2 for PCC-grade aggregate. See Figure 4.14.2 for changes.

State "Regional Significance" Designations: Per Special Report No. 198, in late 2007 the SMGB directed its Minerals and Geologic Resources Committee to commence formal designation consideration for the roughly 5,950 acres newly identified as Sectors of "regionally significant construction aggregate resources" within the Palm Springs Production-Consumption Region. In 2010, the SMGB moved to adopt this designation for the area and, as of May 2011, California State rulemaking is pending to codify the change. Since it is reasonably foreseeable that the SMGB will eventually complete the designation process for these areas, this EIR's analyses treat these sites as if already designated.

4.14.3 Policies and Regulations Addressing Mineral Resources

A. State and Federal Regulations

1. Surface Mining and Reclamation Act of 1975

The State of California has recognized that mineral resources are essential to the needs of society and the economic well-being of the state. In 1975, the State Legislature passed the Surface Mining and Reclamation Act (SMARA), Public Resources Code (PRC) Section 2710, *et seq.* The intent of SMARA is to promote production and conservation of mineral resources, minimize the environmental effects of mining and ensure mined lands are reclaimed to conditions suitable for alternative uses. Reclaiming land for other uses once mining operations are completed is important for the general health, safety and welfare of the community. Under SMARA, permits are

required for all mining activities commencing operation on or after January 1, 1976. In addition, all new and existing mining operations are required to file a reclamation plan with the appropriate jurisdiction (such as the County of Riverside) to address how the land would be brought back to a productive status once mining operations cease. The County of Riverside has been given the authority to permit or restrict mining operations within the county, adhering to the SMARA legislation. Under this authority, Riverside County has set forth regulations for mineral extraction and reclamation within unincorporated Riverside County via Ordinance No. 555 (Implementing SMARA in Riverside County).

SMARA also requires every lead agency, such as the County of Riverside, within which a mineral resource's economic value has been classified by the State Geologist or has been designated as having regional economic significance by the SMGB, to establish Mineral Resource Management Policies (MRMPs) for the mineral resource in its General Plan. Riverside County's General Plan policies, described below, fulfill this regulatory requirement.

Under current SMARA statutes (PRC Section 2763), prior to permitting a use that would threaten the potential to extract minerals in an area designated by the SMGB as having mineral resources of regional or statewide significance, the County of Riverside must prepare a statement specifying its reasons for permitting the proposed use. In it, the County of Riverside must consider its MRMPs, balance the mineral values against alternative land uses and consider the importance of the minerals to their market region as a whole and not just their importance to the county area. This process is designed to ensure that decision-makers weigh the economic and environmental value of non-renewable mineral resources when determining whether or not to protect existing mineral resources.

B. Riverside County Regulations

The following policies are intended to ensure the conservation of mineral resources in Riverside County:

Ordinance No. 555 – Implementing SMARA: This ordinance addresses the importance of mineral extraction to the economic well-being of Riverside County. It regulates all surface mining operations in the unincorporated portions of Riverside County, as authorized by SMARA, to ensure that:

- The production and conservation of minerals is encouraged while considering and balancing values relating to recreation, watershed, wildlife, range and forage, and aesthetic enjoyment. And, at the same time, eliminating or minimizing the residual hazards to public health and safety.
- The adverse effects of surface mining operations are prevented or minimized and that mined lands are reclaimed to a useable condition readily adaptable for alternative land use.
- The reclamation of mined lands is carried out in a way that permits the continued mining of minerals.

C. Existing Riverside County General Plan Policies

The following existing General Plan polices address effects related to mineral resources:

1. Land Use (LU) Element

Policy LU *27.1* (Previously 21.1): Require that surface mining activities and lands containing mineral deposits of statewide or of regional significance comply with Riverside County ordinances and SMARA.

Policy LU *27.2* (Previously 21.2): Protect lands designated as Open Space-Mineral Resource from encroachment of incompatible land uses through buffer zones or visual screening.

Policy LU *27.3* (Previously 21.3): Protect road access to mining activities and prevent or mitigate traffic conflicts with surrounding properties.

Policy LU *27.4* (Previously 21.4): Require the recycling of mineral extraction sites to open space, recreational or other uses that are compatible with the surrounding land uses.

Policy LU *27.5* (Previously 21.5): Require an approved reuse plan prior to the issuing of a permit to operate an extraction operation.

2. Multipurpose Open Space (OS) Element

Policy OS 14.1: Require that the operation and reclamation of surface mines be consistent with the State Surface Mining and Reclamation Act (SMARA) and County Development Code provisions.

Policy OS 14.2: Restrict incompatible land uses within the impact area of existing or potential surface mining areas.

Policy OS 14.6: Accept California Land Conservation (Williamson Act) contracts on land identified by the State as containing significant mineral deposits subject to the use and acreage limitations established by the County.

D. Proposed New or Revised County General Plan Policies

GPA No. 960 includes the following proposed new and revised policies related to mineral resources:

1. Land Use (LU) Element

NEW **Policy LU 9.6:** *If any area is classified by the State Geologist as an area that contains mineral deposits and is of regional or statewide significance, and the County either has designated that area in its general plan as having important minerals to be protected pursuant to subdivision (a) of section 2761 of the Surface Mining and Reclamation Act, or has otherwise not yet acted pursuant to subdivision (a), then prior to permitting a use which would threaten the potential to extract minerals in that area, the County shall prepare, in conjunction with its project CEQA documentation, a statement specifying its reason for permitting the proposed use, and shall forward a copy to the State Geologist and the State Mining and Geology Board for review.*

NEW **Policy LU 9.7:** *Protect lands designated by the State Mining and Geology Board as being of regional or statewide significance from encroachment of incompatible land uses, such as high-density residential, low-density residential with high values, sensitive public facilities, institutions (e.g., schools, hospitals), etc., by requiring incorporation of buffer zones or visual screening into the incompatible land use.*

2. Multipurpose Open Space (OS) Element

Policy OS 14.3: *Prohibit* ~~Restrict~~ land uses incompatible with mineral resource recovery within areas designated Open Space-Mineral Resources *and within areas designated by the State Mining and Geology Board as being of regional or statewide significance.*

Policy OS 14.4: *The County Geologist shall* impose conditions as necessary on *proposed* mining operations *projects* to minimize or eliminate the potential adverse impact of mining operations on surrounding properties and environmental resources.

Policy OS 14.5: Require that new non-mining land uses adjacent to existing mining operations be designed to provide a buffer between the new development and the mining operations. The buffer distance shall be based on an evaluation of noise, aesthetics, drainage, operating conditions, biological resources, topography, lighting, traffic, operating hours and air quality. *The same standards shall apply to non-mining land uses within or adjacent to areas classified by the State Geologist as MRZ-2a.*

4.14.4 Thresholds of Significance for Mineral Resources

The project would result in a significant impact on mineral resources if it would cause:

A. Loss of the availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

B. Loss of availability of a known mineral resource that would be of value to the region and the residents of the State of California.

4.14.5 Effect of GPA No. 960 on the General Plan and on Mineral Resources

GPA No. 960 includes revision of General Plan Figure OS-5 (Mineral Resources) to ensure that the General Plan reflects the current level of information regarding mineral resources issued by the State Geologist and SMGB. This proposed figure (equivalent to Figure 4.14.1, herein) encompasses the changes indicated in Figures 4.14.2 and 4.14.3. The relationship of this change to the project's environmental baseline is discussed in Section 4.14.2.

As indicated in the table below, GPA No. 960 has the potential to adversely affect up to 23 acres of lands designated as regionally significant by the SMGB. In total, up to 340 acres of lands classified by the State Geologist as MRZ-2 (presence of significant mineral resources known or inferred) may also be adversely affected. The proposed changes would also include up to roughly 12,000 acres of lands for which the significance of known mineral resources is undetermined (MRZ-3) and 3,800 acres for which the presence of important mineral resources has not been determined (MRZ-4 and "unstudied" areas). Where no information is available (i.e., MRZ-3 and MRZ-4 areas), no impacts to "known mineral resources" would occur. Additional study would be necessary to determine if any significant mineral resources exist in such areas at the time implementing project is proposed. Such additional study is typically required when the Riverside County Geologist determines it is needed on a case-by-case basis.

The 23-acre area of adopted "Regional Significance" lies within the Santa Ana River, north of Mount Rubidoux, and is proposed for land use designation change from Estate Density Residential (EDR) to Public Facilities (PF). This area is located within Sector E-24, which encompasses approximately 114 acres designated by the State of California as being regionally significant aggregate resources. The vacant site is proposed for PF because it is Riverside County-owned land adjacent to Flabob Airport, and the designation is necessary to ensure airport safety. No specific uses are proposed for the land, and the mineral resources onsite would not be precluded.

Additionally, the site is surrounded to the northeast, north and west by extensive urban and suburban development, mainly medium-high and high-density residential. These existing residential uses greatly reduce the site's potential for future mineral extraction.

The 67 acres of MRZ-2b affected by the project are located in an area newly classified within the Palm Springs Production-Consumption Region in the North Indio Hills, north of Dillon Road. In this area, a number of parcels (Area C2-24) are proposed to change from OS-CH to Rural Residential because they have been or will be sold off by the federal Bureau of Land Management. Presently this area is sparsely developed with single-family residences on large lots, generally of 5 acres or larger. There are no active mines in the immediate vicinity. Designating these 67 acres as Rural Residential would serve to preclude any future mineral extraction from the sites, as commercial extraction of mineral resources is not allowed under the Rural Residential designation. However, the area is not necessary for mineral extractions. Also, the large lot size (5-acre minimum) standard would enable onsite buffering from any future mining activities in the vicinity, thus limiting potential encroachment effects.

Table 4.14-A: Changes Affecting State Mineral Resource Areas

State Mineral Resource Classification / Designation	Total Within Riverside County[1]	Areas Affected by Proposed GPA No. 960
Classification Category	**ACRES**	**ACRES**
MRZ-1 ("Little or no mineral deposits")	83,270	<1
MRZ-2 [2] ("Known or Inferred Significant" mineral deposits)	41, 730	250
MRZ-2a [3] (Mineral deposits of "Prime Importance")	22,110	0
MRZ-2b (Mineral deposits "Potentially Suitable" for MRZ-2a listing)	7,430	67
MRZ-3 ("Significance Undetermined," requires further evaluation)	1,336,720	12,040
MRZ-4 ("Unstudied" or not enough information to determine)	1,751,890	3,810
Sectors of "Regional Significance" (Designations by State) [3]		
SMGB Adopted Designation	11,850	23
SMGB Proposed for Designation [4]	6,370	0
TOTAL	**3,261,380**	**16,1880**

Footnotes:
1. Totals over 100 acres rounded to nearest 10 after aggregation.
2. This category of MRZ-2 encompasses all areas not categorized as MRZ-2a, MRZ-2b or Regionally Significant.
3. Though technically a sub-set of MRZ-2a, Sectors are listed separately under "SMGB Adopted" and "SMGB Proposed."
4. New Sectors within the Palm Springs Production-Consumption Region were approved by the SMGB in October 2010 for official designation as "regionally significant" and, as of May 2011, are pending rulemaking to codify the change.

Source: Riverside County GIS Dept., spatial analysis of project data, 2010. California Geological Survey Special Report (see text). State Mining & Geology Board SMARA Designation Reports (see text).

Lastly, of the roughly 250 acres of MRZ-2 lands proposed for changes under GPA No. 960, none would affect any areas adjacent to existing mineral resource extraction activities. In three instances, small areas of MRZ-2 proposed for Open Space-Conservation Habitat (OS-CH) land use designation for lands acquired are on biological conservation. Although extant mineral resources would be conserved in place on such sites, the OS-CH designation is generally not compatible with mineral extraction. For the affected MRZ-2 along the Santa Ana River, proposed changes (associated with Flabob ALUP-triggered revisions) reflect the urbanizing nature of the area and no active mining sites would be affected. Also in that area, a roughly 20-acre site (Area C3-2) is proposed to become Medium-High Density Residential (MHDR) with a closed landfill overlay. However, the prior use of the site as a sanitary landfill makes it unsuitable for mineral extraction. Thus, no adverse impact would occur.

4.14.6 Mineral Resources - Impacts and Mitigation

A. Would the project result in loss of the availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Impact 4.14.A – Result in the Loss of Availability of Delineated Locally Important Minerals: No. As shown in Figure 4.14.1, the Riverside County General Plan does not contain any "locally important mineral resource recovery sites." GPA No. 960 does not propose to change this. Therefore, the proposed project would not have an effect on this type of resource.

B. Would the project result in loss of availability of a known mineral resource that would be of value to the region and the residents of the State of California?

Impact 4.14.B – Result in the Loss of Availability of Known Mineral Resources: Future development consistent with the land use and policy changes proposed by GPA No. 960 has the potential to result in the loss of availability of known mineral resources that would be of value to the region and the residents of the State of California. Compliance with existing laws, regulatory programs and General Plan policies, as well as proposed new or revised General Plan policies, would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.14.B

The land use and related policy changes proposed by GPA No. 960 would alter the potential range of development and intensity ultimately allowed on specific parcels, as described in Section 4.14.5 and Table 4.14-A, where foreseeable. Likewise, where land use changes are proposed on or adjacent to areas of known or inferred significance (MRZ-2 areas), the assignment of incompatible or potentially incompatible land uses could also result in encroachment or preclusion of potentially important mineral resources.

GPA No. 960 changes would result in potential direct future loss of 23 acres of land designated as "regionally significant" by the SMGB. As explained in Section 4.14.5, however, this acreage is not suitable for future mining activities due to its location amidst dense residential development. Thus, the site may be characterized as no longer meeting California State's definition as "regionally significant." For this reason, the loss does not represent a significant adverse impact on the availability of regionally important mineral resources. The future development accommodated by the project would also result in the preclusion of future mining potential on approximately 320 acres of MRZ-2 land as a result of the generally incompatible new land use designations proposed. Measures that minimize the effects of this loss are described below.

Although not representing known mineral resources, the project would also have the potential to affect mineral availability on previously unstudied lands, such as MRZ-3 or MRZ-4, for which the potential for economically viable mineral resources might exist. Analysis presented in Section 4.14.5 indicates that up to 15,844 acres of MRZ-3 and MRZ-4 lands could be affected by future development accommodated by the proposed project. Since the presence and extent of important mineral resources has not been established for these areas, these effects do not represent impacts to any "known mineral resources." Additional study would be necessary to determine if any significant mineral resources exist in such areas at the time implementing project is proposed. Such additional study is typically required when the Riverside County Geologist determines it is needed on a case-by-case basis.

The project area also includes a number of areas in which significant mineral resources are unlikely to be affected. Specifically, areas of infill within existing urban areas (totaling roughly 1,100 acres) would, by definition, not qualify for MRZ-2 status. In addition, SMGB standards for mineral resource designation (as discussed in Special Report No. 198) state that deposits of less than one million tons are below the current threshold value criteria for construction aggregate. Due to widespread urbanization of western Riverside County, it is also less likely suitable mineral resources would be available in areas of sufficient size and remoteness to be economically viable for mineral extraction.

Within the easternmost third of Riverside County, there are many areas which, even if they were found to qualify as MRZ-2, could be developed without adversely affecting the total availability of economically viable mineral resources in the region since such resources (particularly sand and gravel) occur in large volumes in Riverside County's eastern desert region. In Special Report No. 198 (2007) for the Palm Springs Production-Consumption Region, the California Geological Survey indicated that alternative aggregate sources do exist outside of the Palm Springs P-C Region within the desert to the east, San Gorgonio River to the west, the Twenty-nine Palms area to the north and Imperial Valley to the south. Based on these factors, proposed future development accommodated by GPA No. 960 in eastern Riverside County would not result in significant mineral resource losses.

Overall, because of the urbanizing nature of most of western Riverside County and the wide-spread availability of potential aggregate resources in eastern Riverside County, project-related impacts to MRZ-3 lands would be less than significant. Nevertheless, measures designed to determine potential suitability of these areas for economically viable future mineral resource extraction would be necessary prior to approval of any land-disturbing or encroaching uses. Policies to avoid or minimize these impacts are included in part of GPA No. 960, as described below.

Indirect impacts could also occur where MRZ-2 lands are encroached upon by incompatible uses, particularly residences and other sensitive uses, and where development lies adjacent to MRZ-2 sites otherwise suitable for mining. To avoid or minimize this impact, this EIR includes several measures to ensure that no future development arising from the changes in GPA No. 960 causes encroachment on significant mineral resources. See proposed General Plan Policies LU 9.6 and 9.7, in particular.

Lastly, the project would have a significant adverse impact on availability of important mineral resources if it contributes incrementally to a cumulative loss of lands with mineral resources necessary to meet the region's projected demand. As shown in Table 4.14-A, however, the MRZ-2 lands affected by GPA No. 960 land use changes would occur incrementally over 50-plus years and are insignificant compared to the total resources available. As such, their loss would not rise to the level of cumulatively significant. In addition, the policies described below would ensure conservation of the mineral resources necessary to meet future demand.

2. Regulatory Compliance for Impact 4.14.B

As explained below, compliance with the following laws, regulatory programs, as well as existing and proposed General Plan policies, would lessen significant impacts to known mineral resources as a result of GPA No. 960.

a. Compliance with Federal, State and County Regulations

All future development of mineral resources within unincorporated Riverside County must conform to the requirements and standards of a Surface Mining Permit issued by the County of Riverside pursuant to SMARA and Ordinance No. 555 prior to start of operations. This permit process ensures that measures necessary to avoid or minimize significant environmental effects are implemented for all phases of an approved project, including

construction and development, operations and reclamation. They also serve to help protect any adjacent uses in the vicinity from adverse incompatibility effects.

b. Compliance with Existing General Plan Policies

The General Plan contains the following policies that address potential impacts to mineral resources, as well as compatibility issues between uses. See Section 4.14.3.C for full text of each of these policies.

Policies LU 27.1, 27.4, 27.5 and OS 14.1: These policies ensure existing mines and future mineral extraction activities are carried out in a manner that does not harm the environment or adjacent sensitive uses and resources.

Policies LU 27.2, 27.3 and OS 14.2: These policies prevent loss of potential mineral resources by protecting them from encroachment or preclusion by incompatible uses.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan would address potential impacts to mineral resources. See Section 4.14.3.C for full text of each of these policies.

Policies LU 9.6 and 9.7: These policies ensure mineral resource conservation through various means, including requiring determination of an area's mineral resource potential prior to permitting development to ensure previously unknown resources are not lost; requiring consideration of the site's mineral resource value against its development value as a non-mining use; and restricting land uses incompatible with mineral recovery in certain areas.

Policies OS 14.3, 14.4 and 14.5: These policies prevent loss of potential mineral resources by protecting them from encroachment or preclusion by incompatible uses through requirements for buffer zones, screening, etc. They also ensure that existing mines and future mineral extraction activities are carried out in a manner that does not harm the environment or adjacent sensitive uses and resources.

3. Significance of Impact 4.14.B After Mitigation

With the implementation of the above existing regulations, existing and proposed General Plan policies, GPA No. 960 would have a less than significant impact on known mineral resources, including mineral resource availability.

4.14.7 Mineral Resources - Level of Significance After Mitigation

Implementation of and compliance with the above regulations and Riverside County General Plan policies would ensure that significant impacts to known mineral resources of regional or statewide significance are either avoided or minimized to less than significant. The revision of General Plan Figure OS-5 and the proposed associated policies ensure that County of Riverside decisions comply with SMARA and are based on appropriate current information. Compliance with existing laws and policies, as well as the proposed new and revised General Plan policies discussed herein, would ensure that significant mineral resources are appropriately identified and protected. Lastly, these General Plan policies ensure that environmental impacts of existing and future mining activities are minimized and that conflicts between mining and non-mining land uses are also minimized or

avoided. Together they ensure that any significant adverse impacts to mineral resources resulting from future implementation of GPA No. 960 would be mitigated to below the level of significance.

Section 4.15

Noise

Section 4.15 Noise

4.15.1 Introduction and Background

This section evaluates the potential for the proposed project, General Plan Amendment No. 960 (GPA No. 960), to affect or be affected by noise and vibration levels within unincorporated Riverside County. This includes assessing the potential for exposure of Riverside County's population to new noise or vibration sources introduced as a result of the project, as well as the potential for increased or new populations near existing or new noise and vibration sources. A variety of noise and vibration sources within Riverside County are assessed, including vehicular traffic on roadways and highways, as well as aircraft, railway and stationary sources. Traffic is probably the most pervasive noise source affecting most communities and, since GPA No. 960 includes revisions to the General Plan roadway network throughout Riverside County, the scope of this section is similarly countywide.

Information used to prepare this section is based on the noise study prepared by LSA for this project. The study, entitled "Noise Measurement and Analysis Services for Riverside County General Plan Amendment No. 960," and dated March 2011, is included in this EIR as Appendix EIR-7. The study includes ambient noise measurements of various locations throughout unincorporated Riverside County taken during November 2010, as well as noise modeling of roadway noise levels for a variety of locations and times. The methodologies and models used in the study include the Federal Transit Administration's "Transit Noise and Vibration Impact Assessment" (FTA-VA-90-10003-06, May 2006) for rail and mass transit noise and vibration sources and Highway Traffic Noise Prediction Model (FHWA RD-77-108, 1977) for future roadway noise calculations. The analyses presented herein address noise issues at the programmatic level by examining the short-term and long-term impacts of the project on sensitive uses and by evaluating the effectiveness of available regulatory and programmatic mitigation.

A. Characteristics of Sound

Sound and noise have two important aspects. First, the physical: sound is generated when a mechanical wave results from the oscillation of pressure transmitted through a solid, liquid or gas. Second, the biological: when sound is perceived by the ear, it becomes sensory information affecting the entity hearing it. Thus, 'noise' can be defined as unwanted sound; any sound that may produce physiological or psychological damage or interfere with communication, work, rest, recreation or sleep.

As a mechanical wave, sound can be characterized by its frequency, wavelength, amplitude (wave height), intensity and pressure, as well as speed and direction. Sound intensity refers to how hard the sound wave strikes an object, which in turn produces the sound's effect. This characteristic of sound can be precisely measured with instruments.

Physiologically, sound is 'heard' when ears, or other sense organs, detect waves within the appropriate range of frequency (that is, pitch) and loudness. Pitch is measured by the number of complete vibrations (cycles per second, or Hertz) the sound wave makes. The higher the frequency of the sound wave, the higher the pitch of tone that is heard. The average adult ear can hear sounds pitched between 20 and 16,000 Hertz (Hz). Sounds below 20 Hz may be felt as a vibration. Sounds above 16,000 Hz may be heard by other species (see for example, a dog whistle). Loudness is the strength of a sound and is measured as the amplitude of the sound wave. In humans, loudness is determined by the intensity of the sound waves combined with the reception characteristics of the ear. In physiological terms, pitch changes are commonly perceived as an annoyance, while loudness can affect one's ability to hear.

B. Measurement of Sound

In its simplest form, sound can be thought of as a wave traveling outward spherically from its generation source, which would be at the center of the sphere. Because energy is expended as the wave travels away, sound dissipates exponentially with distance from the noise source. Sound, as heard by humans, is commonly described in terms of the decibel (dB), a unit derived from *bel* in honor of telecommunications pioneer Alexander Graham Bell, back in the early days of modern telephony. The decibel is a logarithmic unit of ratio used in acoustics to describe the effective sound pressure of a sound relative to a reference value. For example, in modeling human hearing response, the commonly used 'zero' reference is relative to the threshold of human hearing at 1 kiloHertz (kHz). This is a sound level roughly akin to the sound of a mosquito flying 10 feet away.

Because of its logarithm scale, in energy terms, 10 decibels are 10 times more intense than 1 decibel, while 20 decibels are 100 times more intense. With 30 dB being 1,000 times more intense than 1 dB, 30 dB represents 1,000 times as much acoustic energy as one decibel. Accordingly, a sound as soft as human breathing is about 10 times greater than 0 dB. In this way, the decibel system of measuring sound provided gives a rough correlation between the physical intensity of sound and its perceived loudness to the human ear. A change in power ratio by a factor of 10 is a 10 dB change; however, a change by a factor of two is approximately a 3 dB change. A 10-decibel increase in sound level is perceived by the human ear as only a doubling of the loudness of the sound. A 3 dB change is commonly considered the point at which noise changes are perceptible to human ears. Ambient sounds, those common to the human environment, generally range from 30 dBA (very quiet) to 100 dBA (very loud).

A sound's decibel level decreases as the distance from that source increases. For a single point source, sound levels decrease approximately 6 dB for each doubling of distance from the source. This drop-off rate is appropriate for noise generated by stationary equipment. If noise is produced by a linear source, such as highway traffic or railroad operations, the sound decreases 3 dB for each doubling of distance in a hard (reflective) site environment. Line source noise in a relatively flat environment with absorptive vegetation decreases 4.5 dB for each doubling of distance.

Since the human ear does not have a flat spectral response, sound pressures are often frequency weighted so that the measured level matches the perceived level more closely. The International Electrotechnical Commission has defined several weighting schemes. When measured on the A-weighted scale, sound intensity is corrected for the relative frequency response of the human ear. That is, an A-weighted noise level de-emphasizes low and very high frequencies of sound similar to the human ear's de-emphasis of these frequencies. A-weighted sound pressure levels are reported in 'dBA,' that is A-weighted decibels.

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans must also account for the annoying effects of sound. An equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human

communities in California are the L_{eq} and Community Noise Equivalent Level (CNEL) or the Day-Night Average Level (L_{dn}) based on A-weighted decibels (dBA). CNEL is a measure for time-varying noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 pm to 10:00 pm (defined as relaxation hours) and a 10 dBA weighting factor applied to noise occurring from 10:00 pm to 7:00 am (defined as sleeping hours, when a given noise would have more impact due to the quieter environments). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during the evening hours. CNEL and L_{dn} are within 1 dBA of each other and are normally exchangeable. But, it is important to note that CNEL does not represent the actual sound level heard at any particular time, but rather the total sound exposure over 24 hours.

Other noise rating scales of importance when assessing the annoyance factor include the maximum noise level (L_{max}), which is the highest exponential time-averaged sound level that occurs during a stated time period. The noise environments discussed in this analysis are specified in terms of maximum levels denoted by L_{max} for short-term noise impacts. L_{max} reflects peak operating conditions and addresses the annoying aspects of intermittent noise. In addition to L_{max}, for noise ordinance enforcement purposes, also expressed in L, percentile noise levels are often used. For example, the L_{10} noise level represents the noise level exceeded 10% of the time during a stated period, that is, the loudest 10%. The L_{50} noise level represents the median (50%) noise level where half the time the noise level exceeds this level. The L_{90} noise level represents the noise level exceeded 90% of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} would normally be approximately the same.

C. Physiological Effects of Noise

Physical damage to human hearing begins at prolonged exposure to noise levels higher than 85 dBA. Exposure to high noise levels affects the entire system, with prolonged noise exposure in excess of 75 dBA increasing body tensions and thereby affecting blood pressure and functions of the heart and the nervous system. In comparison, extended periods of noise exposure above 90 dBA would result in permanent cell damage. When the noise level reaches 120 dBA, a tickling sensation occurs in the human ear even with short-term exposure. This level of noise is called the threshold of feeling. As the sound reaches 140 dBA, the tickling sensation is replaced by the feeling of pain in the ear. This is called the threshold of pain. A sound level of 160 to 165 dBA will result in dizziness and/or loss of equilibrium.

D. Ambient Noise and Noise Abatement

Ambient noise is the general sound level present in an environment, inclusive of all sounds, at a given point in time. High levels of background, or ambient, noise can be a problem if loud enough. This problem is generally more widespread in concentrated urban areas, rather than the less-developed outlying areas. Conversely, specifically because of its greater quiet, rural regions can be more readily disturbed by excess noises. To summarize, see Table 4.15-A (Definitions of Acoustical Terms) for acoustical definitions used herein and Table 4.15-B (Common Sound Levels and Their Noise Sources) for sound levels of commonly encountered noise sources.

Three basic mechanisms are effective at reducing excessive noise exposure: 1) reduce the strength of the noise at the source; 2) increase the distance between the source and the receiver; and 3) place an obstruction between the noise source and the receiver. Depending on the location of sensitive land uses in relation to noise generating sources, the relocation of sensitive land uses away from freeways or major streets is not practical or feasible. In these instances, a noise wall is often the remaining practical solution. A properly sited wall can reduce noise levels by almost 10 dB. A decrease of 10 dB is perceived by people to be about one-half the loudness as measured

before the decrease. Another method of obstructing noise for residential or commercial buildings involves the use of design features, site planning or building materials to protect the users of buildings within the interior of the building. Features such as dense landscaping and the use of double-paned windows are two examples.

E. Vibration

Vibration is the periodic oscillation of a medium or object with respect to a given reference point. Sources of vibration include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) and those introduced by human activity (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, (e.g., operating factory machinery) or transient in nature, as in explosions. Vibration levels can be depicted in terms of amplitude and frequency, relative to displacement, velocity or acceleration. Vibration amplitudes are commonly expressed in peak particle velocity (PPV) or root-mean-square (RMS) vibration velocity. It is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is typically used in the monitoring of transient and impact vibration and has been found to correlate well to the stresses experienced by buildings. PPV and RMS vibration velocity are normally described in inches per second (in/sec).

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. The response of the human body to vibration relates well to average vibration amplitude; therefore, vibration impacts on humans are evaluated in terms of RMS vibration velocity. Similar to airborne sound, vibration velocity can be expressed in decibel notation as vibration decibels (VdB). The logarithmic nature of the decibel serves to compress the broad range of numbers required to describe vibration.

Background vibration levels in most inhabited areas are usually 50 VdB or lower, well below the threshold of perception (which is typically about 65 VdB). In most cases, when environmental vibration is perceptible, people are in their homes, workplaces, etc., and the vibration source is in the same building (i.e., operation of heating, ventilation and air-conditioning [HVAC] equipment, movement of other occupants, slamming of doors, etc.). Outdoor sources most commonly responsible for producing perceptible vibration are heavy construction equipment, steel-wheeled trains and motor vehicle traffic on rough roads; if roadways are smooth, the vibration from traffic is rarely perceptible. The range typically encountered is from approximately 50 VdB, which is the typical background vibration velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. The general human response to different levels of groundborne vibration velocity levels is identified in Table 4.15-C (Human Responses to Groundborne Vibration).

Table 4.15-A: Definitions of Acoustical Terms

Term	Definition
Decibel (dB)	A unit of level that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
Frequency (Hz)	Of a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., number of cycles per second).
A-Weighted Sound Level (dBA)	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this report are A-weighted, unless reported otherwise.
Percentile-Exceeded Sound Level (L_{02}, L_{08}, L_{50}, L_{90})	The fast A-weighted noise levels that are equaled or exceeded by a fluctuating sound level for the given percentage of a specified time period (i.e., 2%, 8%, 50%, 90%). Thus, as an example, the L_{10} is the sound level exceeded 10% of the time; L_{90} is the sound level exceeded 90% of the time.
Equivalent Continuous Noise Level (L_{eq})	The level of a steady sound that, in a stated time period and at a stated location, has the same A-weighted sound energy as the time-varying sound.
Community Noise Equivalent Level (CNEL)	The 24-hour A-weighted average sound level from midnight to midnight, determined after the addition of 5 decibels to sound levels occurring in the evening between 7:00 pm and 10:00 pm and after the addition of 10 decibels to sound levels occurring between 10:00 pm and 7:00 am at night.

Term	Definition
Day/Night Noise Level (L_{dn})	The 24-hour A-weighted average sound level from midnight to midnight, determined after the addition of 10 decibels to sound levels occurring between 10:00 pm and 7:00 am at night.
Maximum and Minimum Sound Levels (L_{max}, L_{imn})	The maximum and minimum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging.
Ambient Noise Level	The all-encompassing noise level associated with a given environment at a specified time, usually a composite of sound from many sources at many directions, near and far, with no particular sound dominant.
Intrusive	Noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency and time of occurrence as well as its tonal or informational content and the prevailing ambient noise level.

Table 4.15-B: Common Sound Levels and Their Noise Sources

Noise Source	A-Weighted Sound Level in Decibels (dBA)	Noise Environments	Subjective Evaluations
Near Jet Engine	140	Deafening	128 times as loud
Civil Defense Siren	130	Threshold of Pain	64 times as loud
Hard Rock Band	120	Threshold of Feeling	32 times as loud
Accelerating Motorcycle at a Few Feet Away	110	Very Loud	16 times as loud
Pile Driver; Noisy Urban Street/Heavy City Traffic	100	Very Loud	8 times as loud
Ambulance Siren; Food Blender	95	Very Loud	
Garbage Disposal	90	Very Loud	4 times as loud
Freight Cars; Living Room Music	85	Loud	
Pneumatic Drill; Vacuum Cleaner	80	Loud	2 times as loud
Busy Restaurant	75	Moderately Loud	
Near Freeway Auto Traffic	70	Moderately Loud	Reference level
Average Office	60	Quiet	One-half as loud
Suburban Street	55	Quiet	
Light Traffic; Soft Radio Music in Apartment	50	Quiet	One-quarter as loud
Large Transformer	45	Quiet	
Average Residence without Stereo Playing	40	Faint	One-eighth as loud
Soft Whisper	30	Faint	
Rustling Leaves	20	Very Faint	
Human Breathing	10	Very Faint	Threshold of hearing
Silence	0	Very Faint

(See Appendix EIR-7 for full study.)

Table 4.15-C: Human Responses to Groundborne Vibration

Vibration Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception for many people.
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation-related vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.

4.15.2 Existing Environmental Setting - Noise

Pursuant to CEQA, the description of the physical environmental conditions provided in this EIR is as they generally existed at the time of the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting constitutes the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant. Because of the countywide scope and nature

of this project and its programmatic EIR, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence is used and a discussion of how it is or is not expected to differ from the existing physical conditions provided. For this section, ambient noise monitoring data was collected in November 2010. The use of 2010 data provides a recent and reasonable snapshot of existing noise conditions within Riverside County.

A. Ambient Noise Monitoring

Ambient noise measurements provide a snapshot of the existing noise environment for a given area and may be done in both short- and long-term locations. Surveys of the existing noise environment were conducted on November 2, 3, 4, 5, 15, 16 and 18, 2010 (when traffic was free-flowing). The dates on which long-term and short-term measurements were made reflect typical traffic conditions throughout the year because there were no holidays on any of the dates. The specific locations for short-term and long-term noise measurements were selected to represent areas of growth across Riverside County. The purpose of the noise monitoring was to document the existing noise environment and capture the noise levels associated with typical daily operations and activities in the unincorporated Riverside County area.

Short-term noise measurements were taken over 15-minute periods for a total of 29 locations as identified in Table 4.15-D (Short-Term Ambient Noise Monitoring Results) and illustrated in Figure 4.15.1 (Short-Term and Long-Term Noise Monitoring Locations Map). The measured short-term noise level ranged from 44.3 to 74.8 dBA L_{eq}.

Long-term noise levels were taken at a total of eight locations, as identified in Table 4.15-E (Long-Term Ambient Noise Locations) and also illustrated in Figure 4.15.1, selected to typify the normal sound environments affecting Riverside County. These eight long-term measurement sites were selected to capture the diurnal noise patterns throughout the full day/night cycle at these locations. At each location, a series of 24 sequential one-hour measurements were made and a range of data collected. All measurement locations had direct lines-of-sight to traffic on existing adjacent roadways. The resultant data is summarized in Table 4.15-F (Long-Term Ambient Noise Monitoring Results). The full data set is included in the noise study (see Appendix EIR-7). Because airport surroundings are usually covered by the airport noise contour maps, they are not included in the noise measurement areas. The figure shows that most of the growth has occurred in the western region of the county. In general, vehicular traffic is the dominant noise source in unincorporated Riverside County.

Land uses within Riverside County include a range of residential, commercial, institutional, industrial, recreational, agricultural and open space areas. In general, vehicular traffic is the dominant noise source in the unincorporated Riverside County area. Other noise sources which contributed to the ambient noise, included: car alarms, engine startups, car doors shutting, vehicle reverse beeping, cars braking and honking, operation of lawn mowers, weed whackers and dust blowers, people conversing and playing, music, shopping carts rattling, dogs barking, construction activity, birds chirping, whistles blowing, school bells ringing, airplane and helicopter overflights, ambulance sirens, children playing at playgrounds, air conditioning units running, chain-link fences clanking and leaves and vegetation rustling in the wind. Significant noise also occurs from airplane traffic, railroads and various stationary sources as described below. Sensitive noise receptors typically include residences, schools, child-care centers, hospitals, long-term health care facilities, convalescent centers and retirement homes. See Table 4.15-D for results of short-term (15-minute interval) ambient noise monitoring and Table 4.15-F for long-term (24-hour interval) ambient noise monitoring.

Table 4.15-D: Short-Term Ambient Noise Monitoring Results

ID	Location	Start Time	L_{eq} (dBA)	Noise Sources	Remarks
1	20 feet (ft) from street, on SW corner of Riverside Dr and Wineville Ave.	3:21 pm	73.2	Traffic on SR-60, I-15, Riverside Dr & Wineville Ave.	Intersection is a four-way controlled stop. Land uses all industrial.
2	30 ft from the street, on NW corner of Etiwanda Ave and Cantu Galleano Ranch Rd.	2:41 pm	67.4	Traffic on Etiwanda Ave and Cantu Galleano Ranch Rd.	Four-way signalized intersection. Land use is light industry, sports grounds and vacant/open space.
3	5 ft from the street, on SE corner of Jurupa Rd and Troth St.	3:54 pm	69.1	Traffic on Jurupa Rd and Troth St.	Intersection is a four-way controlled stop. All commercial, except residential house on SE corner.
4	10 ft from street, on SW corner of Magnolia Ave and McKinley St.	1:34 pm	70.2	Traffic on McKinley St and Magnolia Ave.	Intersection is signal-controlled; both streets are major streets with heavy traffic in each direction. Surrounding land use is commercial, preschool and residential area.
5	20 ft south of Indiana Ave at bend in street, near intersection of Indiana Ave and Barker Lane.	12:53 pm	58.0	Traffic on Indiana Ave; children playing and talking at nearby residence.	Airplanes flying over the sound meter and train passing screened out airport surroundings are usually covered by noise contour maps. Land use is residential and mountain area.
6	20 ft from the street, on NE corner of Cajalco Rd and Eagle Canyon Rd.	10:43 am	72.5	Cars and heavy trucks traffic on Cajalco Rd and Eagle Canyon Rd.	Three-way intersection with a stop sign for Eagle Cyn. Rd, Cajalco Rd has right-of-way (ROW). Heavy trucks consistently exiting and entering Eagle Canyon Rd. Land use is vacant/open space at intersection; a few residential areas to east.
7	NE corner of Armstrong Rd and 34th St. (5 ft E of 34th St and 75 ft from Armstrong Rd)	4:38 pm	62.8	Traffic on Armstrong/ Valley Rd and 34th St.	Four-way signalized intersection. Land use is residential and vacant/open space.
8	NE corner McAllister St and El Sobrante Rd., 30 ft from street	5:04 pm	68.1	Traffic on McAllister St and El Sobrante Rd.	Three-way intersection with a stop sign for McAllister St; residential to the NW.
9	140 ft west of Via Lakistas, on sidewalk; 3 ft south from Eureka St.	1:34 pm	44.3	Traffic on Eureka St and Via Lakistas.	Intersection is a two-way controlled stop; Via Lakistas has ROW. Land use is residential.
10	20 ft from street, on SE corner of Center St and Mt. Vernon Ave.	5:27 pm	63.7	Traffic on both roads (heavier on Mt Vernon Ave).	Four-way stop intersection. Land use is residential, vacant/open space and agricultural.
11	NW corner of Washington St. and Van Buren Blvd., 20 ft from Washington St.	4:23 pm	65.2	Cars passing on both rds; cars pulling in/out of lot on Washington St near the sound meter.	Four-way signalized intersection; commercial (7-11 Market) on NW corner of intersection.
12	SE corner of Cajalco Rd and El Sobrante Rd., 5 ft from street	3:38 pm	74.8	Traffic on Cajalco Rd and El Sobrante Rd.	Three-way intersection with a signal.
13	Stafford Street, 15 ft S of Ellis Ave; SH-74 to the north	10:10 am	71.7	Traffic on SH-74 and Ellis Ave.	Heavy traffic on SH-74; intersection 250 ft south from Ellis Ave is signal-controlled. Land use is low-density residential or empty space.
14	25 ft from southbound SH–74, near driveway to residential area.	9:40 am	71.0	Traffic on SH-74.	High speed traffic on SH-74. Land use is low-density residential.
15	NW corner of Hansen Ave. and Reservoir Ave., 20 ft S of Ramona Expressway	11:25 am	73.5	Traffic on Ramona Expressway; traffic on Da-vis/Hansen Ave.	Heavy traffic and many heavy trucks on Ramona Expressway. Land use is commercial, sports field and vacant/open space.
16	10 ft east of Olson Ave, near intersect. of McWade Ave and Olson Ave.	4:55 pm	56.5	Traffic on Olson; light traffic on McWade Ave.	Light traffic on Olson Ave and McWade Ave. Children talking and playing outside, a few dogs barking. Land use is residential.
17	Off NW corner of SR-79 (25 ft. east of) and Scott Rd. (150 ft north of)	3:20 pm	71.1	Heavy traffic and high speeds on SR-79; traffic on Scott Rd.	Intersection is signal controlled. Land use is vacant/open space.

ID	Location	Start Time	L_{eq} (dBA)	Noise Sources	Remarks
18	20 ft from south of De Portola Rd (nearby address #34265).	12:55 pm	46.3	Very low traffic and slow speeds on De Portola Rd, community noise, farmer working and talking nearby.	Helicopters flying over the sound meter but screened out during monitoring work. Land use is agriculture.
19	10 ft from street, on NE corner of Cherry Valley Blvd and Beaumont Ave.	12:40 pm	66.3	Traffic on Cherry Valley Blvd and Beaumont Ave.	Intersection is signal-controlled; Moderate traffic levels on Cherry Valley Blvd and Beaumont Ave. Aircraft flying over the sound meter (screened out). More traffic on Beaumont Ave. Land uses are commercial, community center and a school.
20	15 ft from street, on SE corner of Mayberry Ave and Cornell St.	4:20 pm	58.1	Traffic on Cornell St and Mayberry Ave.	Intersection is a two-way controlled stop, Cornell St with the ROW. Low traffic on both roadways. Land use is residential.
21	10 ft south of SR 79 at Radec (junction of SR 79 and Sage Rd).	2:00 pm	69.4	Traffic on SR 79 and Sage Rd.	Heavy traffic on SR 79; low traffic on Sage Rd. Land use is commercial and residential, plus a closed commercial building to the NW.
22	15 ft from street, on NW corner of Broadway Rd and Bonita Ave.	9:53 am	62.0	Traffic on Broadway Rd and Bonita Ave.	Intersection is a two-way controlled stop on Bonita Ave; Broadway Rd has ROW. Residential developments to the SW. Windy conditions.
23*	In front of entrance gate to windmill farm (Green Power), on N corner of Ruppert St and 19th Ave.	4:30 pm	51.7	Windmill noise. Traffic on I-10, 2,000 ft away from the sound meter but faint.	Aircraft flying over the sound meter but screened out. Quiet area. Land uses are office, light industrial and windmill farm.*
24	10 ft from street, on SW corner of Ramon Rd and Desert Moon Dr.	3:45 pm	69.8	Traffic on Ramon Rd and Desert Moon Dr.	Intersection is a two-way controlled stop; Ramon Rd has the ROW. More traffic on Ramon Rd. Land use is residential, commercial and vacant.
25	30 ft from street, on NW corner of Adams St and 42nd Ave.	3:00 pm	65.6	Traffic on Adams St and 42nd Ave.	Intersection is a four-way controlled stop; residential development on three corners. Bermuda Dunes Country Club is located south of 42nd Ave.
26	15 ft south of SH-74, across from Pinyon 30 Fire Station.	12:40 pm (Nov. 5, 2010)	68.1	Traffic on SH-74, faint radio sound, faint people talking.	Posted speed limits on SH-74 are 35 mph but actual speeds appear much higher. Roadway pavement rough.
27	30 ft from street, on NW corner of Hwy 86 and 62nd Ave.	2:00 pm	69.3	Heavy and high-speed traffic on Highway 86 and lower speed traffic on 62nd Ave.	Intersection is a two-way controlled stop; Highway 86 has the ROW. Roadway construction activities occurred approximately 2,000 ft away from the sound meter, but faint noise. Land use is agriculture. Slightly windy.
28	15 ft south from Ragsdale Rd; 150 ft west from Desert Center Rice Rd.	4:35 pm	61.8	Traffic on I-10 (approx. 1,000 ft S of sound meter), low-speed trucks on Ragsdale Rd and parking activities.	Trucks idling in parking lot and moving slowly. Land use is commercial, parking lot and vacant space.
29	20 ft from the street, on the southeast corner of Arrowhead Blvd and 28th Ave.	2:15 pm	63.2	Traffic on 28th St and Arrowhead Blvd, two tractors on Arrowhead and agri. equip. nearby.	Three-way intersection; free flowing traffic on 28th Ave; Arrowhead Blvd has a stop sign. Land use is agriculture.

Key: dBA = A-weighted decibels Leq = equivalent continuous sound level SH = State Highway
* Measurement conducted within the City of Palm Springs because the proposed monitoring location was not available.

Table 4.15-E: Long-Term Ambient Noise Locations

ID	Location	Start Time[1]	Noise Sources	Remarks
1	SW corner of Magnolia Ave. and McKinley St., 10 ft from the street and 230 ft. south of Magnolia Ave.	4:00 pm, Nov. 18, 2010	Traffic on McKinley St and on Magnolia Ave.	Intersection is signal controlled. Both streets are major streets with heavy traffic in each direction. Surrounding is commercial, preschool and a residential area away from the intersection.
2	NE corner of Cajalco Rd. and Eagle Canyon Rd, 15 ft from street.	5:00 pm, Nov. 18, 2010	Cars and heavy truck traffic on both roads.	Three-way intersection with stop sign for Eagle Cyn Rd; Cajalco Rd. traffic has right-of-way (ROW). Heavy trucks consistently exiting and entering Eagle Cyn Rd. Surrounding is empty space at intersection and a few residences along E side.
3[2]	30 ft from I-215 N-bound, near Nandina Ave.	6:00 pm, Nov. 16, 2010	Traffic on I-215 fwy and airplanes from March Air Rsrv Base.	Traffic on I-215 dominant noise source. Surrounding land use is military base, commercial and empty/open space.
4	S of Hwy. 74, 15 ft N of Ellis Ave.	4:25 pm, Nov. 16, 2010	Traffic on Hwy. 74 and on Ellis Ave.	Heavy traffic on Hwy 74. Intersection at 250 ft S from Ellis Ave. is signal controlled. Land use is low-density residential and open space (vacant land).
5	Near intersection of McWade Ave and Olson Ave., 15 ft east of Olson Ave.	1:00 pm, Nov. 15, 2010	Traffic on Olson Ave. and light traffic on McWade Ave.	Traffic on Olson and McWade Avenues. Surrounding land use is residential.
6	SE corner of Rancho California and Anza Rds., 15 ft from street.	1:00 pm, Nov. 4, 2010	Traffic on Rancho California Rd and on Anza Rd.	Intersection is a 4-way controlled stop. Heavy traffic on Rancho California Rd. Surrounding land use is farmland.
7	Near 34265 DePortola Rd, 20 ft south of road.	1:00 pm, Nov. 2, 2010	Very low traffic and slow speeds on DePortola Rd.	Quiet rural area. Surrounding land use is farmland.
8	NW corner of Mayberry Ave and Cornell St., 20 ft from street.	2:00 pm, Nov. 15, 2010	Traffic on Cornell St and on Mayberry Ave.	Intersection is 2-way controlled stop, Cornell St. traffic has ROW. Low traffic levels on both roads. Surrounding land use is residential.

Footnotes:
1. Monitoring ran for 24 hours from start time / date indicated and consisted of 24 one-hour samples.
2. This measurement was conducted within the City of Perris because the originally proposed monitoring location was unavailable.

Footnotes:
1. See Table 4.15-E for more information on noise monitoring locations.
2. Data listed in uniform sequence to allow trend comparison; actual monitoring start times and dates varied.
3. A variety of noise readings were taken. See Appendix B to the Noise Study prepared by LSA (included as Appendix EIR-7) for the full data set of readings.
4. Measurements made at 25 minutes past each hour (4:25 pm, 5:25 pm, etc.)

Source: LSA Associates, Inc., Noise Measurements and Analyses for GPA No. 960, Appendix B, March 2011. (See Appendix EIR-7 for full study.)

B. Vehicular Traffic Noise

Motor vehicle noise commonly causes sustained noise levels along busy roadways or freeways. Several high-volume freeways run through Riverside County, primarily Interstate 10 (I-10), Interstate 15 (I-15), Interstate 215 (I-215), State Route 60 (SR-60) and State Route 91 (SR-91). Riverside County also has many local roads that experience very high traffic volumes, particularly high truck traffic volumes that contribute to traffic noise and vibration. Many noise-sensitive receptors throughout Riverside County are located along these high-traffic corridors, including older residences, which usually are not protected by sound walls or other barriers; unlike newer residences mostly built within or near incorporated cities. In many cases, newer residences are protected by sound walls or include additional acoustic insulation as protection from noise intrusion because they were built to accommodate the noise increase caused by higher traffic volumes.

The FHWA highway traffic noise prediction model (FHWA RD-77-108) was used to estimate freeway and highway traffic-related noise levels in unincorporated Riverside County. This model uses a variety of parameters, including traffic volumes, vehicle mix, vehicle speed, and roadway geometry to compute typical equivalent noise levels during daytime, evening and nighttime hours. Because this EIR is intended to generally document existing traffic noise environment and project future potential traffic noise levels throughout Riverside County, rather than determine specific data and impacts for a single proposed use, such as residential, the traffic noise modeling deviates from the Riverside County Department of Public Health's usual residential traffic noise impact standards.

The average daily traffic (ADT) volumes used for traffic noise modeling are based on results generated from the Riverside County Traffic Analysis Model (RIVTAM). See Appendix EIR-4 for traffic data prepared by the Riverside County Transportation Department, November 2010. The resultant noise levels are weighed and summed over 24-hour periods to determine the L_{dn} value. L_{dn} contours are derived through a series of computerized iterations to isolate the 60, 65 and 70 dBA L_{dn} contours for traffic noise levels. In addition, to facilitate comparisons amongst roadways, a single noise level (L_{dn}) was calculated for each roadway at 50 feet from the centerline of the road's outermost lane. These noise levels represent the worst-case scenarios; that is, they assume no shielding is provided between the traffic and the noise contour locations. Table 4.15-G (Traffic Noise Levels, Base Year (Existing, 2007) Conditions) provides the results of the base year (2007) traffic noise calculations adjacent to representative segments of the freeways and the major roads in unincorporated Riverside County. The base year, 2007, is shown because it is the year for which the "existing" traffic levels were modeled.

Only roadway segments with traffic volumes higher than 6,000 ADT and representative of the subareas covering unincorporated Riverside County were selected for analysis. In some subareas where several ADTs were presented at close range, only the segment with the highest ADT was analyzed. Along roadway segments with traffic volumes less than 6,000 ADT, the 70 and 65 dBA L_{dn} noise contours would be confined within the roadway right-of-way (i.e., within 50 feet of the roadway centerline). Therefore, no modeling of the traffic noise along these roadway segments was provided. It should be noted that the 70 and 65 dBA limits are utilized as the upper thresholds for noise as these are the levels at which commercial and residential uses are conditionally acceptable. Noise levels greater than these limits are unacceptable based on land use noise guidelines implemented by the County of Riverside.

As shown in Table 4.15-G, noise modeling results indicate that traffic noise levels measured at 50 feet from the outermost travel lane for these roadways ranges from a low of 60.4 dBA L_{dn} (along Graeber Street between Cactus Avenue and Meyer Street) to a high of 84.7 dBA L_{dn} (along I-10 between Apache Trail and Field Road).

Key: ADT = average daily traffic dBA = A-weighted decibels Ldn = Day-Night Average Level

Footnotes:

1. ADT values rounded up to the nearest 100.
2. Traffic noise within 50 feet of the roadway centerline should be evaluated with site-specific information.

Source: LSA Associates, March 2011

C. Railway Noise

Riverside County is traversed by three rail mainlines. The BNSF Transcon is owned by Burlington Northern/ Santa Fe (BNSF). The UP Los Angeles Subdivision (UP LA Sub) and the UP El Paso Line are owned by Union Pacific (UP). The BNSF Transcon is the main artery linking the Los Angeles basin to all midwestern, southwestern and eastern markets on the BNSF rail system. UP LA Sub connects to the Sunset Corridor at Colton in the Los Angeles basin, while the UP El Paso Line is part of the UP Sunset Corridor and extends to El Paso. This route is designated as the primary intermodal line between the Los Angeles basin and eastern markets. The UP LA Sub segment of the mainline connects with the UP El Paso Line via the BNSF Transcon Line between west Riverside and Colton. The UP El Paso Line exits south through Imperial County towards Yuma, Arizona, and the eastern side of the Salton Sea. The BNSF Transcon has a route exiting to the north into San Bernardino County. In 2003, 68 million tons of rail freight passed through Riverside County with less than 5% originating or ending locally. Currently 85 freight trains per day pass through Riverside County according to the Multi-County Goods Movement Action Plan, Riverside County Action Plan (Wilbur Smith Associates, April 30, 2008).

Due to the sensitivity of rail schedules and information, specific railroad operations were not available from the respective railroad operators. In the absence of such information, other rail studies for the area and staff at the Riverside County Transportation Commission were consulted. The Inland Empire Railroad Main Line Study Final Report (Southern California Association of Governments [SCAG], 2005) notes the "frequencies of main-line train operations vary from day to day." Typically, the amount of traffic along the principal railroad lines fluctuates considerably since trains (principally freight) are operated in response to demand and not on the basis of fixed or permanent schedules.

The final report projected the following railroad operations data for the year 2010: UPRR operates 50 daily freight trains in Riverside County and BNSF operates 82 in the Highgrove area (southwest of Corona) of the county. BNSF also operates 82 daily freight trains in the Atwood (West Riverside) area of the county. Metrolink operates 24 daily passenger trains in the Highgrove area of the county and 38 in the Atwood (West Riverside) area. As stated in various reports and confirmed by County of Riverside staff, the average daily speeds of freight and passenger trains are not available from the railroads at this time. The size of the train along with the number of locomotives can cause the train speed to fluctuate. Also, due to security concerns, specific train schedules and rail cargo transportation plans are not available at this time, beyond those published for Metrolink for commuters.

Most of the rail tracks in western Riverside County are continuously welded, as are most railways in the USA built after 1950. On such tracks, rails are welded together via flash-butt welding to form a single rail which can be thousands feet long. Unwelded rails are held together by joints, bars and bolts, which could result in greater noise generation.

There are no engines that are strictly electric; however, some engines are a combination of electric and diesel. Generally, electric engines can deliver varying outputs more efficiently and rapidly than diesel engines. But diesels are most economical at constant engine speeds and tend to make less noise and generate fewer vibrations.

Currently, daily train traffic produces noise that may disrupt activities in proximity to railroad tracks. For instance, trains are required to sound their horns at all at-grade crossings and they may also be required to slow down through residential areas. These types of noise disturbances can interfere with activities conducted on noise-sensitive land uses. However, due to relatively low volumes of train traffic and the isolated locations of the current system of rail lines from noise-sensitive land uses, they do not expose as many people to the intensity of sound as do the airports. Figures 4.15.2, 4.15.3 and 4.15.4 provide typical railroad noise contours.

D. Aircraft Noise

Riverside County is served by seven public use general aviation airports along with a number of smaller airports and air fields. Most of the airports in Riverside County have published airport noise contour maps, as noted below. The figures noted here are for the noise contours that best reflect existing conditions. In some cases, where future plans for an airport call for an expansion in operations or increase in flights, a second "future" noise contour may have been developed. Future noise contours are provided in Section 4.15.5, as cited below. The noise contour maps within these airport land use plans are based on airport operational data and provide a more accurate noise condition than if these areas were measured as part of the short-term noise monitoring. Because airport surroundings are usually covered by the airport noise contour maps, they are not included in the noise measurement areas.

Regarding specific airports, it should be noted that although the Chino Airport is not located in Riverside County, its noise contours affect areas within Riverside County and thus it is included in this section. Conversely, noise contours from the Los Angeles International and Ontario International Airports do not extend to the Riverside County border and therefore they are not included here. Also, Skylark Airport is not included here as it is not a public use airport according to records maintained by the California Department of Transportation (CalTrans), Division of Aeronautics. Permission is required prior to landing any aircraft at this facility. Lastly, although a major source of aircraft activity in western Riverside County, the March Air Reserve Base is also not included here for two reasons. First, the airport and the surrounding lands are addressed under their own master plan issued by the March Joint Powers Authority. As such, these lands are not under the direct jurisdiction of the Riverside County General Plan. Secondly, military operations are subject to different regulations than those discussed for public-use airports here, as it is recognized that matters of national security and safety at times are of greater significance than noise levels.

Banning Municipal Airport: Includes noise contours for 2002/2003 and future (ultimate); last updated in 2004. See Figure 4.15.5 (Banning Municipal Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.23 (Banning Municipal Airport Future Noise Contours) for future contours.

Bermuda Dunes Airport: Includes noise contours for 2003 and future (ultimate, average annual and peak season); last updated in 2004. See Figure 4.15.6 (Bermuda Dunes Airport Existing Noise Contours – Average Annual Day) and Figure 4.15.7 (Bermuda Dunes Airport Existing Noise Contours – Average Peak Season Day) for existing noise contours map and Figure 4.15.24 (Bermuda Dunes Airport Future Noise Contours – Average Annual Day) and Figure 4.15.25 (Bermuda Dunes Airport Future Noise Contours – Average Peak Season Day) for future contours.

Blythe Airport: Includes noise contours for 1999, 2020 and ultimate; last updated in 2004. See Figure 4.15.8 (Blythe Municipal Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.26 (Blythe Municipal Airport Future (2020) Noise Contours) and Figure 4.15.27 (Blythe Municipal Airport Future (Ultimate) Noise Contours) for future contours.

Chiriaco Summit Airport: Includes noise contours for 2025; last updated in 2004. No contour map is available for existing conditions. See Figure 4.15.28 (Chiriaco Summit Airport Future Noise Contours) for future conditions.

Corona Municipal Airport: Includes noise contours for 2002/2003 and future (ultimate); last updated in 2004. See Figure 4.15.9 (Corona Municipal Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.29 (Corona Municipal Airport Future Noise Contours) for future contours.

Desert Center Airport: Includes noise contours for 2025; last updated in 2004. No contour map is available for existing conditions. See Figure 4.15.30 (Desert Center Airport Future Noise Contours) for the future conditions map. Also, this airport is no longer public use.

Flabob Airport: Includes noise contours for 2003 and future (ultimate); last updated in 2004. See Figure 4.15.10 (Flabob Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.31 (Flabob Airport Future Noise Contours) for future contours.

French Valley Airport: Includes noise contours for 2002 and future (ultimate); last updated in 2004. See Figure 4.15.11 (French Valley Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.32 (French Valley Airport Future Noise Contours) for future contours.

Hemet-Ryan Airport: Includes noise contours for 1990 and 2005; last updated in 1992. See Figure 4.15.12 (Hemet Ryan Airport Existing (1990) Noise Contours) for existing (1990) noise contours map and Figure 4.15.33 (Hemet Ryan Airport Future (2005) Noise Contours) for future (2005) noise contours.

Jacqueline Cochran Regional Airport: Includes noise contours for 2002 and 2025 (and ultimate); last updated in 2004. See Figure 4.15.13 (Jacqueline Cochran Regional Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.34 (Jacqueline Cochran Regional Airport Future (2025) Noise Contours) and Figure 4.15.35 (Jacqueline Cochran Regional Airport Future (Ultimate) Noise Contours) for future noise contour maps.

Palm Springs International Airport: Includes noise contours for 2002 and 2025; last updated in 2005. See Figure 4.15.14 (Palm Springs International Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.36 (Palm Springs International Airport Future (2025) Noise Contours) for future contours.

Perris Valley Airport: Noise contours for 2008 and 2028; last updated in 2010. No unincorporated areas within the Plan area. See Figure 4.15.15 (Perris Valley Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.37 (Perris Valley Airport Future (2028) Noise Contours) for future noise contours.

Riverside Municipal Airport: Includes noise contours for 2003 and 2025; last updated in 2005. See Figure 4.15.16 (Riverside Municipal Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.38 (Riverside Municipal Airport Future (2025) Noise Contours) for future contours.

Chino Airport: Includes noise contours for 2002 and 2028; last updated in 2008. See Figure 4.15.17 (Chino Airport Existing Noise Contours) for existing noise contours map and Figure 4.15.39 (Chino Airport Future (2028) Noise Contours) for future contours.

E. Military Noise Sources

Military activities can have various effects on the ambient noise environment, mainly from aircraft and ordnance delivery. In 2010, the U.S. Department of the Navy issued a Final Environmental Impact Statement (Final EIS) addressing a proposal to base, train and operate a new fighter jet, the F-35B, on the West Coast. Much of the military noise information presented in this section comes from that document. Information regarding operations at the Chocolate Mountain Aerial Gunnery Range (CMAGR, discussed below) and other facilities comes from the CMAGR Land Withdrawal Renewal Draft Legislative Environmental Impact Statement (Draft LEIS) issued by the U.S. Department of the Navy in August 2012. The Draft LEIS assesses the potential environmental effects of continuing to use CMAGR for military training activities for another 25 years beyond 2014.

The predominant noise sources associated with military activities are aircraft operations, both at and around base airfields, as well as in military airspace and on ranges. Airspace noise includes supersonic flight and ordnance delivery events. According to the Final EIS issued by the U.S. Navy for West Coast base operations, noise conditions associated with military operations can include a variety of aircraft-related noises, such as the following:

- Sonic booms generated by aircraft traveling at airspeeds in excess of Mach 1 (the speed of sound, about 340 miles per hour). A short burst of vibration may accompany the sound. Per the Navy Final EIS (page 3-9), the overpressures of sonic booms that reach the ground are well below those that would begin to cause physical injury to humans or animals. They can, however, be annoying and cause startle reaction in humans and animals.

- Area-type operations, where aircraft are uniformly distributed horizontally within an airspace, including: rotary-wing close air support; air-to-air operations (helicopters and jets), such as air combat maneuvers, area reconnaissance, low-altitude training and air interdiction (i.e., tactical attack without ground support); fixed-wing close air support. Any of which may occur in multiple areas at once. These types of noises can be fairly continuous when involving aircraft hovering or centered over a single area for long periods. Rotary-wing aircraft may also generate low-level (weak) airborne vibrations as well.

- Route-type operations, where aircraft are dedicated to a specific route (for example, bombing runs or ingress/egress routes), including: low-altitude rotary-wing close air support and high-altitude fixed-wing close air support. These types of noise tend to be of shorter duration, as the noise source tends to travel into and out of earshot as a route is flown. Any associated vibrations are also transient.

- Ordnance delivery by aircraft (contributing both aircraft and very-short duration explosive noise and vibration).

Except for route-type operations, the above operations are generally limited to the restricted areas on, above and in the general vicinity of the military facility conducting the exercise. Route operations can also take aircraft away from the military facility's direct (restricted) airspace along "military training routes," which are discussed below. Other ground-based noise and vibration can be generated on military facilities by the following:

- Artillery fire from field guns, mortars, howitzers, anti-aircraft guns, etc. (very-short duration explosive noise and vibration).

- Ground-based arms, artillery and ordnance exercises, including "numerous rifle, machinegun, rocket and explosive demolition" sounds (Draft LEIS, page 3-102). This includes both weapon discharges as well as detonation of explosives (including high explosives) and demolition charges.

- Vehicle travel, including both traditional axled vehicles (cars, jeeps, trucks, Humvees, etc.) as well as tracked vehicles (tanks, bulldozers, etc.). Vehicles may travel both on and off road. Vehicle noise may also be associated with transit to/from the facility.

- Operation of fixed and portable equipment, such as electricity generators, air conditioners, radios and other communication, data and navigation devices, etc.

Other "non-military man-made" sources of noise occurring on or near military facilities can include: roadway vehicle operation, rail traffic, commercial and industrial operations, agricultural activities and equipment (discing, sowing, harvesting, etc.), off-road vehicle operation, property landscaping and maintenance, operation of heating, ventilation and air conditioning (HVAC) equipment at residences, commercial, industrial or agricultural land uses, etc. (Draft LEIS, page 3-93).

With its large expanses of open land, Riverside County is home to a number of military bases, including three active facilities: the Chocolate Mountain Aerial Gunnery Range (part of the Bob Stump Training Range Complex), March Joint Air Reserve Base and the Naval Surface Warfare Center (in Corona). The Naval Warfare Center provides technical operations, testing and assessment, and engineering support for the Navy and is not associated with aircraft, munitions or other significant military noise sources. Thus, it is not discussed further here.

Bob Stump Training Range Complex: Since before World War II, the southwestern United States has been vital in providing the vast expanses of open space necessary for the training of the country's Armed Forces. Spanning over 1.2 million acres in southwest Arizona and southeast California, including a portion of Riverside County, the Bob Stump Training Range Complex (BSTRC) is the largest military training facility in the world (see Figure 4.15.18 (Military Airspace in Southern California)). The U.S. Marine Corps complex encompasses the Chocolate Mountain Aerial Gunnery Range (CMAGR) in Riverside and Imperial counties, the El Centro Range Complex (in southern Imperial County, near the Mexico border), the Air Ground Combat Center at Twenty-nine Palms in San Bernardino County, the Barry M. Goldwater Range in Yuma County, Arizona, and also the U.S. Army's Yuma Proving Ground also in Arizona.

In addition to providing territory for various wide-ranging ground force and surface-fire activities, the BSTRC is used for training exercises that frequently also involve jet and other military aircraft flying high speeds at low altitudes. Thus, in addition to noise generated on the ground and above military bases and training facilities themselves, portions of the western U.S., particularly the remote desert regions around the Bob Stump Training Range Complex, may be subject to noise from jet overflight and other military use of airspace.

Chocolate Mountain Aerial Gunnery Range: The other most notable source of military noise is the Chocolate Mountain Aerial Gunnery Range (CMAGR). The northern tip of CMAGR is located in Riverside County immediately east of the Salton Sea. In total, the range encompasses nearly 460,000 acres, roughly half of which is public land administered by the Bureau of Land Management (BLM) and half is federal land administered by the Department of the Navy. A total of 108,363 acres of CMAGR are within Riverside County; the remainder (roughly 75% of the site) is in Imperial County.

Since the 1940s, CMAGR has provided support training that is essential to the readiness of the nation's Marine Corps and Naval Air Forces. CMAGR is a live-fire tactical aviation training range that takes advantage of the area's desert mountain terrain, which is ideal for air-to-ground attack and air-to-air combat training. According to the Navy (Draft LEIS, page 3-10), "25 types of tactical aviation training activities currently occur on a regular basis at the CMAGR and its adjacent MTRs." Tactical military exercises at CMAGR involve live explosives and large force-on-force aviation training, including bombing, rocketry and strafing practice. Artillery, demolitions,

small arms and Naval Special Warfare training are also conducted within the range, as well as parachute air drops and helicopter operations. Aircraft use the CMAGR as well as the special use airspace associated with it. According to the Navy Draft LEIS, CMAGR sees 6,000-7,000 training sorties annually for fixed wing aircraft (one sortie represents one flight by one aircraft from takeoff to landing, but may include any number of bombing, strafing or other training runs). Sorties per day tend to average between five and roughly 20 for most CMAGR airspace areas.

In terms of ordnance operations, the other major source of noise from CMAGR, the Navy's West Coast FEIS reports that an average of 204,000 rounds of large caliber munitions are expended annually and "approximately 42,000 of those rounds were high explosives." (Final EIS, page 6-18) It also notes that "approximately 80% of all rounds fired are associated with air-to-ground activity on the range and 15% and 2% of the total expenditure were during the CNEL evening and nighttime periods, respectively." Based on the data provided, the FEIS notes that CMAGR range use occurs 305 days per year.

Figure 4.15.19 (Existing Noise Contours for Chocolate Mountain Aerial Gunnery Range) shows the existing noise contours associated with CMAGR as reported in the Draft LEIS based on "worse-case" operation levels involving daily operations (i.e., all 30 days of the month monitored) and nearly 7,400 light operations per year. Per the Draft LEIS (page 3-93), the area between the CMAGR southwestern boundary and the Salton Sea "appears to contain a variety of land uses that include either residential uses on what may otherwise be agricultural land, residential communities, such as Bombay Beach and Niland, and even commercial resorts such as Glamis North KOA ['Kampgrounds of America'] and the apparent residences near area attractions such as Salvation Mountain. The latter two examples appear to abut the Coachella Canal and might thus be considered representative of closest off-range potentially noise-sensitive receivers with respect to the CMAGR boundary." Of these sites, only the Glamis North KOA campground is located within Riverside County, the rest are all within Imperial County. As reported by the Navy (Draft LEIS, page 3-102), the ambient noise levels (L_{eq}) in the region range from 30-60 dBA over a continuous 24-hour period (for nighttime hours, the effective L_{dn} would be approximately 50 dBA). (Note, the measurement was taken near Niland, roughly two miles from the CMAGR boundary and also "appear to include sound from distant military operations conducted at the CMAGR con-current[ly].")

The noise contours shown address noise generated by ordnance detonations and aircraft flight. As shown in Figure 4.15.19, modeling of ordnance noise generation found that the "62 dBC CNEL noise contours do not extend beyond the current government property boundaries" of CMAGR (Draft LEIS, page 3-102) and no "off-range persons or housing units" (in Riverside or Imperial County) are exposed to noise levels greater than 62 dBC CNEL. For aircraft noise, the 65 dBA contour is limited to within the boundaries of the CMAGR, also as shown in Figure 4.15.19. Note, as opposed to dBA, which filter out very high and very low frequencies to replicate human ear sensitivity, dBC units denote essentially unweighted decibels. "C-weighting" is typically applied to impulsive sounds, such as sonic boom or ordnance detonation (Final EIS, page 3-7).

According to the Draft LEIS, the existing contours reflect typical activities ongoing at the range through a given training year (305 days of activity annually). The noise contours mapped and modeled, as shown in Figure 4.15.19, are for existing activity levels at CMAGR. This level of activity is projected to continue to occur at the same approximately level of intensity for the next 25 years. Thus, no separate "future" noise contour maps are included in this section for CMAGR. Also, since noise exposure outside CMAGR within Riverside County are mapped as being within limits (i.e., under 65 dBA), CMAGR as a noise source is not discussed further in either the 'Effects' or 'Impacts and Mitigation' portions of this section (Sections 4.15.5 and 4.15.6). With the proposed General Plan policies and low level of development potential surrounding the CMAGR in Riverside County, it can safely be concluded that future development resulting from or accommodated by GPA No. 960, including

land use changes in the Salton Sea area, would not be subject to significant noise impacts from CMAGR activities. No further analysis is needed at this time.

March Joint Air Reserve Base: March is one of the oldest airfields operated by the U.S. military, having been established as Alessandro Flying Training Field in 1918. March Field's primary mission was pilot training, then in 1931 it became used as an operations base. (It was also home to Bob Hope's first USO show in 1941.) After World War II, the base became part of the Air Force's Tactical Air Command, later the Strategic Air Command (until 1992). Since 1996, March has been an Air Reserve Base under the Air Force Reserve Command (renamed a Joint Air Reserve Base in 2003). The base is still active as a military airport, hosting operational flying missions, particularly humanitarian missions, the 4th Air Force of the Air Force Reserve Command and multiple units of the California Air National Guard. It is also to be used for air cargo (as part of the adjacent March GlobalPort) in the future. However, other than air shows and other short special events, March Air Reserve Base is typically not a major center for noise-generating military exercises, training or other activities. See Figure 4.15.20 (March Joint Air Reserve Base, Noise Contours) for the existing noise contour for March.

Military Operations Areas and Military Training Routes: Both of these terms denote types (or uses) of military airspace that can lead to the travel of military aircraft at altitudes and/or speeds that could result in (usually) brief noise and/or vibration exposures to people on public or private lands outside of military facilities. Because of the speed and power of the aircraft involved, these airspaces can stretch a hundred or more miles from the associated military facility. Associated noise exposures can affect thousands of people, though almost always for very brief periods at infrequent intervals.

A "military operations area" (MOA) is defined in the Code of Federal Regulations (Title 14, Section 1.1) as "airspace established outside Class A airspace to separate or segregate certain non-hazardous military activities from IFR traffic [i.e., aircraft navigating by instrument, such as commercial jetliners] and to identify for VFR traffic [i.e., aircraft navigating visually, such as civilian light planes, etc.] where these activities are conducted." MOAs are designed for routine training or testing maneuvers. Areas above military bases, near actual combat or other military emergencies are generally designated as "restricted airspace." MOAs have restrictions or prohibitions that occur periodically, rather than continuously, and apply only to the aircraft not participating in the military operation. Typically, MOAs restrict non-military aircraft to certain elevations or speed, but do not prohibit them entirely.

MOAs are often positioned over isolated, rural areas to provide ground separation for any noise nuisance or potential accident debris. Each designated MOA appears on the relevant air avigation sectional charts, along with its normal hours of operation, lower and upper altitudes of operation, controlling authority contact and using agency. Although live-fire training with aircraft weapons can only occur within restricted airspace, the adjacent MOAs enhance the versatility and realism of this training by expanding the airspace available for tactical maneuvers before or following ordnance delivery actions, for example at the CMAGR (Draft LEIS, page 3-8). MAOs in Southern California, including portions of eastern Riverside County, are shown in Figure 4.15.18.

As shown in Figure 4.15.21 (Military Training Airspace in the SMAGR Operating Area), a number of "military training routes" (MTRs) link the various facilities of the Bob Stump Training Complex, as well as providing routes across the country. MTRs are aerial corridors established jointly by the Federal Aviation Administration (FAA) and the federal Department of Defense (DOD) in which military aircraft can operate below 10,000 feet mean sea level (MSL) at speeds exceeding the 250 knot limit (nearly 290 miles per hour) that all other aircraft are normally restricted to when below that elevation (the exception is when a craft is instructed otherwise by an air traffic controller, e.g., for hazard avoidance reasons, emergencies, etc.). These runs are conducted as part of military low-altitude, high-speed training and at times may exceed the 10,000 foot MSL level. Military craft are supposed to, however, stay at or below Mach 1 (the speed of sound). According to the U.S. Marine Corps, aircraft using

these military training routes may fly as low as 200 feet above ground level at speeds up to, but not exceeding, the speed of sound.

Thirteen MTRs, which share nine centerlines, are currently located within five nautical miles of the restricted airspace at CMAGR (see Figure 4.15.21). Three of these MTRs are used for training missions at the CMAGR, providing entry to the CMAGR and allowing aircrews to practice long-distance, low-level, terrain-following, high-speed flight as a tactic for attacking a target while using terrain to mask their approach and evade detection. Four other MTRs transit airspace near the CMAGR, but do not directly support its operations. Others link the southeastern California bases with other military facilities further north (such as the Twenty-nine Palms Air Ground Combat Center north of Riverside County) and in Arizona to the east (e.g., Yuma Proving Ground and Laguna Army Airfield) and southeast (such as the Yuma Air Station and the Barry M. Goldwater Range). All of these facilities are within 100 miles of CMAGR (Draft LEIS, page 3-8).

According to the Riverside County Airport Land Use Commission (RCALUC), per its 2004 Riverside County Airport Land Use Compatibility Plan Policy Document (page I-3), there are also military and restricted flight areas in Riverside County associated with the Quail Military Operations Area, located north of Blythe Airport and the Kane and Abel Military Operations Areas (part of the CMAGR). Additionally, there is a restricted flight area associated with Camp Pendleton (a U.S. Marine Corps Air Station in San Diego County) located southwest of French Valley Airport.

Other Special Use Airspace: Special use airspace is defined as airspace where activities must be confined because of their nature or where limitations are imposed on aircraft not taking part in those activities. Although these areas are often reserved for military use and are designed to separate non-participating aircraft from military training operations, such as the MOAs and MTRs discussed above, they can also apply to other areas where noise reductions are desired.

In particular, locations surrounding wilderness areas and national wildlife refuges area also designated as special use airspace. As these areas fall under the definition of "National Park," all aircraft are requested to maintain a minimum altitude of 2,000 feet above the surface of designated National Park areas per FAA regulations. FAA Advisory Circular 91-36C defines the "surface" as the highest terrain within 2,000 feet laterally of the route of flight or the uppermost rim of a canyon or valley. There are several wilderness areas within Riverside County. Joshua Tree National Park being the largest, it is in the vicinity of Chiriaco Summit Airport, Jacqueline Cochran Regional Airport, Desert Center Airport and Palm Springs International Airport. Other restricted airspace over wildernesses include Anza-Borrego State Park and the San Mateo Canyon, Santa Rosa, San Jacinto, Agua Tibia and San Gorgonio Wilderness Areas. (See RCALUC Compatibility Plan Document, page I-3). See Figure 4.15.22 (Special Use Airspace in Riverside County).

F. Other Noise Sources

Stationary Noise Sources: Stationary noise sources present in residential areas include HVAC equipment and maintenance equipment such as leaf-blowers and gasoline-powered lawnmowers. Another stationary noise source is amplified sound, which includes noise from personal or home audio equipment, automotive audio equipment, outdoor loudspeakers, such as those used for paging, and amplified sound at music or theatrical performances. Because this sound typically includes music or speech, it is potentially more detectable and more annoying than other sounds of the same noise level. Conditional use permits, as well as the Riverside County Noise Ordinance (No. 847) establishes limitations on time and magnitude of noise for these sources.

Commercial uses often include larger, rooftop-mounted HVAC equipment. The motors, pumps and fans that cool and heat buildings produce point-source noise that most directly affects adjacent land uses. Frequently, this

equipment includes components of pure tone noise from the rotational frequency of motors. Although noise levels are generally low from these sources, the fact that such sources may operate continuously and may include pure tones that make them audible at a substantial distance creates potential for conflict. Riverside County ordinances, such as No. 348 (Zoning Code) and No. 847 (Regulating Noise) generally address these conflicts.

Agricultural Activity Noise: Agricultural operations may produce significant noise during planting and harvesting times from equipment operation. Agricultural noise may be disturbing to neighboring residential areas, a common phenomena as urban development intrudes into agricultural lands. Agricultural areas may also have noise-sensitive uses, which can be disturbed by high noise levels as is the case with the raising of animals and poultry. Therefore, the potential for noise conflicts exists at the outskirts of urban areas where agricultural operations and urban development abut or intermix.

Industrial and Other Major Noise Sources: Industrial land uses can be associated with a variety of noise impacts, particularly due to stationary sources. Industrial uses can generate noise during normal operations from sources such as shipping and loading facilities, concrete crushing facilities, recycling activities and other large mechanical or hydraulic equipment use. Other stationary sources of noise include natural gas extraction facilities, water treatment facilities and mining activities that are located throughout Riverside County.

Riverside County has several major industrial and commercial sites that generate relatively high noise levels that potentially affect their respective neighborhoods. These sources include the following:

- Numerous industrial sites in the Mira Loma area.
- Desert Hills truck stop/inspection facility on I-10 in Cabazon.
- Numerous auto body shops on Mission Avenue in the Rubidoux area.
- Wind Energy Conversion Systems ("wind mills") in San Gorgonio Pass near Palm Springs.
- Lake Elsinore Storm Stadium (sports arena), located at 500 Diamond Drive in Lake Elsinore.
- El Sobrante Landfill near Corona at 10910 Dawson Canyon Road.
- All-American Asphalt mining, located at 400 East Sixth Street in Corona.
- 3M Mining, located at 18750 Minnesota Road in Corona.
- Approximately 18 mining operations in the Coachella Valley area.
- Gas line pressure release valves in various locations throughout the county.
- Water wells in various locations throughout the county.

U.S. Marine Corps Bob Stump Training Range Complex (BSTRC)
1. Primary mission—training support for all aspects of Marine Corps tactical aviation
2. CMAGR and BMGR West provide the core training capabilities and capacities
3. ECR and YPG provide supplementary training capabilities and capacities
4. Close to Marine and Navy air stations, Camp Pendleton, and aircraft carriers
5. Year-round flying weather

Recreational Activity Noise: Recreational lands and wildlife habitat are also impacted by noise. Recreational uses include both those that are quiet by nature and those that are noisy by nature. Quiet recreational uses include activities such as hiking, bicycling and horseback riding. Noise-generating recreational uses include sports park activities and off-road vehicle recreational areas. Uncontrolled use of off-road vehicles in parks and open space lands degrade recreational opportunities for Riverside County's residents. Noise intrusion into wildlife habitat drives off wildlife and with prolonged use, may effectively reduce the amount of land used as habitat by various species. As described earlier under military noise, aircraft overflight noise can also affect open space values and, as a result, FAA regulations prohibit flight over National Parks and Wilderness Areas below 2,200 feet.

In addition to the noise sources described above, there are several noise sources within the unincorporated Riverside County area that are considered to have potential noise impacts to their immediate neighborhoods. These recreational noise sources include the following:

- Mike Rahauges Shooting Range near Norco on River Road off I-15 at Second Street.
- Rice Valley Dunes off-road vehicle park, 5 miles south of Rice Valley, exit on Highway 62.
- Ira G. Long Off-road Vehicle Park, in Palm Springs.
- Water activities on the Colorado River, particularly the operation of recreational watercraft.

4.15.3 Policies and Regulations Addressing Noise

This section covers the various federal, state and local regulations, policies and standards that exist (or are proposed) to address noise. Many of these regulations serve to reduce potential adverse impacts caused by noise within Riverside County. These impacts and mitigation effects are discussed later in Section 4.15.6.

A. State and Federal Regulations

1. Federal Noise Control Act of 1972

The U.S. Environmental Protection Agency (EPA) Office of Noise Abatement and Control was originally established to coordinate federal noise control activities. After its inception, the Office promulgated the Federal Noise Control Act of 1972, establishing programs and guidelines to identify and address the effects of noise on public health, welfare and the environment. To aid compliance, the EPA published "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety" ("EPA Levels" herein). The EPA Levels document recommends that the L_{dn} should not exceed 55 dBA outdoors or 45 dBA indoors to prevent significant activity interference and annoyance in noise-sensitive areas.

In addition, the EPA identifies 5 dBA as an "adequate margin of safety" for a noise level increase relative to a baseline noise exposure level of 55 dBA L_{dn} (meaning, there would not be a noticeable increase in adverse community reaction for an increase of 5 dBA or less from this baseline level). The EPA did not promote these findings as universal standards or regulatory goals with mandatory applicability to all communities, but rather as

advisory exposure levels below which there would be no risk to a community from any health or welfare effect of noise.

In 1981, EPA administrators determined that subjective issues such as noise would be better addressed at lower levels of government. Consequently, in 1982 responsibilities for regulating noise control policies were transferred to state and local governments. However, noise control guidelines and regulations contained in EPA rulings from prior years remain in place providing guidance for more individualized control of specific issues by federal, state and local government agencies.

2. Federal Transit Administration

The Federal Transit Administration (FTA) has developed methodology and significance criteria to evaluate incremental noise impacts from surface transportation modes (i.e., on-road motor vehicles and trains) as presented in Transit Noise Impact and Vibration Assessment (FTA Guidelines). It includes incremental noise impact criteria based on EPA findings and studies of annoyance levels in communities affected by transportation noise. The FTA extended the EPA's 5 dBA incremental impact criterion to ambient levels above 55 dBA. It found that as baseline ambient levels increase, it takes smaller and smaller increments to trigger increases in community annoyance. The FTA also developed criteria for judging the significance of vibration impacts based on annoyance levels expected in communities exposed to vibration from transportation sources and construction activity. The applicable standards that were used in relation to this programmatic EIR are as follows.

Standards for Substantial Noise Increases: In addition to standards for "excessive" noise, criteria are also necessary for establishing when an *increase* in noise levels will result in a significant impact. For this type of analysis, this section uses the FTA's incremental criteria for noise exposure, which become progressively more stringent as the baseline noise levels increase. This is appropriate given the logarithmic nature of sound (i.e., sound intensity increases exponentially as the decibel value increases). As a result, these criteria are more protective of communities with high noise exposure.

Table 4.15-H: Incremental Noise Impact Criteria for Noise-Sensitive Uses

Existing Noise Exposure (CNEL, in dBA)	Allowable Project Noise Exposure (CNEL, in dBA)	Allowable Combined Noise Exposure (CNEL, in dBA)	Allowable Noise Exposure Increment (CNEL, in dBA)
55	55	58	3
60	57	62	2
65	60	66	1
70	64	71	1
75	65	75	0

Source: Federal Transit Administration, 1995.

Standards for Excessive Groundborne Vibration or Noise: The FTA's groundborne vibration impact thresholds for sensitive buildings, residences and institutional land uses are shown in Table 4.15-I (Groundborne Vibration and Noise Impact Criteria), below. It should be noted that even with these standards, vibration-sensitive manufacturing or research would require additional, detailed (site-specific) evaluation to define the applicable vibration levels. Generally, however, vibration-sensitive equipment is not affected by groundborne sound waves (or noise levels).

The increase in ambient noise levels expected over time is attributable almost entirely to traffic-related sound in most areas of the county. As identified in Table 4.15-H, above, where the baseline L_{dn} is less than 60 dBA, a permanent increase in roadway traffic noise levels of 3 dBA over baseline ambient noise levels is considered to be substantial and, therefore, significant. Where the baseline L_{dn} is between 60 dBA and 65 dBA, a permanent

increase in roadway traffic noise levels of 2 dBA over baseline ambient noise levels is considered to be substantial and, therefore, significant. And, where the baseline L_{dn} is between 65 dBA and 70 dBA, a permanent increase in roadway traffic noise levels of 1 dBA over baseline ambient noise levels is considered to be substantial and, therefore, significant. This means, for example, that in residential areas with a baseline ambient noise level of 50 dBA L_{dn}, a less-than 5 dBA increase in noise levels would produce a minimal increase in community annoyance levels, while at 70 dBA L_{dn}, only a 1 dBA increase can be accommodated before a significant annoyance increase results.

Table 4.15-I: Groundborne Vibration and Noise Impact Criteria

Land Use Category	Groundborne Vibration Impact Levels (VdB re 1 micro inch/sec)[1]		Groundborne Noise Impact Levels (dB re 20 microPascals)	
	Frequent Events[2]	Occasional or Infrequent Events[3]	Frequent Events[2]	Occasional or Infrequent Events[3]
Category 1: Buildings where low ambient vibration is essential for interior operations	65 VdB	65 VdB	NA[4]	NA[4]
Category 2: Residences and buildings where people normally sleep	72 VdB	80 VdB	35 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use (schools, churches, libraries, etc.)	75 VdB	83VdB	40 dBA	48 dBA

Footnotes:
1. This criterion limit is based on levels acceptable for most moderately sensitive equipment, e.g., optical microscopes.
2. "Frequent Events" are defined as more than 70 vibration events per day.
3. "Occasional or Infrequent Events" are defined as fewer than 70 vibration events per day.
4. Does not apply (N/A): vibration-sensitive equipment is not sensitive to groundborne noise.

Source: U.S. Dept. of Transportation, Federal Transit Administration, "Transit Noise and Vibration Impact Assessment," May 2006.

3. Federal Aviation Administration

The primary regulation used by the Federal Aviation Administration (FAA) to address "planning for aviation noise compatibility on and around airports" is 14 CFR Part 150. These regulations were issued in 1981 under the authority of the Aviation Safety and Noise Abatement Act of 1979 (49 United States Code Appendix 2104c). In addition to airports, this regulation also addresses freestanding heliports as well. The aim of these regulations is to provide a "balanced approach for mitigating the noise impacts of airports upon their neighbors while protecting or increasing both airport access and capacity, as well as maintaining the efficiency of the national aviation system."

Among other things, these regulations prescribe the methodology governing development, submission and review of airport noise exposure maps and noise compatibility programs for communities near airports. The noise exposure maps use average annual L_{dn}/CNEL contours around the airport as the primary noise descriptor. Per FAA standards, all land uses are considered compatible when aircraft noise effects are less than 65 dBA L_{dn}/CNEL. At higher noise exposures, increasing restrictions are applied to development within the aircraft noise contours depending upon the noise-sensitivity of the land use and the degree of noise attenuation required in the structures' interior spaces.

4. Federal Highway Works Administration

Vehicular noise is the most prevalent source of noise disturbances within Riverside County. The Federal Highway Works Administration (FHWA) implements a number of noise-related policies and procedures in order to protect the health, safety and welfare of the public from highway noise. Title 23 of the Code of Federal Regulations (CFR) establishes noise abatement criteria and requirements for information to be given to local

officials for use in the planning and design of approved highways. Part 772, in particular, establishes procedures for noise studies and noise reducing measures. In simple terms, the FHWA adheres to a 67 dBA noise level standard for highway projects.

5. State Regulations

California Building Standards Code: The State of California has adopted noise standards in areas of regulation not preempted by the federal government. State standards regulate noise levels of motor vehicles, sound transmission through buildings, occupational noise control and noise insulation. Title 24 of the California Code of Regulations (CCR), also known as the California Building Standards Code, establishes building standards applicable to all occupancies throughout the state. The code includes acoustical regulations for exterior-to-interior sound insulation, as well as for sound isolation between adjacent spaces of various occupied units. Specifically, Title 24 regulations state that interior noise levels generated by exterior noise sources shall not exceed 45 dB L_{dn}, with windows closed, in any habitable room for general residential uses.

California Noise Insulation Standards: The California Noise Insulation Standards (CCR Title 25 Section 1092) establish uniform minimum noise insulation performance standards for new hotels, motels, dormitories, apartment houses and dwellings other than detached single-family dwellings. Specifically, Title 25 specifies that interior noise levels attributable to exterior sources shall not exceed 45 dBA L_{dn}/CNEL (i.e., the same levels that the EPA recommends for residential interiors) in any habitable room of a new dwelling. An acoustical study must be prepared for proposed multiple unit residential and hotel/motel structures where outdoor L_{dn}/CNEL is 60 dBA or greater. The study must demonstrate that the design of the building would reduce interior noise to 45 dBA L_{dn}/CNEL or lower. Because noise levels can increase over time in developing areas, Title 25 also specifies that dwellings are to be designed so that interior noise levels will meet this standard for at least ten years from the time of building permit application.

OPR General Plan Guidelines: Though not adopted by law, the 2003 California General Plan Guidelines, published by the California Governor's Office of Planning and Research (OPR), provides guidance for the compatibility of projects within areas of specific noise exposure. The designation of a level of noise exposure as "normally acceptable" for a given land use category implies that the exterior and interior noise levels would be acceptable to the occupants without the need for any noise abatement measures outside or special structural acoustic treatment for the interior spaces. The Guidelines identify the suitability of various types of construction relative to a range of outdoor noise levels and provide local communities with some flexibility in setting local noise standards to allow for the variability in community preferences. Findings presented by the EPA in its EPA Levels document also influenced the recommendations of the OPR Guidelines, most importantly in the choice of noise exposure metrics (i.e., L_{dn} or CNEL) and in the upper limits for the "normally acceptable" outdoor exposure of noise-sensitive uses. These principals have been adopted into Riverside County's General Plan Noise Element as well. See discussion of General Plan Table N-1 (under Table 4.15-K, below), for additional information.

California Vehicle Code: Recent studies show that the most objectionable feature of traffic noise is the sound produced by vehicles equipped with illegal or faulty exhaust systems. In addition, such vehicles are often operated in a manner that causes tire squeal and excessively loud exhaust noise. A number of California vehicle noise regulations can be enforced by local authorities, as well as the California Highway Patrol. These include Sections 23130, 23130.5, 27150 and 38275 of the California Vehicle Code (CVC), as well as excessive speed laws, which may also be applied to curtail traffic noise. These sections discuss the following:

- CVC Sections 23130 and 23130.5 establish maximum noise emission limits for the operation of all motor vehicles at any time under any conditions of grade, load, acceleration or deceleration.

- CVC Section 27150 requires motor vehicles to be equipped with an adequate muffler to prevent excessive noise.

- CVC Section 38275 requires off-highway motor vehicles to be equipped with an adequate muffler to prevent excessive noise.

The California Highway Patrol and the California Department of Health Services (as well as local health departments) are available to aid local authorities in code enforcement and training pursuant to proper vehicle sound level measurements.

B. Riverside County Regulations

1. Airport Land Use Compatibility Plans

The Riverside County Airport Land Use Commission (ALUC) adopted the Riverside County Airport Land Use Compatibility Plan (ALUCP) Policy Document which establishes land use compatibility planning and policies near airports throughout the county. This policy document replaced compatibility plans (ALUCPs) for individual airports adopted by ALUC at various times from 1974 through 1998. Individual airports covered under the new master ALUCP have varying adoption dates (the earliest new adoption date was 2005). In cases where the master ALUCP has not been adopted yet, the given airport would continue to implement its existing individual airport compatibility plan.

These ALUCP documents promote compatibility between airports and the land uses that surround them. As required by California State law, either the policy document or an earlier ALUCP has been adopted for all of the public-use and military airports in Riverside County, while preparation of compatibility plans for private-use airports is at the option of the ALUC. It should be noted that the Chino Airport is located in San Bernardino County, thus only the portion of that airport's influence area that extends into Riverside County is addressed herein.

Within the County of Riverside, noise levels and development around airports are also addressed under General Plan Policy N 7.3, which states, "Prohibit new residential land uses, except construction of a single-family dwelling on a legal residential lot of record, within the current 60 dB CNEL contours of any currently operating public-use or military airports. The applicable noise contours are as defined by the Riverside County Airport Land Use Commission and depicted in [General Plan] Appendix L, as well as in the applicable Area Plan's Airport Influence Area section."

Also, it should also be noted that the table of noise level and compatibility standards issued as part of the FAA Part 150 regulations includes a footnote that specifies, "The designations in this table do not constitute a county determination that any use of land is acceptable or unacceptable under federal, state or local law. The responsibility for determining the acceptable and permissible land uses and the relationship between specific properties and specific noise contours rests with local land use authorities. FAA determinations under Part 150 are guidelines and are not intended to substitute for land uses determined to be suitable by local authorities in response to locally determined needs and values in achieving noise compatible land uses."

2. County Ordinance No. 847 - Regulating Noise

Ordinance No. 847 addresses sound disturbances and sets various acceptable noise limits. Though not explicitly used to set CEQA thresholds, the ordinance does "establish countywide standards regulating noise," although a number of activities and uses are exempt from the regulations. Table 4.15-J (County Ordinance No. 847 Sound Level Standards), below, lists the sound level standards associated with various land uses under Ordinance No. 847. The ordinance states that "no person shall create any sound...on any property that causes the exterior sound level on any other occupied property to exceed the sound level standards set forth in Table 1 [reproduced as Table 4.15-J herein]." The ordinance also sets a series of additional "special sound source standards" that apply to motor vehicles, power tools and equipment, audio equipment, sound amplifying equipment and live music.

Accordingly, this ordinance sets various limits for acceptable noise levels depending on the type of land use. For open space and residential areas, the acceptable nighttime threshold is much lower (45 dB L_{max}) than for areas used for commercial and industrial areas (55 – 75 dB L_{max}). Activities in any area that surpass applicable thresholds would be in violation of the ordinance and thus subject to sanction. Table 4.15-J, below, shows all of the ordinance's sound levels.

Table 4.15-J: Riverside County Ordinance No. 847 Sound Level Standards

3. Standards from the Riverside County General Plan

Within the existing Riverside County General Plan, five policies directly address a noise threshold or standard, including Policies N 1.3, 14.1 and 14.9, which address acceptable noise levels for new development, particularly residential uses. Policy N 4.1 addresses stationary source noise levels and Policy LU 16.10 addresses noise coming from wind turbines. In addition, Policy N 16.3 addresses vibration levels and Policy N 7.3 addresses aviation noise contours. See the full texts of these policies below.

In addition to these policies, the General Plan Noise Element also includes Table N-1, "Land Use Compatibility for Community Noise Exposure" and Table N-2, "Stationary Source Land Use Noise Standards." Table N-1, which is reproduced in Table 4.15-K, below, indicates the acceptable, provisional and unacceptable noise levels associated with various land uses. The guidelines also provide adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise and its assessment of the relative importance of noise pollution.

General Plan Table N-2 (see Table 4.15-L, below) sets standards for residential land uses in conjunction with General Plan Policy N 2.3. The table also notes, however, that these are only "preferred standards" and that the final decision is made by the Riverside County Planning Department and Office of Public Health.

C. Existing Riverside County General Plan Policies

The Riverside County General Plan Noise Element addresses noise and noise sources within the county through these existing policies below. Noise issues are also addressed directly or tangentially in several other Elements of the General Plan, also as indicated below.

1. Noise (N) Element Policies

Policy N 1.1: Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas. If the noise-producing land use cannot be relocated, then noise buffers such as setbacks, landscaping or block walls shall be used.

Policy N 1.2: Guide noise-tolerant land uses into areas irrevocably committed to land uses that are noise-producing, such as transportation corridors or within the projected noise contours of any adjacent airports.

Policy N 1.3: Consider the following uses noise-sensitive and discourage these uses in areas in excess of 65 CNEL:

- Schools
- Rest homes
- Mental care facilities
- Libraries
- Places of worship
- Hospitals
- Long-term care facilities
- Residential uses
- Passive recreation uses

According to the State of California Office of Planning and Research General Plan Guidelines, an acoustical study may be required in cases where these noise-sensitive land uses are located in an area of 60 CNEL or greater. Any land use that is exposed to levels higher than 65 CNEL will require noise attenuation measures.

Table 4.15-K: Land Use Compatibility for Community Noise Exposure (aka GP Table N-1)

Legend:	
Normally Acceptable:	Specified land use is satisfactory based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
Conditionally Acceptable:	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditions will normally suffice. Outdoor environment will seem noisy.
Normally Unacceptable:	New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made with needed noise insulation features included in the design. Outdoor areas must be shielded.

	Clearly Unacceptable:	New construction or development should generally not be undertaken. Construction costs to make the indoor environment acceptable would be prohibitive and the outdoor environment would not be usable.

Source: Riverside County General Plan, Table N-1 (from California Office of Noise Control), 2003.

Policy N 1.4: Determine if existing land uses will present noise compatibility issues with proposed projects by undertaking site surveys.

Policy N 1.5: Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors and noise-sensitive uses of Riverside County.

Policy N 1.6: Minimize noise spillover or encroachment from commercial and industrial land uses into adjoining residential neighborhoods or noise-sensitive uses.

Policy N 1.7: Require proposed land uses, affected by unacceptably high noise levels, to have an acoustical specialist prepare a study of the noise problems and recommend structural and site design features that will adequately mitigate the noise problem.

Policy N 1.8: Limit the maximum permitted noise levels that cross property lines and impact adjacent land uses, except when dealing with noise emissions from wind turbines. Please see the Wind Energy Conversion Systems section for more information.

Policy N 2.1: Create a County Noise Inventory to identify major noise generators and noise sensitive land uses and to establish appropriate noise mitigation strategies.

Policy N 2.2: Require a qualified acoustical specialist to prepare acoustical studies for proposed noise-sensitive projects within noise impacted areas to mitigate existing noise.

Policy N 2.3: Mitigate exterior and interior noises to the levels listed in the table below [i.e., General Plan Table N-2] to the extent feasible for stationary sources.

Table 4.15-L: Stationary Source Land Use Standards (aka General Plan Table N-2)

Land Use	Interior Standards*	Exterior Standards*
Residential		
10:00 pm to 7:00 am	40 L_{eq} (10 minute)	45 L_{eq} (10 minute)
7:00 am to 10:00 pm	55 L_{eq} (10 minute)	65 L_{eq} (10 minute)

* These are only preferred standards; final decision will be made by the Riverside County Planning Department and the Office of Public Health.
Source: Riverside County General Plan, Table N-2, 2003.

Policy N 3.1: Protect Riverside County's agricultural resources from noise complaints that may result from routine farming practices through the enforcement of the Riverside County right-to-farm ordinance.

Policy N 3.2: Require acoustical studies and subsequent approval by the Planning Department and the Office of Industrial Hygiene to help determine effective noise mitigation strategies in noise-producing areas.

Policy N 3.3: Ensure compatibility between industrial development and adjacent land uses. To achieve compatibility, industrial development projects may be required to include noise mitigation measures to avoid or minimize project impacts on adjacent uses.

Policy N 3.4: Identify point-source noise producers such as manufacturing plants, truck transfer stations and commercial development by conducting a survey of individual sites.

Policy N 3.5: Require that a noise analysis be conducted by an acoustical specialist for all proposed projects that are noise producers. Include recommendations for design mitigation if the project is to be located either within proximity of a noise-sensitive land use, or land designated for noise-sensitive land uses.

Policy N 3.6: Discourage projects that are incapable of successfully mitigating excessive noise.

Policy N 3.7: Encourage noise-tolerant land uses, such as commercial or industrial, to locate in areas already committed to land uses that are noise-producing.

Policy N 4.1: Prohibit facility-related noise received by any sensitive use from exceeding the following worst-case noise levels:

a. 45 dBA-10-minute L_{eq} between 10:00 pm and 7:00 am.

b. 65 dBA-10-minute L_{eq} between 7:00 am and 10:00 pm.

Policy N 4.2: Develop measures to control non-transportation noise impacts.

Policy N 4.3: Ensure any use determined to be a potential generator of significant stationary noise impacts be properly analyzed and ensure that the recommended mitigation measures are implemented.

Policy N 4.4: Require that detailed and independent acoustical studies be conducted for any new or renovated land uses or structures determined to be potential major stationary noise sources.

Policy N 4.5: Encourage major stationary noise-generating sources throughout the County of Riverside to install additional noise buffering or reduction mechanisms within their facilities to reduce noise generation levels to the lowest extent practicable prior to the renewal of conditional use permits or business licenses or prior to the approval and/or issuance of new conditional use permits for said facilities.

Policy N 4.6: Establish acceptable standards for residential noise sources, such as, but not limited to, leaf blowers, mobile vendors, mobile stereos and stationary noise sources, such as home appliances, air conditioners and swimming pool equipment.

Policy N 4.7: Evaluate noise producers for the possibility of pure-tone producing noises. Mitigate any pure tones that may be emitted from a noise source.

Policy N 4.8: Require that the parking structures, terminals and loading docks of commercial or industrial land uses be designed to minimize the potential noise impacts of vehicles on the site, as well as on adjacent land uses.

Policy N 5.1: Enforce the Wind Implementation Monitoring Program (WIMP).

Policy N 5.2: Encourage the replacement of outdated technology with more efficient technology with less noise impacts.

Policy N 6.1: Consider noise reduction as a factor in the purchase of County maintenance equipment and its use by County contractors and permittees.

Policy N 6.2: Investigate the feasibility of retrofitting current County-owned vehicles and mechanical equipment to comply with noise performance standards consistent with the best available noise reduction technology.

Policy N 6.3: Require commercial or industrial truck delivery hours be limited adjacent to noise-sensitive land uses unless there is no feasible alternative or there are overriding transportation benefits.

Policy N 6.4: Restrict the use of motorized trail bikes, mini-bikes and other off-road vehicles in areas of the county except where designated for that purpose. Enforce strict operating hours for these vehicles in order to minimize noise impacts on sensitive land uses adjacent to public trails and parks.

Policy N 7.2: Adhere to applicable noise compatibility criteria when making decisions regarding land uses adjacent to airports. Refer to the Airports section of the Land Use Element (Page LU-32) and the Airport Influence Area sections of the corresponding Area Plans.

Policy N 7.4: Check each development proposal to determine if it is located within an airport noise impact area as depicted in the applicable Area Plan's Policy Area section regarding Airport Influence Areas. Development proposals within a noise impact area shall comply with applicable airport land use noise compatibility criteria.

~~**Policy N 9.3 (Previously N 8.3):** Require development that generates increased traffic and subsequent increases in the ambient noise level adjacent to noise-sensitive land uses to provide for appropriate mitigation measures.~~

~~**Policy N 9.7 (Previously N 8.7):** Require that field noise monitoring be performed prior to siting to any sensitive land uses along arterial roadways. Noise level measurements should be of at least 10 minutes in duration and should include simultaneous vehicle counts so that more accurate vehicle ratios may be used in modeling ambient noise levels.~~

Policy N *9.1* (Previously N 8.1): Enforce all noise sections of the California Vehicle Code.

Policy N *9.2* (Previously N 8.2): Ensure the inclusion of noise mitigation measures in the design of new roadway projects in the county.

Policy N *9.3* (Previously N 8.3): Require development that generates increased traffic and subsequent increases in the ambient noise level adjacent to noise-sensitive land uses to provide for appropriate mitigation measures.

Policy N *9.4* (Previously N 8.4): Require that the loading and shipping facilities of commercial and industrial land uses, which abut residential parcels be located and designed to minimize the potential noise impacts upon residential parcels.

Policy N *9.5* (Previously N 8.5): Employ noise mitigation practices when designing all future streets and highways, and when improvements occur along existing highway segments. These mitigation measures will emphasize the establishment of natural buffers or setbacks between the arterial roadways and adjoining noise-sensitive areas.

Policy N *9.6* (Previously N 8.6): Require that all future exterior noise forecasts use Level of Service C and be based on designed road capacity or 20-year projection of development (whichever is less) for future noise forecasts.

Policy N *9.7* (Previously N 8.7): Require that field noise monitoring be performed prior to siting to any sensitive land uses along arterial roadways. Noise level measurements should be of at least 10 minutes in duration and should include simultaneous vehicle counts so that more accurate vehicle ratios may be used in modeling ambient noise levels.

Policy N *10.1* (Previously N 9.1): Encourage local and regional public transit providers to ensure that the equipment they operate and purchase is state-of-the-art and does not generate excessive noise impacts on the community.

Policy N *10.2* (Previously N 9.2): Encourage the use of quieter electric-powered vehicles.

Policy N *10.3* (Previously N 9.3): Encourage the development and use of alternative transportation modes including bicycle paths and pedestrian walkways to minimize vehicular noise within sensitive receptor areas.

Policy N *10.4* (Previously N 9.4): Actively participate in the development of noise abatement plans for freeways and rapid transit.

Policy N *11.1* (Previously N 10.1): Check all proposed projects for possible location within railroad noise contours using typical noise contour diagrams.

Policy N *11.2* (Previously N 10.2): Minimize the noise effect of rail transit (freight and passenger) on residential uses and other sensitive land uses through the land use planning process.

Policy N *11.3* (Previously N 10.3): Locate light rail and fixed rail routes and design rail stations in areas that are accessible to both residential and commercial areas, but also minimize noise impacts on surrounding residential and sensitive land uses.

Policy N *11.4* (Previously N 10.4): Install noise mitigation features where rail operations impact existing adjacent residential or other noise-sensitive uses.

Policy N *11.5* (Previously N 10.5): Restrict the development of new sensitive land uses to beyond the 65 decibel CNEL contour along railroad rights-of-way.

Policy N *12.1* (Previously N 11.1): Utilize natural barriers such as hills, berms, boulders, and dense vegetation to assist in noise reduction.

Policy N *12.2* (Previously N 11.2): Utilize dense landscaping to effectively reduce noise. However, when there is a long initial period where the immaturity of new landscaping makes this approach only marginally effective, utilize a large number of highly dense species planted in a fairly mature state, at close intervals, in conjunction with earthen berms, setbacks or block walls.

Policy N *13.1* (Previously N 12.1): Minimize the impacts of construction noise on adjacent uses within acceptable practices.

Policy N *13.2* (Previously N 12.2): Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

Policy N *13.3* (Previously N 12.3): Condition subdivision approval adjacent to developed/occupied noise-sensitive land uses (see policy N 1.3) by requiring the developer to submit a construction-related noise mitigation plan to the County for review and approval prior to issuance of a grading permit. The plan must depict the location of construction equipment and how the noise from this equipment will be mitigated during construction of this project, through the use of such methods as:

a. Temporary noise attenuation fences;

b. Preferential location of equipment; and

c. Use of current noise suppression technology and equipment.

Policy N *13.4* (Previously N 12.4): Require that all construction equipment utilize noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

Policy N *14.1* (Previously N 13.1): Enforce the California Building Standards that sets standards for building construction to mitigate interior noise levels to the tolerable 45 CNEL limit. These standards are utilized in conjunction with the Uniform Building Code by the County's Building Department to ensure that noise protection is provided to the public. Some design features may include extra-dense insulation, double-paned windows and dense construction materials.

Policy N *14.2* (Previously N 13.2): Continue to develop effective strategies and mitigation measures for the abatement of noise hazards reflecting effective site design approaches and state-of-the-art building technologies.

Policy N *14.3* (Previously N 13.3): Incorporate acoustic site planning into the design of new development, particularly large scale, mixed-use or master-planned development, through measures which may include:

a. Separation of noise-sensitive buildings from noise-generating sources.

b. Use of natural topography and intervening structure to shield noise-sensitive land uses.

c. Adequate sound proofing within the receiving structure.

Policy N *14.4* (Previously N 13.4): Consider and, when necessary, lower noise to acceptable limits, require noise barriers and landscaped berms.

Policy N *14.5* (Previously N 13.5): Consider the issue of adjacent residential land uses when designing and configuring all new, non-residential development. Design and configure on-site ingress and egress points that divert traffic away from nearby noise-sensitive land uses to the greatest degree practicable.

Policy N *14.6* (Previously N 13.6): Prevent the transmission of excessive and unacceptable noise levels between individual tenants and businesses in commercial structures and between individual dwelling units in multi-family residential structures.

Policy N *14.7* (Previously N 13.7): Assist the efforts of local homeowners living in high noise areas to noise attenuate their homes through funding assistance and retrofitting program development, as feasible.

Policy N *14.8* (Previously N 13.8): Review all development applications for consistency with the standards and policies of the Noise Element of the General Plan.

Policy N *14.9* (Previously N 13.9): Mitigate 600 square feet of exterior space to 65 dB CNEL when new development is proposed on residential parcels of 1 acre or greater.

Policy N *15.1* (Previously N 14.1): Minimize the potential adverse noise impacts associated with the development of mixed-use structures where residential units are located above or adjacent to commercial uses.

Policy N *15.2* (Previously N 14.2): Require that commercial and residential mixed-use structures minimize the transfer or transmission of noise and vibration from the commercial land use to the residential land use.

Policy N *15.3* (Previously N 14.3): Minimize the generation of excessive noise level impacts from entertainment and restaurant/bar establishments into adjacent residential or noise-sensitive uses.

Policy N *16.1* (Previously N 15.1): Restrict the placement of sensitive land uses in proximity to vibration-producing land uses.

Policy N *16.2* (Previously N 15.2): Consider the following land uses sensitive to vibration:

- Hospitals
- Concert halls
- Sensitive research operations
- Offices
- Residential areas
- Libraries
- Schools

Policy N *16.3* (Previously N 15.3): Prohibit exposure of residential dwellings to perceptible ground vibration from passing trains as perceived at the ground or second floor. Perceptible motion shall be presumed to be a motion velocity of 0.01 inches/second over a range of 1 to 100 Hz.

Policy N *17.1* (Previously N 16.1): Identify, quantify and map noise producers and provide noise contour diagrams as is practical.

Policy N *17.2* (Previously N 16.2): Identify and map noise-sensitive land uses throughout the county.

Policy N *17.3* (Previously N 16.3): Identify and map point-source noise producers such as surface mines, wind turbines, manufacturing plants, truck transfer stations, active recreational facilities and amphitheaters.

Policy N *18.1* (Previously N 17.1): Maintain baseline information on an ongoing basis regarding ambient and stationary noise sources.

Policy N *18.2* (Previously N 17.2): Monitor and update available data regarding the community's existing and projected ambient stationary noise levels.

Policy N *18.3* (Previously N 17.3): Assure that areas subject to noise hazards are identified, quantified and mapped in a form that is available to decision makers.

Policy N *18.4* (Previously N 17.4): Develop and maintain a detailed, comprehensive noise data base.

Policy N *18.5* (Previously N 17.5): Develop and update county noise inventories using the following steps.

a. Identify noise sources and noise-sensitive land uses.

b. Continue to identify various agency responsibilities, review noise complaint files and conduct noise surveys and monitoring, as needed.

Policy N *18.6* (Previously N 17.6): Identify those areas of the county affected by high noise levels.

Policy N *18.7* (Previously N 17.7): Evaluate current land use to identify potential noise conflict areas.

Policy N *18.8* (Previously N 17.8): Gather activity operations' data of noise sources; prepare analytical noise exposure models to develop existing and projected noise contours around major noise sources down to 50 CNEL.

Policy N *18.9* (Previously N 17.9): Encourage greater involvement of other County departments in the identification, measurement and reduction of noise hazards throughout the county, including: Building and Safety Department, Aviation Department and the Department of Public Health-Office of Industrial Hygiene.

Policy N *19.1* (Previously N 18.1): Provide information to the public regarding the health effects of high noise levels and means of mitigating such levels.

Policy N *19.2* (Previously N 18.2): Cooperate with industry to develop public information programs on noise abatement.

Policy N *19.3* (Previously N 18.3): Condition that prospective purchasers or end users of property be notified of overflight, sight and sound of routine aircraft operations by all effective means, including:

a. Requiring new residential subdivisions that are located within the 60 CNEL contour or are subject to overflight, sight and sound of aircraft from any airport to have such information included in the State of California Final Subdivision Public Report.

b. Requiring that Declaration and Notification of Aircraft Noise and Environmental Impacts be recorded and made available to prospective purchasers or end users of property located within the 60 CNEL noise contour for any airport or air station or is subject to routine aircraft overflight.

Policy N *19.4* (Previously N 18.4): Promote increased awareness concerning the effects of noise and suggest methods by which the public can be of assistance in reducing noise.

Policy N *19.5* (Previously N 18.5): Require new developments that have the potential to generate significant noise impacts to inform impacted users on the effects of these impacts during the environmental review process.

2. Land Use (LU) Element Policies

Policy LU 1.8: As required by the Airport Land Use Law, submit certain proposed actions to the Riverside County Airport Land Use Commission for review. Such actions include proposed amendments to the general plan, area plans, or specific plans, as well as proposed revisions to the zoning ordinance and building codes.

Policy LU *7.4* (Previously LU 6.4): Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing and traffic.

Policy LU *15.1* (Previously LU 14.1): Allow airport facilities to continue operating in order to meet existing and future needs respecting potential noise and safety impacts.

Policy LU *16.9* (Previously LU 15.9): Restrict placement of commercial wind turbine arrays within 2,000 feet of residential development for arrays with 10 or fewer wind turbines and restrict placement of commercial wind turbine arrays within 3,000 feet or greater of residential development for arrays with more than 10 wind turbines, unless the applicant supplies documentation that the machines are designed according to proven engineering practices and will not violate applicable County noise standards including excessive low frequency or pure tone noise.

Policy LU *16.10* (Previously 15.10): Require wind turbines to operate at less than 65 dBA and not more than 60 dBA when installed adjacent to noise-sensitive land uses.

Policy LU *29.6* (Previously 23.6): Require that commercial projects abutting residential properties protect the residential use from the impacts of noise, light, fumes, odors, vehicular traffic, parking and operational hazards.

Policy LU *30.6* (Previously LU 24.6): Control the development of industrial uses that use, store, produce, or transport toxins, generate unacceptable levels of noise or air pollution, or result in other impacts.

Policy LU *31.3* (Previously LU 25.3): Require that new public facilities protect sensitive uses, such as schools and residences, from the impacts of noise, light, fumes, odors, vehicular traffic, parking and operational hazards.

Policy LU *32.10* (Previously LU 26.10): Require that mixed-use developments be designed to mitigate potential conflicts between uses, considering such issues as noise, lighting, security, trash, and truck, and automobile access.

3. Circulation (C) Element Policies

Policy C 3.27: Evaluate proposed highway extensions or widening projects for potential noise impacts on existing and future land uses in the area. Require that the effects of truck mix, speed limits and ultimate motor vehicle volumes on noise levels are also explored during the environmental process.

Policy C 3.28: Reduce transportation noise through proper roadway design and coordination of truck and vehicle routing.

Policy C 3.29: Include noise mitigation measures in the design of new roadway projects in the county.

Policy C 5.1: Encourage Caltrans to install and maintain landscaping and other mitigation elements along freeways and highways, especially when they are adjacent to existing residential or other noise sensitive uses.

Policy C 6.7: Require that the automobile and truck access of commercial and industrial land uses abutting residential parcels be located at the maximum practical distance from the nearest residential parcels to minimize noise impacts.

Policy C 9.3: Encourage the development of a mass multi-modal transit system with reduced noise characteristics.

Policy C 9.4: Encourage local and regional public transit providers to ensure the equipment they use and operate does not generate excessive noise impacts on the community.

Policy C 9.5: Properly maintain transit lines and encourage operational restrictions (e.g. hours of operation, speed limits) at times that will reduce adverse noise impacts in residential areas and other noise sensitive areas.

Policy C 13.7: Dedicate right-of-way and land for future transit centers in community centers and/or major activity areas (high concentrations of employment and residential uses) and in areas that minimize noise impacts on surrounding residential and sensitive land uses.

Policy C 14.3: Encourage the use of noise-reducing flight procedures for airplanes and helicopters, such as maintaining flight altitudes or using flight patterns that avoid noise-sensitive neighborhoods to the extent permitted by Federal Aviation Administration regulations.

Policy C *20.8* (Previously C 20.6): Protect Riverside County residents from transportation generated noise hazards. Increased setbacks, walls, landscaped berms, other sound absorbing barriers or a combination thereof shall be provided along freeways, expressways and four-lane highways in order to protect adjacent noise-sensitive land uses from traffic-generated noise impacts. Additionally, noise generators such as commercial, manufacturing and/or industrial activities shall use these techniques to mitigate exterior noise levels to no more than 60 decibels.

D. Proposed New or Revised General Plan Policies

The following new General Plan Noise (N) Element policy is proposed as part of GPA No. 960.

1. Noise (N) Element Policies

Policy N 7.1: New land use development within Airport Influence Areas shall comply with airport land use noise compatibility criteria contained in the corresponding airport land use compatibility plan for the area. Each Area Plan affected by a public-use airport includes one or more Airport Influence Areas, one for each airport. The applicable noise compatibility criteria are fully set forth in [General Plan] Appendix *I-1*~~L~~ and summarized in the Policy Area section of the affected Area Plans.

Policy N 7.3: Prohibit new residential land uses, except construction of a single-family dwelling on a legal residential lot of record, within the current 60 dB CNEL contours of any currently operating public-use or military airports. The applicable noise contours are as defined by the Riverside County Airport Land Use Commission and depicted in [General Plan] Appendix *I-1*~~L~~, as well as in the applicable Area Plan's Airport Influence Area section.

***NEW* Policy N 8.1:** *Prohibit residential development, except construction of a single-family dwelling on a legal residential lot of record, within the current 60 dB CNEL contours of the Chocolate Mountain Aerial Gunnery Range.*

2. Land Use (LU) Element Policies

Policy LU 4.1: Require that new developments be located and designed to visually enhance, not degrade the character of the surrounding area through consideration of the following concepts:

a. Compliance with the design standards of the appropriate area plan land use category.

b. Require that structures be constructed in accordance with the requirements of the County=s zoning, building, and other pertinent codes and regulations.

c. Require that an appropriate landscape plan be submitted and implemented for development projects subject to discretionary review.

d. Require that new development utilize drought tolerant landscaping and incorporate adequate drought-conscious irrigation systems.

e. Pursue energy efficiency through street configuration, building orientation, and landscaping to capitalize on shading and facilitate solar energy, as provided for in Title 24 *Part 6 and/or Part 11*, of the California ~~Administrative~~ Code *of Regulations (CCR)*.

f. Incorporate water conservation techniques, such as groundwater recharge basins, use of porous pavement, drought tolerant landscaping, and water recycling, as appropriate.

g. Encourage innovative and creative design concepts.

h. Encourage the provision of public art *that enhances the community's identity, which may include elements of historical significance and creative use of children's art*. ~~Encourage creative use of children's art as public art. An example of this would be a child day care center utilizing appropriate design elements (such as murals made by the children in place of a plain painted wall). If the project area is of historical significance, consider including that element into the project design.~~

i. Include consistent and well-designed signage that is integrated with the building=s architectural character.

j. Provide safe and convenient vehicular access and reciprocal access between adjacent commercial uses.

k. Locate site entries and storage bays to minimize conflicts with adjacent residential neighborhoods.

l. Mitigate noise, odor, lighting, and other impacts on surrounding properties.

m. Provide and maintain landscaping in open spaces and parking lots.

n. Include extensive landscaping.

o. Preserve natural features, such as unique natural terrain, *arroyos, canyons, and other* drainage ways, and native vegetation, wherever possible, particularly where they provide continuity with more extensive regional systems.

p. Require that new development be designed to provide adequate space for pedestrian connectivity and access, recreational trails, vehicular access and parking, supporting functions, open space, and other pertinent elements.

q. Design parking lots and structures to be functionally and visually integrated and connected.

r. Site buildings access points along sidewalks, pedestrian areas, and bicycle routes, and include amenities that encourage pedestrian activity.

s. Establish safe and frequent pedestrian crossings.

t. Create a human-scale ground floor environment that includes public open areas that separate pedestrian space from auto traffic or where mixed, it does so with special regard to pedestrian safety.

u. Recognize open space, including hillsides, arroyos, riparian areas, and other natural features as amenities that add community identity, beauty, recreational opportunities, and monetary value to adjacent developed areas.

v. Manage wild land fire hazards in the design of development proposals located adjacent to natural open space.

Policy LU *15.2* (Previously LU 14.2): Review all proposed projects and require consistency with any applicable airport land use compatibility plan as set forth in [General Plan] Appendix *I-1*~~L~~ and as summarized in the Area Plan's Airport Influence Area section for the airport in question.

***NEW* Policy LU 23.8:** *Restrict through truck traffic in residential areas and on streets with specific facilities that have high density of people/users; through planning and design of developments, direct truck traffic to mater transportation corridors.*

3. Open Space (OS) Element Policies

Policy OS 14.5: Require that new non-mining land uses adjacent to existing mining operations be designed to provide a buffer between the new development and the mining operations. The buffer distance shall be based on an evaluation of noise, aesthetics, drainage, operating conditions, biological resources, topography, lighting, traffic, operating hours and air quality. *The same standards shall apply to the non-mining land uses within or adjacent to areas classified by the State Geologist as MRZ-2a.*

4.15.4 Thresholds of Significance for Noise

Thresholds are used to determine whether a project may have a significant environmental effect. The "threshold of significance" for a given environmental effect is simply the level at which the Lead Agency finds the effects of the project to be significant. A threshold may be based on health-based standards, safety requirements, a regulatory standard or any of a variety of qualitative factors, as deemed appropriate by the Lead Agency. For the noise and vibration issues addressed in this section, the CEQA thresholds are used. However, because of the nature of these CEQA questions, a variety of standards, policies and other values also come into play, as discussed below after the CEQA thresholds.

A. CEQA Thresholds

For this EIR, implementation of GPA No. 960 may result in a significant noise impact if it would:

1. Generate or expose persons to noise levels in excess of standards established in the General Plan, noise ordinance or applicable standards of other agencies.

2. Generate or expose persons to excessive groundborne vibration or groundborne noise levels.

3. Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project.

4. Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

5. Result in exposure of people residing or working in the project area to excessive noise levels for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport, public use airport or private airport/private airstrip.

B. Standards for Significance and Mitigation

In the first CEQA threshold above, noise level significance is related to the exceedance of standards "established in the General Plan, noise ordinance or applicable standards of other agencies." As seen in the prior section (4.15.3), however, a large number of noise standards exist for a wide range of situations. Some standards apply to just federal projects or to freeways or to airports. Others address stationary sources or are merely "recommended" as guidelines for local agencies. As a result, determining specifically what impacts are significant in which cases can be difficult at the programmatic level. In all cases, the specific circumstances and nature of the proposed project or discretionary action dictate what standards are applicable or most appropriate. The impacts and mitigation necessary, if any, would then be assessed for the given situation.

For the case of this countywide, programmatic EIR, several 'simplified' standards are used as reference points for potential significance in analyzing the data generated for noise in association with this project. As an indicator of a potentially significant noise level for residential uses (as generally representing all sensitive receptors), the analyses in the rest of this section use an exterior sound level standard of 55 dBA (or 60 dBA if no 55-dBA contour is available and for certain airports). Use of this standard is consistent with an interior noise level that can readily be attenuated to 40 dBA (or lower) through standard building construction techniques (i.e., without requiring any special noise mitigation). See subsequent sections for additional information. As a proximal threshold for significant sound *increases*, the FTA's incremental noise increase standards in Table 4.15-H are used.

Lastly, for noise effects associated with air travel and airport activities, the standards used are those consistent with the General Plan (e.g., Policy N 7.3) and the Riverside County Airport Land Use Compatibility Plan (Policy Document). This specifically refers to a maximum CNEL of 60 dBA for new residential development (except a level of 55 dB is applied to the Chiriaco Summit and Desert Center Airports per the ALUCP).

The above thresholds are equal to or lower than those set by the various agencies and policies discussed in Section 4.15.3, i.e., EPA levels, FAA levels and California Building Code (Title 24) levels, as well as Riverside County General Plan Table N-1, etc. The use of the specific thresholds above serve to ensure that noise significance is addressed conservatively. Further, these outdoor sound level ranges are considered within the limits of reasonably achievable noise attenuation values that could be reached through conventional construction measures and, if needed, reasonably feasible sound mitigation measures. These issues are discussed further in the subsequent sections.

4.15.5 Effect of GPA No. 960 on the General Plan and on Noise

GPA No. 960 includes specific changes to General Plan land use designations (LUDs) on various parcels throughout unincorporated Riverside County. In addition to these land use changes, the project also includes several Policy Area, Study Area and overlay changes. The proposed project would also incorporate maps for new trail and road alignments, road standard revisions and an incidental commercial policy for rural areas. As a result, future development accommodated by the proposed project, GPA No. 960, may result in the siting of commer-

cial and industrial uses in close proximity to noise sensitive uses, such as residences, schools or hospitals. Likewise, it could lead to homes being sited near noise sources, such as industrial uses or busy highways. The following sections analyze how the proposed project may affect, or be affected by, noise sensitive uses within Riverside County. The section following this one analyzes the relative significance of these results and outlines appropriate mitigation and regulatory actions to address impacts.

A. Proposed Noise-Related General Plan Changes

In regards to noise, GPA No. 960 includes several proposed changes to the General Plan Noise Element to update the chapter to reflect current noise conditions in Riverside County, as well as current regulatory issues.

Airport Future Noise Contours: The project includes an update to the discussion of airports and their contribution to noise within the county to reflect name changes and that the Desert Center Airport is not a public facility. As described in greater detail in EIR Section 3.0 (Project Description), three airports within Riverside County (Flabob, Riverside Municipal and Blythe) also have proposed land use designation (LUD) changes designed to improve their compatibility with the associated Airport Land Use Compatibility Plans. The General Plan also notes that the most recent airport noise contours (as adopted by the Riverside County ALUC) are included in Appendix L of the General Plan. The currently approved set of airport noise contours are also shown in Figures 4.15.5 through 4.15.17 in Section 4.15.2. The future year airport noise contours are included as Figures 4.15.23 through 4.15.39, below.

Military Noise Sources: The Noise Element also includes a new section recognizing the presence of the Chocolate Mountain Aerial Gunnery Range (CMAGR) in Riverside County. Specifically, proposed new Policy N 8.1 prohibits new residential land uses, other than single homes on single lots, within the CMAGR's 60 dB CNEL contours. General Plan policies to ensure land use consistency and protect future land uses adjacent to CMAGR from noise and vibration effects from the range are also included in the affected Area Plans, i.e., the Eastern Coachella Valley Area Plan and the Far Eastern Desert Area (which is addressed in the Land Use Element itself, rather than as a separate Area Plan).

Updated Noise Appendix: The new ambient noise data collected as part of this EIR (see Appendix EIR-7) is also included in Appendix I-1 of the General Plan, as required by State/OPR General Plan regulations.

New Noise Data – Ambient Noise Levels: As outlined in Section 4.15.2, the newly collected ambient noise monitoring data was used to develop a new baseline of current ambient noise levels in Riverside County. The noise monitoring documents the existing noise environment and captures the noise levels associated with typical daily operations and activities throughout the county. The specific locations used for the short-term and long-term noise measurements were selected to represent areas of growth across the county. That is, areas most likely to have increased ambient noise levels since the last countywide data was collected in 1999. The use of new 2010 data provides a recent and reasonable snapshot of existing noise conditions within Riverside County. See Tables 4.15-D and 4.15-F for the ambient noise monitoring results for both long-term and short-term.

New Noise Data – Projected Traffic Noise Levels: Per Section 4.15.2, noise levels associated with traffic on county roads were also recalculated. For traffic noise, the sound levels are modeled, rather than measured directly. This modeling allows development of noise scenarios (contours) for a variety of traffic patterns, including for traffic levels projected to occur when the General Plan builds out, both with and without the GPA No. 960 project. As a result, these build out noise contours can indicate where potential noise impacts might occur and where buffers, sound walls or other measures to reduce noise levels might be warranted.

The modeled traffic noise levels for the base year (environmental existing setting) of 2007 were presented in Table 4.15-G in Section 4.15.2. The future traffic noise levels forecast for 2060 (General Plan build out year) are provided in Table 4.15-M (Future Traffic Noise Levels, With and Without Project), below. The resultant data was then used to develop a series of projected contour maps for various county roadway locations and types, as provided in Figures 4.15.40 through 4.15.53, also below.

Table 4.15-M: Future Traffic Noise Levels, With and Without Project

Roadway Segments (All results in Ldn dBA at 50 feet from Centerline of Outermost Lane)	Existing: Base Year (2007)	Future: GP Build Out Year (2060)				B/O Scenario Difference*

D. Effects Associated with New Noise Data

In general terms, the effects, impacts and mitigation associated with noise resulting from build out of the Riverside County General Plan over time (roughly 50 years) were previously addressed in EIR No. 441, certified for the 2003 RCIP General Plan. Overall, at the programmatic scale, the generalized noise effects and build out impacts within Riverside County are unchanged from that document. See Section 4.15.6 for a full discussion of these. What has changed, however, as demonstrated by both the existing setting and future noise level data included herein, are the noise conditions in which existing uses are occurring and, more importantly (for the purposes of this EIR), in which future uses and sensitive receptors would be exposed.

Increased noise exposure as a result of development, for example this project, can occur in two basic ways. First, it can occur through the introduction of new uses into existing noisy areas causing sensitive receptors, such as residents, school children and other students, patients, congregants, etc., to be exposed to excessive noise levels. This could occur because of existing high noise levels in an area (ambient, stationary, roadway, railroad, airport, etc.) or through an increase in an area's noise over time from initially acceptable to eventually unacceptable levels. And, since vehicle traffic is the main source of pervasive noise within Riverside County, an increase in traffic levels (which also include air and rail) is the second key way in which sensitive receptors can be exposed to excessive noise.

Accordingly, General Plan build out effects, either with or without the project's proposed General Plan changes, would be potentially significant for any that introduce new sensitive receptors into areas in which exterior noise levels exceed 55 dBA. It would likewise be significant for incremental traffic noise increases attributable to the project that would result in either an existing noise level (at any point) that exceeded 55 dBA or in an incremental increase exceeding any of the levels noted in Table 4.15-H.

E. Effects Associated with GPA No. 960

GPA No. 960 would result in a significant noise effect where it would create a change that exposed a sensitive receptor to excessive noise levels or a substantial increase in noise, as defined previously. The proposed project would contribute to noise generation, noise exposure or noise increase in the ways outlined below.

1. General Noise Effects

Depending on intensity, frequency, duration and other factors, noise can affect human health and quality of life. Noise problems can manifest themselves in two general ways:

- The absolute level of noise can generate impacts to existing or reasonably foreseeable future noise-sensitive land uses; or

- A substantial increase in the ambient noise levels existing before project implementation can generate impacts to pre-existing noise-sensitive land uses.

Typical noise-related adverse effects associated with new development projects generally fall into the following categories: noise from construction of a development, noise from the operation of a development and the exposure of noise-sensitive land uses to existing and future noise from all sources.

Construction of a development (as well as its supporting infrastructure) causes the exposure of onsite and/or offsite areas to associated noise, including but not limited to, site grading, truck and construction equipment movement, engine noise, rock excavation, rock crushing and blasting. See Table 4.15-N (Typical Vibration Levels Associated with Construction Equipment) for a list of typical construction equipment and noise generated. Operation of a facility can also cause the exposure of onsite and/or offsite areas to increased noise. Typical operational noise sources include, but are not limited to, mechanical equipment (pumps, rooftop equipment, condenser units, air conditioning units, pneumatic equipment, etc.), operational traffic (onsite vehicle movement, engine noise, etc.), speakers, bells, chimes and outdoor human activity in defined areas.

Lastly, the exposure of noise-sensitive land uses to existing and future noise from all sources is another typical adverse effect of development. This is particularly true of exposure to roads and highways, which are the single largest contributor to ambient noise levels. Other noise sources commonly contributing to this type of exposure include railroads, airports, heliports and extractive industries. This category includes the noise caused by new development, when it affects existing or foreseeable future noise-sensitive land uses. It also includes new development that creates or places noise-sensitive land uses where they would be affected by noise (e.g., when a new residential project creates residences close to a highway).

2. Land Use Changes

The General Plan is concerned mainly with the physical build out of Riverside County; many of the changes associated with GPA No. 960 would affect planned land usage. The proposed project's update to the General Plan includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in areas throughout Riverside County. As with the current General Plan, future development accommodated by GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas. Where existing or future noise levels exceed standards, this could result in the exposure of noise-sensitive land uses to excessive noise levels.

The variety of LUD and policy area changes proposed, as per the descriptions in Section 3.0 of EIR and associated Figure 3-1 (and corresponding maps within each Area Plan), may either directly or indirectly affect noise levels and noise exposure within Riverside County. Changes would lead to either an increase or decrease in development potential (density or intensity). Introducing new people and structures into areas would increase the number of sensitive receptors potentially exposed to noise and add incrementally to the traffic volumes that are responsible for a large proportion of the noise generated.

This page intentionally left blank

Table 4.15-M, above, provides a projection of roadway-related noise levels expected at General Plan build out (2060) both with and without the project. It also includes the same data for the baseline year (2007) to allow for comparison to existing conditions. These values provide a sampling of representative roadway segments throughout unincorporated Riverside County. They indicate where existing noise levels may already exceed acceptable standards (e.g., 55 dBA) or would do so upon General Plan build out as a result of incremental traffic increases over time. These results are based on the traffic data generated for this project, as described in Section 4.18 (Transportation and Circulation).

It should be noted that the following projections assume that *all* of the changes proposed under GPA No. 960 actually result in future development and fully build out (as part of overall implementation of the Riverside County General Plan). That is, it is a theoretical, worst-case scenario, that likely over-states the actual development potential in the real world. The *actual* future development of the individual parcels and areas affected by GPA No. 960 proposals, as with build out of the rest of the General Plan, are subject to the discretion of many hundreds to thousands of individual property owners, including both private individuals, business entities and even various public agencies and other entities.

The County of Riverside has little to no control over the decision to propose development (new or redeveloped) on a given site (though the County of Riverside is the entity with discretion for review and approval of such development applications for most cases within unincorporated Riverside County). Demand for additional development is often a result of many interrelated factors, including population growth and economic demand, as well as location, local supply (i.e., existing home inventory) and even infrastructure availability (water supply, electricity, etc.). For individual parcel-specific land use designation, policy or overlay changes, specific noise effects on the parcel or development cannot be delineated at present since they are dependent on a number of site-specific factors, including distance to roadway, topography, type of use proposed, setback distances, fence heights and composition and others.

For sake of comparison, however, Table 4.15-M lists the noise increase above existing baseline for both the existing General Plan's build out and for build out of the General Plan as it would be if GPA No. 960 is approved as proposed. For a comparison of how the two build out scenarios differ in terms of noise, the table also includes the difference in noise level between the two scenarios. In the plan-to-plan build out comparison, because GPA No. 960 includes proposals for deletion or reduction of development intensity (e.g., deletion of several Rural Village Study Areas), the data indicate that the with-project scenario would result in slightly lower noise levels upon build out in a number of areas.

In terms of actual development, however, as per Table 4.15-M, some existing developed land uses in Riverside County are already subject to excessive noise levels; other areas in which baseline levels are acceptable would increase to unacceptable levels over time. Similarly, areas of future development could be subject to the same unacceptable noise levels; however, in those cases, project design measures could be incorporated to reduce noise to acceptable levels and ensure that future noise is accommodated as well. Much of this noise increase, however, is planned for in the existing General Plan and was already analyzed under the EIR (No. 441) certified for the 2003 RCIP General Plan.

For Riverside County-initiated land use designation (LUD) changes, areas designated for development could be affected by noise related to construction, operation or both. GPA No. 960 proposes roughly 111,400 acres of LUD, policy area or overlay changes, with approximately 10,700 acres (roughly 10%) of the area changes including new development potential (increased density or intensity). These areas include lands that would be going from vacant to developed (e.g., residential, commercial, industrial, institutional, etc.) upon General Plan build out, resulting in an incremental increase in the area's population. This would introduce new people and facilities that

would be potentially subject to construction or operational noises. The operational noise levels (existing and build out) are included in the tables previously referenced above. In terms of construction noise levels, Table 4.15-O (Typical Maximum Noise Levels for Construction Equipment) shows noises typically associated with construction. Table 4.15-N (Typical Vibration Levels Associated with Construction Equipment) shows the same for groundborne vibration and sounds.

Table 4.15-N: Typical Vibration Levels Associated with Construction Equipment

Equipment	25 Feet	50 Feet	75 Feet	100 Feet
Large Bulldozer	87	81	77	75
Loaded Trucks	86	80	76	74
Jackhammer	79	73	69	67
Small Bulldozer	58	52	48	46

Source: Federal Transit Administration, 1995.

Specific construction noise levels cannot be predicted or modeled at this time as they depend greatly on site-specific conditions (parcel size, location relative to sensitive receptors, topography, vegetation, etc.) and the type of construction activities necessary (scraping, grading, rock blasting or removal, structure construction, roadway construction, etc.). Instead, these impact types are each addressed programmatically in the section following this one.

Table 4.15-O: Typical Maximum Noise Levels for Construction Equipment

Type of Equipment	Maximum Sound Level (L_{max}) at 50 Feet	
	Typical Range (dBA)	Suggested Maximum[1] (dBA)
Pile Drivers, 12,000 to 18,000 feet-pounds/blow	81–96	93
Rock Drills	83–99	96
Jackhammers	75–85	82
Pneumatic Tools[2]	78–88	85
Pumps	74–84	80
Scrapers[2]	83–91	87
Haul Trucks	83–94	88
Cranes	79–86	82
Portable Generators	71–87	80
Rollers	75–82	80
Dozers[2]	77–90	85
Tractors	77–82	80
Front-End Loaders	77–90	86
Hydraulic Backhoes[2]	81–90	86
Hydraulic Excavators	81–90	86
Graders	79–89	86
Air Compressors	76–89	86
Trucks[2]	81–87	86

Key: dBa = A-weighted decibels. L_{max} = Maximum noise level.

Footnotes:

1. The "suggested maximum" value is actually an averaged value derived from the range noted for the particular piece of equipment during its use. Since it is not the very top of the range, the use of this value for analyses is more conservative and more accurately represents conditions than the absolute maximum sound level for the equipment.
2. These pieces of equipment are commonly associated with roadway construction per CalTrans. FTA, 1995, as cited in Table 8-1 from CalTrans Final Noise Study Report for the State Route 91 Widening Project (SR-55 to SR-2241) in Orange County, CA. Prepared by ICF Jones and Stokes, August 2008.

Source: Noise Control for Buildings and Manufacturing Plants, Bolt, Beranek, and Newman, 1987, and per Footnote 2.

3. Airport-Related Changes

As noted previously, the General Plan update includes updated references to the ALUCPs most recently adopted by the Riverside County ALUC for the various public airports affecting Riverside County. These include airport

noise contour maps for both existing conditions and future conditions. The airport noise exposure (contour) maps are designed to identify an airport's present and future noise patterns and the land uses which are or are not compatible with those noise patterns. Further, per the FAA, these noise maps must comply with all applicable laws and regulations.

Where a sensitive receptor exists within, or may be proposed within, a noise contour above 55-60 dBA (standard varies depending on the airport), potential noise effects could occur. Table 4.15-P (Airport Compatibility Zones and Noise Levels), below, lists the various zones mapped for airport ALUCPs in conjunction with their associated noise levels and land use compatibilities.

As part of GPA No. 960, changes are proposed to land use designations (LUDs) within the airport's mapped Airport Influence Area (and/or addressed by its ALUCP) for three airports: Flabob, Riverside Municipal and Blythe airports. These changes ensure that the General Plan's LUDs are consistent with these airports' respective ALUCPs, including existing and future noise contour exposure.

Table 4.15-P: Airport Compatibility Zones and Noise Levels

Airport Zone		Noise	Associated Noise Effects
A	Runway Protection Zone (RPZ) and Within Building Restriction Line	Very High	Includes 65 CNEL contour at airports where this contour extends beyond RPZs.
B1	Inner Approach/ Departure Zone	High	Generally encompasses 60 CNEL contour (55 CNEL at outlying airports). Single-event noise sufficient to disrupt a wide range of land use activities, including indoors if windows are open.
B2	Adjacent to Runway	Moderate to High	Encompasses 55 CNEL contour lateral to runway. Exposed to loud single-event noise from take-offs and jet thrust-reverse on landings, also from pre-flight run-ups.
C	Extended Approach/ Departure Zone	Moderate	Encompasses most of 55 CNEL contour beyond runway ends. Aircraft typically below 1,000 feet altitude on arrival. Individual events occasionally loud enough to intrude upon indoor activities.
D	Primary Traffic Patterns	Moderate	Contains remaining 55 CNEL contour, if any. Aircraft at or above traffic pattern, except for instrument approaches. More concern with respect to individual loud events than with cumulative noise contours. [With respect to residential uses,] noise concerns can be minimized either by limiting the number of dwelling units in affected areas or by allowing high-density development, which tends to have comparatively high ambient noise levels.
E	Other Airport Environs	Low	Beyond 55 CNEL contour. Occasional overflights intrusive to some outdoor activities.
*	Height Review Overlay	Low	Individual noise events [may be] slightly louder because high terrain reduces altitude of overflights.

Source: Excerpted from Riverside County Airport Land Use Commission, Riverside County Airport Land Use Compatibility Plan, Policy Document, Table 3A, page 3-3, 2004.

4. Circulation Changes

GPA No. 960 also includes updates to both the countywide roadway network and the trails maps throughout Riverside County. Revisions are also proposed for trail standards, including types. It should be noted, however, that the new maps for trails and county roads (General Plan Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements would be determined based on site assessment of opportunities and constraints.

Roads are associated with both construction and operational noise. Construction noise is generated both at the time of a road's initial development, as well as when periodic maintenance is performed. In terms of operational

noise, the roads represent substantial noise sources due to the vehicles traveling along them. A road's noise levels are directly proportional to the traffic volumes traveling on them; typically, the greater the volume, the louder the noise levels. Noise levels are also dependent upon traffic type and speed, type of road surface, its grade, width, setback distances and the vegetation, berms, walls or other structures present or nearby, among other factors.

Traffic noise impacts on sensitive land uses can occur where predicted noise levels would exceed standards for existing noise levels or where predicted design-year noise levels approach or exceed the land use's applicable noise threshold. Where traffic noise impacts are identified, noise abatement must be considered for reasonableness and feasibility, and implemented pursuant to CEQA. The overall reasonableness of noise abatement is determined by considering factors such as cost, absolute predicted noise levels, predicted future increase in noise levels, expected noise abatement benefits, build date of the development that would surround or abut the noise source (particularly for roadways), environmental impacts of abatement construction, opinions of affected residents (or other sensitive receptors), input from public and local agencies, and lastly, social, legal and technological factors. Accordingly, potential noise abatement measures to be considered for mitigating a significant noise exposure (particularly for roadway noise) include the following:

- Avoiding the impact by using design alternatives, such as altering the horizontal and vertical alignment of the project.
- Constructing noise barriers.
- Acquiring property to serve as a buffer zone or setback.
- Using traffic management measures to regulate types of vehicles and speeds.
- Acoustically insulating public-use or nonprofit institutional structures.

GPA No. 960 also includes revisions to proposed alignments for new pedestrian or multi-use trails and trail connections throughout Riverside County. Although trails are not considered habitable structures, they have the potential to be located near noise-generating activities, particularly roadways. Due to the short duration of use in any one location, trail noise effects are typically more of an aesthetic concern than a health (hearing protection) concern.

5. Other Changes

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies and others, as described in Section 3.0 of the EIR. Actual locations subject to new development or improvements pursuant to these policies would be determined based on site assessment of opportunities and constraints. Accordingly, specific locations and timing of future development are not presently foreseeable beyond the master countywide level (as addressed previously in EIR No. 441). This future development would require site-specific analyses and mitigation when proposed as part of the overall build out of the county pursuant to the plans and policies of the General Plan. As such, future impacts and mitigation can only be assessed programmatically pursuant to the representative noise data presented in this section and the performance standards outlined in Section 4.15.6 of this EIR, as well as in EIR No. 441. Within the parameters of the programmatic impacts and mitigation addressed herein, future projects would require project-specific analysis and mitigation developed at the later individual project stage.

F. Attenuating Factors

Because noise is propagated as a wave through the air (though vibration and sound can also travel through the ground or other solid objects as well), several factors play a role in its attenuation. One of the most important traits is geometric spreading. This is a physical property of noise that causes it to diminish (decay) over distance at a rate of about 6 dB per each doubling of distance. This means that a noise that registers as 65 dB at 100 feet away would only register at 59 dB at 200 feet away. This is the reason that setbacks are an important tool for managing sound exposure to sensitive receptors.

Another source of sound attenuation for roadways and other outside noises is ground absorption. Since the noise propagation path from a highway to a receiver is usually very close to the ground, ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. According to CalTrans, as a rule of thumb (for distances under about 200 feet), the excess attenuation is also expressed in terms of attenuation per doubling distance. Ground absorption is greatest for acoustically absorptive (or "soft") sites, such as soft dirt, grass or scattered vegetation, typically providing roughly 1.5 dB of attenuation per doubling distance. When added to spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling distance. Acoustically hard sites, such as a parking lot or a body of water, provide no excess ground attenuation. Atmospheric effects can also play a role in sound attenuation, with wind having the greatest effect on noise levels. Receptors located downwind from a source can be exposed to increased noise levels as compared to calm conditions, whereas upwind locations can have lowered noise levels. Temperature, particularly temperature inversions, humidity and turbulence can also affect noise levels.

Shielding by natural or human-made features is another source of sound attenuation. A large object or barrier between a noise source and a receiver can substantially attenuate receiver noise levels. The amount of attenuation provided by the shielding depends on the size of the object and the frequency content of the noise source. Natural terrain features (e.g., hills, forests and dense woods) and human-made features (e.g., buildings, walls and fences) can substantially reduce noise levels. Walls are often constructed between a source and a receiver specifically to reduce noise. A barrier that breaks the line of sight between a source and a receiver will typically result in at least 5 dB of noise reduction. Taller barriers provide increased noise reduction. However, vegetation between the highway and receiver is rarely effective as shielding for reducing noise because it does not create a solid barrier.

For interior noise levels, the Riverside County ALUC states in the 2004 ALUCP (page 2-24) that, "Wood frame buildings constructed to meet 1990 [or newer] standards for energy efficiency typically have an average noise level reduction of approximately 20 dB with windows closed." For this reason, compliance with exterior noise level limits for sensitive land uses are normally deemed satisfactory for ensuring interior noise levels meet the State of California's Title 24 45 dB maximum standard. If additional interior noise attenuation is needed, other building features can be added, such as double-paned windows, sealed windows with air provided by air conditioning/ HVAC instead, increased wall insulation, additional backyard setbacks and placement (or increasing the height) of solid exterior walls.

4.15.6 Noise - Impacts and Mitigation

A. Would the project generate or expose persons to noise levels in excess of standards established in the General Plan or noise ordinance, or applicable standards of other agencies?

Impact 4.15.A – Generate Noise or Cause Noise Exposure in Excess of Standards: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. In some locations this would result in the introduction of new noise-sensitive land uses into areas of existing excess noise or areas in which county growth would eventually lead to excess noise levels. In addition, future development accommodated by GPA No. 960 would contribute incrementally to increased traffic volumes on Riverside County roads, resulting in noise increases affecting sensitive land uses along existing and future roads. As a result, new development, particularly residential uses along and adjacent to major transit corridors, could be exposed to noise levels that exceed Riverside County's noise standards. Existing sensitive uses would also be subject to these higher noise levels. Compliance with existing noise standards, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441 would reduce the effects of noise on new development to less than significant levels. However, where noise generators would expose existing receptors (residences and other sensitive uses) to excessive noise, impacts would be significant and unavoidable, as mitigation of these incremental and wide-spread noise impacts is infeasible.

1. Analysis of Impact 4.15.A

a. Noise Generation

Future development accommodated by the proposed project, GPA No. 960, would *generate* noise in two ways: through the introduction of new uses and through the generation of additional traffic. First, in providing new uses, future development would require construction for its creation and for the provision of new roads, infrastructure, public services and the ancillary uses that serve the new development. This construction would result in temporary (short-term) noise impacts; these are discussed under Impact 4.15.D, below. Once completed, some of these new uses could be associated with stationary noise sources (e.g., warehouses, water treatment plants, factories, schools and parks with playgrounds, outdoor performance spaces, mining equipment, etc.). Additional noise generated through these means would result in noise impacts if the noise levels exceed any of the various applicable noise level standards. As discussed earlier in Section 4.15.3, General Plan Table N-1 provides a range of acceptable noise levels for various land uses. A stationary source that exposes sensitive receptors to noise levels exceeding these standards may be significant if not reducible through regulatory compliance or mitigation measures. (Note, however, Riverside County standards state that new stationary noise sources must not result in "facility-related noise" exposures to any existing or proposed noise-sensitive land uses that exceed 45 dBA L_{eq} at night (i.e., between 10 pm and 7 am) and 65 dBA L_{eq} during the day, i.e., between 7 am and 10 pm.)

Second, the project would result in noise generation from the increased traffic that results from the introduction of new people and uses within Riverside County. With increased traffic volumes, associated noise levels typically increase as well. Noise levels projected at General Plan build out, both with and without the project, are shown in Table 4.15-M. This table also shows the baseline values, as well as the difference between the two build out scenarios, to highlight the project's impacts on noise levels.

b. Noise Exposure

In addition to generating noise, the project would also *expose* people (i.e., residents and other sensitive receptors, such as infants and children, ill people, etc.) to noise in several ways. First, future development accommodated by the project would introduce new uses, and hence new populations, into both existing and future areas subject to excessive noise. These include areas of substantial existing ambient or roadway noise levels (as shown in Tables 4.15-D, 4.15-F and 4.15-G), as well as areas within future roadway noise contours (i.e., Table 4.15-M and Figures 4.15.40 through 4.15.53). They also include areas of existing (i.e., Figures 4.15.5 through 4.15.17) and future (i.e., Figures 4.15.23 through 4.15.39) airport noise contours, as well as existing/future railroad noise contours (i.e., Figures 4.15.2 through 4.15.4).

Second, the additional traffic generated as a result of the project, as discussed under Noise Generation, above, would expose both existing and future populations to increased noise levels throughout Riverside County. Noise levels projected at General Plan build out, both with and without the project, are shown in Table 4.15-M. Although vehicular traffic on roadways would be the largest sources of additional noise exposure, increases in airport and railroad transportation would also cause potential noise exposure. GPA No. 960, however, would not directly affect railroad noise levels. As for airport noise effects, see Impact 4.15.E, below.

As identified in Table 4.15-M, along most roadways traffic noise levels would be higher in the future than they are now in Riverside County. Under GPA No. 960, the changes in motor vehicle trips and circulation patterns would increase noise levels within Riverside County by up to 11.1 dBA CNEL, although most increases in noise would be between 1 and 5 dBA. As described in Table 4.15-H, however, the significance of roadway noise increase is dependent upon existing noise levels. So while a roadway noise increase of 1.5 dBA CNEL may not be significant for one roadway segment, it may be significant for another based on the noise levels and sensitive receptors along the roadway segment. Also, it should be noted that the roadway traffic noise levels identified in Table 4.15-M represent conservative potential noise exposure. In reality, noise levels may vary from that represented since the calculations do not assume natural or artificial shielding or reflection from existing or proposed structures or topography. Intervening structures or other noise-attenuating obstacles between a roadway and a receptor may reduce roadway noise levels at the receptor.

c. Noise Impacts

Project-related impacts from the generation of noise or the exposure of people to noise would be significant if both of the following conditions are met: 1) The noise level in question exceeds the applicable standard (see Section 4.15.3 for discussion of the various applicable standards); and, 2) the excessive noise cannot be reduced to an acceptable level through various feasible noise reduction measures.

With implementation of GPA No. 960, future development of noise-sensitive uses (e.g., residential dwellings, schools, hospitals, nursing homes, parks, hotels, places of worship, libraries, etc.) would occur in areas that either are currently exposed to or would be exposed to future traffic, airport or railroad noise levels that exceed the current standards (65 dBA L_{dn} for exterior areas and 45 dBA L_{dn} for interior areas). Development would also occur within areas exposed to noise from non-transportation (stationary) noise sources that exceed the current standards (for example, residential standards include 45 dB L_{eq} nighttime and 65 dBA L_{eq} daytime for exteriors and 40 dBA L_{eq} nighttime and 55 dBA L_{eq} daytime for interiors, according to General Plan Table N-2). Again, it must be noted that Riverside County standards specify that proposed new noise-sensitive uses must be sited, designed and/or engineered to ensure that the interior and exterior exposure standards are not exceeded.

Future development accommodated by GPA No. 960 would accommodate a variety of land uses, including residential, commercial, office and industrial, open space and recreation, institutional and public facilities (e.g.,

electrical substations, water and wastewater treatment facilities, schools, etc.). Stationary noise sources present in residential areas include HVAC equipment and maintenance equipment such as leaf-blowers and gasoline-powered lawnmowers. Commercial uses often include larger, rooftop-mounted HVAC equipment. Industrial uses can generate noise during normal operations from sources such as shipping and loading facilities, concrete crushing facilities, recycling activities and so on. Noise levels exceeding standards established by Riverside County would represent a significant impact.

In most cases, new development can be designed to include the necessary setbacks, construction materials, sound walls, berms or other features necessary to ensure internal and external noise levels meet the applicable standards. The measures by which this can be achieved are outlined below. Where full mitigation may not be possible, however, is for noise exposure to existing uses, particularly to excessive roadway noise. Roadway noise is pervasive and increases incrementally as a result of build out of many small (and large) contributing developments throughout Riverside County. As a result, many, many existing homes and other sensitive receptors could potentially be subjected to significant noise levels as a result of future development accommodated by the project.

In some cases, mitigation of the excessive sound impacts on existing uses would be infeasible due to the sheer number of sites affected (e.g., hundreds or even thousands of homes) or the cost for retrofitting them individually for appropriate sound attenuation. In other cases, it simply may not be feasible to retrofit or redesign an existing receptor to provide greater noise attenuation, and it is not always feasible to construct barriers between existing development and roadways. And, lastly, in many cases, even if adequate sound reductions are achievable for the near-term (e.g., existing conditions and the next 5-10 years), continued growth within Riverside County as it builds out over the next 50 years could eventually result in substantial noise increases later despite current measures. Thus, while mitigation is available for protecting new noise-sensitive land uses from potentially significant noise impacts, the same is not true for existing uses.

It should also be noted that the noise levels indicated in this section for roadways assume that no natural or artificial shielding is present and that no reflection from existing or proposed structures or topography occurs. In reality, intervening structures or other noise-attenuating obstacles between a roadway and a receptor may reduce roadway noise levels at the receptor. Due to the number of factors involved, however, these would have to be evaluated on a case-by-case basis.

Thus, while available implementation (as outlined below) would be sufficient to ensure the effects of noise generation or noise exposure due to stationary or traffic sources on *new* development are less than significant, due to the full scope and scale of impacts involved, it may not be possible to fully mitigate significant noise impacts on existing development. Even with all feasible mitigation, in some cases impacts due to the generation of or exposure to noise levels in excess of standards would remain significant and unavoidable.

2. Regulatory Compliance for Impact 4.15.A

As explained below, compliance with the following existing laws, regulatory programs and General Plan policies would aid in reducing potentially significant impacts related to the generation of or exposure to excessive noise levels.

a. Compliance with Federal, State and County Regulations

All future development within unincorporated Riverside County must conform to the requirements and standards of the General Plan, as well as state and federal requirements for noise. These regulations and standards ensure that measures necessary to minimize potential noise-related impacts are implemented for all phases of the project.

Federal Noise Control Act of 1972: A primary set of noise standards were set by the EPA pursuant to this act. It also led to the establishment of guidelines and standards for indoor and outdoor noise levels to address the effects of noise on public health, welfare and the environment. Accordingly, compliance with this act's standards would prevent considerable interference and annoyance in noise-sensitive areas. Although the regulation of noise control policies have since been transferred to the state and local levels of government, the standards and regulations set forth by the Noise Control Act remain in place and provide guidance in relation to acceptable noise practices for state and local agencies. Future development accommodated by GPA No. 960 would be required to comply with all necessary standards prior to approval, thereby reducing potential adverse impacts related to project noise generation or exposure.

California Building Standards Code: The State of California has also adopted standards that regulate noise levels from a number of different noise emitters as detailed in CCR Title 24. The regulations include standards for both interior and exterior sound levels. By restricting noise levels based on the type of development, compliance with these codes would aid in preventing those developments consistent with GPA No. 960 from generating noise or causing noise exposure.

California Noise Insulation Standards: This regulation sets noise insulation standards for the interior room noise of multi-family residential buildings as established in CCR Title 24. This code also requires that an acoustical study be prepared whenever residential structures are being proposed near various transportation routes and where noise levels may exceed 60 dB or greater, thereby ensuring that development the residence has been designed in such a manner that will minimize interior noise levels. These standards would further ensure that GPA No. 960 would keep noise generation and noise exposure from future new development, particularly new stationary sources, to less than significant levels.

Ordinance No. 847 - Regulating Noise: This ordinance establishes countywide standards regulating noise in order to preserve the quality of life for Riverside County residents. The maximum decibel levels set forth in Ordinance No. 847 have been established based on General Plan land use designation consistency. Restricting and enforcing noise levels throughout Riverside County would ensure that noise generation and noise exposure impacts (from both stationary and traffic sources) on new development are kept at less than significant levels.

b. Compliance with Existing General Plan Policies

Within the Riverside County General Plan, five policies directly address a noise threshold or standard. These include Policies N 1.3, 14.1 and 14.9, which address acceptable noise levels for new development, particularly residential uses. Policy N 4.1 addresses stationary source noise levels and Policy LU 16.10 addresses noise coming from wind turbines. Of the General Plan policies listed in Section 4.15.3.C, above, these policies, in particular, provide mitigation for impacts associated with noise generation and noise exposure. See Section 4.15.3.C for the full text of each policy. Implementation of these and other General Plan policies, as discussed below, would reduce noise impacts on future growth and development and help lessen noise generation effects. Specifically:

Policies N 1.1, 1.2 and 14.2: These policies specifically address land use compatibility in relation to noise levels. The policies focus on restricting those land uses that have higher levels of noise production from being located near those land uses that are more sensitive to noise levels. The policies also promote focusing those land uses with higher noise levels in areas that tend to produce more noise such as transit corridors.

Policies N 1.7, 2.2, 3.2, 3.5 and 4.4: These policies requires acoustical studies and reports to be prepared for those proposed developments that may be affected by high noise levels as well as those proposed developments that are considered noise-sensitive. Policy N 3.5 also requires that the acoustical analysis include recommend-ations for design mitigation as well.

Policies N 6.4, 9.3, 9.7 and 11.5: These policies establish requirements for development projects sited near transit-oriented land uses. The requirements include providing the appropriate mitigation for those developments that will increase traffic, conducting noise monitoring for developments that propose sensitive land uses near arterial roadways and restricting the development of sensitive land uses along railways. Policy 6.4 specifically restricts the usage of off-road vehicles in any area of the county with the exception of those areas specifically designated for off-road vehicles.

Policy LU 32.10: This policy requires that developments of various types mitigate potential impacts such as noise during the development review process.

Policies LU 15.1, 15.2, 16.9, 16.10, 29.6, 30.6 and 31.3: These policies establish requirements and standards regarding land use compatibility as it relates to potential impacts, including noise effects to sensitive receptors. By ensuring compatibility among land uses, potential adverse impacts related to noise are reduced.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised policies of the Riverside County General Plan would also help prevent significant impacts related to noise generation and/or noise exposure. See Section 4.15.3.C for full policy text.

Policies N 7.3: This policy places limitations on the construction of residential uses that fall within the noise contours of an airport.

Policy LU 4.1: This policy requires that developments of various types mitigate potential impacts such as noise during the development review process.

Policy OS 14.5: This policy addresses land use compatibility issues for mining operations. It requires non-mining uses located adjacent to existing mining operations be designed with a buffer to protect the uses from mining-related noises, thereby reducing potential noise exposure impacts.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, certified for the 2003 RCIP General Plan, Mitigation Measures 4.13.2A, B, C and D were imposed to reduce impacts associated with long-term noise sources that would exceed Riverside County noise standards. These measures remain applicable to this project. Mitigation Measure 4.13.2A would lessen noise impacts by restricting development of noise-sensitive uses if exterior and interior noise standards cannot be met. Mitigation Measure 4.13.2B would lessen noise impacts by requiring preparation of a site-specific noise analysis ("describing how the exterior and interior noise standards will be met") for residential projects with a noise exposure greater than 65 dBA L_{dn} to ensure that homes are situated in appropriately quiet areas or are constructed with the necessary sound attenuation measures to reduce noise levels to appropriate levels. Mitigation Measure 4.13.2C would lessen impacts by also requiring new commercial and industrial development proposals include a noise study that analyzes site-specific noise impacts and provides mitigation appropriate for achieving the allowable noise levels. Mitigation Measure 4.13.2D would lessen noise impacts on schools by restricting their development within 2 miles of an airport. In addition, EIR No. 441 also included Mitigation Measures 4.13.3A, 4.13.3B and 4.13.3C to address impacts from stationary noise sources. These measures would also apply to future development accommodated by GPA No. 960.

Existing Mitigation Measure 4.13.2A: All new residential developments within the County [of Riverside] shall conform to a noise exposure standard of 65 dBA L_{dn} for outdoor noise in noise-sensitive outdoor activity areas

and 45 dBA L_{dn} for indoor noise in bedrooms and living/family rooms. New development, which does not and cannot be made to conform to this standard, shall not be permitted.

Existing Mitigation Measure 4.13.2B: Acoustical studies, describing how the exterior and interior noise standards will be met, shall be required for all new residential developments with a noise exposure greater than 65 dBA L_{dn}. The studies shall also satisfy the requirements set forth in Title 24, Part 2 of the California [Building] Code (Noise Insulation Standards), for multiple-family attached homes, hotels, motels, etc. No development permits or approval of land use applications shall be issued until an acoustic analysis is received and approved by the [Riverside] County Planning Department.

Existing Mitigation Measure 4.13.2C: The County [of Riverside] shall require that proposed new commercial and industrial developments prepare acoustical studies, analyzing potential noise impacts on adjacent properties, when these developments abut noise-sensitive land uses. The County [of Riverside] will require that all direct impacts to noise-sensitive land uses be mitigated to the maximum extent practicable.

Existing Mitigation Measure 4.13.2D: Ensure that all new schools, particularly in subdivisions and specific plans, are sited more than 2 miles away from any airport.

Existing Mitigation Measure 4.13.3A: Acoustical studies shall be required for all new noise-sensitive projects that may be affected by existing noise from stationary sources.

Existing Mitigation Measure 4.13.3B: To permit new development of residential and noise-sensitive land uses where existing stationary noise sources exceed [Riverside] County's noise standards, effective mitigation measures shall be implemented to reduce noise exposure to or below the allowable levels of the zoning code/noise control ordinance.

Existing Mitigation Measure 4.13.3C: No industrial facilities shall be constructed within 500 feet of any commercial land uses or within 2,800 feet of any residential uses without the preparation of a noise impact analysis. This analysis shall document the nature of the industrial facility as well as "noise producing" operations associated with that facility. Furthermore, the analysis shall document the placement of any existing or proposed commercial or residential land uses situated within the noted distances. The analysis shall determine the potential noise levels that could be received at these commercial and/or residential land uses and specify measures to be employed by the industrial facility to ensure that these levels do not exceed [Riverside] County noise requirements. Such measures could include, but are not limited to, the use of enclosures for noisy pieces of equipment, the use of noise walls and/or berms for exterior equipment and/or on-site truck operations, and/or restrictions on hours of operations. No development permits or approval of land use applications shall be issued until an acoustic analysis is received and approved by the County [of Riverside] staff.

3. Finding on Significance for Impact 4.15.A

Compliance with the above regulations, standards, policies and existing mitigation measures would ensure potentially adverse impacts related to noise generation and noise exposure associated with future new development accommodated by GPA No. 960 would be less than significant. In particular, compliance with Mitigation Measures 4.13.2A and 4.13.2B would ensure that new residential uses are only allowed if they would achieve interior noise levels of 45 dBA, consistent with Riverside County standards. Existing sensitive uses, particularly residences, however, would also be subject to project-related traffic noise increases. Much of the mitigation listed above would not be feasible for reducing wide-spread noise exposures to existing uses, particularly from roadway noise or other noises generated outside of a new development site. For this reason, noise impacts would be significant and unavoidable.

B. Would the project result in the exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Impact 4.15.B – Generate or Cause Exposure to Excessive Groundborne Vibration: Future development accommodated by GPA No. 960, and its associated infrastructure and support uses, would require construction activities that could cause temporary, short-term vibrations. These vibrations would be disruptive if located near sensitive receptors. Also, future development of new vibration-sensitive land uses could occur within areas subject to existing sources of vibration (e.g., railroads). However, compliance with General Plan policies and existing mitigation measures would ensure that new uses are not subject to excessive vibration impacts. For construction-related vibration, compliance with existing Riverside County ordinances and General Plan policies, as well as a new project-specific Mitigation Measure 4.15.B-N1, would help reduce the effects of groundborne vibration impacts on sensitive receptors. In some cases, for example when construction occurs within 150 feet of an existing sensitive receptor, effects may still be felt. However, due to the short-term, temporary nature of construction impacts, these remaining effects would not be significant.

1. Analysis of Impact 4.15.B

Aside from seismic events, the greatest regular sources of groundborne vibration in typical communities are roadway truck and bus traffic. Trucks and buses traveling city streets typically generate groundborne vibration velocity levels of around 63 VdB, with levels reaching up to 72 VdB where trucks and buses pass over bumps in a roadway.

Construction and demolition activities associated with future development accommodated by GPA No. 960 would result in various levels of temporary groundborne vibration depending on the specific construction equipment used, the location of construction activities relative to sensitive receptors and the types of operations or activities involved. Vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. The type and density of soil can also affect the transmission of energy. Table 4.15-N provides vibration levels for typical construction equipment.

Construction activities would occur at discrete locations throughout Riverside County and vibration from such activities may affect existing buildings (i.e., through structural damage) and their occupants (i.e., through activity disruption, annoyance, etc.) if they are located close enough to the construction sites. In general, vibration-induced structural damage only occurs when certain types of construction (e.g., blasting, pile-driving, heavy earthmoving) take place very close to existing structures. Vibration-induced structural damage can be avoided by prohibiting construction projects with the potential for causing structural damage to nearby buildings. Vibration-induced disruptions or annoyance can occur during more common types of construction activity (e.g., truck movements and earthmoving) for greater distances from the activity site.

The specific types of equipment to be used for construction of the future development accommodated by GPA No. 960 are not known or foreseeable at this time. However, based on common construction practices, it can reasonably be assumed construction vibration would be generated from pile drivers, trucks, bulldozers and similar equipment. Based on the information presented in Table 4.15-I, vibration levels could be problematic if sensitive uses are located within approximately 100-150 feet of potential project construction sites. Under such conditions, sensitive receptors (e.g., residents, school children, etc.) would experience vibration levels that exceed the FTA's vibration impact threshold of 72 VdB.

In addition, if construction activities were to occur during more noise-sensitive hours (e.g., before 7 am or after 10 pm), vibration from construction sources could annoy or disrupt the sleep of nearby residents of existing or new (future) residences, and expose people to excessive groundborne vibration or groundborne noise levels. The

Riverside County noise ordinance addresses noise and vibration levels occurring outside of normal work hours. However, it does not prohibit all construction-induced vibrations nor address disruption/annoyance effects of such vibrations. Where certain types of construction would occur within approximately 100 feet of a vibration sensitive use (residences, schools, hospitals, scientific facilities, certain types of manufacturing, etc.), the residual potential for disruption/annoyance impacts to sensitive receptors remains. In these cases, however, the temporary nature of the construction activities means that the disturbance would be of limited duration and, for this reason, not significant overall.

Future development near major rail lines or truck routes could also introduce new sensitive receptors into areas affected by groundborne vibration. In general, the potential for vibration-induced structural damage from such sources would be low, but disruption/annoyance to the occupants could occur if the uses were close enough to such sources. However, such vibration-induced disruption/annoyance could be avoided by not approving vibration-sensitive uses in areas where FTA vibration criteria (Table 4.15-I, for example) are exceeded and requiring setbacks of sufficient distance to ensure vibration levels are within acceptable limits. Implementation of General Plan Policies N.15.1, N.15.2 and N.15.3, as well as adherence to existing EIR No. 441 Mitigation Measure 4.15.2A would ensure that operational vibration effects on new development would be less than significant.

2. Regulatory Compliance for Impact 4.15.B

As explained below, compliance with the following General Plan policies and new Mitigation Measure 4.15.B-N1 would help reduce or limit substantial effects related to groundborne vibration and ensure they are not significant.

a. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.15.3.C, above, Policies N 16.1, 16.2 and 16.3, in particular, provide mitigation for impacts associated with groundborne vibration. Specifically:

Policy N 16.1: This policy restricts sensitive land uses from proximity to existing vibration-producing land uses. Future development projects, including those accommodated by GPA No. 960, would be required to comply with this policy.

Policy N 16.2: This policy specifically identifies those uses that are considered by the Riverside County General Plan as being sensitive to vibration. By identifying these specific uses, the County of Riverside can more effectively mitigate potential impacts from vibration on these uses.

Policy N 16.3: This policy prohibits proposed residential developments from being exposed to perceptible ground vibration from passing trains and identifies the levels at which vibrations become perceptible (motion velocity of 0.01 inches/second over a range of 1 to 100 Hz).

b. Compliance with Proposed New or Revised General Plan Policies

Policy N 15.2: This policy specifically requires minimization of vibration transfer from commercial to residential land uses in mixed-use developments. Future development projects, including those accommodated by GPA No. 960, would be required to comply with this policy.

3. Additional Mitigation Measure for Impact 4.15.B

As detailed below, a new mitigation measure is proposed in order to help minimize the effect of operational vibrations on existing uses. Compliance with this measure would ensure that potential adverse impacts of operational groundborne vibrations on new development are reduced to less than significant levels.

NEW **Mitigation Measure 4.15.B-N1:** Prior to the issuance of any grading permit for new development involving vibration-sensitive land uses (which shall include, but not be limited to: hospitals, residential areas, concert halls, libraries, sensitive research operations, schools and offices), the project proponent shall provide evidence to the County of Riverside that placement of such uses within the area would not exceed groundborne vibration or groundborne noise impact criteria identified by the FTA (for example, the standards shown in Table 4.15-I of this EIR) or as otherwise deemed appropriate for the situation by the County of Riverside.

4. Finding on Significance for Impact 4.15.B

Compliance with the above-listed regulations, standards, policies and proposed new Mitigation Measure 4.15.2B-N1 would ensure that potentially adverse impacts related to groundborne noise and vibration generation and exposure associated with future new development accommodated by GPA No. 960 would be less than significant. Existing sensitive uses would also be subject to potential project-related construction vibrations. In some cases, vibration levels would exist even with reduction measures incorporated, particularly for sensitive uses within 100-150 feet of the vibration source. In these cases, however, the temporary nature of the construction activity ensures that the vibration impacts, while possibly annoying, would not be significant.

C. Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Impact 4.15.C – Result in a Substantial Permanent Increase in Ambient Noise Levels: Future development associated with implementation of GPA No. 960 would contribute to an increase in traffic, resulting in a corresponding increase in traffic noise. In some cases, this would cause ambient noise levels to either exceed the threshold of acceptability (65 dBA CNEL, for example) or to become further unacceptable in areas already exceeding noise thresholds. Compliance with existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441, would reduce potential impacts due to increased noise levels. For new development, full mitigation would typically be feasible. For existing noise-sensitive land uses, however, due to the widespread and pervasive nature of the noise impacts, it is generally not be feasible to mitigate the impact fully for all affected receptors. Thus, this impact would be significant and unavoidable, even with the implementation of all feasible mitigation.

1. Analysis of Impact 4.15.C

Future development associated with implementation of GPA No. 960 would contribute to an increase in traffic, developed uses, equipment and maintenance noise, and other noises generated by human activity. As Riverside County builds out, traffic volumes would increase triggering a corresponding increase in vehicular noise, which the single largest noise source throughout Riverside County. In some areas, this would cause ambient noise to increase from acceptable to unacceptable levels (exceed 65 dBA, for example). Where existing ambient noise levels already exceed acceptable thresholds, the additional traffic-related increase could result in greater noise impacts, including more people being annoyed or disturbed. Also, because of the exponential nature of sound levels, the louder the ambient noise level, the less increase in sound necessary to trigger a significant impact.

GPA No. 960 would contribute incrementally, but significantly, to traffic levels in Riverside County. Since the noise ambient level for many county roadways already exceed 65 dBA, the project's traffic noise contributions would result in a substantial permanent increase in ambient noise levels in certain areas. Compliance with existing laws, regulations, General Plan policies and existing EIR No. 441 mitigation measures, would reduce potential impacts due to increased noise levels. For new development, full mitigation would typically be feasible. For existing noise-sensitive land uses, however, due to the widespread and pervasive nature of the impact, it would generally not be feasible to mitigate the impact fully for all affected receptors. Thus, this impact would be significant and unavoidable.

2. Regulatory Compliance for Impact 4.15.C

Compliance with the following laws, regulatory programs and General Plan policies would aid in reducing potentially significant impacts due to increased noise levels as a result of future development accommodated by GPA No. 960.

a. Compliance with Federal, State and County Regulations

All future development within unincorporated Riverside County must conform to the requirements and standards of the General Plan, as well as state and federal requirements for noise. These regulations and standards ensure that measures necessary to minimize potential noise-related impacts are implemented for all phases of the project. However, the proposed policies would not guarantee the remediation or reduction of noise impacts on all existing noise-sensitive land uses in areas with current and continuing future high noise exposures.

Federal Noise Control Act of 1972: The noise standards set by the EPA pursuant to this act provide guidelines and standards for indoor and outdoor noise levels to address the effects of noise on public health, welfare and the environment. Accordingly, compliance with this act's standards would prevent considerable noise interference and annoyance in noise-sensitive areas. Future development accommodated by GPA No. 960 would be required to comply with all necessary standards prior to approval, thereby reducing potential adverse impacts due to increased noise levels.

California Building Standards Code: The State of California has also adopted standards that regulate noise levels from a number of different noise emitters as detailed in CCR Title 24, which address both interior and exterior sound levels. By restricting noise levels based on the type of development, compliance with these codes would aid in preventing those developments consistent with GPA No. 960 from excessive increased noise exposure.

California Noise Insulation Standards: Under CCR Title 24, this regulation sets interior noise insulation standards for multi-family residential buildings. Title 24 also requires that an acoustical study be prepared whenever residential structures are being proposed near various transportation routes and where noise levels may exceed 60 dB. This would ensure that residential developments are designed to minimize interior noise to acceptable levels. These standards would further ensure that future new development, particularly new stationary sources, would not cause a significant increase in noise exposure to their surroundings.

Riverside County Airport Land Use Compatibility Plans: These documents promote compatibility between airports and the land uses that surround them by restricting residential densities, limiting the intensities of non-residential developments and in some cases prohibiting certain uses based on the particular zone of the airport plan. Compliance with Airport Land Use Compatibility Plans would ensure that sensitive receptors in the vicinity of public airports are not exposed to significant noise increases.

Ordinance No. 847 - Regulating Noise: This ordinance establishes countywide standards regulating noise with maximum decibel levels based on General Plan land use designation consistency. Restricting and enforcing noise levels throughout Riverside County would ensure that new developments are not exposed to significant increased noise levels.

b. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.15.3.C, above, a number of policies provide mitigation for impacts associated with increased noise levels. These policies are described below. Compliance with these existing General Plan policies would ensure future development achieves appropriate exterior noise levels. However, the proposed policies would not guarantee the remediation or reduction of impacts due to increasing sound levels for all existing noise-sensitive land uses.

Policies N 1.1, 1.2 and 15.2: These policies specifically address land use compatibility in relation to noise levels. The policies focus on restricting those land uses that have higher levels of noise production from being located near those land uses that are more sensitive to noise levels. The policies also promote focusing those land uses with higher noise levels in areas that tend to produce more noise such as transit corridors.

Policies N 1.7, 2.2, 3.2, 3.5 and 4.4: These policies require acoustical studies and reports to be prepared for those proposed developments that may be affected by high noise levels as well as those proposed developments that are considered noise-sensitive. Policy N 3.5 also requires that the acoustical analysis include recommendations for design mitigation as well.

Policies N 6.4, 9.3, 9.7, 10.4, 11.1, 11.3, 11.5 and 13.1-13.4: These policies establish requirements for development projects that may be sited near transit oriented land uses. The requirements include providing the appropriate mitigation for those developments that will increase traffic, conducting noise monitoring for developments that propose sensitive land uses near arterial roadways and restricting the development of sensitive land uses along railways. Policy N 6.4 specifically restricts the usage of off-road vehicles in any area of Riverside County with the exception of those areas specifically designated for off-road vehicles.

Policies N 10.1, 10.3, 11.2, 11.4, 12.1 and 12.2: These policies establish standards and requirements related to various methods of transportation in an effort to reduce potential adverse operational noise impacts.

Policies LU 16.9 and 16.10: These policies establish standards and requirements for the operation of wind turbines in an effort to reduce potential adverse impacts related to operational noise.

Policies C 3.27-3.29, 6.7, 9.4, 9.5, 13.7, 14.3, 20.8 and 23.8: These policies also establish standards and requirements related to various methods of transportation in an effort to reduce potential adverse operational noise impacts.

c. Compliance with Proposed New or Revised General Plan Policies

Policy N 7.3: This policy places limitations on the construction of residential uses that fall within the noise contours of an airport.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, certified for the 2003 RCIP General Plan, Mitigation Measures 4.13.3A, B and C were imposed to reduce stationary noise impacts from future development to less than significant. These measures remain applicable to this project. Mitigation Measure 4.13.3A would lessen noise impacts by requiring the preparation and approval of a site-specific noise study. Mitigation Measure 4.13.3B requires implementation of mitigation measures where development noise levels would expose people to noise levels higher than the identified standard. Mitigation Measure 4.13.3C would lessen impacts associated with this issue by restricting certain types of land uses within a certain distance of noise-sensitive uses. In addition, existing EIR No. 441 Mitigation Measures 4.13.2A, 4.13.2B, 14.13.2C and 4.13.2D, as presented in the mitigation discussion for Impact 4.15.A, shall also apply as mitigation for this impact.

Existing Mitigation Measure 4.13.3A: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.3B: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.3C: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2A: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2B: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2C: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2D: See Impact 4.15.A, above, for full text of this measure.

3. Finding on Significance for Impact 4.15.C

Excessive (i.e., exceeding regulatory standards) exterior and interior noise in existing and proposed noise-sensitive areas can be remediated by such mitigation strategies as relocating roadways, applying roadway coatings or reducing road speeds, building sound walls, providing buffer zones, retrofitting older homes with insulation or appropriate window treatments (i.e., double-paned windows, interior storm windows, etc.) or choosing development sites in quiet areas. For new development, it is anticipated that Riverside County standards could be met and substantial noise impacts could be avoided by incorporating such appropriate mitigation strategies which would reduce potential impacts to less than significant levels. However, for existing noise-sensitive uses located in areas adjacent to roadways or rail lines, or close to airports or other stationary sources, it may not be possible or feasible to include noise reduction strategies to address interior noise impacts. The County of Riverside cannot demonstrate at this time that the revised policies and actions in the GPA No. 960 would reduce impacts of each project and upon each project that could be developed under GPA No. 960 to a less than significant level. Even with the incorporation of feasible mitigation measures, this impact would remain significant and unavoidable.

D. Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Impact 4.15.D – Result in a Substantial Temporary or Periodic Increase in Ambient Noise Levels: Future development accommodated by GPA No. 960 would necessitate construction activities which could temporarily exceed applicable Riverside County standards at nearby noise-sensitive receptors. In many cases, the peak

sound levels would be extremely brief and overall ambient noise levels would remain within acceptable limits. In addition, compliance with existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441, would also help reduce potential short-term noise impacts. On occasion, however, construction requirements and/or the proximity of the sensitive land use (e.g., within 150 feet or less) would make significant noise impacts unavoidable, even though temporary. Because of the close distances involved for such significant impacts, mitigation of sound levels to less than significant are technologically impossible. Thus, no additional project-specific mitigation is feasible. Future development accommodated by GPA No. 960 may result in significant short-term noise impacts that would be significant and unavoidable.

1. Analysis of Impact 4.15.D

Short-term construction noise impacts would arise from vehicle trips to and from the site, as well as from demolition, excavation, grading, building and other construction activities associated with the development of individual future projects pursuant to the General Plan, as amended by the proposed project, GPA No. 960. Construction-related short-term noise levels could temporarily elevate or exceed existing ambient noise levels in the project vicinity. In some cases, even with mitigating measures, such noise levels would exceed the applicable threshold. In such cases, the temporary noise impacts would be significant, even though the levels would decrease once the construction was completed. These issues are discussed further in the subsections that follow.

a. Temporary Vehicular Noise

Two types of short-term noise impacts would arise during construction of individual development (or infra-structure) projects. First, commuter trips by construction crews and the transport of construction equipment and materials to (and from) the construction site would incrementally increase noise levels on access roads leading to the site. These can have a relatively high single-event noise exposure potential, i.e., up to 87 L_{max} dBA at 50 feet from passing trucks, resulting in potential short-term intermittent annoyances. The effects on long-term ambient noise levels, however, are typically small when averaged over the longer period of time (i.e., 24 hours).

Truck traffic on public roads, however, is regulated by federal and state governments and not subject to local (county) government jurisdiction. This limits the range of regulatory and litigator options available at the county level. Also, the federal Department of Transportation is involved in setting noise standards and safety regulations for civil aviation, railroads, transit facility and vehicles, as well as for the Interstate freeways. While construction noise is regulated by the County of Riverside for development projects and infrastructure improvements on unincorporated lands, the State of California is responsible for establishing regulations for noise control where not preempted by federal rules. The State of California regulates noise from motor vehicles, freeways and arterial roadways and establishes the base noise planning standards for land use compatibility. In addition, the California Department of Transportation (CalTrans) has jurisdiction over California State road projects, such as freeways, including responsibility for the noise impacts associated with them (both in their construction and their operation, including maintenance work). However, since the County of Riverside is ultimately responsible for maintaining the health and welfare of its residents, this largely means implementing appropriate land use planning and control measures to ensure that existing and future residents and visitors are not exposed to unsafe sound levels.

b. Temporary Construction Noise

The second type of short-term noise impact is from noise generated during demolition, excavation, grading and building erection on individual project sites. During construction of a project, noise from construction activities may intermittently dominate the noise environment in the immediate area of construction.

Each step of construction has its own mix of equipment and, consequently, its own noise-generating characteristics. The various sequential phases of construction each contribute to the noise generated on an individual site and, therefore, the noise levels surrounding the site. Despite the variety in the type and size of construction equipment, there are certain similarities in the dominant noise sources and patterns of operation that allow construction-related noise ranges to be categorized by work phase. Table 4.15-O lists typical construction equipment noise levels for noise impact assessments, based on a distance of 50 feet between the equipment and the noise receptor.

Construction equipment would typically generate noise levels ranging from 70 to 90 dB at a distance of 50 feet. Noise produced by construction equipment would be reduced over distance at a rate of about 6 dB per doubling distance. The site preparation phase, which includes site excavation and grading, tends to generate the highest noise levels because the noisiest construction equipment tends to be earthmoving equipment. Earthmoving equipment includes a variety of excavating machinery, such as back fillers, bulldozers, draglines and front loaders. Earthmoving and compacting equipment includes compactors, scrapers, and graders. Typical operating cycles for these types of equipment may involve one or two minutes of full power operation followed by three or four minutes at lower power settings.

Construction activities would be an ongoing occurrence within Riverside County and, in some cases, could occur in close proximity to existing noise-sensitive uses. All construction activities are required to be conducted pursuant to the community noise exposure conditions placed on the project (e.g., limiting days and hours of construction, requiring mufflers and other sound-attenuating features on equipment, etc.). A number of other federal, state and/or local regulations would also apply (see below).

Under development and/or grading permit conditions of approval, as well as Ordinance No. 847 and other regulations, the County of Riverside enacts a number of noise controls on construction activities. These include limiting activities to specific hours of the day (or severely restricting allowable noise levels after certain hours, typically 10 pm), limiting idling, staging and loading locations (away from adjacent homes, for example), requiring setbacks, sound baffles or other equipment modifications, as appropriate for the situation.

Riverside County's noise ordinance, however, specifically exempts from the limitations of the ordinance sound generated by "private construction projects located one-quarter of a mile or more from an inhabited dwelling." Private construction within less than a quarter-mile is also exempt provided that construction does not occur between the hours of 6:00 pm and 6:00 am during June through September and between the hours of 6:00 pm and 7:00 am during the months of October through May. Capital improvement projects of a governmental agency, facilities owned or operated by or for a governmental agency, and activities for the maintenance or repair of public properties are also all exempted from the ordinance's noise limitations. Thus, in some circumstances, construction equipment noise may not be reducible to the levels specified in Riverside County's noise ordinance or may be exempt from such provisions.

c. Significant Impacts

Although a number of noise standards exist for community noise levels, they often cannot be readily applied to construction activities. With construction work, the noise sources on a site may produce very loud noise for only very short durations. Such brief "impulse" sound sources may technically exceed a set sound limit, but be deemed less than significant due to its extremely short duration. For this reason, it becomes more appropriate to use the following indicators for determining when construction activity would result in significant temporary or periodic noise impacts:

- Construction activities lasting more than one day would exceed ambient exterior noise levels by 10 dBA or more when measured at the nearest noise-sensitive land use.

- Construction activities lasting more than ten days within a three-month period would exceed existing ambient exterior noise levels by 5 dBA or more when measured at the nearest noise-sensitive land use.

- Construction activities would exceed the ambient noise level by 5 dBA at a noise-sensitive land use between the hours of 9:00 pm and 7:00 am, Monday through Friday; and before 8:00 am or after 6:00 pm on Saturday; or, anytime on Sunday.

Many times, the infrequent nature of the peak very loud construction noises, even on active construction sites, means that the construction activities would not exceed the above thresholds. In those cases in which a threshold is exceeded, however, the temporary noise impact would be significant. Because of the rate at which sound levels decrease over distance, this type of significant impact would be most likely for construction sites involving demolition, pile-driving or blasting within 150 feet of a noise-sensitive land use (residences, in particular). Because of the widespread and varied nature of the future development needed to achieve build out of Riverside County pursuant to the General Plan, it is reasonably foreseeable that in some cases, such significant construction impacts would occur.

2. Regulatory Compliance for Impact 4.15.D

As explained below, compliance with the following existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441 would aid in reducing potential adverse impacts related to construction noise. They cannot, however, ensure that noise levels are reduced to below the level of significance in all cases, and significant impacts may still result.

a. Compliance with Federal and County Regulations

All future development within unincorporated Riverside County must conform to federal and local regulations regarding noise. These regulations ensure that measures necessary to avoid or minimize significant noises are implemented for all project phases, including both construction and operation. They also help protect adjacent sensitive uses from adverse construction noise effects, as follows:

Federal Noise Control Act of 1972: The noise standards set by the EPA pursuant to this act provide guidelines and standards for indoor and outdoor noise levels to address the effects of noise on public health, welfare and the environment. Accordingly, compliance with this act's standards would prevent considerable noise interference and annoyance in noise-sensitive areas. Future development accommodated by GPA No. 960 would be required to comply with all necessary standards prior to approval, thereby reducing potential adverse impacts related to construction noise.

Ordinance No. 847 (Regulating Noise): This ordinance establishes countywide standards regulating noise with maximum decibel levels based on General Plan land use designation consistency. While the County of Riverside does not set construction noise limits, Ordinance No. 847 does restrict construction activities within one-quarter of a mile of an occupied residence to the hours of 6:00 am to 6:00 pm during the months of June through September, and from 7:00 am to 6:00 pm during the months of October through May. Restricting private construction hours of operation throughout Riverside County would reduce potential impacts related to construction noise.

b. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.15.3.C, above, Policies N 13.1 through 13.4, in particular, provide mitigation for impacts associated with construction noise. Implementation of these General Plan policies related to construction noise would reduce potential adverse impacts of future growth and development as a result of development consistent with GPA No. 960 to less than significant levels.

Policy N 13.1: This policy requires that future development minimize potential impacts of construction noise on adjacent uses within acceptable practices.

Policy N 13.2: This policy ensures that construction activities are limited to certain hours of operation in order to minimize adverse noise impacts. Regulations regarding hours of operation for construction are also detailed in various Riverside County ordinances, including Ordinance No. 847, as per above.

Policy N 13.3: This policy requires developments adjacent to occupied, noise-sensitive uses have a construction noise mitigation plan prepared prior to issuance of a grading permit. This requirement is included as part of a project's conditions of approval that are issued by the County of Riverside. The plan must identify specific details on construction noise impacts and how it would be mitigated.

Policy N 13.4: This policy requires that all construction equipment utilize noise reduction features (mufflers, engine shrouds, etc.) at least as effective as those originally installed by the manufacturer.

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.13.1A and 4.13.1B were imposed to reduce impacts associated with construction noise generated from development projects to a less than significant level. These measures remain applicable to this project. Mitigation Measure 4.13.1A would lessen impacts by requiring the preparation and approval of a construction-related noise mitigation plan. Mitigation Measure 4.13.1B would lessen impacts by limiting the time and frequency of construction haul trucks in the area. These mitigation measures would apply to any new developments and would address any construction noise impacts on adjacent existing sensitive uses.

Existing Mitigation Measure 4.13.1A: Prior to the issuance of any grading plans, the County [of Riverside] shall condition approval of subdivisions adjacent to any developed/occupied noise-sensitive land uses by requiring applicants to submit a construction-related noise mitigation plan to the County [of Riverside] for review and approval. The plan should depict the location of construction equipment and how the noise from this equipment will be mitigated during construction of the project through use of such methods as:

- The construction contractor shall use temporary noise attenuation fences where feasible, to reduce construction noise impacts on adjacent noise sensitive land uses.
- During all project site excavation and grading on site, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise sensitive receptors nearest the project site during all project construction.

- The construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 7:00 am and 7:00 pm Monday through Saturday. No construction shall be allowed on Sundays and public holidays.

Existing Mitigation Measure 4.13.1B: The construction-related noise mitigation plan required shall also specify that haul truck deliveries be subject to the same hours specified for construction equipment. Additionally, the plan shall denote any construction traffic haul routes where heavy trucks would exceed 100 daily trips (counting those both to and from the construction site). To the extent feasible, the plan shall denote haul routes that do not pass sensitive land uses or residential dwellings. Lastly, the construction-related noise mitigation plan shall incorporate any other restrictions imposed by [Riverside] County staff.

3. Finding on Significance for Impact 4.15.D

Per the above analysis, future development accommodated by GPA No. 960 must include measures to adequately mitigate construction noise impacts. It is feasible that this could be achieved for new development (through site design, buffers, layout, construction materials, increased insulation, etc.). In addition, compliance with the above-listed regulatory programs and General Plan policies, as well as Mitigation Measures 4.13.1A and 4.13.1B from EIR No. 441, would further reduce any construction-related impacts to future new development. However, in some cases, particularly where existing noise-sensitive land uses occur within 100-150 feet of certain construction activities (pile driving, demolition, etc.), it may not be possible to reduce construction noise levels to less-than-significant levels. In these locations, impacts may be significant if the construction-associated noise levels exceed regulatory limits and/or exceed "temporary" duration. In these cases, significant construction impacts would result that cannot be reduced to less-than-significant levels. Such impacts would be significant and unavoidable.

E. Would the project result in the exposure of people residing or working in the project area to excessive noise levels for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport, public use airport or private airport/private airstrip?

Impact 4.15.E – Expose People to Excessive Airport-Related Noise Levels: Future development accommodated by the project, GPA No. 960, may result in the exposure of new noise-sensitive land uses to noise from operations at public and private airports, airstrips and helipads. Around larger public airports, noise levels can exceed acceptable standards (e.g., 60 dBA) in certain areas, as shown by noise-contour maps of existing, future and ultimate build out operational conditions for public airports. The Airport Land Use Compatibility Plan (ALUCP) adopted by the Riverside County Airport Land Use Commission (ALUC) addresses noise-related land use constraints for the various zones surrounding Riverside County's airports. All future development proposed would be required to comply with applicable ALUC policies, as well as state and county regulations and policies, regarding site design and building construction to achieve acceptable interior and exterior noise exposure levels for habitable structures. Compliance with these and other applicable standards, as well as existing mitigation measures from EIR No. 441, would ensure that airport-related noise impacts on future development pursuant to the project would be less than significant.

1. Analysis of Impact 4.15.E

Implementation of the project would ultimately result in an additional number of people living within areas where airport-related noise levels exceed acceptable exterior noise exposure standards. Residential infill on small parcels

located within the immediate vicinity of the airport could also result in an incremental increase in exposure of people to elevated noise levels.

Airports that are either public or serve a scheduled airline are required to have an ALUCP adopted by the airport land use commission (ALUC) overseeing Riverside County's airports. Among other things, the purpose of the ALUCP is to ensure that public safety is protected, including safety from excess noise effects. In addition, GPA No. 960 includes changes in General Plan land use designations (LUDs) for parcels surrounding three airports (Flabob, Riverside Municipal and Blythe) to better improve land use compatibility between potential development and the surrounding airports' safety, noise and other constraints (e.g., those shown in Table 4.15-P). No other airport-related changes are proposed under GPA No. 960, nor does it include the provision of (or changes to) any new airports, private airstrips or helipads. Thus, the project would not result in any increase in noise levels at any of these air facilities and would not cause additional airport-related noise exposure to any existing or future noise-sensitive land uses surrounding these air facilities.

As described previously, each public airport in or affecting Riverside County has an associated ALUCP that shows airport noise contours and identifies allowable land uses within each noise contour. These ALUCPs also contain noise level criteria specifically for a variety of land uses, including: residential, manufacturing, transportation, communications and utilities, wholesale and trade, business and personal services, shopping districts, public and quasi-public services, and recreation uses. Areas addressed by ALUCPs are indicated in the Riverside County General Plan by Airport Influence [Policy] Areas (AIAs). Development proposed within an AIA is required to be evaluated for aircraft noise impacts and to incorporate or implement appropriated noise-reduction measures, such as aviation noise easements, increased building insulation, double-paned windows, etc. Such policies would be applied on a project-by-project basis, as necessary to mitigate site- and project-specific noise impacts.

Use of project-specific noise mitigation measures (building siting and design, construction materials, buffers, sound walls and other noise abatement measures) and adherence to the safety setback and land use compatibility guidelines in the ALUCP would ensure that airport-related noise impacts would be mitigated to less than significant levels. Implementation of the General Plan's policies and plans would also help reduce the potential for excess noise effects. In total, therefore, the project would not cause, result or be subject to any significant airport-related noise impacts, and the effects of air-related noise on future development accommodated by GPA No. 960 would be less than significant.

2. Regulatory Compliance for Impact 4.15.E

As explained below, compliance with the following existing laws, regulatory programs, General Plan policies and existing Mitigation Measure 4.13.2D from EIR No. 441 would aid in ensuring airport noise impacts on new development accommodated by GPA No. 960 are less than significant.

a. Compliance with Federal and County Regulations

Compliance with the following regulations would reduce potential adverse airport noise impacts:

Federal Aviation Administration (FAA) Standards: Title 14, Part 150 of the FAA standards details requirements regarding the development, submission and review of airport noise exposure maps and airport noise compatibility programs. They also establish requirements for approving or disapproving compatibility plans, as well as identifying those uses that are generally compatible with various noise levels. The FAA set a noise level standard of 65 dBA L_{dn} CNEL for land uses to be considered compatible when associated with aircraft noise. Those areas

that exceed noise levels of 65 dBA L_{dn} CNEL due to aircraft noise are more limited on the types of development that would be allowed. Future development accommodated by GPA No. 960 would be required to adhere to the FAA standards, thereby ensuring development is appropriate for the noise levels present or projected.

California Noise Insulation Standards: This regulation sets noise insulation standards for the interior room noise of multi-family residential buildings as established in CCR Title 24. This code also requires that an acoustical study be prepared whenever residential structures are being proposed near various transportation routes (including airports) where noise levels may exceed 60 dB or greater. It also requires implementation of all necessary mitigation to ensure acceptable noise levels are achieved, thereby ensuring that development of the residence has been designed in such a manner that will minimize interior noise levels. These standards would further ensure that future development resulting from GPA No. 960 would not be exposed to significant air travel-related noise impacts.

Riverside County Airport Land Use Compatibility Plans: The ALUCP (both the master document and earlier ones, where not superseded) promotes compatibility between airports and the land uses that surround them by restricting residential densities, limiting the intensities of non-residential developments and in some cases prohibiting certain uses based on the particular zone of the airport plan. Compliance with the ALUCP would ensure that noise-sensitive land uses developed in the vicinity of public airports and other air facilities would not be exposed to significant noise impacts.

b. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.15.3.C, above, Policies N 7.1 through 7.4 and LU 1.8, 15.1 and 15.2, in particular, provide mitigation for impacts associated with airport noise for the reasons discussed below. Implementation of these General Plan policies would ensure air-related noise impacts on future new development accommodated by GPA No. 960 are reduced to less than significant levels.

Policy N 7.1: This policy requires that future development within General Plan Airport Influence [Policy] Areas comply with the applicable ALUCP compatibility criteria. These requirements ensure that new development is compatible with the existing and future (and ultimate) airport noise environment by using airport noise contours as guides to future planning and development decisions.

Policy N 7.2: This policy requires the County of Riverside to adhere to noise compatibility criteria as detailed by the applicable Airport Influence Area when making land use decisions. This would ensure land use compatibility and reduce potential adverse impacts related to airport noise.

Policy N 7.3: This policy prohibits any new residential land use with the exception of single-family dwellings on legal lots to be developed within noise contour areas of 60 dB CNEL for any operating public-use or military airports. Along with Policies N 7.1 and 7.2, this policy further ensures land use compatibility, reducing the potential for significant adverse impacts related to airport noise.

Policy N 7.4: This policy requires future development sites be consistent with applicable Airport Influence Area policies to protect new development from significant air-travel related noise impacts.

Policy LU 1.8: This policy requires that various development applications, such as specific plans, as well as General Plan and specific plan amendments, among others, which fall within an Airport Influence Area be submitted to the ALUC for review and consistency finding. The ALUC determines whether or not the development proposal is consistent with the applicable ALUCP, including noise contours. Ensuring consistency with applicable ALUCPs help reduce adverse impacts related to airport noise.

Policy LU 15.1: This policy encourages the continued operation of airport facilities in order to meet current and future needs. It also, however, requires the operation of said facilities in a manner that minimizes potential noise impacts.

Policy LU 15.2: This policy also requires all future development projects be consistent with applicable ALUCPs, reducing potential adverse impacts related to airport noise through land use compatibility.

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, certified for the 2003 RCIP General Plan, Mitigation Measure 4.13.2D, as well as several others (see below) were imposed to reduce impacts associated with long-term noise sources, including air-travel related noise, that would exceed Riverside County noise standards. These measures remain applicable to this project. In particular, compliance with Mitigation Measure 4.13.2D would ensure land use compatibility for schools and ensure they are not subject to significant air-travel related noise impacts. In addition, existing EIR No. 441 Mitigation Measures 4.13.2A, 4.13.2B and 14.13.2C, as presented in the mitigation discussion for Impact 4.15.A, shall also apply as mitigation for this impact.

Existing Mitigation Measure 4.13.2A: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2B: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2C: See Impact 4.15.A, above, for full text of this measure.

Existing Mitigation Measure 4.13.2D: Ensure that all new schools, particularly in subdivisions and specific plans, are sited more than 2 miles away from any airport.

3. Finding on Significance for Impact 4.15.E

Implementation of, and compliance with, the above-listed existing regulatory programs, General Plan policies and existing Mitigation Measures from EIR No. 441 would ensure that adverse airport noise impacts on new development accommodated by GPA No. 960 would be less than significant. No project-specific mitigation is needed.

4.15.7 Significance After Mitigation for Noise

As outlined above, future development accommodated by the General Plan changes proposed under GPA No. 960 would result in a significant increase in ambient noise levels and increase the number of people and noise-sensitive land uses exposed to substantial noise levels. It would also generate or expose people to excessive groundborne noise and vibration, as well as substantially increase ambient noise levels throughout the county. Where new development is proposed in areas subject to excessive existing noise or projected to exceed acceptable noise levels in the future, compliance with a variety of federal, state and county policies, regulations, standards and programs, as well as Riverside County General Plan policies and existing mitigation measures from EIR No. 441, would be sufficient to ensure new development is sited, designed and constructed in a manner that minimizes ambient noise impacts. Potential impacts to noise-sensitive land uses as a result of air-travel related noise levels would similarly be reduced to less than significant levels.

For impacts to existing noise-sensitive uses, however, the wide-spread, diffuse nature of the noise impacts, particularly those from increased traffic volumes resulting from the project, would result in significant impacts that cannot be feasibly reduced to acceptable noise levels. Thus, the project would result in generation or exposure of existing uses to excessive noise in some areas, or would result in a substantial permanent or temporary increase in ambient noise levels. These impacts would be significant and unavoidable for the reasons outlined herein.

Section 4.16

Parks and Recreation

Section 4.16 Parks and Recreation

4.16.1 Introduction

This section assesses how the proposed project, General Plan Amendment No. 960 (GPA No. 960), would affect both existing and future parks and recreational facilities, as well as the physical environment on which these resources are or may be located. Because of its recreational functions, Riverside County's trail system, which provides non-motorized transport and recreation for pedestrians, bicycle riders and equestrians, is also discussed in this section.

4.16.2 Existing Environmental Setting - Parks and Recreation

Riverside County has a variety of natural and recreational resources, ranging from the mile-high alpine wilderness of San Jacinto State Park to the blistering expanse of the Colorado Desert floor; from historic parks, such as California Citrus State Historic Park, to the rolling hills of the Santa Rosa Plateau Ecological Reserve. Riverside County parks and recreational areas offer residents and visitors a myriad of recreational opportunities while providing valuable buffers within built-up urban spaces. The locations of existing parks and recreation areas in unincorporated Riverside County are shown in Figure 4.16.1 (Map of Existing Parks and Recreational Resources in Riverside County). A summary of all the existing parks within unincorporated Riverside County is also provided in Table 4.16-A (Park and Recreational Jurisdictional Totals within Riverside County), below. Additional details on these facilities were provided in the 1999 Existing Setting Report, which was prepared for the 2003 General Plan EIR No. 441.

With an increasingly urban population developing in Riverside County, greater demands are being placed upon available parks and recreational facilities. In addition, parks provide valuable buffers between built-up urban spaces and encourage healthy active lifestyles. The County of Riverside currently maintains 35 regional parks, encompassing roughly 22,300 acres. More than half of these parks are located in the western portion of the county, with other facilities scattered in throughout the desert, mountains and Colorado River regions.

Within Riverside County are four park and recreation districts: Beaumont-Cherry Valley, Desert, Jurupa and Valleywide. Together, these four districts provide approximately 27 neighborhood and community parks accounting on approximately 275 acres of parkland. Additionally, some County Service Areas (for example, CSA 134) also provide local park maintenance services, often for parks constructed as part of development projects. The cities within Riverside County also offer numerous park and recreational facilities as well; currently 215 parks over 1,500 acres. However, these city facilities are outside the scope of the County's jurisdiction. (Note: the City of Jurupa Valley is treated as unincorporated land for the purposes of this chapter since its July 1, 2011, incorporation post-dates this EIR's NOP date of April 2009.)

Large swaths of open and recreational lands fall under state or federal jurisdictions within Riverside County. The boundaries of many of these facilities, particularly the National Parks and Forests, typically stretch beyond Riverside County. Table 4.16-A, below, summarizes parks and recreational areas under state or federal jurisdiction. Details on their size and boundaries are also provided in more detail in Table 4.16-B (Existing and Proposed Parks and Recreation in Riverside County).

Table 4.16-A: Park and Recreational Jurisdictional Totals Within Riverside County

Type of Parks	Number of Parks	Total Acres	General Description
National (Federal)	4	1,126,350	National Forest, National Park and National Monument lands
State of California	8	39,423	State-maintained parks, open space and recreation areas
Riverside County[1]	35	22,317	Regional park locations offering a wide range of recreational activities
Riverside County Park Districts[2]	27	275	Neighborhood and community parks offering a wide range of recreational activities

Footnotes:
1. Parks maintained by the Riverside County Regional Park and Open Space District.
2. Accounts for park and recreational facilities in County of Riverside park districts.

A. Federal Recreational Resources

There are four National Park and Recreation areas that fall within Riverside County, including the Santa Rosa/San Jacinto Mountains National Monument, the San Bernardino National Forest, the Cleveland National Forest and Joshua Tree National Park. Together, these landmarks provide extensive recreational opportunities for the residents of Riverside County. These resources are as follows:

Santa Rosa / San Jacinto Mountains National Monument: Established by U.S. Congress in 2000 and encompassing two federal Wilderness Areas, the National Monument covers approximately 150,800 acres of federal lands (86,400 acres Bureau of Land Management (BLM) and 64,400 acres United States Forest Service (USFS)). The total area also includes approximately 23,000 acres controlled by the Agua Caliente Band of Cahuilla Indians, 8,500 acres controlled by California Department of Parks and Recreation, 34,500 acres controlled by other State of California agencies and approximately 55,200 acres of private land.

San Bernardino National Forest: This large National Forest spans both Riverside and San Bernardino Counties. Of the National Forest's 823,816 total acres, approximately 241,600 acres occur within Riverside County, in three discontinuous locations (223,980 acres, 17,453 acres and 167 acres, respectively). The U.S. Forest Service manages this resource.

2. Regions Key:
   - NW Riverside metro region (Riverside, Corona, Eastvale, etc.)
   - SW SWAP and Temescal Valley region (including Wine Country, Menifee, etc.)
   - WV Western valley region (Perris, San Jacinto, etc.)
   - CM Central mountains region (San Jacinto Mountains, Idyllwild, etc.)
   - NP Northern Pass region (Cherry Valley, Banning, Beaumont, etc.)
   - CV Coachella Valley region (Indio, Coachella, Salton Sea areas, etc.)
   - CR Far east region (along Colorado River, Blythe, Stateline, etc.)
3. Acreage listed is that within Riverside County only; in total, the park covers 14,100 acres , most in San Bernardino County.
4. Acreage listed for portions within Riverside County only. See Section 4.14.2 for full details.

Source: Riverside County GIS Dept., RCLIS, 2011.

Cleveland National Forest: The Cleveland National Forest covers a total of 566,866 acres and is the southernmost National Forest in California. It spans across three counties, including San Diego, Orange and Riverside. The portion within Riverside County totals approximately 90,750 acres and is under U.S. Forest Service management.

Joshua Tree National Park: This BLM-managed National Park encompasses a total of approximately 1,017,750 acres spanning Riverside and San Bernardino counties. Approximately 794,000 acres are within Riverside County.

B. State Recreational Resources

The California Department of Parks and Recreation manages and operates eight state parks within Riverside County, including the California Citrus State Historical Park. They also have State Recreation Areas at Lake Perris and the Salton Sea. These resources are as follows:

Anza-Borrego Desert State Park: This 600,000-acre park is the largest state park in California. The park is home to various plant and animal species, as well as a number of camp sites and trails. The park also encompasses a rich Native American History. Approximately 38,489 acres of the Anza-Borrego Desert falls within Riverside County.

California Citrus State Historic Park: The 387-acre California Citrus State Historic Park opened as a museum in 1993. The park is a tribute to the citrus industry and its importance to the State of California. The park features a number of recreational activities including, but not limited to, wildlife viewing, picnic areas as well as 186 acres of citrus groves.

Chino Hills State Park: Chino Hills State Park is a 14,102-acre park containing over 65 miles of trails. The park offers camping, walking, horseback riding and wildlife viewing to its visitors. Approximately 310 acres of Chino Hills State Park falls within Riverside County.

Indio Hills Palms Park: Indio Hills Palms Park is a part of the Coachella Valley Reserve and is directly adjacent to the preserve. The 5,661-acre park is known for its abundance of fan palms, which are native to California.

Lake Perris State Recreation Area: Our Nation's bird, the bald eagle, can be seen from the *Lake* Perris State Recreation Area ~~Park~~. This 9,615-acre park provides recreational activities such as hiking, horseback riding, camping and bird watching as well as numerous recreational water activities on Lake Perris.

Mount San Jacinto State Park: Mount San Jacinto is the second highest mountain range in Southern California. And, at 10,834 feet above sea level, Mount San Jacinto is the highest point in Riverside County. This park covers approximately 14,000 acres and is easily accessible from both eastern and western Riverside County. Visitors enjoy a number of recreational resources, including hiking and camping. The better portion of Mount San Jacinto State Park is located within the Santa Rosa and San Jacinto Mountains National Monument.

Salton Sea State Recreation Area: Man-made Salton Sea lies at 227 feet below sea level and was created roughly 100 years ago from water diversions and is maintained mainly by agricultural runoff today. Its perimeter features approximately 130 miles of shoreline, and water covers approximately 9,611 acres. The sea is reached from Highway 111. A variety of recreational activities are available including hiking, kayaking and camping.

San Timoteo Canyon Park: San Timoteo Canyon Park is currently an undeveloped State park and is not open to the public at this time. Once completed, San Timoteo Canyon Park is planned to cover approximately 2,000 acres.

C. Riverside County Regional Park and Open Space District

The Riverside County Regional Park and Open Space District (Park District) acquires, manages, develops and maintains 27 neighborhood and regional parks throughout Riverside County. The Park District maintains approximately 71,700 acres of land including 150 miles of multi-purpose recreational trails, seven archaeological sites, 16 wildlife reserves and natural areas. It also operates one boxing facility, manages four nature centers, patrols six historic sites and provides annual interpretive programs to more than 82,000 students. The District's park and open space resources provide enjoyment to residents of Riverside County and visitors alike.

The Park District also supports an Advisory Commission founded by the Board of Directors in 1994 for the purpose of advising and making recommendations to the Board concerning the planning, acquisition, development and use of parks and open space in unincorporated portions of Riverside County. The Commission also advises the Board on matters relating to the acquisition, development, maintenance and promotion of regional recreation trails in the county, and matters relating to the conservation and propagation of fish and game in Riverside County. Additionally, the Park District houses the Riverside County Historical Commission and Off-Highway Vehicle Recreation (OHVR) Commission. The Historical Commission is charged with discovering and identifying persons, events and places of historical significance in Riverside County and advises the Board of Supervisors in historical matters. The OHVR Commission advises the Board of Directors concerning the planning, acquisition, development and use of OHVR parks within the Regional Park District. There are also a number of off-road vehicle (ORV) parks within Riverside County operated by the USFS and BLM on federal lands, as well as numerous private recreational facilities throughout the county.

D. Park and Recreation Districts Within Riverside County

Beaumont-Cherry Valley Recreation and Park District (BCVRPD): The BCVRPD was formed in 1971 to provide, manage and maintain recreation and park facilities and activities for the Beaumont/Cherry Valley region of Riverside County. The District includes the incorporated cities of Beaumont and Calimesa, as well as unincorporated Cherry Valley and other areas west of the cities. Boundaries of the BCVRPD service area are shown in Figure 4.16.1; the three BCVRPD facilities within unincorporated Riverside County are indicated in Table 4.16-B. BCVRPD has an adopted service standard of 5 acres of parkland per 1,000 residents.

Desert Recreation District: The Desert Recreation District (DRD), formerly known as the Coachella Valley Recreation and Park District, encompasses the cities of Indio, La Quinta, Rancho Mirage, Coachella and Palm Desert, as well as unincorporated Riverside County regions of Thermal, Thousand Palms, Mecca and the surrounding areas. The DRD manages five community centers in the Coachella Valley region and a skate park in Palm Desert, as well as a number of parks, ball fields, pools and community centers. The District also has an archeological resource area that encompasses approximately 600 acres, 123 acres of which are planned to be developed for public access as part of Coral Mountain Park. Boundaries of the DRD are shown in Figure 4.16.1.

Valleywide Recreation and Park District: The Valleywide Recreation and Park District (VWRPD) provides recreational and park services to residents within an approximately 800-square mile area that includes the cities of Hemet, San Jacinto and Menifee, in addition to unincorporated territory in the region. Boundaries of the VWRPD are shown in Figure 4.16.1. Among the facilities managed by VWRPD are over 40 community parks, sports parks, tot lots and pockets parks, as well as four community centers and an aquatic park. There are also approximately 16 parks either planned or under development within the VWRPD.

Jurupa Area Recreation and Park District: The Jurupa Area Recreation and Park District (JARPD) formed in 1984 to provide parks and recreational facilities for "current and future families in the 91752 and 92509 zip code

areas." The District's boundaries are shown in Figure 4.16.1. The JARPD manages approximately 20 parks and recreational facilities, including a skate park, several pools and equestrian arenas.

E. County Service Areas

County Service Areas (CSAs) are managed by the Riverside County Economic Development Agency (EDA) and provide focused government services, such as fire protection, street lighting, parks and recreational facilities, or maintenance activities for localized portions of the county. CSA facilities operated by the County of Riverside include 22 County-owned and maintained parks and five community centers. In addition, CSAs will be responsible for 45 new parks that are currently in the planning/development stage and four planned regional sports parks. These new facilities are not a part of GPA No. 960 however. These CSAs provide the following local park maintenance: CSA 145 – La Ladera Park; CSA 152B – Temescal Valley Adopted Master Park Plan; CSA 143 – Willows Park, Morgan Hill Park, Silverhawk Park and Trail System; CSA 134 – Sycamore Creek Community Park. Boundaries of the relevant CSAs are shown in Figure 4.16.1.

F. Other Recreation Facilities

Off-Road Vehicle Parks: As noted in Table 4.16-B, there are a number of off-road vehicle (ORV) parks that operate within unincorporated Riverside County. These parks provide areas for the safe off-road operation of motorized vehicles, such as motorcycles (dirt bikes) and 3- and 4-wheeled all-terrain vehicles. Off-road vehicle parks within unincorporated Riverside County are located in the Cleveland National Forest, the San Bernardino National Forest and the Santa Rosa and San Jacinto National Monuments. These off-road parks are operated by the USFS and the BLM.

Private Facilities: This category only includes recreational facilities that are run by private entities on lands leased from or controlled by Riverside County. Countless other private recreational opportunities exist throughout the county, including golf courses, polo and equestrian centers, water parks, amusement parks, sports arenas and stadiums, among others, that are not included here.

An additional type of private recreational facilities is found primarily in planned communities and apartment complexes. Such facilities typically include playgrounds, tennis or basketball courts, pools and hot tubs, and often small turf areas for play or picnicking. However, these existing facilities are generally small and are so few in number that they have a minor effect on the overall provision of recreational facilities within Riverside County. Rather, they are designed to serve the residents of the multi-family units with which they are associated. There are also a number of existing and commercial recreational facilities within Riverside County that are privately owned and operated, and thus not listed here.

G. Trails, Bikeways and Paths

Trails are located throughout Riverside County and come in a variety of designs for pedestrians, bicyclists and equestrians to enjoy. The General Plan features a map of the "Trails and Bikeway System" envisioned for Riverside County at build out. Figure C-7 in the General Plan provides an overview of the county system with corresponding figures in each of the Area Plans for more detailed, local maps. See Figure 4.16.2 (Countywide Trails and Bikeways Map), below. The mapped system reflects a combination of both existing and proposed trails and alignments. Due to the complexity and sheer size of the trail system, no separate map exists of just the existing trails and paths.

1. Existing Trails System

At present, the system includes a wide variety of formal and informal trails. In some areas, formal trails have been built and are maintained by the County of Riverside or other responsible entity, such as a homeowners association, community service area or local park and recreation district. Formal trails are normally built according to County of Riverside (or park district or other agency) standards on identified easements with, where applicable, appropriate signage and maintenance provided by the responsible agency. In terms of formal trails, Riverside County currently has one developed trail that it maintains, the Santa Ana River Trail. The Santa Ana River Trail is part of a planned regional trail extending across multiple jurisdictions from the Pacific Ocean in Orange County to the San Bernardino Mountains in San Bernardino County.

Historical trails, created prior to the inception of county or park district standards, also exist but may not conform to current standards. Lastly, there are also many informal trails within Riverside County used by pedestrians, bicyclists and others for recreational and transportation purposes as well. Such trails are generally not formally mapped, especially if they do not coincide with planned county trail system alignments. These types of trails may cross public or even private lands, run along utility easements, abandoned railroad tracks, unmaintained dirt roads, etc. Often such trails lack connectivity to the Riverside County trail system, resulting in fragmentation and increasing difficulties for planning and implementation of the formal system.

2. Existing County Trail and Bikeway Standards

The General Plan includes a county trail system to provide connectivity among various existing recreational areas and regional trails, as well as policies to ensure coordination of trails with future development. The General Plan Circulation Element contains standards for two basic types of county trails: regional trails and community trails. Typical trail cross-sections are presented in General Plan Figure C-8 (see also Figure 4.16.3 (Existing Countywide Trails and Bikeways Map), below). Functions for these two existing General Plan trail types are outlined below. For a description of the revisions to these trail standards proposed as part of GPA No. 960, see Section 4.16.5.A, later in this chapter.

Regional Trails: Regional trails represent the "primary long-distance trails within the county" and are intended to provide linkages between communities, regional parks and open space areas. County regional trails also provide connectivity with federal and state parks, forests and recreational areas. They are generally maintained and operated by the Riverside County Regional Park~~s~~ and Open Space District.

Community Trails: Community trails are designed to connect to the regional trail system as well as provide connectivity throughout communities. They are designed for trail users preferring a soft trail surface, for example, equestrians, pedestrians, joggers and mountain bikers. Community trails are typically maintained by a local parks and recreation district or other governmental entity.

The Riverside County trail system also addresses bicycle use by providing three types of bike paths, plus a combination trail (bikes and pedestrians). The General Plan Circulation Element contains specifications and cross-sections on each of these trails, as well as standards for their construction and maintenance. In general, each bikeway type provides the following:

Class I Bikeways: Class I bikeways provide a separate right-of-way for the sole use of bicyclists and pedestrians. Class I bikeways may include landscape buffers and may also be designed to permit golf carts.

Class II Bikeways: Class II bikeways are provided within paved areas of roadways intended for preferential usage by bicycles. These one-way lanes follow the flow of motor vehicle movement.

Class III Bikeways: Class III bikeways are intended to provide continuity to the bikeway system by connecting Class I and Class II bikeways that are not contiguous.

Combination Trails: Combination trails provide both a Class I bikeway and a regional trail in one alignment. These trails serve as connectors that link together urban and rural communities along with other recreational resources such as various bodies of water and parks. Combination trails are ideal for users looking for long-distance trails.

4.16.3 Policies and Regulations Addressing Parks and Recreation

A. State and Federal Regulations

The following existing regulations are intended to protect existing parks and recreational resources. These regulations are not a part of the proposed GPA No. 960. Rather, they are regulations that have been enacted by the federal and state governments under separate actions.

1. General Management Plans

The strategic long-term vision, management and visitor use for National Park and Recreational areas is often guided through General Management Plans. These plans establish the foundation for protecting the respective park while also providing for memorable experiences for its visitors.

2. Quimby Act

Passed in 1975, this State of California law (CGC, Section 66477) enables the County of Riverside to require that developers set aside land, donate conservation easements or pay fees for park improvements as condition of approval for a tract or parcel map. The goal of the Quimby Act is to require developers to help mitigate the impacts of development that introduces new users for park and recreational facilities. The revenues generated through the Quimby Act, however, cannot be used for the operation or maintenance of park facilities. The Quimby fees must be paid and/or land directly conveyed to the local public agency that will provide the community's park and recreation services. For Riverside County, Ordinance No. 460 (Regulating the Division of Land) includes Section 10.35 addressing park and recreation fees and dedications related to Quimby Act and other issues; see below.

RIVERSIDE COUNTY PLANNING DEPARTMENT

EXISTING TRAIL DETAILS

This page intentionally left blank

B. Riverside County Regulations

The following existing regulations and policies are intended to protect existing parks and recreational resources within Riverside County. These policies are not part of the proposed GPA No. 960. Rather, they are policies that have been approved by the County of Riverside as separate discretionary actions.

Ordinance No. 460 - Regulating the Division of Land: This ordinance establishes the key provisions addressing the division of land in Riverside County. Among other things, in Section 10.35, it specifies that: "Whenever land that is proposed to be divided for residential use lies within the boundaries of a public agency designated to receive dedications and fees pursuant to this section, a fee and/or the dedication of land shall be required as a condition of approval of the division of land." It further specifies that dedication of 3 acres of parkland per 1,000 population, or payment of a fee in-lieu of such dedication, is necessary for the "public interest, convenience, health, welfare and safety." The fee and/or land dedications or improvements can only be used to provide neighborhood and community parks that would serve the proposed development.

Ordinance No. 328 - Rules and Regulations for the Government of County or District Owned or Operated Parks and Open Space Areas: This ordinance prescribes rules and regulations for parks and open space areas within Riverside County for the purpose of maintaining the integrity and effective use of such areas for recreational purposes. The ordinance also regulates the following: those uses allowed in parks/open space areas, the circulation of vehicles throughout the recreational areas and the maintenance and protection of landscaped areas.

C. Existing Riverside County General Plan Policies

The following policies are already part of the General Plan and are not part of the proposed project, GPA No. 960. Rather, these policies are those considered to play a role in ensuring any potential environmental impacts are further reduced through their application on a case-by-case basis when a given development proposal warrants their use.

1. Multi-Purpose Open Space (OS) Element Policies

Policy OS 20.3: Discourage the absorption of dedicated park lands by non-recreational uses, public or private. Where absorption is unavoidable, replace park lands that are absorbed by other uses with similar or improved facilities and programs.

Policy OS 20.5: Require that development of recreation facilities occur concurrent with other development in an area.

Policy OS 20.6: Require new development to provide implementation strategies for the funding of both active and passive parks and recreational sites.

2. Circulation (C) Element Policies

Policy C 16.1: Implement the Riverside County trail system as depicted in the Bikeways and Trails Plan, [General Plan] Figure C-7.

Policy C 17.2: Require bicycle access between proposed developments and other parts of the county trail system through dedication of easements and construction of bicycle access ways.

3. Land Use (LU) Element Policies

Policy LU *9.2* (Previously LU 8.2): Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the General Plan and federal and state regulations, such as CEQA, NEPA, the Clean Air Act and the Clean Water Act.

Policy LU *25.1* (Previously LU 19.1): The County of Riverside shall develop and maintain a regional park system that provides recreational opportunities for residents and visitors of Riverside County.

Policy LU *25.3* (Previously LU 19.3): Require that park facilities be accessible to the community, regardless of age, physical limitations or income level.

4. Noise (N) Element Policies

Policy N 1.4: Determine if existing land uses will present noise compatibility issues with proposed projects by undertaking site surveys.

Policy N *13.1* (Previously N 12.1): Minimize the impacts of construction noise on adjacent uses within acceptable practices.

D. Proposed New or Revised Riverside County General Plan Policies

The following revisions to existing General Plan policies are included as part of GPA No. 960. The revisions are intended to enhance the policies' implementation and comprehensive use.

1. Land Use (LU) Element Policies

Policy LU *25.2* (Previously LU 19.2): Provide for a balanced distribution of recreational amenities. ~~in Open Space, Rural and Community Development land uses.~~

Policy LU *25.4* (Previously LU 19.5): Require that new development meet *or exceed* the parkland requirements as established in the Quimby Act and County enabling ordinances.

2. Circulation (C) Element Policies

Policy C *4.9* (Previously C 4.10): Review all existing roadways without pedestrian facilities when they are considered for improvements ~~(whether maintenance or upgrade)~~ to determine if new pedestrian facilities are warranted. New roadways should also be assessed for pedestrian facilities.

Policy C 15.1: Implement *a two-tiered system of trails,* and later expand *it into* an effective non-motorized transportation system.

Policy C 15.2: Seek financing to implement an effective non-motorized transportation system. This funding can include such *potential sources* ~~things~~ as state and federal grants*, Riverside County transportation funds, "in-lieu" fees, special assessments, parking meter revenues, other public and non-profit organization funds, developer contributions and other sources*.

Policy C 15.3: Develop a trail system which connects County parks and recreation areas while providing links to open space areas, equestrian communities, local municipalities and regional recreational facilities (including other regional trail systems), *and ensure that the system contains a variety of trail loops of varying classifications and degrees of difficulty and length.*

Policy C 15.4: *Periodically* ~~R~~*r*eview and update the *Trails and Bikeways Plan (*[General Plan] Figure C-7) ~~Regional Trail Map~~ in accordance with the review procedures and schedule of the General Plan, in order to *ensure its* ~~assure~~ compatibility with the other ~~elements~~ *components* of the *Riverside* County General Plan and with the similar plans of *agencies, such as* Western Riverside County Council of Governments *(WRCOG)*, Coachella Valley Association of Governments *(CVAG)*, Riverside County Transportation Commission *(RCTC)*, *Regional Conservation Authority, Riverside County Habitat Conservation Agency* and all jurisdictions within and abutting Riverside County. *This shall include consistency with the WRCOG and CVAG non-motorized planning documents.*

Policy C 16.2: Develop a multi-purpose ~~recreational~~ trail network with support facilities which provide a linkage with regional facilities, *and require trailheads and staging areas that are equipped with adequate parking, bicycle parking, restrooms, informative signage, interpretive displays, maps, and rules of appropriate usage and conduct on trails accessed from such facilities.*

Policy C *16.7* (Previously C 16.6) Adhere to the following trail-development guidelines when siting a trail:

a. ~~Permit urban trails to be located in or along transportation rights-of-way in fee, utility corridors, and irrigation and flood control waterways so as to mix uses, separate traffic and noise, and provide more services at less cost in one corridor.~~ *Require, where feasible, trails in urban areas to be located either outside of road rights-of-way or within road rights-of-way with the additional dedication right-of-way or easements in fee title to the County requiring dual use of utility corridors, irrigation and flood control channels so as to mix uses, separate traffic and noise, and provide more trail services at less cost.*

b. Secure separate rights-of-way for non-motorized trails when physically, financially and legally feasible. Where a separate right-of-way is not feasible, maintain recreation trails within the County *of Riverside or Flood Control* right-of-way*, where feasible*.

c. *Develop and implement* ~~Use~~ trail design standards which will minimize maintenance due to erosion or vandalism.

d. *Maximize visibility and physical access to trails from streets and other public lands.*

e. Provide a trail surface material that is firm and unyielding to minimize erosion and injuries.

f. ~~d.~~ When a trail is to be ~~reserved~~ *obtained* through the development approval process, base the precise trail alignments on the physical characteristics of the property, assuring connectivity through adjoining properties.

g. ~~e.~~ Consider the use of abandoned rail lines as multipurpose "rail-trails" *corridors through the "Rails-to-Trails" program.* ~~for multi-purpose trails~~

b. ~~f.~~ Place all recreation trails ~~a~~ safe distance*s* from the edge*s* of active aggregate mining operations and separate them by physical barriers*, such as fences, berms or other effective separation measures*. ~~i)~~ Avoid placing a trail where it will cross an active *mined materials* haul route.

i. ~~g.~~ Install warning signs indicating the presence of a trail at locations where regional or community trails cross public roads with high amounts of traffic. *Design and build trail crossings at intersections with proper signs, signals, pavement markings, crossing islands, and curb extensions to ensure safe crossings by users. Install trail crossing signs at the intersections of trail crossings with public roads to ensure safe crossings by users.*

j. ~~h.~~ *Design and construct trails that properly account for* ~~Take into consideration~~ such issues as sensitive habitat areas, *cultural resources,* flood*ing* potential~~s~~, access to neighborhoods and open space, safety, alternate land uses and usefulness for both transportation and recreation. ~~when designing and constructing trails.~~

k. ~~i.~~ Coordinate with other agencies and/or organizations (such as the U.S. Fish and Wildlife Service*, National Park Service, Bureau of Land Management, U. S. Army Corp of Engineers, U. S. Bureau of Reclamation,* and the *California* Department of Transportation) to encourage the development of multi-purpose trails. Potential joint uses may include historic*, cultural resources* and environmental interpretation, access to fishing areas and other recreational uses, opportunities for education and access for the disabled.

l. ~~j.~~ Work with landowners to address concerns about privacy, liability, security and trail maintenance.

m. Regional Urban, Regional Rural and Regional Open Space trails should be designed to be compatible with the community contexts in which they are being sited.

n. Driveway crossings by trails should be designed and surfaced in a manner compatible with multipurpose trails usage. Except for local, neighborhood-serving trails that are not intended as primary community linkages, select routes for trails that minimize driveway crossing.

o. Benches, fencing, water fountains, trees and shading, landscape buffers, rest stops, restrooms and other trail-related amenities shall be provided where appropriate.

p. All trails along roadways shall be appropriately signed to identify safety hazards, and shall incorporate equestrian crossing signals, mileage markers and other safety features, as appropriate.

q. Information about the County's trail system shall be provided at the Riverside County Park and Open Space District and online in order to make the public aware of the County's trail system.

r. Trails designed to accommodate equestrians shall not be sited along sound walls, project boundary walls and other walls that effectively obstruct visibility beyond the edge of a trail.

s. All trail surfacing shall be appropriate to an array of users of the trail. Soft-surfaced trails shall have smooth, firm, slip-resistant surfacing so as to minimize foot and ankle injuries.

t. Use already available or disturbed land for trails wherever possible for new or extended trails.

u. Use pervious pavement or bio-swales along paved trails to assist in maintaining water quality.

Policy C 17.3: Ensure that the bikeway system incorporates the following:

a. Interconnection *throughout and between* ~~of~~ cities and unincorporated communities.

b. ~~Provision of~~ *Appropriate* lanes to specific destinations such as State or County parks.

c. ~~Provision for~~ *Appropriate opportunities for recreational bicycle riding and* bicycle touring. ~~; and~~

d. ~~Support of Encouragement of~~ *Opportunities for* bicycle commuting *and golf cart commuting within communities, as appropriate for the terrain, traffic levels and proximity to surrounding destinations.*

e. Bikeways connecting to all urban transit centers and systems (bus stops, Metrolink stations, etc.) in the vicinity.

f. Bicycle parking at transit stops and park-and-ride lots.

Policy C 18.1: *Trail* Acquisition:

a. Promote public/private partnerships for trail acquisition.

b. Seek ways to build a trail system affordably and seek partners in doing so within a reasonable time frame, possibly in stages, to serve all trail communities and upgrade system of linkages/destinations.

c. ~~b.~~ Determine which public and/or private agencies have *existing* easements or ~~existing~~, unused rights-of-way, which potentially could be incorporated as trail linkages throughout Riverside County. Such agencies may include the Riverside County Flood Control and Water Conservation District, *regional and local park districts and transportation entities,* various utility companies/districts and railroad companies. ~~Leverage u~~*U*se roads, dirt roads, *and other easements* as trail routes.~~, to f~~*F*oster partnerships, get *which serve to facilitate* the *siting, building and managing of* trails built and managed, etc.

d. ~~c.~~ Evaluate the potential use of private-landowner tax credits for acquiring necessary trail easements and/or rights-of-way. A system such as this would allow a landowner to dedicate an easement for trail purposes in exchange for having that portion of the property assessed as open-space instead of a higher land-use category.

e. Seek to connect existing cul-de-sacs to each other, and to trail networks. In rare occasions, this may entail purchasing homes at the end of streets, constructing the connections and reselling the homes.

f. Wherever possible and to the extent consistent with overall trail system objectives, use trail designs and locations that minimize construction and maintenance costs.

Policy C 18.2: *Trail management and* maintenance*:*

a. Implement maintenance options such as the use of volunteers, associations, or private landowner maintenance agreements, and/or adopt-a-trail programs sponsored by various groups.

b. Implement methods to discourage unauthorized use of trails by motorized vehicles, which may cause trail deterioration, create an unsafe environment, and/or disrupt the enjoyment of the trails by legitimate trail users. These methods may include the installation of gates and motorcycle barriers, posting signs prohibiting unauthorized activities, or implementing educational programs to encourage the proper use of trails.

c. Research the potential for, and consider establishing, a countywide trail management entity that will facilitate the acquisition of adequate funds for trial maintenance.

d. Research the potential for, and consider establishing, a separate agency within the County to manage and maintain the county's trails system.

e. Use trail designs that remove or limit injury/safety liability concerns.

f. Use trail designs that minimize trail maintenance costs.

Policy C 18.3: *Trail* Funding*:*

a. Solicit all possible sources of funding to plan, acquire, and construct recreational trails. Sources can include, but not be limited to, development mitigation fees, private foundation grants, ~~and/or~~ funds *or assessments* from local, regional, state ~~and~~ *or* federal government entities.

b. Persuade local communities to finance their own community trail systems through the use of special tax *assessment* districts. If applicable, these districts should also provide adequate regulation for the keeping of horses.

3. Air Quality (AQ) Element Policies

Policy AQ 4.7: To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, MDAQMD, ~~SOCAB~~ *SCAB*, the Environmental Protection Agency and the California Air Resources Board.

4.16.4 Thresholds of Significance for Parks and Recreation

The proposed project would result in a significant impact on parks or recreation if it would:

A. Cause growth that increases the use of existing neighborhood parks, regional parks or other recreational facilities resulting in or accelerating substantial physical deterioration of the facility.

B. Trigger growth that results in the need for new or physically altered park or recreation facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives.

C. Trigger the need for construction or expansion of recreational facilities or uses that would have a significant adverse physical effect on the environment due to their provision.

4.16.5 Effect of GPA No. 960 on the General Plan and on Parks and Recreation

This section discusses the changes proposed in the General Plan related to parks and recreation. After this, the effects of the proposed project on parks and recreation are analyzed. Specific impacts and mitigation, as well as their level of significance, are evaluated in the subsequent section.

A. Proposed Changes to the General Plan

The existing General Plan addresses park and recreation resources in the Land Use (LU) Element and, in particular, in the Circulation (C) Element. As part of the project review process, park and recreation policies in the General Plan were reviewed and updated where necessary. In particular, this included an extensive revamping of the standards and specifications for both trails and bikeways, as described below. The changes were made to permit trail types to better suit the level of connectivity needed. For text of relevant General Plan policies, including those revised as part of GPA No. 960, see Section 4.16.3.C.

1. Revisions to County Trail Standards

As described above, the existing General Plan includes two basic types of trails: regional and community. As part of the General Plan update, these categories were revamped and expanded to provide a greater range of options for trail planning. The proposed trail sub-types would distinguish between suburban and open space areas, allowing for fewer amenities where trails serve merely to connect open or undeveloped areas. In more developed areas, trail standards may call for more elaborate trail construction, surfaces, amenities or other features appropriate to a park-like setting or community connectivity function. The proposed revisions also note that, "the Riverside County Regional Park and Open Space District has prepared and adopted a Trails Development Standards Policy Manual, which is anticipated to be used in all trails planning, construction and maintenance activities." Accordingly, GPA No. 960 proposes to revise the existing "regional trail" standard to include two trail sub-types, as follows and as shown in Figure 4.16.4 (New Trail and Bikeway Cross-Sections).

Regional Urban and Rural Trails: This trail type is intended primarily to connect communities, parks and open space areas. They are to feature unpaved, soft surfaces and generally be 10-12 feet wide within 20-foot easements (though width may vary). These trails would typically be maintained by the Riverside County Regional Park and Open Space District, the Transportation Department through a Lighting and Landscape Maintenance District or by other entities subject to approval by the County of Riverside.

Regional Open Space Trails: This trail type is intended for both open space areas associated with private developments and for public and quasi-public open space areas. The key emphasis of this trail type is on minimizing the effect of human usage on the landscape and the need for trail maintenance (and the associated disturbances). These trails generally already exist, although some new trails may be built. Typically, the Riverside County Regional Park and Open Space District or the public or quasi-public entity owning the open space containing the trails would be responsible for their maintenance. Alternatively, one of these agencies would maintain them under agreement with the landowner.

Other, more minor changes made to trail standards in this section include right-of-way widths for community trails and expansion of the definition of "non-county public land trails" to include trails on other public and quasi-public lands besides National Forests and BLM lands. Wording was also added to acknowledge the role individual area design guidelines play in local trail planning.

2. Revisions to County Bikeway Standards

Text was added and policies updated to reflect Riverside County's plans for bikeways and other routes suitable for bicycle use. The standards more clearly specify when grade separation is needed between bikes and cars, as well as ensuring adequate separation between pedestrians and bikes, horses, golf carts, etc., to accommodate the various non-vehicular transportation modes used within these routes. In addition to revisions to Class I and II bikeways, a third type, Class II bikeways, is proposed to "provide continuity within the bikeways systems, usually by connecting discontinuous segments of Class I and Class II bikeways." As "bike routes" this class of bikeway would be marked by signage, but not marked on pavement or by grade separation.

3. Revisions to Trails Mapping

As part of GPA No. 960, Figure C-7, Bikeways and Trails Plan, was updated to include the new trails plan. This master map provides a countywide overview of the trails system. See Figure 4.16.2. To reflect these revisions, the corresponding trails and bikeways exhibits for each Area Plan were also updated. Also see Figure 4.16.4 for the changes made to the trail cross-sections in the General Plan.

B. Analysis of GPA No. 960 Effects on Parks and Recreation

The General Plan is concerned mainly with the physical build out of Riverside County; many of the changes associated with GPA No. 960 would affect planned land usage. The proposed project's update to the General Plan includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in areas throughout Riverside County. As with the current General Plan, future development accommodated by GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas; all of which would require adequate park and recreation services to ensure compliance with state and county regulations.

Table 4.16-C (Theoretical Parkland Needs With and Without the Project), below, provides a summary of the theoretical needs for park and recreation facilities within the county according to the theoretical estimate of need associated with existing land uses, as well as that for build out of the known spatial components of GPA No. 960 (i.e., site-specific LUD changes, policy area and study area changes, etc.). The table shows all three separate scenarios.

It should be noted that the following projections are based on the assumption that all of the changes proposed under GPA No. 960 actually result in future development and fully build out, that is, the theoretical, worst-case scenario that likely over-states the actual development potential in the real world. The actual future development of the individual parcels and areas affected by GPA No. 960 proposals are subject to the discretion of many hundreds to thousands of individual property owners, including both private individuals, business entities and even various public agencies and other entities. The County of Riverside has little to no control over the decision to propose development (new or re-developed) on a given site although the County of Riverside is the entity with discretion for review and approval of such development applications for most cases within unincorporated Riverside County. Demand for additional development is often a result of many interrelated factors, including population growth and economic demand, as well as location, local supply (i.e., existing home inventory) and even infrastructure availability (water supply, electricity, etc.).

RIVERSIDE COUNTY PLANNING DEPARTMENT

PROPOSED TRAIL TYPE DETAILS

This page intentionally left blank

For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), specific effects on park, trail and other recreational needs cannot be delineated at present as they are location-dependent. For the sake of comparison, however, Table 4.16-C shows the theoretical park and recreation needs at build out for both the current General Plan and the General Plan as it would be if amended pursuant to proposed GPA No. 960.

Table 4.16-C summarizes projected theoretical needs for park acreage, as an indicator of the need for recreational opportunities and facilities, for three scenarios. Again, these calculations are all labeled "theoretical" because they use the same basic set of assumptions and factors to allow for valid comparisons between and amongst scenarios. The first scenario shows demand associated with the existing (baseline) level of development currently estimated to be present on the portions of Riverside County directly affected by proposed land use-related changes as compared to full build out of the same areas as permitted under the updated General Plan (e.g., pursuant to the changes proposed in GPA No. 960).

Because much of the area addressed by GPA No. 960 includes regions for which future development potential is being eliminated (e.g., deletion of Rural Village Study Areas), the first scenario includes many areas where the build out scenario under the updated General Plan is the same as that which would occur under the existing (current General Plan's) mapped LUDs. As such, these areas do not represent new areas of growth attributable to the project, GPA No. 960, but rather simply reflect the anticipated build out of the Riverside County General Plan that would occur with or without the project.

Thus, in order to focus on the areas where the proposed project would actually result in new development potential (i.e., potential impacts), and hence population increases or shifts, a second scenario was developed for just the areas proposed for a change that would result in a future population increase.

Lastly, the third scenario included in the table shows a "plan-to-plan" comparison between the build out conditions of the General Plan as it currently exists and then as it would be if GPA No. 960 were approved and fully implemented. This scenario demonstrates the relative effects of the project on long-range planning, rather than environmental impacts per se, and is provided for informational purposes and to allow comparison between build out outcomes.

Table 4.16-C: Theoretical Parkland Needs With and Without the Project

Service Item	Generation Factors[1]	Existing Condition[2] (No Project)	Revised Condition (With Project)	Difference
Scenario 1: Existing Conditions / Updated General Plan Build out, Full Project Spatial Area[3]				
	Population[1]	16,520 persons	46,370 persons	+ 29,840 people
Quimby Standard[4]	3.0 acres per 1,000 people	49.6 acres	139.1 acres	+ 89.5 acres
Scenario 2: Existing Conditions / Updated General Plan Build out, Areas of New Development Potential Only[5]				
	Population[1]	6,590 persons	19,610 persons	+ 13,020 people
Quimby Standard[4]	3.0 acres per 1,000 people	19.8 acres	58.8 acres	+ 39.0 acres
Scenario 3: Build out of Current General Plan / Updated (per GPA No. 960) General Plan, Countywide[6]				
	Population[7]	1,736,700 persons	1,599,000 persons	- 137,800 people
Quimby Standard[4]	3.0 acres per 1,000 people	5,210 acres	4,800 acres	- 410 acres

Footnotes:

1. Populations calculated as per General Plan Appendix E-1 standards. See Section 4.1 (Environmental Assumptions and Methods) for more information. All results rounded to the nearest 10 for population in scenarios 1 and 2, and nearest 100 for everything else.
2. Existing condition parkland acreages represent the countywide totals considered appropriate for the given population value; they do not represent actual acreages present.

3. Theoretical population estimated for the land uses associated with the 111,440-acre area of known spatial project changes. Existing condition is the current uses of land within these areas. Revised condition is the build out (development) of the same areas pursuant to the General Plan as updated per GPA No. 960.
4. As reflected in Section 10.35 of Riverside County Ordinance No. 460.
5. Encompasses just the 10,690 acres proposed for new or increased development intensity or density under GPA No. 960. Eliminates growth effects from areas that would develop per the existing General Plan, isolating the effects of the proposed project. Existing condition is the current uses of land within the limited area. Revised condition is the build out of the same area per the General Plan as updated per GPA No. 960.
6. Existing condition is the build out of unincorporated Riverside County pursuant to the existing (2008) General Plan. Revised condition is build out of the same pursuant to the General Plan as updated by GPA No. 960.
7. Population data provided by Riverside County Center for Demographic Research, 2010.

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Parkland standards from Section 10.35 of Riverside County Ordinance No. 460.

In regards to the planning, siting and development of new parks and other recreational facilities, it should be remembered that all such decisions are made by the applicable park and recreation district or other management entity. In some cases, such development is instigated solely by the entity. In most cases, however, such improvements are associated with new development projects undertaken by private developers. In such cases, the park and recreation entity typically reviews and approves proposals made by the developer. The entity's master plan is used to guide such development decisions. Nevertheless, all such future actions would require the appropriate level of environmental analysis and review, as warranted.

When built out pursuant to the existing (2008) General Plan, as shown in Table 4.16-C, Riverside County's population as a whole would require roughly 5,200 acres of parkland to serve its recreational needs. Under the updated General Plan, amended per GPA No. 960, this build out total would decrease roughly 8% to 4,800 acres because of the reduced population capacity associated with the proposed revisions.

Thus, on a comparative basis the proposed project would result in fewer environmental impacts due to the reduced need for park and recreational facilities. Such a reduced need would be reflected in any of several ways, including through a reduction in the capacity needed within existing parks and recreational facilities, by delaying the need for construction of new parks or, by reducing the size of new parks constructed.

In terms of future development, however, as indicated in the table under scenario one, future development accommodated by the project would introduce a total of just under 30,000 new residents to Riverside County. These residents would trigger the need for a total of approximately 90 acres of new parklands. This total represents demand across Riverside County, however. The actual increases would be spread throughout the 19 Area Plans of unincorporated Riverside County, plus the remainder area of eastern desert not in an Area Plan. As such, the adverse effects on any single area would be small to negligible. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary services.

In terms of actual development, however, as indicated in the first scenario in Table 4.16-C, the existing theoretical population of Riverside County within the lands potentially affected by the project requires roughly 50 acres of parklands. These needs are currently met by the roughly 22,500 acres of parks and recreational facilities within Riverside County that are operated and managed by the various park and recreation districts and other entities located throughout Riverside County (inclusive of cities). Build out of the same area pursuant to the updated General Plan would result in the need for just under 90 acres of additional parklands. Much of this growth, however, is already planned for in the existing General Plan and was analyzed under EIR No. 441, which was certified for the 2003 RCIP General Plan.

Scenario two of Table 4.16-C isolates just the areas of growth associated with GPA No. 960 that would potentially be greater than that originally planned under the existing General Plan. Once areas planned merely for growth according to the existing General Plan are removed, the resultant scenario indicates that the future new development potential arising from GPA No. 960 would result in a population capacity of roughly 13,000

additional people over existing conditions. To serve this population, an additional 40 acres of parkland would be needed overall; roughly two 20-acre community parks or four 10-acre neighborhood parks, for example. To determine where in the county these new parks would be needed, the same data was broken down by region (Area Plan).

The regional analysis indicated that approximately one new 12-acre park would be needed for the area within the Elsinore Area Plan and one new 8-acre park within the Palo Verde Valley Area Plan. Smaller amounts of parkland would be needed for three other regions: Jurupa Area Plan (6 acres), Mead Area Plan (5 acres) and Western Coachella Valley Area Plan (4 acres). Increases of less than 1 acre would also occur for the San Jacinto Valley, Southwest and Temescal Canyon Area Plans. The increased needs of the Elsinore Area Plan region as a result of GPA No. 960 would be due primarily to future development of the proposed Meadowbrook and Good Hope Rural Village Land Use Overlays. The LUD changes associated with achieving ALUP consistency around the Blythe Airport would increase park demands within the Palo Verde Valley Area Plan. The remaining increases would result from the various Riverside County-initiated LUD changes proposed under GPA No. 960, plus the LUDs being adjusted within the Jurupa Area Plan to ensure consistency with the Flabob and Riverside Municipal Airport ALUPs.

In terms of General Plan changes, the project would only incrementally affect most of Riverside County's Area Plans and regions in amounts not large enough to trigger the need for a full additional park in most areas. Not surprisingly, the increased demand for parks shows up most clearly in the areas being planned for urbanization – the Meadowbrook and Good Hope Rural Village Overlays in particular. In terms of environmental effects, future development accommodated by GPA No. 960 would contribute incrementally to the need for additional parks and recreational opportunities throughout Riverside County. The environmental impacts and mitigation implications of these increases are discussed in the section that follows below.

In regards to trails, the revisions proposed are expected to improve trail planning and implementation by providing trail standards that more accurately reflect and address the needs of the various types of development that will occur in Riverside County over time. This will enable trails, pathways and bikeways to continue to be constructed as required to provide connectivity both within new development and between new and existing uses, as well as connections to the existing and proposed trail system.

Future development accommodated by the project would increase demand for additional trails and bikeways within new development and also increase the use of existing trails and bikeways, particularly those that connect new uses to existing destinations (schools, bus stops, retail areas, etc.).

4.16.6 Parks and Recreation - Impacts and Mitigation

A. Would the project cause growth that increases the use of existing neighborhood parks, regional parks or other recreational facilities resulting in or accelerating substantial physical deterioration of the facility?

Impact 4.16.A – Increase the Use of Existing Parks or Other Recreational Facilities Resulting in Their Substantial Physical Deterioration: Future development accommodated by GPA No. 960 changes would result in population growth in certain areas within Riverside County, incrementally increasing the number of residents using existing neighborhood and regional parks, as well as other recreational facilities, including trails and bikeways, in localized areas. This use would contribute slightly, but not significantly, to the wear and tear on

existing facilities. Moreover, compliance with existing state and county regulatory programs and General Plan policies would further ensure that project-related effects on existing parks or recreation facilities are less than significant.

1. Analysis of Impact 4.16.A

The changes to General Plan land use plans and policies proposed in GPA No. 960 would result in a reduction of expected residential capacity at build out, thus accommodating a smaller county population than previously forecasted (scenario three in Table 4.16-C). Nevertheless, some components of GPA No. 960 would generate an incremental net increase in park needs. Specifically, this encompasses the various Riverside County-initiated land use designation changes, as well as those associated with the Blythe, Riverside Municipal and Flabob Airports; the Good Hope and Meadowbrook Rural Village Overlays; revisions to accommodate fish farms around the Salton Sea; and, lastly, the revisions to the Lake Elsinore Environs Policy Area related to Lakeland Village. See EIR Section 3.0 (Project Description) for further details.

The growth generated by each project component identified in Table 4.16-C (scenarios one and two) would increase the number of people utilizing existing recreational resources and necessitate the provision of new facilities to maintain adequate levels of service, at minimum those set forth under the Quimby Act. However, the incremental increase of 13,000 people associated with the project would be spread over the entire county in various amounts and occur over roughly 50 years. As such, this increase is an insignificant increment (0.8%) of the total expected county growth over the same period.

2. Regulatory Compliance for Impact 4.16.A

As detailed and explained below, compliance with existing regulations and General Plan policies are sufficient to ensure that impacts associated with increased use and potential deterioration of park and recreation facilities, including trails and bikeways, due to growth as a result of GPA No. 960 would be less than significant.

a. Compliance with State and County Regulations

Compliance with the following state and Riverside County regulations would prevent significant impacts associated with increased use and potential deterioration of park and recreation facilities, including trails and bikeways.

Quimby Act: The Quimby Act (CGC Section 66477) allows local jurisdictions, through an ordinance, to require developers to dedicate land, pay fees or a combination of both for park and recreational purposes as a condition of approval of tract and parcel maps. The land, fees or combination thereof would be used for the development of new, or rehabilitation of existing, park and recreation facilities to serve the associated population. Implementation of Quimby Act standards would provide for additional park and recreational resources throughout the county, which in turn would lessen impacts related to overuse and overcrowding at existing facilities in the affected region.

Ordinance No. 460 - Regulating the Division of Land: In regards to parks and recreation, Section 10.35 of Ordinance No. 460 details the methods by which Quimby Act compliance is achieved (i.e., land dedication, in-lieu fee payment or combination of both) for residential projects approved within unincorporated Riverside County. The ordinance requires developers to dedicate, at a minimum, 3 acres of land for each 1,000 persons that may reside within Riverside County. In lieu of dedicating land, a developer may choose to pay fees, at an amount determined by the County of Riverside, for park and recreational purposes in order to satisfy Ordinance No. 460

and Quimby Act regulations. The fee and/or land dedications or improvements can only be used to provide neighborhood and community parks that serve the proposed development. Implementation of Ordinance No. 460 ensures that an adequate amount of park and recreational facilities are available to the residents of Riverside County.

Ordinance No. 328 - Rules and Regulations for County Parks and Open Space Areas: This ordinance prescribes rules and regulations for parks and open space areas within Riverside County to maintain their integrity and effective use for recreational purposes. By regulating those uses allowed in parks and open space areas, regulating the circulation of vehicles throughout such areas and prohibiting the destruction of landscaped areas, the regulations found in Ordinance No. 328 would effectively reduce the potential wear and tear that facilities may experience due to population growth accommodated by to GPA No. 960, thereby helping reduce potential adverse impacts to existing recreational resources.

b. Compliance with Existing Riverside County General Plan Policies

The following existing policies of the Riverside County General Plan would further reduce the insignificant impacts associated with increased use and potential deterioration of park and recreation. See Section 4.16.3.C for the full text of each of these policies.

Policy OS 20.3: Discourages the encroachment of public or private non-recreational uses on dedicated recreational lands, thereby preserving existing recreational resources.

Policies OS 20.5 and 20.6: Requires recreational facilities be developed (or funded) concurrently with other development in a given area. Developing recreational facilities in conjunction with development proposals would help ensure that additional populations do not have excessive impacts on existing neighborhood and regional parks or recreational facilities.

c. Compliance with Proposed New or Revised Riverside County General Plan Policies

The following revised policies of the Riverside County General Plan will prevent significant impacts associated with increased use and potential deterioration of park and recreation facilities. See Section 4.16.3.C for full text of each of these policies.

Policy LU 25.2: Provides for a balanced distribution of recreational amenities for all land uses so as to not over burden existing recreational resources and reduce potential impacts to those existing resources.

3. Finding on Significance of Impact 4.16.A

With the implementation of, and compliance with, the above listed regulations, Riverside County ordinances and General Plan policies, potential adverse impacts to existing parks and recreational facilities, including trails and bikeways, would be limited to insignificant levels. As such, the growth associated with the project would not increase population levels in a manner that would cause significant impacts on existing parks or recreational facilities; nor would it result in or accelerate substantial physical deterioration of facilities.

B. Would the project trigger growth that results in the need for new or physically altered park or recreation facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives?

Impact 4.16.B – Trigger Growth Effects Resulting in the Need for Additional Parks or Recreational Facilities: Future development accommodated by GPA No. 960 changes would result in population growth in certain areas within the county, triggering the need for expansion of existing or development of new recreational facilities and opportunities. This need, however, would be incrementally small (less than 1%) of the overall growth expected in the county over the next 50 years and would be spread throughout Riverside County for the most part. As such, impacts would be less than significant. In a few areas, population increases would be large enough locally to potentially trigger the need for a new park, trail or other recreational facility. For such locations, compliance with existing state and Riverside County regulatory programs (the Quimby Act, specifically), as well as existing General Plan policies, would ensure project-related affects to parks, trails and other recreation would be less than significant.

1. Analysis of Impact 4.16.B

As discussed in Impact 4.16.A above, development activities accommodated by GPA No. 960 would facilitate additional population growth within the county compared to existing conditions. This anticipated growth would necessitate the provision of new park and recreational facilities to maintain adequate levels of service, at minimum those set forth under the Quimby Act and Section 10.25 of Riverside County Ordinance No. 460. As indicated in Table 4.16-C, the land use changes associated with GPA No. 960 would trigger the need for approximately 40 acres of additional parklands. Additional trails and bikeways would also be needed to provide for recreation and non-motorized transportation connectivity both within new developments (internally) and externally between other uses offsite, as well as to the existing trails network per General Plan Figure C-7.

The growth generated by each project component identified in Table 4.16-C (scenarios one and two) would increase the number of people utilizing existing recreational resources and necessitate the provision of new facilities to maintain adequate levels of service, at minimum those set forth under the Quimby Act. However, the incremental increase of 13,000 people associated with the project would be spread over the entire county in various amounts and occur over roughly 50 years. As such, this increase is an insignificant increment (0.8%) of the total expected county growth over the same period. This growth level is in line with that expected in Riverisde County over time and it is anticipated that it would be readily accommodated by the policies and plans of the General Plan. See Section 5.3 for further details on growth effects specifically.

GPA No. 960 does not alter or affect the existing park service ratios for Riverside County, including those that would apply to any future development accommodated by GPA No. 960. Existing fiscal plans for Riverside County, particularly Quimby Act requirements for provision of a minimum level of park acreage or payment of equivalent in-lieu fees, would continue to provide or fund adequate new facilities to support new areas of growth within Riverside County. Through this means, any population growth associated with new development from the project would be reduced to less than significant levels. As such, the potential effects of project-related population growth on the need for new or altered recreation facilities would be less than significant.

2. Regulatory Compliance for Impact 4.16.B

As discussed under Impact 4.16.A, the State of California Quimby Act, Ordinance No. 328 and Ordinance No. 460, as well as the various General Plan policies detailed for Impact 4.16.A would reduce the adverse impacts of

potential growth on the need for additional recreation facilities as well. Through implementation of these regulations and policies, the County of Riverside would be able to address the potential funding and open space needs triggered by project-related growth as it occurs. Such regulatory measures and General Plan policies would be sufficient to ensure that impacts resulting in the need for additional recreational facilities as a result of GPA No. 960 would be less than significant.

3. Finding on Significance of Impact 4.16.B

With the implementation of the above-listed existing regulations and General Plan policies, particularly Section 10.35 of County Ordinance No. 460, GPA No. 960 would have a less than significant impact on the need for new or physically altered park, trails, bikeways or other recreation facilities.

C. Would the project trigger the need for construction or expansion of recreational facilities or uses that would have a significant adverse physical effect on the environment due to their provision?

Impact 4.16.C – Result in Significant Adverse Environmental Effects Due to the Need for Additional Parks or Recreational Facilities: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in the county, resulting in a small overall population increase that would contribute incrementally to the need for an additional parks and recreational uses (including trails and bikeways) within Riverside County. Where these needs are localized due to specific policy and land use changes, increased populations could result in the need for an additional park or other recreational use, the construction or expansion of which could have an adverse physical effect on the environment. However, compliance with existing regulations, County ordinances, mitigation measures from EIR No. 441 and General Plan policies, as outlined throughout this EIR, would be sufficient to ensure that resultant environmental impacts are less than significant.

1. Analysis of Impact 4.16.C

As described above, development consistent with GPA No. 960 would necessitate the provision of new recreational facilities and the expansion of existing facilities to accommodate expected population growth for those areas featuring additional residential populations. As outlined in the prior section, GPA No. 960 changes would disproportionately affect population growth for the Elsinore, Palo Verde Valley, Jurupa, Mead and Western Coachella Valley Area Plan regions. As such, it is possible that the Elsinore and Palo Verde Valley areas would each need an additional community park (of 12 acres and 8 acres, respectively). The remaining areas would potentially need an additional neighborhood or smaller park (of 6 acres, 5 acres and 4 acres, respectively). All of these areas would also need walkways, trails and bikeways, as appropriate, to provide recreational opportunities as well as connectivity for non-motorized transportation within new sites and externally to the existing trails network, as well as to existing and future new uses offsite (e.g., bus stops, schools, retail, etc.).

To ensure adequate parks and recreational uses are provided along with new residential development that introduces additional populations, the Riverside County Regional Parks and Open Space Department and the Riverside County Planning Department enforce the Quimby Act standards enacted under Riverside County Ordinance No. 460 as they review development and building plans. The County of Riverside requires development applicants to provide specific levels of new recreational development (parks, recreational areas, etc.) and/or pay a specific amount of in-lieu fees that would then be used by the applicable public park and recreation entity to construct new or expanded facilities. Trail requirements and offsite improvement contributions are also handled similarly (through mandatory Conditions of Approval).

In the case of development-level applications (particularly, specific plans and specific plan amendments), parks and recreational facilities may be sited, planned and designed as part of the overall project. In other cases, such work may be performed separately as unrelated actions (as part of the implementation of a Parks Master Plan, for example). In either case, full environmental analysis, review and the formulation of all necessary mitigation would be required.

Where development of new or expanded facilities would occur on previously vacant land, the potential exists for construction to impact the physical environment. In particular, these physical impacts may include loss of open space and agricultural lands, loss of natural biological habitat and effects to plants and animals on a given site, the potential for effects to known or previously unknown cultural resources, as well as increasing use of various resources, such as water, energy, law enforcement patrols, etc. Similar impacts and related mitigation are addressed generally in their respective chapters of EIR No. 441, which was certified in conjunction with the 2003 RCIP General Plan. This EIR, EIR No. 521, also provides additional mitigation measures when deemed necessary to mitigate a potentially significant environmental impact.

2. Regulatory Compliance for Impact 4.16.C

Compliance with the following regulations, policies and existing mitigation measures from prior EIR No. 441 would reduce or minimize impacts associated with the need for new or expanded parks, trails or other recreational facilities.

a. Compliance With Federal, State and County Regulations

The State of California and Riverside County regulations, programs and ordinances outlined for Impacts 4.16.A and 4.16.B, as well as throughout both this EIR and EIR No. 441, which was certified for the 2003 RCIP General Plan, would serve to ensure that the roughly 40 acres of additional parks and recreational uses necessitated by project-related population growth would be developed without significant environmental impacts. Given the small areas involved (12 acres maximum) and the large inventory of vacant, undeveloped land available within Riverside County, it is reasonable to assume that significant physical impacts can be avoided through careful site selection, in many cases. For the remaining cases, a combination of site selection, appropriate design, construction and management measures, as well as implementation of the various mitigation measures associated with EIR No. 441 and this EIR would be sufficient to ensure no substantial impacts result from the construction of necessary new or physically altered park or recreational facilities to serve the project.

b. Compliance with Existing General Plan Policies

As outlined previously for the prior two impact discussions, a variety of existing policies of the Riverside County General Plan would help prevent significant impacts resulting from the construction or expansion of recreational facilities or uses. These include Policies OS 20.5 and 20.6, C 4.9, 16.1 and 17.2, and LU 25.1-25.3. See Section 4.16.3.C for the full text of each of these.

Policy LU 9.2: Requires new development, including any recreational facility construction, to comply with the Multipurpose Open Space Element of the General Plan as well as federal and state regulations, such as CEQA, NEPA, the Clean Air Act and the Clean Water Act, in order to protect environmental resources.

c. Compliance with Proposed New or Revised County General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan would prevent significant impacts resulting from the construction or expansion of recreational facilities or uses. Policies LU 25.2, 25.4, C 15.1, 15.2, 15.3, 15.4, 16.2, 16.7, 17.3, 18.1 and 18.2 provide mitigation for impacts associated with environmental effects of recreational facility construction. See Section 4.16.3.C for the full text of each of these policies.

3. Finding on Significance for Impact 4.16.C

With the implementation of the above-listed General Plan policies, ordinances and regulations, as well as the existing mitigation associated with EIR No. 441 in general, GPA No. 960 would have less than significant impacts associated with the need for construction or expansion of new or physically altered parks or recreational facilities.

4.16.7 Parks and Recreation – Level of Significance After Mitigation

Implementation of, and compliance with, the above regulations and General Plan policies would ensure that significant impacts to park and recreation resources, including trails and bikeways, are either avoided or minimized to less than significant levels. Compliance with existing State of California and County of Riverside laws and regulatory compliance measures would ensure that parks and recreation facilities are developed concurrently with other development in a given area and in accordance with the minimum amount of acres prescribed by both the Quimby Act and County Ordinance No. 460. Compliance with existing laws, regulatory programs and policies would minimize impacts to existing parks and recreation facilities and conflicts associated with the expansion of existing or new facilities. Together these measures ensure that any significant adverse impacts to parks, trails, bikeways and other recreational resources resulting from future development accommodated by GPA No. 960 would be less than significant.

Section 4.17

Public Facilities

Section 4.17 Public Facilities

4.17.1 Introduction

This section assesses the potential impacts associated with public facilities that could occur as a result of future development accommodated by the proposed project, General Plan Amendment No. 960 (GPA No. 960). The emphasis of this section is on the various public services and facilities provided within unincorporated Riverside County, including fire protection, law enforcement protection by the Riverside County Sheriff's Department, solid waste management, schools, libraries and medical facilities. Wastewater (sanitary sewer) is discussed in Section 4.19 (Water Resources) along with other water supply issues; parks are addressed in Section 4.16 (Parks and Recreation).

This EIR section examines the effects of build out of the General Plan on public services and assesses whether any adverse environmental effects would result from the need to provide additional public services or facilities as a result of the project's revisions to the General Plan. This chapter also includes analysis of changes to baseline conditions that would result from future development accommodated by the project. The Riverside County General Plan does not include a section on public services, as it is not one of the seven general plan elements (land use, circulation, housing, conservation, noise, open space and safety) required pursuant to California Government Code (CGC) Section 65302. However, public services are addressed directly or indirectly in a variety of locations in the General Plan.

A. Background on Data Sources and Methods

The three most prominent characteristics of Riverside County affecting the delivery of services are its size, diverse topography and land use patterns. The focus of the land use patterns and development within Riverside County center mainly around Riverside County's 24 cities. These cities not only provide housing for citizens but also establish a pattern that relates directly to the location of citizens throughout Riverside County, incorporated as well as unincorporated, and their need for public services and facilities. The importance of public service availability cannot be overstated, ~~for~~ *as this* determines ~~in a fundamental way~~ where and when urban ~~intensity~~ development can occur. For example, without a safe and efficient municipal water system, land cannot be transformed from open or rural to a more *urban* ~~closely knit~~ development pattern, in which someone other than the end water user must be responsible for obtaining and distributing ~~the~~ water ~~that is used~~. Electricity and telephony are similarly important. In addition, public facility providers must closely monitor existing service capacities and future projections to ensure that capacity continues to be available or added as an area grows.

For most public services, this future growth can be used to project future demand. Future demand is used by providers to establish long-range plans to ensure additional capacity is added at pace with, or in advance of, developing need. An example of this would be a school district beginning their planning for construction for a

new high school now to eventually accommodate the increased number of children that are entering kindergarten today and who will need the high school space in 10 years.

Accordingly, public facility demands are most often determined on the basis of future demographic and/or socioeconomic projections, which can include population, dwelling units (residences) and employment sources (jobs), as well as growth rate predictions. Providers typically have usage factors they employ to calculate service needs based off these projections. For example, a water district may have water usage factors for a variety of land uses (such as 200 gallons per day for single-family homes and 180 gallons per day for multi-family homes).

As a result, the future demand on a public facility can be modeled (estimated) for a variety of future scenarios, such as the "build out scenario," which is a theoretical point in time when all of the land uses planned would have been built. As detailed in Section 4.1 (Environmental Assumptions and Methods), the theoretical build out point used in this EIR for the existing General Plan and GPA No. 960 is approximately the year 2060. It should be noted, however, that build out represents a *theoretical* point in time, fixed in order to allow comparison between two differing outcomes. The ultimate outcome, that is, what actually gets built in the real world, is subject to many complex and varying factors over time. Hence, the theoretical approximation is more of a likely best (or worst) case scenario, rather than a precise acre-by-acre prediction. Also, these calculations also do not take into account any future annexations of unincorporated county areas into existing (or new) cities or public facility districts, which could lead to other agencies being responsible for provision of the public services. This is appropriate because doing so means the public service needs of the unincorporated county are, at worst, *over*-estimated so that, in an abundance of caution, mitigation needs are similarly overestimated.

Nevertheless, these theoretical build out projections are valuable because they provide a snapshot of how Riverside County *might* look if all of the land uses mapped in the existing (2008) General Plan were built as planned, and they enable a comparison of the possible outcome of the changes proposed by the project. In each of the subsections that follow, for each type of public facility, details are provided on how specific projections were developed, as well as the data sources and methods used.

B. Proposed Changes to the General Plan Relating to Public Services

As part of the project review process, land use and demographic data in the General Plan were updated and policies reviewed and revised where necessary. The existing General Plan addresses public facilities mainly in the Land Use (LU) Element. GPA No. 960 includes policies related to coordinating public facilities with future land use development. Texts of relevant existing and revised or new General Plan policies are provided under the applicable topic herein. For parks and recreation updates, see Section 4.16 (Parks and Recreation).

The variety of LUD and policy area changes proposed, as per the descriptions in Section 3.0 (Project Description) of this EIR and associated Figure 3-1 (and corresponding maps within each Area Plan), may indirectly affect public facilities and services. Such changes would lead to either an increase or decrease in development potential (density or intensity). Introducing new people and structures into areas would increase the use of existing public services and add incrementally to the need for additional facilities and services as well.

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies and others, as described in Section 3.0 of the EIR. Similarly, new maps for trails and county roads (General Plan Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements would be determined based on site assessment of opportunities

and constraints. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines, and such, are also developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need.

Accordingly, specific locations and timing of future infrastructure, including power and natural gas transmission lines, water and sewer lines and pumps, as well as roads, schools and other public services are not presently foreseeable beyond the master countywide level (as addressed previously in EIR No. 441). These improvements would require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the General Plan builds out. As such, future impacts and mitigation can only be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed at the later individual project stage. Nevertheless, this section presents theoretical estimates for both existing conditions and build out conditions. See each of the individual subsections that follow for specifics.

4.17.2 Fire Protection Services

A. Fire Protection – Existing Environmental Setting

The County of Riverside contracts with the State of California (the California Department of Forestry and Fire Protection, also now known as "CalFire") for fire protection. Under CalFire "Riverside Operational Unit" management, the Riverside County Fire Department (RCFD) operates ~~95~~ *94* fire stations in 17 battalions with about 230 pieces of equipment. Fifty-one of these stations, as well as three stations operated directly by CalFire, are located in the unincorporated portion of Riverside County. See Table 4.17-A (Cities Served by the Riverside County Fire Department (CalFire)). In addition to all of unincorporated Riverside County, the CalFire Riverside Unit serves small portions of San Diego and Orange counties, and also operates 18 city fire departments and one community services district (CSD) fire department for the Rubidoux CSD. Combined, the Riverside Unit is one of the largest fire departments in the nation. The RCFD also responds to a number of cities and communities through mutual and automatic aid agreements and also provides dispatch under contract. See Table 4.17-B (CalFire Aid Agreements).

Within its service area, RCFD provides fire suppression, emergency medical, rescue and fire prevention services and is equipped to fight both urban and wildland emergency conditions. The State (CalFire) also has primary responsible responsibility for managing fires on lands designated "State Responsibility Areas" (SRAs). A variety of local fire agencies, for example city fire departments, have jurisdiction over "Local Responsibility Areas" (LRAs). And on federal lands, Federal Responsibility Areas (FRAs), federal agencies (BLM or U.S. Forest Service) are responsible. Within Riverside County, the CalFire Riverside Unit is responsible for 544,180 acres of SRA, plus 2,630 acres in San Diego County and 620 acres in Orange County. As the contract fire protection agency for various cities within Riverside County, CalFire is also responsible for 13,206 acres of LRA land within Riverside County. Other agencies, such as city fire departments, etc., are responsible for 572 acres of LRA. On federal lands (FRA) within Riverside County, the BLM is responsible for 52,650 acres and the U.S. Forest Service for 62,520 acres. For a full discussion on SRAs, LRAs, etc., see Section 4.13 (Hazardous Materials and Safety).

According to the CalFire Riverside Unit 2012 Strategic Fire Plan (page 9), State resources include 14 type 3 engines, one type 2 helicopter, two type 3 air tankers and three bulldozers. County resources include 81 type 1 engines, five type 2 engines, one bulldozer, water tenders, eight medic ambulances and two breathing supports.

Other equipment in the RCFD inventory includes: structural engines, rural engines, brush engines, telesquirts, trucks, paramedic units, a helicopter, hazardous materials unit, incident command units, water tenders, fire crew vehicles, mobile communications centers, breathing support units, lighting units, power supply units, fire dozers, mobile training vans and emergency feeding units.

CalFire also operates Ryan Air Attack Base (RAAB) out of the Hemet-Ryan Airport in the French Valley area. RAAB Air Attack A310 provides firefighting air support for CalFire using OV-10A aircraft for airborne command and control functions (e.g., for directing tanker and helicopter drops from the air). It also uses S-2T tankers for air drops of water and fire retardant. Lastly, it operates a UH-1H Super Huey helicopter out of RAAB for helitack (firefighting support, e.g., water and retardant drops) and the air rescue program (e.g., hoist rescue operations, medical evacuations, etc.).

Table 4.17-A: Cities Served by the Riverside County Fire Department (CalFire)

Western Riverside County		Eastern Riverside County
Banning	Menifee	Coachella
Beaumont	Norco	Desert Hot Springs

The RCFD is also the Operational Area Coordinator for the California Fire and Rescue Mutual Aid System for all fire service jurisdictions in the county (such as, municipal, tribal, state and federal – that is, National Forests). Upon receipt of a call for mutual aid through Riverside County's Emergency Command Center (ECC), Riverside County's mutual aid coordinator will determine whether a city or the County of Riverside will provide a response. The ECC is a combined Riverside County, State of California and local agency dispatch center responsible for alerting and handling incidents over a 7,200-square mile area. Staffing is a mix of paid State of California and County of Riverside dispatchers with volunteer call handling support.

The Riverside County Fire Department provides the following services:

- Structural and wildland fire response

The Riverside County Fire Department (RCFD) fire stations are ~~can be~~ staffed by ~~a mixture of~~ State (CalFire)~~, Riverside County (RCFD), contract city (if applicable) and volunteer~~ firefighters. Currently, RCFD Battalion Chief Tracy Hobday reports that each engine unit is staffed with three personnel. Depending on the service area (Riverside County is divided into six), the staffing configurations are either: fire captain, fire apparatus engineer and fire fighter or Company officer (fire captain or fire apparatus engineer) and two firefighters. RCFD engine companies are also advanced life support paramedic assessment units. All units are dispatched by the ECC and are part of the "Integrated Fire Protection System," under contract with the State of California. The fire stations serving Riverside County are identified in Table 4.17-B, below. According to the 2012 Strategic Fire Plan (page 9), during peak staffing, the Riverside Unit has 96 stations staffed with 1,150 CalFire career personnel, 240 Riverside County and OES personnel and 280 volunteer/reserve firefighters. CalFire also provides 11 battalion chiefs and 17 hand crews. County of Riverside resources include 30 battalion chiefs, two medical squads, eight truck companies and two hazmat units.

RCFD responsibilities include:

- Fire control – due to increasing population, RCFD is faced with a growing structural fire problem. Riverside County is one of the most active wildland fire counties in the state.
- Air attack program – CalFire and the U.S. Forest Service (USFS) operate a joint air tanker base at the Hemet/Ryan Airport. The base is statistically the most active in the nation and deploys one CalFire and two USFS air tankers. Two air coordination aircraft and one CalFire helicopter are also stationed at Ryan Air Attack Base.

According to data published by the County in its "Financial Highlights (Fiscal Year 2008-2009)," within Riverside County the Fire Department provided medical assistance on just over 91,700 calls, extinguished over 4,400 fires and provided nearly 18,500 other services, including standby response to bomb threats, electrical hazards, gas leak hazards, etc., public service assistance and false alarms.

The County of Riverside also provides fire protection planning and engineering, in which County fire protection specialists review plans for all new residential developments, commercial and industrial buildings proposed within unincorporated Riverside County and the contract cities. Requirements are established to provide a high degree of life safety and property protection. Common requirements include installation of fire hydrants, sprinkler systems, early warning fire detection systems and fire safety zones in remote areas. See Section 4.13 (Hazardous Materials and Safety) for more information on building standards related to fire protection. In addition, as disaster and recovery planning are key elements for emergency services, the Riverside County Emergency Services Division maintains two underground Emergency Operation Centers with communications for government use during major events.

In terms of station locations and response times, according to EIR No. 441, prepared for the 2003 adoption of the RCIP General Plan, an acceptable response time is generally defined as within five minutes for urban areas, ten minutes for suburban and rural community areas and twenty minutes for rural outlying areas.

Source: Riverside County Fire Dept. website, www.rvcfire.org/opencms/facilities/Fire Stations/index.html, accessed Feb. 17, 2011.*Letter from Riverside County Fire Department to Kristi Lovelady, June 30, 2014*

B. Policies and Regulations Addressing Fire Protection

1. State Regulations and Plans

2012 CalFire Riverside Unit Strategic Fire Plan (RUSFP): The RUSFP is used by the CalFire Riverside Unit to direct and guide its fire management activities for its service area. The plan emphasizes "pre-fire" management, which is the process to assess alternatives to protect assets from unacceptable risk of wildland fire damage and focus on those actions that can be taken in advance of a wildland fire to potentially reduce the severity of the fire and ensure safety. Pre-fire "project alternatives" may include a combination of fuels reduction, ignition management, fire-safe engineering activities and forest health improvement to protect public and private assets. In addition to its main emphasis on the San Jacinto Mountains and its at-risk communities, pre-fire projects have also been planned and implemented on SRA lands in and adjacent to the Cleveland National Forest. A number of cooperative projects have taken place with many more being planned. The Riverside Unit also treats fuels within the region's Multi-Species Preserves and other public lands within SRAs, but not in National Forests. The overall goal of the RUSFP is to reduce total government costs and citizen losses from wildland fire in the Riverside Unit by protecting assets at risk through focused pre-fire management prescriptions and increasing initial attack success. See Section 4.13.2 (Existing Environmental Setting – Hazardous Materials and Safety) for additional details.

Public Resources Code (PRC) Sections 4290-4299: This portion of the PRC requires minimum statewide fire safety standards pertaining to: road standards for fire equipment access; standards for signs identifying streets, roads and buildings; minimum private water supply reserves for emergency fire use; and fuel breaks and greenbelts. With certain exceptions, all new construction in potential wildland fire areas is required to meet the statewide standards. State requirements, however, do not supersede more restrictive local regulations. See EIR Section 4.13 (Hazardous Materials and Safety) for full maps, discussion and analysis of hazardous fire areas within Riverside County.

PRC Sections 4102-4127 - State Responsibility Areas: PRC Section 4102 specifies that "'State responsibility areas' means areas of the state in which the financial responsibility of preventing and suppressing fires has been determined by the [State Fire] Board pursuant to Section 4125, to be primarily the responsibility of the state." These areas may contain state or privately owned forest, watershed and rangeland. Sections 4126-4127 of the PRC further specify the standards that define what does and does not constitute an SRA.

California Code of Regulations (CCR) Title 24, Parts 2 and 9 – Fire Codes: Part 2 of Title 24 of the CCR refers to the California Building Code which contains complete regulations and general construction building standards of State of California adopting agencies, including administrative, fire and life safety and field inspection provisions. Part 2 was updated in 2008 to reflect changes in the base document from the Uniform Building Code to the International Building Code. Part 9 refers to the California Fire Code, which contains other fire safety-related building standards. In particular, Chapter 7A, "Materials and Construction Methods for Exterior Wildfire Exposure," in the 2010 California Building Code addresses fire safety standards for new construction and Section 701A.3.2 addresses "New Buildings Located in Any Fire Hazard Severity Zone."

CCR Title 14 – Natural Resources: These regulations constitute the basic wildland fire protection standards of the California Board of Forestry. They were prepared and adopted to establish minimum wildfire protection standards in conjunction with building, construction and development within SRAs. Among other things, Title 14 requires the design and construction of structures, subdivisions and developments in an SRA provide for basic emergency access and perimeter wildfire protection measures (fire fuel modification zones, etc.).

California Government Code (CGC) Sections 51178-51179 – Very High Fire Hazard Severity Zones: Section 51178 specifies that the Director of CalFire, in cooperation with local fire authorities, must identify areas that are Very High Fire Hazard Severity Zones (VHFHSZs) in Local Responsibility Areas (LRAs), based on consistent statewide criteria and the expected severity of fire hazard. It further specifies that VHFHSZs "shall be based on fuel loading, slope, fire weather and other relevant factors," including areas subject to Santa Ana winds which are a "major cause of wildfire spread." Section 51179 states that a local agency (such as a county) must also designate (and map) the VHFHSZs in its jurisdiction by ordinance. (See the discussion on Ordinance No. 787, below, regarding Riverside County's VHFHSZs). Other portions of the Government Code outline when a local agency may use its discretion to exclude areas from VHFHSZ requirements or add areas not designated by the State of California to its VHFHSZ areas.

CGC Section 51182 – Defensible Space: This code outlines the standards for maintaining a "defensible space" around properties in areas designated as a very high fire hazard severity zone. See Section 4.13.3 (Policies and Regulations Addressing Hazardous Materials and Safety) for specifics.

PRC Section 4213 - Fire Prevention Fees: Pursuant to PRC Section 4213, in July of 2011, the State of California began assessing an annual "Fire Prevention Fee" for all habitable structures within the State's Responsibility Area (SRA) to pay for fire prevention services. The SRA is the portion of the state where the State of California is financially responsible for the prevention and suppression of wildfires. The SRA does not include lands within incorporated city boundaries, Tribal or federally owned land. As of 2013, the fee is up to $150 per habitable structure (i.e., a building that can be occupied for residential use, which does not include incidental buildings such as detached garages, barns, outdoor bathrooms, sheds, etc.).

2. County Plans and Regulations

Riverside County Fire Department Fire Protection and EMS Strategic Master Plan: The County of Riverside has developed a strategic fire plan that details the department's goals and strategies for proactively coordinating fire facility, service and equipment needs for 2009-2029. It incorporates CalFire's management plan for several sub-zones within the county. The plan is aimed at ensuring that existing and future development maintains adequate service levels throughout Riverside County.

Ordinance No. 659 – Establishing a Development Impact Fee Program: This ordinance requires that new development pay Development Impact Fees to ensure that certain facility obligations are met in order to reasonably serve the subject development. Such obligations include the construction of new fire facilities. The

ordinance ensures that there is a reasonable relationship between the use of the fees and the type of development projects on which the fees are imposed.

Ordinance No. 695 - Requiring the Abatement of Hazardous Vegetation: Each spring, the CDF and RCFD distribute hazard abatement notices. These notices, which currently go to about 30,000 Riverside County residents, require property owners to reduce the fuels around their property. Requirements for hazard reduction around improved parcels (those with structures) are set forth in Riverside County Ordinance No. 787 (and PRC Section 4291). A minimum 30-foot clearance is required around all structures, which can be extended to 100 feet in areas where severe fire hazards exist. On unimproved parcels, as set forth in Riverside County Ordinance No. 695, the property owner is required to disc or mow 100 feet along the perimeter of the property. The County of Riverside also requires a development within a high fire hazard area to design and implement fuel modification programs for the interface between developed and natural areas within and adjacent to the proposed project area.

Ordinance No. 787 - Fire Code Standards: This ordinance adopts a variety of state codes, such as the Uniform Fire Code (UFC), established by the International Fire Code Institute, for implementation and enforcement at the county level. This ordinance also addresses implementation of the California Uniform Building Code, based on the International Conference of Building Officials. Both major Codes prescribe performance characteristics and materials to be used to achieve acceptable levels of fire protection.

3. Existing County General Plan Policies for Fire Protection

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval.

a. Safety (S) Element

Policy S *5.9* (Previously S 5.2): Reduce fire threat and strengthen fire-fighting capability so that the County could successfully respond to multiple fires.

Policy S *5.10* (Previously S 5.3): Require automatic natural gas shutoff earthquake sensors in high-occupancy industrial and commercial facilities, and encourage them for all residences.

Policy S *5.12* (Previously S 5.5): Conduct and implement long-range fire safety planning, including stringent building, fire, subdivision and municipal code standards, improved infrastructure and improved mutual aid agreements with the private and public sector.

Policy S *5.13* (Previously S 5.7): Develop a program to utilize existing reservoirs, tanks and water wells in the county for emergency fire suppression water resources.

Policy S 7.3: Require commercial businesses, utilities and industrial facilities that handle hazardous materials to: install automatic fire and hazardous materials detection, reporting and shut-off devices; and install an alternative communication system in the event power is out or telephone service is saturated following an earthquake.

b. Land Use (LU) Element

Policy LU 5.2: Monitor the capacities of infrastructure and services in coordination with service providers, utilities and outside agencies and jurisdictions to ensure that growth does not exceed acceptable levels of service.

Policy LU *10.1* (Previously LU 9.1): Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities.

4. Proposed New or Revised County General Plan Policies

The following revisions to existing Safety (S) Element policies within the General Plan are included as part of GPA No. 960. These revisions are intended to enhance the policies' implementation and comprehensive use.

a. Safety (S) Element

Policy S 5.1: Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:

a. All proposed development and construction within Fire Hazard Severity Zones shall be reviewed by the County Fire and Building and Safety departments.

b. ~~a.~~All proposed *development and* construction shall meet minimum standards for fire safety as defined in the Riverside County Building or County Fire Codes, or by County zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy, and use.

c. ~~b.~~In addition to the standards and guidelines of the California ~~Uniform~~ Building Code and California ~~Uniform~~ Fire Code fire safety provisions, continue *to implement* additional standards for high-risk, high occupancy, dependent, and essential facilities where appropriate under the Riverside County Fire *Code (Ordinance No. 787)* ~~Protection Ordinance~~. These shall include assurance that structural and nonstructural architectural elements of the building will not impede emergency egress for fire safety staffing/personnel, equipment, and apparatus; nor hinder evacuation from fire, including potential blockage of stairways or fire doors.

d. ~~c.~~Proposed development *and construction* in *Fire Hazard Severity Zones* ~~Hazardous Fire areas~~ shall provide secondary public access, ~~unless determined otherwise by the County Fire Chief~~ *in accordance with County Ordinances*.

e. ~~f.~~Proposed development *and construction* in *Fire Hazard Severity Zones* ~~Hazardous Fire areas~~ shall use single loaded roads to enhance fuel modification areas, unless otherwise determined by the County Fire Chief.

f. Proposed development and construction in Fire Hazard Severity Zones shall provide a defensible space or fuel modification zones to be located, designed, and constructed that provide adequate defensibility from wildfires.

***NEW* Policy S 5.2:** *Encourage continued operation of programs for fuel breaks, brush management, controlled burning, revegetation and fire roads.*

NEW **Policy S 5.3:** *Monitor fire-prevention measures (such as fuel reduction) through a site specific fire-prevention plan to reduce long-term fire risks in the Fire Hazard Severity Zones.*

NEW **Policy S 5.4:** *Limit or prohibit development or activities in areas lacking water and access roads.*

NEW **Policy S 5.5:** *Encourage proposed development in Fire Hazard Severity Zones to develop where fire and emergency services are available or planned.*

NEW **Policy S 5.6:** *Demonstrate that the proposed development can provide fire services that meet the minimum travel times identified in Riverside County Fire Department Fire Protection and EMS Strategic Master Plan.*

NEW **Policy S 5.7:** *Minimize pockets of flammable vegetation that increase likelihood of fire spread through conceptual landscaping plans to be reviewed by Planning and Fire Departments in the Fire Hazard Severity Zones. The conceptual landscaping plan of the proposed development shall at a minimum include:*

a. Plant palette suitable for high fire hazard areas to reduce the risk of fire hazards.

b. Retention of existing natural vegetation to the maximum extent feasible.

c. Removal of onsite combustible plants.

NEW **Policy S 5.8:** *Design to account for topography of a site and reduce the increased risk from fires in the Fire Hazard Severity Zones located near ridgelines, plateau escarpments, saddles, hillsides, peaks, or other areas where the terrain or topography affect its susceptibility to wildfires by:*

a. Providing fuel modification zones with removal of combustible vegetations, but minimizing visual impacts and limiting soil erosion.

b. Replacing combustible vegetation with fire resistant vegetation to stabilize slopes.

c. Submitting topographic map with site specific slope analysis.

d. Submitting erosion and sedimentation control plans.

e. Providing a minimum 30 foot of setback from the edge of the fuel modification zones.

f. Minimizing disturbance of 25% or greater natural slopes.

Policy S *5.11* (Previously S 5.4): Utilize ongoing brush clearance fire inspections to educate homeowners on fire prevention tips *by implementing annual countywide weed abatement program*.

Policy S *5.14* (Previously S 5.8): Periodically review inter-jurisdictional fire response agreements, and improve firefighting resources as recommended in the *Riverside* County *Fire Department* Fire Protection ~~Master~~ Plan *and EMS Strategic Master Plan* to keep pace with development, including construction of additional high-rises, mid-rise business parks, increasing numbers of facilities housing immobile populations and the risk posed by multiple ignitions, to ensure that:

a. Fire reporting and response times do not exceed *the goals* ~~those~~ listed in the *Riverside* ~~—~~County *Fire Department* Fire Protection ~~Master —~~Plan *and EMS Strategic Master Plan* identified for each of the development densities described.

b. Fire flow requirements (water for fire protection) are consistent with ~~Insurance Service Office (ISO) recommendations~~ *Riverside County Ordinance 787.*

c. The planned deployment and height of aerial ladders and other specialized equipment and apparatus are sufficient for the intensity of development desired.

Policy S *5.15* (Previously S 5.10): Continue to utilize the Riverside County Fire *Department Fire* Protection *and EMS Strategic* Master Plan as the base document to implement the goals and objectives of the Safety Element.

***NEW* Policy S 5.17:** *Identify, map and update on an as-needed continual basis, the Fire Hazard Severity Zone maps [see General Plan Figure S-11].*

***NEW* Policy S 5.18:** *Ensure that the Fire Department has appropriate municipal staffing and fire protection planning staff that meet the needs of development pressure and adequately respond to long range fire safety planning.*

***NEW* Policy S 5.19:** *Implement a coordination program with fire protection and emergency service providers to reassess fire hazards after wildfire events and to adjust fire prevention and suppression needs, as necessary.*

***NEW* Policy S 5.20:** *Implement a regional coordination program to increase support for coordination among fire protection and emergency service providers.*

***NEW* Policy S 5.21:** *Implement a long-term training and education program among government agencies and communities about fire protection.*

Policy S 7.1: Continually strengthen the *Riverside County Office of Emergency Services' Response Plan and Multi-Jurisdictional Local Hazard Mitigation Plan* ~~Multihazard Functional Plan~~ and maintain mutual aid agreements with federal, state, local agencies and the private sector to assist in:

a. Clearance of debris in the event of widespread slope failures, collapsed buildings or structures, or other circumstances that could result in blocking emergency access or regress.

b. Heavy search and rescue.

c. Fire suppression.

d. Hazardous materials response.

e. Temporary shelters.

f. Geologic and engineering needs.

g. Traffic and crowd control.

h. Building inspections.

b. Land Use (LU) Element

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and ~~child~~ day care centers ~~(i.e. infant, toddlers, preschool and school age children),~~ transportation systems and fire/police/medical services.

***NEW* Policy LU 7.8:** *Require new developments in Fire Hazard Severity Zones to provide for a fuel clearance/modification zone, as required by the Fire Department.*

C. Thresholds of Significance for Fire Protection

The proposed project would result in a significant impact related to fire protection if it would:

Result in substantial adverse physical impacts associated with the provision of new or physically altered fire facilities. Or, result in the need for new or physically altered fire facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services.

D. Effect of GPA No. 960 on the General Plan and on Fire Protection

The General Plan is concerned mainly with the physical build out of the county; many of the changes associated with GPA No. 960 would affect planned land usage. The proposed project's update to the General Plan includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in areas throughout the county. As with the current General Plan, future development accommodated by GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas; all of which would require adequate fire protection services to ensure their safety.

Table 4.17-D (Theoretical Fire Station Needs With and Without the Project) provides a summary of the theoretical needs for fire stations within Riverside County according to the theoretical estimate of need associated with existing land uses, as well as that for build out of the known spatial components or locations addressed by GPA No. 960 (i.e., site-specific LUD changes, policy area and study area changes, etc.). It should be noted that the following projections are based on the assumption that all of the changes proposed under GPA No. 960 actually result in future development and fully build out (as part of overall implementation of the Riverside County General Plan). That is, it is a theoretical, worst-case scenario that likely over-states the actual development potential in the real world. The actual future development of the individual parcels and areas affected by GPA No. 960 proposals, as with build out of the rest of the General Plan, are subject to the discretion of many hundreds to thousands of individual property owners, including private individuals, business entities and even various public agencies and other entities.

The County of Riverside has little to no control over the decision to propose development (new or redeveloped) on a given site (though the County of Riverside is the entity with discretion for review and approval of such development applications for most cases within unincorporated Riverside County). Demand for additional development is often a result of many interrelated factors, including population growth and economic demand, as well as location, local supply (i.e., existing home inventory) and even infrastructure availability (water supply, electricity, etc.). For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), specific effects on fire needs cannot be delineated at present since they are location-dependent. ~~For land use policy changes without currently assigned locations (Indian fee lands, incidental rural~~

~~commercial, etc.), specific effects on fire services cannot be delineated at present since they are location-dependent.~~ For the sake of comparison, however, Table 4.17-F (Comparison of Theoretical Fire Support Needs at General Plan Build Out) shows the theoretical fire protection service needs at build out for both the current General Plan and the General Plan as it would be if amended pursuant to proposed GPA No. 960.

The tables below summarize projected theoretical need for fire stations, as an indicator of the need for fire protection services, for three scenarios. Again, these calculations are all labeled "theoretical" because they use the same basic set of assumptions and factors to allow for valid comparisons between and amongst scenarios. In the real world, a number of additional factors that are beyond the scope of this analysis would apply (funding availability, jurisdiction, available manpower and equipment, etc.). The actual planning, locations and development of fire stations and the provision of all associated services are under the purview of the RCFD. Table 4.17-D shows demand for the existing (baseline) level of development currently estimated to be present on the portions of Riverside County directly affected by proposed land use-related changes; compared against the full build out of all of the same areas as they would be permitted under the updated General Plan (e.g., pursuant to the changes proposed in GPA No. 960).

Table 4.17-D: Theoretical Fire Station Needs With and Without the Project

Land Use	Generation Factors (per Fire Station)	Associated with Existing Uses[1,2]		Updated General Plan[1,3] Build Out (with GPA No. 960)		
		Total Units	Fire Stations Needed[3]	Build Out Total Units	Fire Stations Needed[2]	Difference
Residential	2,000 units	5,850 du	2.9	16,600 du	8.3	+ *5.4*
Commercial[4]	3.5 million sq. ft.	580,000 sf	0.2	3,949,000 sf	1.1	+ *0.9*
Industrial[5]	3.5 million sq. ft.	2,108,000 sf	0.6	3,759,000 sf	1.1	+ *0.5*
Total Area	**111,440 acres**	**Totals**	**3.7**		**10.5**	**+ *6.8***

Footnotes:
1. Theoretical need for fire services associated with the given level of development indicated. RCFD determines and implements actual needs. All results rounded after analysis to the nearest 10 for dwelling units (du) and nearest 1,000 for square footage (sf).
2. Theoretical need attributed solely to the portion of Riverside County associated with the lands proposed for spatial changes as part of GPA No. 960.
3. Theoretical need for fire services associated with build out of the General Plan (including as updated pursuant to GPA No. 960) for the same spatial areas.
4. Includes the following land uses: commercial-retail (40%), commercial-tourist, commercial-office and business park.
5. Includes the following land uses: light industrial, heavy industrial and (for existing uses) ranches.

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Fire protection standards (for fire stations needed) from EIR No. 441.

Because much of the area addressed by GPA No. 960 includes regions for which future development potential is being eliminated (e.g., deletion of Rural Village Study Areas), the first scenario (Table 4.17-D) includes many areas where the build out scenario under the updated General Plan is the same as that which would occur under the existing (current General Plan's) mapped LUDs. As such, these areas do *not* represent new areas of growth attributable to the project, GPA No. 960, but rather simply reflect the anticipated build out of the County General Plan that would occur with or without the project. Thus, in order to focus on the areas where the proposed project would actually result in new development potential (i.e., potential impacts), a second scenario was developed. As shown in Table 4.17-E (Theoretical Fire Station Needs for Areas of New Development Potential), this second scenario includes only those areas proposed for a change that would result in an increase in future development density or intensity. This also includes all parcels in which an LUD was changed (except those being assigned to OS-CH due to their acquisition for open space conservation pursuant to the WRC-MSHCP; these parcels would be removed from development potential).

Table 4.17-E: Theoretical Fire Station Needs for Areas of New Development Potential

Land Use[1]	Generation Factors (per Fire Station)	Existing Uses[1,2] (New Development Areas Only)		Build Out[1,3] (New Development Areas Only)		
		Total Units	Fire Stations Needed[3]	Build Out Total Units	Fire Stations Needed[2]	Difference
Residential	2,000 units	2,060 du	1.0	6,350 du	3.2	*+ 2.1*
Commercial[4]	3.5 million sq. ft.	254,000 sf	0.1	3,391,000 sf	1.0	*+ 0.9*
Industrial[5]	3.5 million sq. ft.	1,478,000 sf	0.4	3,253,000 sf	1.0	*+ 0.6*
Total Area	**10,690 acres**	**Totals**	**1.5**		**5.2**	***+ 3.7***

Footnotes:
1. Represents only the areas proposed for new development intensity or density under GPA No. 960 and with known spatial components. For example, omits areas where planned development would be "reduced" to that designated by existing General Plan LUDs (e.g., areas in which Rural Village Overlays or Study Areas were deleted).
2. Theoretical need for fire services associated with the given level of development indicated. RCFD determines and implements actual needs. All results rounded after analysis to the nearest 10 for dwelling units (du) and nearest 1,000 for square footage (sf).
3. Theoretical need attributed solely to the portion of Riverside County associated with the lands proposed for spatial changes as part of GPA No. 960 that increase development density or intensity above existing General Plan.
4. Includes the following land uses: commercial-retail (40%), commercial-tourist, commercial-office and business park.
5. Includes the following land uses: light industrial, heavy industrial and (for existing uses) ranches.

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Fire protection standards (for fire stations needed) from EIR No. 441.

Lastly, the third table, Table 4.17-F, shows a "plan-to-plan" comparison between the build out conditions of the General Plan as it currently exists and then as it would be if GPA No. 960 were approved and fully implemented. This third table indicates the relative effects of the project on long-range planning, rather than environmental impacts per se, and is provided for informational purposes and to allow comparison between build out outcomes.

Upon build out of Riverside County pursuant to the existing (2008) General Plan, as shown in Table 4.17-F, Riverside County as a whole would require 390 fire stations in total (i.e., 295 additional stations). Under the updated General Plan, amended per GPA No. 960, this build out total would decrease to 358 (i.e., an additional 263 fire stations, an 8% decrease). Thus, on a comparative basis, the proposed project would contribute to fewer impacts to the environment at build out since up to 32 fewer new fire stations would need to be constructed.

Table 4.17-F: Comparison of Theoretical Fire Support Needs at General Plan Build Out

Land Use	Current General Plan		General Plan as Amended by GPA No. 960		
	Build Out Total[1]	Fire Stations Needed[2]	Build Out Total	Fire Stations Needed[2]	Difference
Residential	534,100 du	267	498,000 du	249	*- 18*
Commercial[3]	68,059,000 sf	19	57,919,000 sf	17	*- 2*
Industrial[4]	361,013,000 sf	103	323,728,000 sf	92	*- 11*
TOTALS	**4,013,400 acres**	**390**	**4,011,600 acres**	**358**	***- 32***

Footnotes:
1. All results rounded to the nearest 100 for dwelling units (du) or 1,000 for square footage (sf) after analysis.
2. The theoretical total number of fire stations estimated to be needed at build out of the Riverside County General Plan (current and as proposed for amendment). As of 2009, there are 95 existing fire stations in Riverside County.
3 Includes land uses: commercial-retail (40%), commercial-tourist, commercial-office and business park.
4 Includes the following land uses: light industrial and heavy industrial.

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Fire protection standards (for fire stations needed) from EIR No. 441.

In terms of actual development, however, as indicated in Table 4.17-D, the existing developed land uses and activities within Riverside County for the lands potentially affected by the project theoretically require 3.7 fire stations worth of services. These needs are currently met by the 95 fire stations in Riverside County that the RCFD operates. Build out of the same area pursuant to the updated General Plan would result in the need for

just under seven (6.8) additional fire stations. Much of this growth, however, is already planned for in the existing General Plan and was analyzed under EIR No. 441, which was certified for the 2003 RCIP General Plan.

Table 4.17-E isolates just the areas of growth associated with GPA No. 960 that would potentially be greater than that originally planned under the existing General Plan. Once areas planned merely for growth according to the existing General Plan are removed, the resultant scenario indicates that the future new development potential arising from GPA No. 960 would result in the need for an additional 3.7 fire stations.

To determine where in the county these new stations would be needed, the same data was broken down by Area Plan. This analysis indicated that approximately 1.0 additional fire station would be needed in the Elsinore Area Plan region as a result of GPA No. 960, due primarily to future development of the proposed Meadowbrook and Good Hope Rural Village Land Use Overlays. The Northeast Business Park Overlay would add demand for roughly 0.7 additional fire stations to the Lakeview/Nuevo Area Plan, and the LUD changes associated with achieving ALUP consistency around the Blythe Airport would add roughly 0.6 fire stations worth of demand to the Palo Verde Valley Area Plan. And, lastly, both the Jurupa and Western Coachella Valley Area Plans would see roughly 0.3 fire stations worth of demand increase, while the San Jacinto Valley Area Plan would see 0.1. These are all due to the various County-initiated LUD changes proposed under GPA No. 960, plus the LUDs being adjusted within the Jurupa Area Plan to ensure consistency with the Flabob and Riverside Municipal Airport ALUPs.

In terms of General Plan changes, the project would only incrementally affect most of Riverside County's Area Plans; in amounts not large enough to trigger the need for an additional fire station in most county areas. ~~Not surprisingly~~, *T*he increased demand for fire stations show up most clearly in the areas being planned for urbanization – the Meadowbrook and Good Hope Rural Village Overlays in particular. In terms of environmental effects, future development accommodated by GPA No. 960 would contribute incrementally to the need for additional fire stations and services throughout the county to ensure adequate levels of service and response times. For all but the Elsinore Area Plan, the development increases trigger less than one station in need. The environmental impacts and mitigation needed, if any, associated with these additional service needs are discussed in the section that follows, below.

E. Fire Protection – Impacts and Mitigation

The following impacts related to fire protection that would result from implementation of the proposed project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered fire facilities? Or, would it result in the need for new or physically altered fire facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services?

Impact 4.17.A – Cause Adverse Environmental Effects Due to the Need for Fire Protection Services: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and industrial development, as well as the associated population, expected to occur within Riverside County over the next 50 years. In terms of actual changes to existing levels of fire services, however, localized development increases would trigger the need for additional fire services in specific areas, such as the Elsinore Area Plan. Construction and operation of new or

improved fire stations within these areas would be subject to a number of regulatory measures that would ensure no significant environmental impacts occur.

1. Analysis of Impact 4.17.A

New development would introduce additional people and property requiring fire protection and emergency response services. This would result in additional fire and emergency responses from existing facilities. When new development is located outside the normal radius for acceptable response time, people and property would be at increased risk due to delayed response. An acceptable response time is generally defined as within five minutes for urban areas, ten minutes for suburban and rural community areas and twenty minutes for rural outlying areas. The fire and emergency vehicles and equipment responding would experience increased wear and tear due to additional distances traveled. Increased travel times would also decrease the number of calls that could be responded to during a shift. When demand is great enough in a given region, additional fire facilities would be built. However, in areas where development remains sparse, response times would not be likely to be drastically improved.

Hence, future development in areas distant from existing or planned fire stations would be at greater risk of harm due to longer response times. In addition, where new development occurs along the interface between urban areas and wildlands, wildland fire hazards would be created or exacerbated. In areas without adequate services nearby, this could result in the exposure of people and property to high fire hazard conditions without adequate fire protection. See also fire hazards discussion in Section 4.13 (Hazardous Materials and Safety) for additional details and analysis.

As shown in Table 4.17-F, above, existing standards indicate that full build out of the existing General Plan, Riverside County would require a total of approximately 390 fire stations (295 additional stations) to fully protect the populace. Land use changes associated with GPA No. 960 would reduce the number of fire stations needed countywide to 358 (32 fewer stations). Within the areas with known spatial components directly affected by the proposed project (roughly 111,440 acres), as shown in Table 4.17-D, full build out according to the updated General Plan would trigger the need for 6.8 additional fire stations over the estimated 3.7 needed to serve the theoretical existing (baseline) uses. Lastly, as shown in Table 4.17-E, within the spatial project area, a total of roughly 10,700 acres (10%) would have an increase in development density or intensity and was estimated to trigger the need for 3.5 additional fire stations to serve the new development that would directly be accommodated by GPA No. 960.

At the Area Plan level, future development accommodated by GPA No. 960 would trigger the need for a total of 6.8 additional fire stations, mostly spread incrementally throughout Riverside County. As discussed previously in Section 4.17.2 (Fire Protection Services), regional analysis indicates that the increase would be negligible to non-existent for much of Riverside County and small for most of the rest of Riverside County. In these locations, future development as a result of the project would not result in significant adverse impacts on acceptable service ratios or response times. For the Elsinore Area Plan, however, a full 1.0 fire stations would be needed by 2060. Roughly a half-share of a fire station would be triggered for the Lakeview/Nuevo (0.7), Palo Verde Valley (0.6) and Mead (0.4) Area Plans. Three other area plans would have very minor directly attributable increases, as described in the prior section. Other than the four regions above, the data indicate that future development accommodated by GPA No. 960 would only incrementally increase fire service needs in any given region. These small increases would not result in a significant impact on fire service response times in these areas.

Where new fire stations are needed to ensure adequate response times, environmental impacts would be associated with their construction to the extent that their location, construction methods and operations affect the surrounding area. Data indicate that within the affected Area Plans sufficient vacant lands exist within their

general urban footprints. This vacant land availability means that situating new fire stations within these areas could be achieved in a manner that minimizes environmental impacts. In addition, impacts associated with construction of the 3.5 extra stations needed would be offset by the environmental impacts avoided in building 32 fewer fire stations throughout Riverside County. (That is, only 358 fire stations would be needed, opposed to the 390 that would be needed to serve the existing General Plan at full build out; see Table 4.17-F). Hence, the environmental impacts of construction of 3.5 fire stations within unincorporated Riverside County would not be significant and no project-specific mitigation is needed.

2. Regulatory Compliance for Impact 4.17.A

The above analysis indicates this impact would be less than significant and no project-specific mitigation is needed. Moreover, the following regulations, programs, policies and existing mitigation measures from prior EIR No. 441 would further reduce or minimize this already insignificant impact.

a. Compliance With Federal, State and County Regulations

California Codes: A number of California regulations, including PRC Sections 4290-4299 and CGC Section 51178, address fire safety. In particular, these sections require minimum statewide fire safety standards pertaining to: roads for fire equipment access; signage for identifying streets, roads and buildings; minimum private water supply reserves for emergency fire use; and, fire fuel breaks and greenbelts. They also identify primary fire suppression responsibilities among the federal, state and local governments. In addition, it sets fire safety standards for all buildings and structures in, or adjoining, mountainous areas, or forest-, brush- or grass-covered lands or any land covered with flammable material to protect property from wildland fires.

Riverside County Fire Department Fire Protection and EMS Strategic Master Plan: The County of Riverside has developed this plan to proactively plan facility, service and equipment needs for fire protection. The purpose is to ensure that new fire protection facilities are added when and where demand increases warrant them. It also incorporates the CDF Management Plan for several sub-zones within Riverside County. In addition, to ensure adequate fire protection for all residents of Riverside County, the Riverside County Department of Building and Safety and the Riverside County Fire Department enforce fire standards as they review building plans and conduct building inspections. Other programs are enforced to ensure compliance with established fire standards (both county and state), including the mapping and tracking areas of high fire hazard and fuel dangers. Implementation of this plan helps reduce potential risks of fire for residents in fire hazard areas and ensures that the necessary fire protective services are available as needed.

Ordinance No. 787 - Fire Code Standards: This ordinance adopts the Uniform Fire Code and adds requirements to further protect people and structures from fire risks, ensures that building would not impede emergency egress for fire safety personnel, equipment and apparatus would not hinder evacuation from fire, including potential blockage of stairways or fire doors.

Mitigation Fee: To accomplish these programs and ensure adequate services, the County of Riverside requires new development to pay fire protection mitigation fees pursuant to Ordinance No. 659. These fees are used by the Riverside County Fire Department to construct new fire protection facilities or provide facilities in lieu of the fee as approved by the Riverside County Fire Department. In addition, the County of Riverside requires all new structures constructed in unincorporated areas comply with the construction requirements of Riverside County Ordinance No. 787 and shall be provided with fire-retardant roofing material as described in the Uniform Building Code.

b. Compliance With Existing County General Plan Policies

The following existing policies of the Riverside County General Plan would further reduce the already insignificant project impacts to fire protection services. See Section 4.17.2.B. for full text of each of these policies.

Policy LU 5.2: This General Plan policy ensures that new developments contribute funds to be used to provide necessary fire and emergency response services and that needed new facilities are constructed in a timely manner to ensure adequate protection of the people and property of Riverside County.

Policy LU 10.1: This policy requires that future developments contribute a fair amount for the funding of infrastructure, public facilities such as police and fire facilities in order to ensure adequate availability of such infrastructure and services, thereby, reducing potential hazards.

Policy S 5.12: This policy encourages the practice and implementation of long-range fire safety planning as well as more stringent codes and improved infrastructure aimed at the reduction of fire hazards including wildland fire hazards.

Policies S 5.9 and 5.13: These policies require that developments be constructed to various building and fire code standards to ensure structures: provide appropriate levels of fire resistance (such as tile roofs, for example); are situated in a manner that provides adequate emergency access and evacuation; and maintain appropriate fire fuel modification zones. These policies also direct the County of Riverside to provide appropriate fire protective services including, water connections and reservoirs for firefighting purposes.

c. Compliance With Proposed or Revised General Plan Policies

Of the General Plan policies listed in Section 4.17.2.B, above, Policies LU 5.1 and LU 7.8, S 5.1-5.8, S 5.11 and S 5.14-5.21, in particular, provide mitigation for impacts associated with the provision of fire protection services. Implementation of these General Plan policies would aid in reducing the impacts of future growth and development within Riverside County to less than significant levels. Specifically:

Policies LU 5.1 and 7.8: These policies ensure that future development would not overburden infrastructure and public services and that such infrastructure and services would continue to operate at adequate levels. Policy LU 7.8 also requires future development located within designated Fire Hazard Severity Zones to provide for fuel modification as determined by the Fire Department.

Policies S 5.1-5.8, 5.11 and 5.14-5.21: These Safety policies mitigate wildland fire risks through construction design standards and requirements; coordination amongst various County agencies, water agencies and surrounding jurisdictions to implement long-range fire safety planning; improved infrastructure, fire response agreements and adequate water supply and flow with coordination driven by Riverside County's Fire Protection Strategic Master Plan and the General Plan Safety Element; limiting development potential in areas that lack water and access roads; continued usage of fuel breaks, brush management, controlled burnings, revegetation and fire roads including clearance inspections; encouraging future development located within fire hazard zones to develop where adequate fire and emergency services already exist or are being planned; providing services that meet minimum travel times for fire; frequent updates of fire hazard maps; and fire mitigation through landscaping. Policy S 5.11 is implemented through Ordinance No. 659, described above. These policies help protect structures and ultimately Riverside County residents from fire damage, injury or loss of life.

F. Fire Protection Services – Level of Significance After Mitigation

The analysis presented above indicates that future development accommodated by the proposed project, GPA No. 960, would have less than significant impacts on fire protection services and the environment. Moreover, compliance with the above-listed existing regulatory programs, standards and General Plan policies would further prevent or reduce any impacts associated with the project.

4.17.3 Law Enforcement Services

A. Law Enforcement Services – Existing Environmental Setting

Riverside County provides community policing and operates and maintains correctional facilities. The Riverside County Sheriff's Department has 4,500 established positions, including roughly 2,300 sworn personnel, to provide for community policing services. The Sheriff's Department is a "demand response" agency that maintains limited patrol services. Nine Sheriff Department stations are located throughout Riverside County to provide area-level community service. See Table 4.17-G (County Sheriff's Department Substations Serving Riverside County), below, for the locations of these substations. In addition, the Sheriff's Department operates the Moreno Valley Police Department station in the City of Moreno Valley, providing law enforcement services to that city under contract. The Sheriff's Department also operates five adult correction or detention centers located throughout Riverside County. The Riverside County Probation Department operates the juvenile detention facilities.

Table 4.17-G: County Sheriff's Department Substations Serving Riverside County

Substation Name	Location
Cabazon	50290 Main Street, Cabazon
Colorado River	260 North Spring Avenue, Blythe
Hemet	43950 Acacia Avenue, Suite B, Hemet
Thermal	86-625 Airport Boulevard, Thermal
Jurupa Valley	7477 Mission Boulevard, Riverside
Lake Elsinore	333 Limited Avenue, Lake Elsinore
Palm Desert	73705 Gerald Ford Drive, Palm Desert
Perris	137 North Perris Boulevard, Suite A, Perris
Southwest	30755-A Auld Road, Murrieta
Moreno Valley Police Department	22850 Calle San Juan De Los Lagos, Moreno Valley (contract city)

Source: Riverside County GIS Dept., 2009.

In addition to the above stations, the Sheriff's Department operates the following five adult correctional facilities:

Robert Presley Detention Center: Located in downtown Riverside, this facility contains a total of 807 beds.

Southwest Detention Center: Located in the City of Murrieta, this facility contains 1,111 beds.

Indio Jail: Located in Indio, the jail contains 353 beds.

Larry D. Smith Correctional Facility: Located in the City of Banning, this facility contains 1,520 beds.

Blythe Jail: Located in the City of Blythe, this jail contains 115 beds.

The County of Riverside has also established a number of juvenile detention facilities, operated by the Probation Department, including:

Riverside Juvenile Hall: Located in the City of Hemet at 3933 Harrison Street. The Riverside Youth Academy, a juvenile youth camp that shares kitchen and other support elements, but operates as a separate entity with unique programming is also located at this site.

Indio Juvenile Hall: Located in the City of Indio at 47-665 Oasis Street. The Indio Youth Academy, a juvenile youth camp that shares kitchen and other support elements, is also located at this site.

Southwest Juvenile Hall: Located in the City of Murrieta at 30755C Auld Road.

Twin Pines Ranch: A juvenile camp located near the City of Banning at 49500 Twin Pines Road.

Van Horn Youth Center: A juvenile camp located in the City of Riverside at 10000 County Farm Road.

According to data published by the County of Riverside in its "Financial Highlights (Fiscal Year 2008-2009)," within Riverside County the Sheriff's Department responded to 302,400 service calls within unincorporated Riverside County, booked just over 62,000 people and managed a coroner case load of nearly 9,600.

For future planning purposes, according to EIR No. 441 for the 2003 RCIP General Plan, the Riverside County Sheriff's Department has established the following criteria for its staffing requirements in unincorporated areas of Riverside County:

- One sworn officer per 1,000 population
- One supervisor and one support staff employee per seven officers
- One patrol vehicle per three sworn officers
- One school resource officer per school

B. Policies and Regulations Addressing Law Enforcement Services

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval.

1. County Regulations

Ordinance No. 556 - Authorizing Arrest and Citation for Violations of Statute or County Ordinance: This ordinance establishes that "certain classifications of officers and employees of the County of Riverside" are authorized with police powers to arrest persons in relation to misdemeanor or infraction violations of Riverside County statutes or ordinances, pursuant to California Penal Code Section 836.5.

Ordinance No. 469 - Relating to Training Standards for Peace Officers: This ordinance sets County of Riverside standards for the recruitment and training established by the Commission on Peace Officer Standards and Training, or Board of Corrections.

2. Existing Riverside County General Plan Policies

Although the General Plan does not include a Public Services Element, it does include the following Land Use (LU) Element policies intended to address the effects of future residents on law enforcement (Sheriff) protection services.

Policy LU 5.2: Monitor the capacities of infrastructure and services in coordination with service providers, utilities, and outside agencies and jurisdictions to ensure that growth does not exceed acceptable levels of service.

Policy LU *10.1* (Previously LU 9.1): Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities.

3. Proposed New or Revised Riverside County General Plan Policies

The following revision to this existing General Plan policy is included as part of GPA No. 960. The revision is intended to enhance the policy's implementation and comprehensive use.

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and sheriff services, such as libraries, recreational facilities, educational and ~~child~~ day care centers ~~(i.e. infant, toddlers, preschool and school age children),~~ transportation systems and fire/police/medical services.

4. County Law Enforcement Provision Standards

According to the County Sheriff's Department, the service criteria used by the County of Riverside and State of California to determine the level of personnel or capacity of correctional facilities is listed below.

Community Policing: For community policing efforts, the County Sheriff's Department attempts to maintain a ratio of one deputy per 1,000 population.

Correctional Facilities: The capacity of the prison system is occupancy capacity, which is set by federal court order. The order provides that the County of Riverside cannot run the correctional system at more than 90% capacity. As such, the facilities are always at capacity and are projected to remain at capacity. However, the Sheriff's Department indicates that there is a continuous turn-over in the prison population and the number of inmates remains relatively constant.

The County of Riverside requires the payment of developer mitigation fees prior to the final inspection by the Building and Safety Department for any residential dwelling or mobile home installed on a permanent foundation. The fees are for the construction and acquisition of public facilities. The Sheriff's Department's ability to support the needs of future growth is dependent upon their financial ability to hire additional deputies. In addition, a growing population would require that the Sheriff's Department secure sites for and construct new detention facilities on a timely basis.

C. Thresholds of Significance for Law Enforcement Services

The proposed project would result in a significant impact on law enforcement services if it would:

Result in substantial adverse physical impacts associated with the provision of new or physically altered law enforcement facilities. Or, result in the need for new or physically altered law enforcement facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any law enforcement services.

D. Effects of GPA No. 960 on the General Plan and Law Enforcement Services

The proposed update to the General Plan, GPA No. 960, includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in concentrated areas throughout Riverside County. As with the current General Plan, future development accommodated by GPA No. 960 will introduce people, property and structures into previously undeveloped areas; all of which would require adequate law enforcement and public safety services to ensure their protection and security.

The tables below summarize projected need for law enforcement services for three scenarios, as defined by the needed level of staffing and equipment deemed to represent an adequate level of service. Pursuant to Mitigation Measure 4.15.C of EIR No. 441, which was certified for the adoption of the 2003 RCIP General Plan, the following service ratios were applied to these scenarios:

- 1.5 Sworn Peace Officers per 1,000 population (0.5 officers greater than the standard service ratio)
- 1 Supervisory Officer and 1 support staff per every 7 sworn officers
- 1 Patrol vehicle per every 3 sworn officers

Table 4.17-H (Theoretical Law Enforcement Needs With and Without the Project) provides a summary of the *theoretical* needs for law enforcement staffing within Riverside County according to the theoretical estimate of need associated with existing land uses, as well as that for build out of the known spatial components or locations addressed by GPA No. 960 (i.e., site-specific LUD changes, policy area and study area changes, etc.). It should be noted that the following projections are based on the assumption that *all* of the changes proposed under GPA No. 960 actually result in future development and fully build out (as part of overall implementation of the Riverside County General Plan). That is, it is a theoretical, worst-case scenario that likely over-states the actual development potential in the real world. The actual future development of the individual parcels and areas affected by GPA No. 960 proposals, as with build out of the rest of the General Plan, are subject to the discretion of many hundreds to thousands of individual property owners, including private individuals, business entities and even various public agencies and other entities.

For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), specific effects on law enforcement needs cannot be delineated at present since they are location-dependent. For the sake of comparison, however, Table 4.17-J (Theoretical Law Enforcement Needs at General Plan Build Out) shows the theoretical law enforcement needs at build out for both the current General Plan and the General Plan as it would be if amended pursuant to proposed GPA No. 960.

The tables below summarize projected theoretical need for law enforcement staffing, as an indicator of the need for law enforcement and protection services, for three scenarios. Again, these calculations are all labeled "theoretical" because they use the same basic set of assumptions and factors to allow for valid comparisons between and amongst scenarios. In the real world, a number of additional factors that are beyond the scope of this analysis would apply (funding availability, jurisdiction, available manpower and equipment, etc.). The actual planning, locations and development of Sheriff's substations and the provision of all associated services is under the purview of the Riverside County Sheriff.

Table 4.17-H shows demand associated with the existing (baseline) level of development currently estimated to be present on the portions of Riverside County directly affected by proposed land use-related changes; compared against the full build out of all of the same areas as they would be permitted under the updated General Plan (e.g., pursuant to the changes proposed in GPA No. 960).

In addition, to focus on the areas where the proposed project would actually result in *new* development potential (i.e., potential impacts), a second scenario was developed. As shown in Table 4.17-I (Theoretical Law Enforcement Needs for New Development Potential Area), this second scenario includes only those areas proposed for a change that would result in an increase in future development density or intensity. This also includes all parcels in which an LUD was changed (except those being assigned to OS-CH due to their acquisition for open space conservation pursuant to the WRC-MSHCP; these parcels would be removed from development potential).

Lastly, the third table, Table 4.17-J, shows a "plan-to-plan" comparison between the build out conditions of the General Plan as it currently exists and then as it would be if GPA No. 960 were approved and fully implemented. This third table indicates the relative effects of the project on long-range planning, rather than environmental impacts per se, and is provided for informational purposes and to allow comparison between build out outcomes.

Table 4.17-H: Theoretical Law Enforcement Needs With and Without the Project

Staffing Item	Generation Factors	Associated with Existing Land Uses	GPA No. 960 Build Out	
		Total Staffing Needed[2]	Total Staffing Needed[2]	Difference
	Population[1]	***16,520 persons***	***46,370 persons***	***+ 29,840 people***
Sworn Officers	1.5 per 1,000 persons population[3]	24.8	69.5	+ 44.7 officers
Supervisors	1 per 7 officers	3.5	10.0	+ 6.5 staff
Support Staff	1 per 7 officers	3.5	10.0	+ 6.5 staff
Patrol Vehicles	1 per 3 officers	8.3	23.2	+ 14.9 vehicles
	STAFFING TOTALS	**31.9 personnel**	**89.4 personnel**	**+ 57.6 personnel**

Footnotes:

1. Theoretical population estimated for the land uses associated with the 111,440-acre area of known spatial project changes. Populations calculated as per General Plan Appendix E-1 standards. See Section 4.1 (Environmental Assumptions and Methods) for more information. All results rounded to the nearest 10 for dwelling units (du) and nearest tenth for staffing needs.
2. This is the theoretical need for Sheriff services associated with the given level of development indicated in each of the two population scenarios. The Sheriff's Department determines and implements actual needs.
3. Although the stated planning standard reported by the Sheriff's Department is 1.0 officers per 1,000, EIR No. 441 includes Mitigation Measure 4.15.C, which specifies the use of the 1.5-officer standard for new development mitigation purposes. Hence, this value is used herein for both scenarios.

Table 4.17-J: Theoretical Law Enforcement Needs at General Plan Build Out

Staffing Item	Generation Factors	Existing General Plan	GPA No. 960	
		Total Staffing Needed[2]	Total Staffing Needed[2]	Difference
	Build Out Population[1]	***1,736,700 persons***	***1,599,000 persons***	***- 137,800 persons***
Sworn Officers	1.5 per 1,000 persons population[3]	2,600	2,400	- 200 Officers
Supervisors	1 per 7 officers	370	340	- 30 Supervisors
Support Staff	1 per 7 officers	370	340	- 30 Supp. Staff
Patrol Vehicles	1 per 3 officers	870	800	-70 vehicles
	STAFFING TOTALS	**3,350 personnel**	**3,080 personnel**	**- 260 personnel**

Footnotes:
1. Build out scenario populations for the unincorporated county. See Section 4.1 for more details on projection methods and assumptions. Populations rounded to nearest 100. All others rounded to nearest 10.
2. The theoretical total for law enforcement staffing estimated to be needed at build out of the Riverside County General Plan (current and as proposed for amendment). As of 2009, Riverside County had 2,300 sworn peace officers.
3. Although the stated planning standard reported by the Sheriff's Department is 1.0 officers per 1,000, EIR No. 441 includes Mitigation Measure 4.15.C, which specifies the use of the 1.5-officer standard for new development mitigation purposes. Hence, this value is used herein.

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Law enforcement service standards from EIR No. 441.

As shown in the plan-to-plan comparison in Table 4.17-J, at build out, the project would result in a net decrease in the overall number of Sheriff's Department personnel needed throughout Riverside County when compared to build out of the existing General Plan. Staffing needs would require 260 fewer personnel, including 200 fewer sworn peace officers than what had been previously forecast for General Plan build out. Although the Riverside County Sheriff's Department did not provide generation factors for detention facilities, as with the other population-dependent calculations, it can be reasoned that a similar reduction in the need for such facilities would occur.

Thus, on a comparative basis, the proposed project would result in less impact on the environment due to a reduced need for Sheriff stations and detention facilities. Such a reduced need would be reflected in any of several ways, including through a reduction in the capacity needed within existing detention facilities; by delaying the need for construction of new detention facilities; or, by reducing the size of new detention facilities constructed.

In terms of future development, however, as indicated in Table 4.17-H, future development accommodated by the project would introduce a total of just under 30,000 new residents to Riverside County. These residents

would trigger the need for a total of approximately 58 additional law enforcement personnel, including 45 sworn officers, as well as 15 additional patrol vehicles. This total represents demand across Riverside County, however. The actual increases would be spread throughout the 19 Area Plans of unincorporated Riverside County, plus the remainder area of eastern desert not in an Area Plan. As such, the adverse effects on any single area would be small to negligible. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary services.

Table 4.17-I isolates just the areas of growth associated with GPA No. 960 that would potentially be greater than that originally planned under the existing General Plan. This enables to see changes that differ from the background levels already planned for under the existing General Plan. Once these areas are removed, the resultant scenario indicates that the future new development potential arising from GPA No. 960 would specifically result in the need for an additional 20 officers and 6 staff personnel. To determine where in Riverside County these personnel would be needed, this data was further broken down by Area Plan.

This analysis indicated that statistically, the Elsinore Area Plan would need approximately 7 additional law enforcement personnel (6 officers, 1-2 staff) as a result of GPA No. 960, due primarily to future development of the proposed Meadowbrook and Good Hope Rural Village Land Use Overlays. The LUD changes associated with achieving ALUP consistency around the Blythe Airport would necessitate roughly 5 additional personnel (roughly 4.5 officers, 1 staff) within the Palo Verde Valley Area Plan. The Jurupa, Mead and Western Coachella Valley Area Plans would see an increase in staffing needs of about 2-3 officers and 1 staff each. These are all due to the various Riverside County-initiated LUD changes proposed under GPA No. 960, plus the LUDs being adjusted within the Jurupa Area Plan to ensure consistency with the Flabob and Riverside Municipal Airport ALUPs. Lastly, the San Jacinto Valley Area Plan would see its staffing needs go up by roughly one officer.

E. Law Enforcement Services – Impacts and Mitigation

The following impacts related to law enforcement that would result from implementation of the project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered law enforcement facilities? Or, would it result in the need for new or physically altered law enforcement facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any law enforcement services?

Impact 4.17.B – Cause Adverse Environmental Effects Due to The Need for Law Enforcement Services: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and industrial development, as well as the associated population, expected to occur within Riverside County over the next 50 years. In terms of changes to existing levels of service, however, localized development increases would incrementally create demand for additional law enforcement personnel and services in specific areas, such as the Elsinore and Palo Verde Valley Area Plans. None of these increases, however, would trigger the need for new or improved facilities in order to meet the additional demand. The additional personnel (officers, supervisors and support staff), equipment and vehicles necessary could readily be accommodated at existing facilities. Therefore, the project would not have a significant adverse effect on law enforcement services due to the need to construct new facilities. Moreover,

compliance with a variety of existing regulatory programs and General Plan policies would further prevent or reduce any impacts to law enforcement service associated with the project.

1. Analysis of Impact 4.17.B

New development would introduce additional people and property requiring law enforcement and emergency response services. This would result in additional enforcement calls and emergency responses from existing facilities by existing staff. When new development is located outside the normal radius for acceptable response time (defined by the Sheriff's Department as being typically within 5 minutes), people and property would be at increased risk due to delayed response. Law enforcement (Sheriff's Department) vehicles and equipment responding would experience increased wear and tear due to additional distances traveled. Increased travel times would also decrease the number of calls that can be handled during a shift. When demand is great enough in a given region, an additional Sheriff's station would be built. However, in areas where development remains sparse, response times would not be likely to drastically increase. Hence, future development in areas distant from existing or planned Sheriff's stations would be at greater risk of harm due to longer response times.

As shown in Table 4.17-J, above, existing standards indicate that full build out of the existing General Plan would accommodate a population of over 1.7 million people within unincorporated Riverside County. To protect and serve this population, the Sheriff's Department would require an estimated total of 2,600 sworn officers, plus 370 supervisors and a similar number of support staff, plus 870 patrol vehicles. On a plan-to-plan basis, the land use changes associated with GPA No. 960 would mean a reduction in the expected population of Riverside County at capacity of nearly 138,000 people (to roughly 1.6 million) and require roughly 200 fewer sworn officers. Supervisors, support staff, patrol vehicles, equipment and facility needs would be similarly reduced. Similarly, the need for law enforcement facilities, including Sheriff's stations and detention facility space (beds), would also be reduced (by about 6%) compared to those originally forecast. Accordingly, environmental impacts associated with construction of new or improved facilities would be avoided or postponed.

In terms of changes from baseline conditions at the Area Plan level, as shown in Table 4.17-I, GPA No. 960 would accommodate increased future development potential that would increase Riverside County's population by roughly 13,000 people, spread widely throughout Riverside County, but with concentrations in several areas plans, such as Elsinore and Mead. These increases would require roughly 20 additional sworn officers (an increase of less than 1%), three additional supervisors and a similar number of additional support staff, as well as 6-7 additional patrol vehicles. As discussed previously in Section 4.17.3-D, regional (area plan) analysis indicates that the increase would be negligible to non-existent for much of Riverside County and small (7 or fewer) for the few portions of Riverside County experiencing localized increases. Because these increases are less than 1% of existing levels, it is predicted that the future development accommodated by GPA No. 960 would not result in significant adverse impacts on acceptable service ratios or response times.

Where additional staff is needed, increases could be offset through reassignment of resources, for example from areas not growing as quickly. As local increases are small, the additional personnel (officers, supervisors and support staff), equipment and vehicles necessary could be readily accommodated at existing facilities. None of these staffing increases would trigger need for new or improved facilities in order to meet increased demands. Also these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of services as demand arises.

Hence, the proposed project, GPA No. 960, would not result in any substantial adverse physical impact on the environment resulting from the need to provide new or physically altered law enforcement facilities. Project impacts on law enforcement services would be less than significant. No project-specific mitigation is needed.

Existing regulatory programs, such as those outlined in existing EIR No. 441, as well as herein, for example, would also further reduce or avoid impacts to law enforcement services and further enhance public safety.

2. Regulatory Compliance for Impact 4.17.B

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, policies and existing mitigation measures from prior EIR No. 441 would further reduce or minimize this already insignificant impact.

a. Compliance with Existing County General Plan Policies

Land Use (LU) Policies LU 5.1, 5.2 and 10.1 from the existing Riverside County General Plan would further reduce the already insignificant project impacts on law enforcement services. See Section 4.17.3.B for full text of each of these policies.

b. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.15.2A, B, C and D were imposed to ensure that "communities and large private facilities provide private security" and set specific levels of services for law enforcement services to ensure impacts to law enforcement services are less than significant. Although the potential impacts of this project, GPA No. 960, are already less than significant, these measures were programmatic in nature and thus remain applicable to this project.

Existing Mitigation Measure 4.15.2A: The County of Riverside shall require as a part of the development review process, proponents of new businesses, recreational and commercial land uses such as shopping centers, health clubs, large hotels over 200 rooms, convention centers and commercial recreational activities to provide onsite security.

Existing Mitigation Measure 4.15.2B: The TLMA [Riverside County Transportation and Land Management Agency] shall inform the Riverside County Sheriff's Department of the existence of all new homeowner's associations within the county. The Riverside County Sheriff's Department shall coordinate with homeowner's associations to establish a Neighborhood Watch Program.

Existing Mitigation Measure 4.15.2C: Riverside County shall meet and maintain a goal of 1.5 sworn officers per 1,000 population, as recommended by the International City Managers' Association.

Existing Mitigation Measure 4.15.2D: The County [of Riverside] shall require the development applicant to pay the [Riverside] County Sheriff's established development mitigation fee prior to issuance of a certificate of occupancy on any structure as they are developed. The fees are for the acquisition and construction of public facilities.

F. Law Enforcement Services – Level of Significance After Mitigation

The analysis presented above indicates that future development accommodated by the proposed project, GPA No. 960, would have less than significant impacts on law enforcement services. In addition, compliance with the above-listed existing regulatory programs, standards, General Plan policies and existing Mitigation Measures

4.15.2A through 4.15.2D from EIR No. 441, would further prevent or reduce any impacts associated with the project.

4.17.4 Solid Waste Management

A. Solid Waste Management – Existing Environmental Setting

1. Solid Waste Facilities

The following section discusses the active landfills, transfer stations, diversion and recycling programs that currently serve the unincorporated area's solid waste disposal service needs. Figure 4.17.4 (Landfill Locations) shows the location of active landfills within unincorporated Riverside County. Table 4.17-K (Solid Waste Disposal Facilities in Riverside County), below, identifies the primary landfills within Riverside County, as well as those that are either inactive or open limited times.

The Riverside County Waste Management Department (RCWMD) is responsible for the efficient and effective landfill disposal of non-hazardous county waste. To accomplish this, the RCWMD operates six active landfills and administers a contract agreement for waste disposal at the private El Sobrante Landfill. The Department also oversees several transfer station leases, as well as a number of recycling and other special waste diversion programs. As all of the private haulers serving unincorporated Riverside County ultimately dispose of their waste to Riverside County-owned or contracted facilities, they are not further discussed separately here. Rather, the waste they transport to Riverside County landfills (plus El Sobrante) are included in the data discussed here.

All of the active landfills currently located in Riverside County are rated as Class III landfills according to Title 27 of the California Code of Regulations (CCR). Such landfills only accept nonhazardous, municipal solid wastes. Franchise solid waste collection companies are granted permits to collect commercial and residential waste throughout unincorporated Riverside County under Riverside County's general operating authority. These companies are regulated by the Riverside County Department of Environmental Health (RCDEH). In addition, County landfills accept wastes collected in incorporated cities. Within these cities, solid wastes are either collected by the city as a municipal service or are collected by private firms pursuant to a franchise agreement with the city. As part of its long-range planning and management activities, the RCWMD also ensures that Riverside County has a minimum of 15 years of capacity, at any time, for future landfill disposal.

The RCWMD reports that in the past, trash was disposed of in 'dumps' and either burned or buried in a hole. Over time, stringent regulations have been enacted to ensure that landfills are designed, operated, monitored and ultimately closed in a safe and sanitary manner to protect the communities in which they are located. After a landfill closes, the site is capped and continues to be monitored for landfill gas and groundwater quality for a minimum of 30 years. In this manner, in addition to active landfills, the RCWMD also maintains closed landfills and historic 'dump sites' within Riverside County. The RCWMD is involved in the closure and post-closure of 30 disposal sites, requiring in some cases construction, monitoring and/or maintenance activities. Closed landfills are discussed in Section 4.13 (Hazards and Hazardous Materials), rather than here, as they are no longer an active solid waste disposal resource.

All of Riverside County's sanitary landfills accept normal solid wastes, household refuse and yard trimmings as well as furniture, household appliances, televisions and computers, and other electronic wastes. The following are not allowed to be disposed of in any of Riverside County's sanitary landfills: hazardous wastes, household

hazardous wastes (i.e., cleaners, pesticides, pool chemicals, paints, aerosol cans, etc.), explosives or ammunition, untreated medical or infectious wastes (including sharps) or items containing asbestos (such as some floor tile and roofing materials).

Solid waste not dumped directly in a landfill is deposited temporarily in several transfer stations throughout Riverside County. Table 4.17-K identifies the transfer stations serving Riverside County. The region's transfer stations play a vital role in accommodating throughput to landfills, serving as collection and separation points for solid waste and recyclables. Transfer stations also help reduce traffic congestion and provide flexibility for hauling waste to distant landfills or processing plants outside the region when appropriate.

The County of Riverside also operates separate collection facilities for household hazardous wastes (HHW) and offers free one- and two-day HHW collection events throughout the year to provide residents with an environmentally safe way to properly dispose of or recycle their HHW. As defined by the State Health and Safety Code, HHW are hazardous wastes generated incidentally to the owning and maintaining of a residence. They do not include hazardous wastes generated by commercial, industrial or medical uses, even if such use occurs in a residence. Common types of HHW include certain paints, cleaners, stains and varnishes, car batteries, motor oil, lawn and pool chemicals and pesticides that are unused or leftover consumer products. Fluorescent bulbs, ballasts and fire extinguishers may also be disposed of as HHW. HHW also includes sharps and needles, if properly contained.

Improper disposal of these materials (such as in the regular trash or down a storm drain) can be hazardous to people and the environment, as well as potentially illegal. Items that are not accepted at the HHW facilities include: business, non-profit or out-of-county hazardous waste, explosives and ammunition, radioactive materials, asbestos, appliances, tires, containers larger than five gallons and compressed gas cylinders weighing over 40 pounds. For any of these types of wastes, special arrangements must be made for their disposal.

In addition to the HHW facilities, there are three regional ABOP facilities within the county. One operated by RCWMD; the other two by Burrtec, a private waste company. ABOP stands for "antifreeze, batteries, oil and paint," the four most common types of HHW. The facilities accept ABOP, which includes oil filters and paint, but only latex. They do not accept any other types of HHW. For automotive oil and filters, there are also Certified Used Oil Collection Centers throughout California that accept used vehicle oils of 5 gallons or less, often for free.

Hazardous waste that inadvertently enters Riverside County landfills is handled through a Load Check Program, which consists of random waste load inspections, temporary storage of any discovered/recovered hazardous waste at the Lamb Canyon's central accumulation facility and removal of the accumulated hazardous waste by a licensed hazardous waste hauler for recycling and disposal.

2. Existing Landfill Capacities and Waste Volumes

In general, waste originating from anywhere within Riverside County may be accepted for disposal at any of Riverside County's sites. In practice, to minimize truck traffic and vehicular emissions, each landfill has a service area, as follows:

Table 4.17-K: Solid Waste Disposal Facilities in Riverside County

Facility	Location	Hours [1]	Operator
Primary Riverside County Landfills			
Badlands Sanitary Landfill	31125 Ironwood Ave., Moreno Valley	M - Sa, 6 am - 4:30 pm	Riv. Co. Waste Management Dept.
Blythe Sanitary Landfill	1000 Midland Road, Blythe	M – F and 1st Sat of each month, 8 am - 4 pm	Riv. Co. Waste Management Dept.
Desert Center Sanitary Landfill	17991 Kaiser Road, Desert Center	2 days per year: 1st Thurs of Feb & Aug, 8 am - 4:30 pm	Riv. Co. Waste Management Dept.
El Sobrante Sanitary Landfill	10910 Dawson Canyon Road, Corona	M - Sat, 6 am - 6 pm	Privately owned: Waste Mngmnt Inc.
Lamb Canyon Sanitary Landfill	16411 Lamb Canyon Road, Beaumont	M - Sat, 6 am - 4:30 pm	Riv. Co. Waste Management Dept.
Mecca II Sanitary Landfill	95250 66th Avenue, Mecca	2 days per year: 2nd Sat of April & Oct, 8 am - 4:30 pm	Riv. Co. Waste Management Dept.
Oasis Sanitary Landfill	84-505 84th Avenue, Oasis	2 days per week: Wed & Sat, 8 am - 4:30 pm	Riv. Co. Waste Management Dept.
Transfer Stations / Collection Centers [2]			
Robert A. Nelson Transfer Station	1830 Agua Mansa Road, Riverside	M - F, 7 am - 6 pm; Sat, 7 am - 4:30 pm; Sun, 8 am - 3 pm	Burrtec
Anza Transfer Station	40329 Terwilliger Rd, Anza	Thurs - Mon, 8 am - 4:30 pm	Waste Mngmnt, Inc.
Coachella Transfer Station	87-011 Landfill Road, Coachella	M - F, 8 am - 5 pm; Sat, 8 am - 12:00 pm	Burrtec
Idyllwild Transfer Station	28100 Saunder Meadow Rd., Idyllwild	Thurs - Mon, 8 am - 4:30 pm	Waste Mngmnt, Inc.
Pinion Flats Transfer Station	Pinion Flats Road, Pinion Flats	Su - M, 9 am-1 pm; Th, 7-11 am; F, 1:30-5:30 pm; Sat, 8 am - 4 pm	Waste Mngmnt, Inc.
Edom Hill Transfer Station	70-100 Edom Hill Road, Cathedral City	M - Sat, 7:30 am – 5 pm; Sun, 1 pm - 5 pm	Burrtec
Moreno Valley Transfer Station	17700 Indian St., Moreno Vlly	M - F, 8 am - 5 pm	Waste Mngmnt, Inc.
Perris Transfer Station	1706 Goetz Road, Perris	M - F, 7 am - 6 pm	CR&R
Household Hazardous Waste (HHW) Collection Facilities			
Palm Springs Regional Permanent HHW Collection Facility	1100 Vella Road, Palm Springs	Oct. thru May: Sat, 9 am - 2 pm; June thru Sept: Sat, 7 am - Noon	Co. residents only. Accepts e-waste.
Lake Elsinore Regional Permanent HHW Collection Facility	521 N. Langstaff Street, Lake Elsinore	1st Sat of each month, except Dec., 9 am - 2 pm	Co. residents only. Accepts e-waste.
Agua Mansa Regional Permanent HHW Collection Facility	1780 Agua Mansa Road, Riverside	Sat., 9 am - 2 pm	Co. residents only. Accepts e-waste.
Regional ABOP Collection Facilities [3]			
Murrieta Area Regional ABOP Collection Facility	County Road Yard, 25315 Jefferson Ave., Murrieta	Sat., 9 am - 2 pm	Riv. Co. Waste Management Dept.
East Coachella Valley Area Regional ABOP Collection Fac.	Coachella Vlly Transfer Stn., 87-011A Landfill Rd, Coach.	M - F, 8 am - 5 pm; Sat, 8 am - Noon	Burrtec
North-West Coachella Valley Area Regional ABOP Coll. Fac.	Edom Hill Transf Stn, 70-100 Edom Hill Rd, Cathedral City	Sat., 8:30 am – 4:30 pm	Burrtec

Footnotes:
1. Note, any of these facilities may be closed without warning due to rain, snow, excessive winds or other hazardous conditions at Riverside County's discretion. Landfills are also closed on various holidays.
2. All privately owned or operated on Riverside County land. Operators listed in far-right column.
3. "ABOP" stands for "Antifreeze, Battery, Oil (and Filter) and Paint (Latex)."

RIVERSIDE COUNTY PLANNING DEPARTMENT

LANDFILL LOCATIONS

This page intentionally left blank

Badlands: The local service area for the Badlands Landfill is generally considered to include the City of Moreno Valley and surrounding cities and unincorporated communities. The landfill accepts residual waste from the Robert A. Nelson Transfer Station/Materials Recovery Facility, which primarily serves the City of Riverside. As a regional disposal facility, the landfill is also permitted to receive waste from the cities and unincorporated communities of the Coachella Valley in the eastern portion of Riverside County.

Blythe: The Blythe Sanitary Landfill receives solid waste for disposal from the East Riverside County service area, generally considered to include the City of Blythe and the unincorporated communities of Chiriaco Summit, Colorado River Communities, Colorado River Indian Tribe, Desert Center, Eagle Mountain, Lake Tamarisk, Mesa Verde and Ripley.

Desert Center: The Desert Center Sanitary Landfill serves the communities of Eagle Mountain, Desert Center and Lake Tamarisk.

El Sobrante: The local service areas for the El Sobrante Landfill typically include cities/communities within southwestern Riverside County, as well as multiple jurisdictions within the counties of Los Angeles, Orange, San Bernardino and San Diego. Located near the center of the highly populated western third of Riverside County, according to Waste Management, Inc., the landfill's operator, it processes approximately 43% of Riverside County's annual waste.

Lamb Canyon: The local service areas for the Lamb Canyon Landfill typically includes the cities of Beaumont, Banning, San Jacinto and Hemet, and the unincorporated communities of Pine Cove, Cherry Valley, Cabazon, Idyllwild, Homeland, Romoland and Winchester. In addition, this landfill receives waste from the entire Coachella Valley through the Edom Hill and Coachella Valley Transfer Stations.

Mecca II: The Mecca II Sanitary Landfill services the Coachella Valley communities of Mecca, Oasis, North Shore and Thermal.

Oasis: The Oasis Sanitary Landfill services the Coachella Valley communities of Mecca, Oasis, North Shore and Thermal.

All RCWMD sites have the potential for expansion. Currently, the Lamb Canyon Landfill is in the design and permitting stage for its next expansion (Phase 3), which is estimated to provide capacity for additional 30-plus years beyond the estimated closure date of 2021. The closure dates listed for RCWMD sites are estimated dates and subject to change based on actual tonnage received and any future RCWMD re-permitting activities. The specific operational details, such as daily, yearly and lifetime capacities, intake volumes and estimated closure dates, are provided in Table 4.17-L (Active Landfills in Riverside County) for each active landfill serving Riverside County.

Table 4.17-L: Active Landfills in Riverside County

Active Landfills [1] (days per year open)	Permitted Daily Capacity (tons/day)	Current Design Capacity [4] (tons)	Year 2010 Average Intake (tons/day)	Year 2010 Total Intake (tons)	Year 2010 Remaining Capacity [5, 7] (tons)	Estimated Landfill Closure Date
Badlands (open 310 days/yr)	4,000	17,619,521	1,667	516,676	8,987,467	2024
Blythe (open 269 days/yr)	400	1,930,912	60	16,256	1,289,543	2047
Desert Center (open 2 days/yr)	60	58,516	17	34	18,045	2018

Active Landfills [1] (days per year open)	Permitted Daily Capacity (tons/day)	Current Design Capacity [4] (tons)	Year 2010 Average Intake (tons/day)	Year 2010 Total Intake (tons)	Year 2010 Remaining Capacity [5, 7] (tons)	Estimated Landfill Closure Date
El Sobrante [2] (open 311 days/yr)	5,000 [3]	52,320,000	2,201	680,086	N/A[2]	2045 [3]
Lamb Canyon (open 311 days/yr)	5,000	15,646,000	1,703	529,744	8,647,603	2021
Mecca II (open 2 days/yr)	400	229,427	1.5	3	1,332	2037
Oasis (open 103 days/yr)	400	247,411	14	1,407	69,275	2021
Totals	**88,051,787 tons**		**1,744,206 tons**		**19,013,265 tons** [2]	

Footnotes:
1. All listed active landfills, except for El Sobrante, are public facilities owned and operated by Riverside County.
2. El Sobrante Landfill is the only private landfill in the county and is owned and operated by USA Waste of California, a subsidiary of Waste Management, Inc. It is permitted to receive out-of-county waste. The data in the above table represent *only* the in-county portion of the landfill's waste capacity permitted and received that is readily available to the County of Riverside. The rest of the data should be obtained directly from the landfill operator.
3. Based on the current SWFP, El Sobrante is authorized to receive up to 70,000 tons per week, with a daily tonnage limit of 16,054 tons. It is projected to close in 2045. Pursuant to the Second Amendment to the Second Landfill Agreement between the County of Riverside and the landfill owner, a maximum of 52.32 million tons of the landfill's design capacity and 5,000 tons of the permitted daily capacity are reserved for in-county waste.
4. Current design capacity data as of June 30, 2010, based on the latest JTDs and 2010 GASB Report.
5. Year end remaining capacity estimates for Riverside County-owned landfills were derived from the estimates in the 2010 GASB and tonnage data from site info.
6. Estimated closure dates are projections published in the current permitting documents, i.e., RDSI/JTDs. These projections rely not only on landfill capacity design, but also on the economy, which affects waste generation and disposal quantities. Therefore, they are regularly re-evaluated internally for planning purposes.
7. This landfill data is subject to minor system-wide adjustments up to one year after reporting.

Source: Governmental Accounting Standard Board Report, 2010. Riverside County Waste Management Dept., 2011.

The 15-year projection of disposal capacity is prepared each year by the RCWMD as part of the annual reporting requirements for the Countywide Integrated Waste Management Plan (CIWMP). The most recent 15-year projection submitted to the State Integrated Waste Management Board by the RCWMD is shown in Table 4.17-M (Fifteen-Year Disposal Capacity Projections for Riverside County). Riverside County's projection is disposal-based, accounting for both growth in disposal needs or demand (4% per year) and diversion requirements.

Table 4.17-M: Fifteen-Year Disposal Capacity Projections for Riverside County

Year End	Countywide Disposal [1]	Countywide Remaining Capacity [1, 2]	Additional Capacity Needed [3]
2009	2,433,709	77,395,297	0
2010	2,462,691	74,932,606	0
2011	2,561,968	72,370,638	0
2012	2,665,251	69,705,387	0
2013	2,772,701	66,932,686	0
2014	2,884,485	64,048,201	0
2015	3,000,781	61,047,420	0
2016	3,121,768	57,925,652	0
2017	3,247,638	54,678,014	0
2018	3,378,586	51,299,428	0
2019	3,514,818	47,784,610	0
2020	3,656,548	44,128,063	0
2021	3,054,895	40,370,193	0
2022	3,146,167	36,507,762	0
2023	3,894,403	32,613,360	0
2024	4,051,734	28,561,626	0

Footnotes:
1. Disposal and Remaining Capacity figures for 2009 are measured values and those for the rest of the projection years are growth estimates. Countywide remaining capacity was based on 2009 landfill data reported to the State (CalRecycle) in accordance with GASB standards. Disposal figures for 2009 do not include out-of-county tonnage received at El Sobrante Landfill.

2. A Second Amendment to the Second Lease Agreement for the El Sobrante Landfill operation became effective with the issuance of a revised Solid Waste Facility Permit in Sept. 2009, whereby approximately 5 million tons was added to the county disposal capacity reserve. The added capacity is due to airspace (volume) gained from effective refuse compaction, not from literal expansion beyond current permitted boundaries.
3. The Riverside County waste disposal system, with the added capacity at the El Sobrante Landfill in late 2009 and at current disposal rates, would be able to meet disposal needs until mid-2030. Moreover, this countywide capacity reserve would be further expanded by an additional 614,000 tons per year, should the Eagle Mountain Landfill become operative. Most importantly, significant expansion potential exists beyond current refuse disposal footprints at the Badlands and Lamb Canyon Landfills.

Source: Riverside County Waste Management Dept., 2009 Annual Report, Appendix E-1, July 2010.

3. Recycling

Commercial and residential municipal solid waste (MSW) is delivered to Riverside County landfills by both waste hauling companies and self-haulers. Within the unincorporated portion of Riverside County, the waste-hauling companies operate under franchise agreements with the RCDEH. These agreements require haulers to implement residential curbside recycling programs and some commercial recycling. Within the cities, solid waste is either collected by the city itself or by a waste hauler under a franchise agreement with the city. The cities or their haulers carry out similar source reduction and recycling programs. In its 2009 Annual Report to the State of California, the RCWMD reported that in 2008, hauler programs diverted over 18,000 tons of recyclable materials and Riverside County franchise haulers also collected nearly 30,000 tons of curbside green waste. To conserve landfill capacity and promote recycling, the RCWMD also operates several recycling programs at the Riverside County landfills. Metals, appliances and tires are some of the materials recycled through these programs. According to the RCWMD, in 2008 County landfills diverted nearly 1,500 tons of metal from appliances and other sources for recycling. Wood wastes are diverted to green/woody waste recyclers for processing into mulch and fuel. At the Colmac energy facility in the Coachella Valley, biomass is recycled as fuel to generate electricity (see Section 4.10 (Energy Resources) for more information on this program). In 2008, nearly 116,400 tons of wood waste was processed into fuel. In addition, clean green waste that has been ground by local green waste/woody waste recyclers is used for alternative daily cover (instead of soil) at landfills, with over 36,000 tons used at Riverside County landfills in 2008. The RCWMD also operates a construction and demolition waste diversion program to recycle and reuse materials such as concrete and asphalt. Of an estimated 920 tons of construction and demolition waste generated, 620 tons were diverted in 2008. A total of 520 tons of tires were also diverted from landfills. Through the HHW and ABOP efforts outlined previously, the County of Riverside kept nearly 650 tons of these wastes out of its sanitary landfills.

B. Policies and Regulations Addressing Solid Waste Management

1. Federal Regulations

Resource Conservation and Recovery Act (RCRA): This law was enacted in 1976 and is the principal federal law in the United States governing the disposal of solid waste and hazardous waste. The U.S. Environmental Protection Agency (US EPA) oversees waste management regulation pursuant to Title 40 of the Code of Federal Regulations. Under RCRA, however, states are authorized to carry out many of the functions of the federal law through their own hazardous waste programs and laws, as long as they are at least as stringent (or more so) than the federal regulations. Thus, CalRecycle manages the State of California's solid waste and hazardous materials programs pursuant to US EPA approval.

2. State Regulations

CalRecycle: This is the term the State of California uses for its Department of Resources Recycling and Recovery, formerly known as the California Integrated Waste Management Board (CIWMB). This state agency

performs a variety of regulatory functions pursuant to CCR Title 27 and other regulations. Among other things, CalRecycle set minimum standards for the handling and disposal of solid waste designed to protect public health and safety, as well as the environment. (See CCR Section 20050, for example). It is also the lead agency for implementing the State of California municipal solid waste program deemed adequate by the US EPA for compliance with RCRA.

California Integrated Waste Management Act (IWMA), AB 939: This act, Assembly Bill 939 (AB 939), was passed by the State Legislature in 1989 to reduce dependence on landfills for the disposal of solid waste and to ensure an effective and coordinated system for the safe management of all solid waste generated within California. With its passage, solid waste management practices were redefined to require California State's cities and counties to divert disposal of solid waste by 50% by the year 2000. It also required local governments to prepare and implement plans to improve waste resource management by integrating management principles that place importance on first reducing solid waste through source reduction, reuse, recycling and composting before disposal at environmentally safe landfills or via transformation (e.g., regulated incineration of solid waste materials). These plans must also be updated every five years.

Mandatory Diversion and Recycling, AB 341: Approved in 2011, this act amended the California Public Resources Code (Section 42649 *et seq.*) to address solid waste diversion (i.e., recycling) targets to decrease the amount of wastes going to landfills and thus extend their usable lives. AB 341 requires cities and counties, including Riverside County, to include source reduction, recycling and composting in their integrated waste management plans (IWMP). In addition, under AB 341 counties were required to "divert 50% of all solid waste from landfill disposal or transformation [e.g., incineration] by January 1, 2000, through source reduction, recycling and composting activities." By 2020, the target rises to "not less than 75% of solid waste." The RCWMD is responsible for implementing AB 341 in the unincorporated portions of Riverside County. The annual progress report on Riverside County's status towards attaining AB 341 requirements is also prepared by the RCWMD.

In addition to the above, the act also requires the County of Riverside (i.e., the RCWMD) to implement a commercial solid waste recycling program meeting specific elements outlined in the law. It sets new commercial solid waste recycling requirements. And, it also requires "commercial or public entities" that "generate more than 4 cubic yards of commercial solid waste per week" and "multifamily residential dwelling[s] of five units or more" to source separate recyclable materials and arrange for recycling services starting July 1, 2012.

3. County Regulations

As a variety of state and federal regulations exist to ensure that landfill operations minimize impacts to public health and safety, as well as the environment, an important part of the RCWMD's mission is to apply sound environmental practices to ensure compliance with these regulations. The RCWMD manages and oversees compliance with a variety of permits necessary for the operation of their active landfills in Riverside County. These include: solid waste facilities permits, waste discharge requirements, stormwater discharge permits and permits to construct and operate gas management systems and leachate collection systems. These permits are issued and enforced by multiple regulatory agencies, including CalRecycle, the South Coast Air Quality Management District (SCAQMD, which enforces air quality regulations) and the California Regional Water Quality Control Boards (which enforce water quality regulations and stormwater runoff controls). The RCDEH is the local enforcement agency (LEA) for CalRecycle. CCR Title 27 and SCAQMD Rule 1150.1 are the main regulations. In some cases, certain projects may also fall under the jurisdiction of the U.S. Army Corps of Engineers (for waters of the US), the U.S. Fish and Wildlife Service and/or the California Department of Fish and Wildlife (for protected plants, animals or habitats). The RCWMD also evaluates all projects for compliance with CEQA to ensure that any project that could have an impact on the environment is fully analyzed and that any significant impacts are mitigated to the fullest extent possible.

Countywide Integrated Waste Management Plan: The Countywide Integrated Waste Management Plan (CIWMP) was prepared in accordance with the California Integrated Waste Management Act of 1989, Chapter 1095 (AB 939), and is updated every five years. The CIWMP outlines and codifies the goals, policies and programs the County of Riverside and its cities are implementing to create an integrated and cost-effective waste management system that complies with the provisions of AB 939 and its diversion mandates. The CIWMP's components include the Countywide Summary Plan, the Countywide Siting Element, the Source Reduction and Recycling Element, the Household Hazardous Waste Element and Non-Disposal Facility Element. Each of these Elements address plans for both Riverside County and each of its cities. The Riverside Countywide Integrated Waste Management Plan was approved by the California Integrated Waste Management Board in September of 1996 and has subsequently been updated at five-year intervals as required by law.

The RCWMD is specifically charged with the responsibility of: 1) implementing programs that adhere to the goals, policies and objectives outlined in Riverside County's Source Reduction and Recycling Element (SRRE) to ensure that unincorporated Riverside County achieves 50% diversion of solid waste from landfill disposal; 2) implementing programs that adhere to the goals, policies and objectives outlined in Riverside County's Household Hazardous Waste Element to reduce the amount of HHW disposed within landfills; 3) continuing to meet the solid waste disposal needs of all Riverside County residents into the future; and 4) maintaining and updating the CIWMP and reporting to the CIWMB on Riverside County's progress in complying with AB 939.

The Countywide Siting Element addresses the need for Riverside County and its cities to identify, plan for and, eventually implement, adequate sites and space for the waste facilities needed over time. The Siting Element serves as a policy manual that outlines various strategies for meeting the disposal needs of all Riverside County residents and enabling the County of Riverside to provide a minimum of 15 years of disposal capacity at all times.

The RCWMD prepares an Annual Report each August that is submitted to CalRecycle. The Annual Report serves as a basis for determining if the Siting Element and Summary Plan should be revised to include additional disposal capacity, reflect new or changed local and regional solid waste management issues, or include new or changed goals and objectives. The Annual Report is reviewed by the State of California to determine if the County of Riverside is making progress toward meeting its goals and objectives. The CIWMP is also subject to a five-year review to assess if revision is necessary and to determine that Riverside County's waste management practices remain consistent with the hierarchy of waste management practices.

RCWMD Design Guidelines for Refuse and Recyclables Collection and Loading Areas: Part of the RCMWD Planning Section's review of land-use/development projects is to ensure adequate space is provided for collection of recyclables and that solid waste disposal capacity of Riverside County facilities is not overburdened. As such, most new development projects are required to provide refuse/recycling collection and loading areas, as well as submit a Waste Recycling Plan. Specifically, the County of Riverside requires recycling storage/collection areas provided within new commercial, industrial and multi-family developments. Development near or adjacent to a RCWMD facility may be subject to additional requirements or restrictions. These projects are addressed on a case-by-case basis. The Design Guidelines are intended to assist project proponents in identifying space and other design considerations for refuse and recyclables collection and loading areas per the California Solid Waste Reuse and Recycling Act of 1991. Compliance with the Guidelines is necessary for obtaining RCWMD clearance in order to obtain a building permit within unincorporated Riverside County. In addition, projects that have the potential to generate construction or demolition (C&D) waste are required to complete a County of Riverside Waste Recycling Plan (WRP) to identify the estimated quantity and location of recycling for C&D waste resulting from construction. As part of the WRP, a waste recycling report is required upon completion of project construction demonstrating the actual quantity of C&D waste recycled.

4. Existing Riverside County General Plan Policies

Although the General Plan does not include a Public Facilities Element, it does include a General Plan policy from the Land Use Element, LU 5.2, which addresses impacts related to solid waste generation, disposal and management.

Policy LU 5.2: Monitor the capacities of landfills in coordination with service providers, outside agencies and jurisdictions to ensure that projected growth does not exceed acceptable levels of service for landfills.

5. Proposed New or Revised Riverside County General Plan Policies

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and *child* day care centers ~~(i.e. infant, toddlers, preschool and school age children)~~, transportation systems, and fire/police/medical services.

Policy LU *31.2* (Previously 25.2): Protect major public facilities, such as landfill and solid waste *processing* ~~disposal~~ sites and airports, from the encroachment of incompatible uses.

C. Thresholds of Significance for Solid Waste Management

The proposed project would result in a significant impact on solid waste management if it would:

1. Be served by a landfill with insufficient permitted capacity to accommodate the project's solid waste disposal needs.

2. Impede or prevent compliance with federal, state or local statutes and regulations related to solid wastes, including the Countywide Integrated Waste Management Plan (CIWMP).

D. Effect of GPA No. 960 on the General Plan and on Solid Waste Management

The proposed update to the General Plan pursuant to GPA No. 960 includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in concentrated areas throughout Riverside County. As with the current General Plan, future development consistent with GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas. The resultant growth population (from new residential uses) and jobs and economic activity (from commercial, industrial and institutional uses) would result in a corresponding increase the amount of solid waste generated by these various uses, both during their construction (short-term) and their operation (long-term). The disposal of this additional waste would incrementally increase the wastes going into existing landfills, potentially hastening the end of their usable lives and contributing to the eventual need for new or expanded landfill facilities.

The following tables summarize projected existing and future solid waste generation rates based on baseline (existing) conditions and various build out projections. For the purposes of effects on landfills, changes proposed by the project are relevant only if they would result in an ultimate increase in waste-generating activities. Changes that do not adversely affect (increase or re-allocate) populations or land uses within the unincorporated Riverside County area are not discussed further here. For a summary of these areas and the rationale for their omission, see Section 4.17.1.

Solid waste generation rates estimate the amount of waste created by residences and businesses over a certain amount of time (day, year, etc.). Waste generation includes all materials discarded, whether or not they are later recycled or disposed of in a landfill. Waste generation rates for residential and commercial activities can be used to estimate the impact of new developments on the local waste stream. In this way, they are useful in providing a general level of information for planning purposes and estimating potential effects. It should be noted that these tables and rates do *not* take into account any recycling, reduction or diversion. That is, the reductions (potentially upwards of 50%-75%) associated with compliance with AB 341 are not shown. However, in an abundance of caution, these calculations do not apply source reductions.

Table 4.17-N (Theoretical Solid Waste Generation for Existing and Build out Condition) provides a summary of the theoretical needs for landfills (as indicated by solid waste generation) within Riverside County according to the theoretical estimate of need associated with existing land uses, as well as that for build out of the known spatial components or locations addressed by GPA No. 960 (i.e., site-specific LUD changes, policy area and study area changes, etc.). It should be noted that the following projections are based on the assumption that *all* of the changes proposed under GPA No. 960 actually result in future development and fully build out (as part of overall implementation of the County General Plan). That is, it is a theoretical, worst-case scenario, that likely over-states the actual development potential in the real world *and* does not take any source reduction programs into account. The *actual* future development of the individual parcels and areas affected by GPA No. 960 proposals, as with build out of the rest of the General Plan, are subject to the discretion of many hundreds to thousands of individual property owners, including private individuals, business entities and even various public agencies and other entities.

For land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.), specific effects on solid waste management cannot be delineated at present since they are land use-dependent. For the sake of comparison, however, Table 4.17-P (Comparison of Theoretical Solid Waste Generation at Build Out) shows the theoretical waste disposal needs at build out for both the current General Plan and the General Plan as it would be if amended pursuant to proposed GPA No. 960.

Accordingly, Table 4.17-N shows the annual tons of solid waste estimated to be generated for the existing (baseline) level of development currently present within the portions of Riverside County directly affected by proposed land use-related changes and for the land use of those same parcels of land as they would develop pursuant to the proposed project; in essence, with and without the proposed project. Because much of the area addressed by GPA No. 960 includes regions for which future development potential is being eliminated (e.g., deletion of Rural Village Study Areas), the first (Table 4.17-M) scenario includes many areas where the build out scenario under the updated General Plan is the same as that which would occur under the existing (current General Plan's) mapped LUDs. As such, these areas do *not* represent new areas of growth attributable to the project, GPA No. 960, but rather simply reflect the anticipated build out of the Riverside County General Plan that would occur with or without the project.

Table 4.17-N: Theoretical Solid Waste Generation for Existing and Build Out Conditions

Land Use[1]	Generation Factors	Theoretical Solid Waste Generation (tons/year)		
		Existing Uses of Land[2]	General Plan Build Out With GPA No. 960[3]	Difference
Residential	0.41 tons per dwelling unit	5,850 du **2,400 tons/year**	16,570 du **6,790 tons/year**	+ 10,720 du **+ 4,390 tons/year**
Commercial[4]	2.4 tons per 1,000 sq. feet	579.6 ksf **1,390 tons/year**	1,413.0 ksf **9,480 tons/year**	+ 833.4 ksf **+ 8,090 tons/year**
Industrial[5]	10.8 tons per 1,000 sq. feet	2,108.0 ksf **22,770 tons/year**	6,295.2 ksf **40,600 tons/year**	+ 4,187.2 ksf **+ 17,840 tons/year**
Total Area	**111,440 acres**	***26,560 tons/year***	***56,870 tons/year***	***+ 30,320 tons/year***

Footnotes:
1. Theoretical solid waste generation for the indicated level of development. All results rounded after analysis to the nearest 10 for dwelling units (du) and tons, and the nearest 100 for thousand square footage (ksf).
2. Theoretical need attributed solely to the portion of Riverside County associated with the lands proposed for spatial changes as part of GPA No. 960. See Section 4.1 for more details on how projections were derived.
3. Theoretical need associated with build out of the General Plan (including as updated pursuant to GPA No. 960) for the same spatial areas.
4. Includes the following land uses: commercial-retail (40%), commercial-tourist, commercial-office and business park.
5. Includes the following land uses: light industrial, heavy industrial and (for existing uses) ranches.

Source: Riverside County Planning Dept., Project application data and analysis, 2010. Riverside County, EIR No. 441, 2003, for service standards.

Thus, in order to focus on the areas where the proposed project would actually result in *new* development potential (i.e., potential impacts), a second scenario was developed. As shown in Table 4.17-O (Theoretical Solid Waste Generation for New Development Potential Areas), this second scenario includes only those areas proposed for a change that would result in an increase in future development density or intensity. This also includes all parcels where an LUD was changed (except those being assigned to OS-CH for acquisition as open space conservation pursuant to the WRC-MSHCP; these parcels would be removed from development potential).

Lastly, the third table, Table 4.17-P, shows a "plan-to-plan" comparison between the build out conditions of the General Plan as it currently exists and then as it would be if GPA No. 960 were approved and fully implemented. This third table indicates the relative effects of the project on long-range planning, rather than environmental impacts per se, and is provided for informational purposes and to allow comparison between build out outcomes.

On a comparative plan-to-plan basis, as shown in Table 4.17-P, the proposed project would result in a net decrease of roughly 441,800 tons in the overall amount of solid waste generated annually in unincorporated Riverside County. It can reasonably be projected that services related to the disposal of this amount of solid waste, such as transfer stations, HHW and ABOP facilities, etc., would be similarly decreased in proportion to the overall growth accommodated by the changes of the proposed project.

		Theoretical Solid Waste Generation (tons/year)		
Land Use[1]	**Generation Factors**	**Existing Uses of Land[2]**	**General Plan Build Out With GPA No. 960[3]**	**Difference**
Residential	0.41 tons per dwelling unit	2,060 du **850 tons/year**	6,350 du **2,600 tons/year**	+ 4,290 du **+ 1,750 tons/year**
Commercial[4]	2.4 tons per 1,000 sq. feet	254.3 ksf **610 tons/year**	855.5 ksf **8,140 tons/year**	+ 601.2 ksf **+ 7,530 tons/year**
Industrial[5]	10.8 tons per 1,000 sq. feet	1,478.2 ksf **15,970 tons/year**	5,789.3 ksf **24,760 tons/year**	+ 4,311.1 ksf **+ 8,790 tons/year**
Total Area	**10,690 acres**	***17,420 tons/year***	***35,500 tons/year***	***+ 18,070 tons/year[6]***

Footnotes:
1. Theoretical solid waste generation for the indicated level of development. All results rounded after analysis to the nearest 10 for dwelling units (du) and tons, and the nearest 100 for thousand square footage (ksf).
2. Theoretical estimates for the land uses associated with the 10,690-acre area of known spatial project changes that would increase development intensity or density or change an LUD within the Community Development Foundation. See Section 4.1 for more information on how land use estimates were calculated.
3. Need for build out of the General Plan (including as updated pursuant to GPA No. 960) for the same spatial areas.
4. Includes the following land uses: commercial-retail (40%), commercial-tourist, commercial-office and business park.
5. Includes the following land uses: light industrial, heavy industrial and (for existing uses) ranches.
6. Per the RCWMD Jurisdictional Landfill Tonnage Report for First Quarter 2012 (dated July 12, 2012), the total scaled solid waste disposed of at all Riverside County landfills (plus El Sobrante) was 753,331.43 tons, yielding an annual Riverside County disposal total of 3,013,325.7 tons per year. For unincorporated Riverside County, tonnage disposed was 17,259.56 for Badlands, 1,593.08 for Blythe, 28,469.77 for El Sobrante and 9,458.55 tons for Lamb Canyon landfill.

Source: Riverside County Planning Dept., Project application data and analysis, 2010. Riverside County, EIR No. 441, 2003, for service standards.

In terms of actual land use and changes to baseline conditions, future development accommodated by the proposed General Plan changes would increase the amount of solid waste generated annually by approximately 30,320 tons net, as shown in Table 4.17-N. This additional waste would be generated at numerous individual locations throughout Riverside County, however, not localized to any single landfill service area or hauler

franchise area. It would also increase in small increments across a roughly 50-year build out period. As such, impacts to any single landfill or waste facility would be negligible and much of this growth is already planned for in the existing General Plan and was analyzed under EIR No. 441, which was certified for the 2003 RCIP General Plan.

As mentioned above, Table 4.17-O isolates just the areas of growth associated with GPA No. 960 that would potentially be greater than that originally planned under the existing General Plan. This highlights the changes that differ from the background levels already planned for under the existing General Plan. Once these areas are removed, the resultant scenario indicates that the future new development potential arising from GPA No. 960 would result in the generation of a total of roughly 18,070 tons of solid waste per year (before any recycling or diversion programs). Because effects to Riverside County landfills (and El Sobrante Landfill) are dependent upon geography, this solid waste generation data was further broken down by Area Plan.

The analysis indicated that the bulk of the additional tonnage would come from areas of western Riverside County, particularly from within the Elsinore Area Plan (12,500 tons), Lakeview/Nuevo Area Plan (6,100 tons) and Mead Area Plan (4,100 tons), as a result of the new Rural Village Land Use Overlays associated with Good Hope and Meadowbrook, plus the revisions to the Lake Elsinore Environs (Lakeland Village) Policy Area. These areas are within the El Sobrante Landfill's service area and account for roughly 80% of all of the new waste generated. The roughly 22,500 tons, however, is a small fraction (1%) of the roughly 1,930,000 tons collected annually (as projected from the first quarter 2012 El Sobrante disposal totals per the Jurisdictional Landfill Tonnage Report issued by the RCWMD, dated July 12, 2012) and is not expected to be until full build out of Riverside County (roughly 50 years hence).

Table 4.17-P: Comparison of Theoretical Solid Waste Generation at Build Out

Land Use	Current General Plan		General Plan as Amended by GPA No. 960		
	Build Out Total[1]	Tons/Year Generated[2]	Build Out Total	Tons/Year Generated[2]	Difference (Tons/Year)
Residential	534,100 du	**218,900**	498,000 du	**204,200**	***- 14,800***
Commercial[3]	68,059 ksf	**163,300**	57,919 ksf	**139,000**	***- 24,300***
Industrial[4]	361,013 ksf	**3,898,900**	323,728 ksf	**3,496,300**	***- 402,700***
TOTALS	**4,013,400 acres**	***4,281,300 tons***	**4,011,600 acres**	***3,839,400 tons***	***- 441,800 tons***

Footnotes:
1. All results rounded to the nearest 100 for dwelling units (du) and nearest 1,000 for thousand square footage (ksf).
2. The theoretical total tonnage of solid waste estimated to be generated annually at build out of the County General Plan (current and as proposed for amendment). Rounded to nearest 100 tons after analysis.
3 Includes land uses: commercial-retail (40%), commercial-tourist, commercial-office and business park.
4 Includes the following land uses: light industrial and heavy industrial.

Source: Riverside County Planning Dept., Project application data and analysis, 2010. Riverside County, EIR No. 441, 2003, for service standards.

Roughly 2,600 tons would be generated out of the Palo Verde Valley Area Plan region, most likely to be disposed of at the Blythe landfill and roughly 1,400 tons from the Western Coachella Valley Area Plan would go to the Lamb Canyon landfill. The remaining Area Plans would contribute insignificant amounts of waste (115 tons for the REMAP area, 65 tons for the San Jacinto Valley Area Plan and 3-30 tons for six other areas). Analysis of the first quarter landfill disposal patterns for unincorporated Riverside County indicate that roughly 64% of this waste typically goes to the El Sobrante landfill, 18% to the Badlands landfill and 17% to Lamb Canyon, with the remaining 1% going to the Blythe, Desert Center and Oasis landfills. It is assumed that these percentages and distributions would continue for the expected life spans of Riverside County's active landfills. Again, these totals also do not account for any source reductions or diversions. If full AB 341 compliance is achieved, these amounts would be reduced by 75% by 2020 and thereafter as well.

E. Solid Waste Management – Impacts and Mitigation

The following impacts related to solid waste management that would result from implementation of the proposed project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

1. Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Impact 4.17.C-1 – Adversely Affect or Exceed the Permitted Capacity of a Landfill: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses, both residential and non-residential in localized areas throughout unincorporated Riverside County. These increases, however, are to some extent offset by reductions anticipated from other proposed changes of GPA No. 960 (in particular decreases in future commercial-retail and light industrial uses). Overall, future development resulting from the project would increase the annual amount of solid waste requiring disposal in sanitary landfills by roughly 9,000 tons per year over the next 50 years (conservatively assuming only achievement of the current state-mandated 50% diversion rate, but not the 75% by 2020 reduction rate. See Table 4.17-O). Compared to existing and projected capacities at Riverside County landfills, this amount would incrementally increase the county fill rate by roughly 0.6% overall (even conservatively assuming no additional diversion or recycling reductions). In terms of actual changes from baseline conditions, this 0.6% increase due to project-related waste generation would occur in small increments throughout Riverside County over a roughly 50-year period. For these reasons, these amounts represent insignificant incremental increases, and it is projected that sufficient landfill capacity would exist to accommodate the project's future solid waste disposal needs. Accordingly, the project's impact on landfill capacity would be less than significant. Moreover, regulatory compliance, particularly mandatory recycling and diversion programs, as outlined below, would also further reduce the already insignificant impact.

a. Analysis of Impact 4.17.C-1

The proposed update to the General Plan (pursuant to General Plan Amendment No. 960) includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in concentrated areas throughout Riverside County. As with the current General Plan, future development consistent with GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas. The resultant growth population (from new residential uses) and jobs and economic activity (from commercial, industrial and institutional uses) would result in a corresponding increase in the amount of solid waste generated by these various uses. The disposal of this additional waste would incrementally increase the wastes going into existing landfills, potentially hastening the end of their usable lives, and contribute to the need for new or expanded sanitary landfill facilities.

On a comparative plan-to-plan basis, as shown in Table 4.17-P, the proposed project would result in a net decrease of nearly 442,000 tons in the overall amount of solid waste generated annually in unincorporated Riverside County. It can be reasonably projected that services related to the disposal of this amount of solid waste, such as transfer stations, HHW and ABOP facilities, etc., would be similarly decreased in proportion to the overall growth accommodated by the proposed changes. Since the increase associated with the proposed project is *less* than that which would have been projected under the existing General Plan without the project, over the long run the GPA No. 960 can be said to have a net positive effect on Riverside County landfill capacity in that it would serve to decrease the amount of solid waste generated throughout Riverside County over time, reducing the capacity needed in existing landfills, delaying the construction of new landfills and/or reducing the size of new landfills needing to be constructed. For these reasons, the need for additional, new or physically altered solid

waste disposal services or facilities would similarly be reduced. These reduced rates would be reflected in any of several ways, including through a reduction in the capacity needed within existing landfills; by delaying the need for construction of new landfills; or, by reducing the size of new landfills constructed.

In terms of actual changes from baseline conditions, future development consistent with the proposed project could increase the amount of solid waste generated annually by approximately 30,320 tons net, as shown in Table 4.17-N. This additional waste would be generated numerous individual locations throughout Riverside County, however, not localized to any single landfill service area or hauler franchise area. It would also increase in small increments across a roughly 50-year build out period. As such, impacts to any single landfill or waste facility would be negligible.

As shown in previously referenced Table 4.17-L, the total solid waste intake for the year 2010 was 1,744,206 tons. The remaining capacity at the end of that year was 19,013,265 tons. Table 14.17-M projects Riverside County's generation of solid waste through to the year 2024, showing a remaining capacity estimated at 28,561,626 tons. When compared against this total, solid waste generation directly attributable to GPA No. 960 (18,070 tons as per Table 4.17-O) is 0.06% of the total waste generated in Riverside County annually. In addition, since AB 939 mandates the reduction of waste disposal in landfills with a 50% diversion rate, when this is taken into account the amount of solid waste resulting from the project actually reaching sanitary landfill disposal would drop to roughly 9,000 tons. (And, per AB 341, a 75% diversion rate is to be achieved by 2020.) On a relative basis, both fractional project increases are negligible. Accordingly, the project's impact on landfill capacity would be less than significant and no project-specific mitigation is required. Regulatory compliance, as outlined below, would also further reduce the less-than-significant impact.

b. Regulatory Compliance for Impact 4.17.C-1

The above analysis indicates this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, programs, policies and existing mitigation measures from prior EIR No. 441 would further reduce or minimize this already insignificant impact.

(1) Compliance With Federal, State and County Regulations

Compliance with the following state, federal and county regulations would further prevent already insignificant impacts to solid waste disposal facilities.

Compliance with State of California and federal RCRA requirements would ensure that the County of Riverside continues to implement programs for the proper identification and collection/diversion of hazardous wastes away from sanitary landfills. Continued implementation of the myriad of plans, policies and programs contained in the Countywide Integrated Waste Management Plan would ensure that the County continues to operate its landfills in a safe manner to protect the health and welfare of both its residents and the environment. The Plan would also ensure that appropriate long-range planning and implementation of the actions needed to assure continued solid waste disposal facilities with adequate capacities remain available within Riverside County.

In regards to State of California reduction mandates, in particular the AB 341 target of reducing "not less than 75%" of solid waste from landfill disposal by 2020, the County of Riverside (RCWMD) has implemented a number of measures. In terms of new (future) impacts arising from new development approved within unincorporated Riverside County, key compliance is through mandatory measures required as standard Conditions of Approval for new projects. Standard measures require recycling facilities (enclosures, etc.) be provided for all new commercial and industrial developments. Further, all plot plans are required to comply with the RCWMD's

Design Guidelines for Recyclables Collections and Loading Areas, as well as submit a Waste Recycling Plan (WRP) for each building proposed. To verify AB 341 compliance for the recycling of construction and demolition (C&D) materials, RCWD requires accurate records for both C&D recycling, as well as solid waste disposal, be kept. According to RCWD procedures, County occupancy permits will not be cleared for issuance unless the required evidence (e.g., receipts) demonstrating appropriate WRP compliance is presented to the RCWMD.

For residential, commercial and industrial developments, as well as public facilities, other Conditions of Approval are added through issuance of a "clearance letter" by RCWMD. The clearance letter outlines the additional project-specific requirements to ensure that individual project developers provide adequate areas for collecting and loading recyclable materials, such as "paper products, glass and green wastes." No building permits will be issued unless/until RCWD verifies compliance with the clearance letter conditions.

(2) Compliance with Existing County General Plan Policies

Existing Policy LU 5.2 from the Land Use Element of the Riverside County General Plan would further reduce the already insignificant impact to solid waste disposal facilities. See Section 4.17.4.B for full text of this policy.

(3) Compliance with Proposed New or Revised General Plan Policies

Revised Policies LU 5.1 and 31.2 of the Riverside County General Plan would further reduce the already insignificant impact to solid waste disposal facilities. See Section 4.17.4.B for full policy texts.

(4) Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.15.3A through 4.15.3F were imposed to reduce impacts to solid waste facilities to less than significant. Although the potential impacts of GPA No. 960 would already be less than significant, these EIR mitigation measures are programmatic in nature and thus remain applicable to this project (even though some are now outdated).

Existing Mitigation Measure 4.15.3A: Riverside County shall work with its franchise hauling companies to expand curbside and commercial recycling services throughout the unincorporated area of the County [of Riverside].

Existing Mitigation Measure 4.15.3B: Riverside County shall follow State regulations in implementing the goals, policies and programs identified in the Riverside County[wide] Integrated Waste Management Plan in order to achieve and maintain a 50% reduction in solid waste disposal through source reduction, reuse, recycling and composting.

Existing Mitigation Measure 4.15.3.C: In accordance with State regulations, Riverside County shall prepare an annual report of progress for the CIWMB to determine [Riverside] County's progress toward meeting its diversion goals and objectives, to project [Riverside] County's waste disposal needs and to determine if any of the elements that comprise the Riverside CIWMP require revision to include additional disposal capacity, reflect new or changed local and regional solid waste management issues, or reflect new or changed goals and objectives.

Existing Mitigation Measure 4.15.3D: In accordance with CCR Section 18788, Riverside County shall review the Riverside CIWMP every five years to determine if [Riverside] County's waste management practices remain consistent with waste diversion goals and objectives and to assess if revision is required.

Existing Mitigation Measure 4.15.3E: The County [of Riverside] shall require all future commercial, industrial and multifamily residential development to provide adequate areas for the collection and loading of recyclable materials (i.e., paper products, glass and other recyclables) in compliance with the State Model Ordinance, implemented on September 1, 1994, in accordance with AB 1327, Chapter 18, California Solid Waste Reuse and Recycling Access Act of 1991.

Existing Mitigation Measure 4.15.3F: The County [of Riverside] shall require all development projects to coordinate with appropriate [Riverside] County departments and/or agencies to ensure that there is adequate waste disposal capacity to meet the waste disposal requirements of the project, and the County [of Riverside] shall recommend that all development projects incorporate measures to promote waste reduction, reuse, recycling and composting.

c. Finding on Significance for Impact 4.17.C-1

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on solid waste disposal capacity within Riverside County. In addition, compliance with the above-listed existing regulatory programs, standards and General Plan policies, as well as existing Mitigation Measures 4.15.3A through 4.15.3F from EIR No. 441, would further reduce or avoid the insignificant impacts associated with the project.

2. Would the project impede or prevent compliance with federal, state and local statutes and regulations related to solid wastes, including the Countywide Integrated Waste Management Plan (CIWMP)?

Impact 4.17.C-2 – Cause Inconsistencies With Applicable Statutes and Regulations Related to Solid Waste, Including the County Integrated Waste Management Plan: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses, both residential and non-residential in localized areas throughout unincorporated Riverside County. These increases, however, are to some extent offset by reductions in other parts of Riverside County. Project-related waste generation would increase incrementally throughout Riverside County over a roughly 50-year period. Any future development authorized pursuant to the project would be required to comply with all applicable state, federal and county requirements for solid waste disposal, including the Countywide Integrated Waste Management Plan. Accordingly, the project would not have a significant adverse impact on the implementation, attainment or compliance with any of these statutes or regulations. Moreover, regulatory compliance, as outlined below, would further reduce the already insignificant impact.

a. Analysis of Impact 4.17.C-2

All development of future land uses would be required to comply with all applicable federal, state and local statutes and regulations related to solid waste. The RCDEH has the primary responsibility for ensuring the proper operation and closure of solid waste facilities and disposal sites in Riverside County. It also is responsible for ensuring the proper storage and transportation of solid wastes. The RCDEH is the local enforcement agency (LEA) for CalRecycle. As such, it provides solid waste inspection and permitting services to the various jurisdictions within Riverside County; conducts enforcement, inspection and permitting for solid waste facilities, operations and disposal sites, including those that are permitted, exempt, illegal, inactive, closed or abandoned; maintains LEA certification in good standing with the State (CalRecycle); maintains communication with CalRecycle as well as other local enforcement and regulatory agencies; and, promotes interagency cooperation with all entities involved in solid waste management and disposal in Riverside County.

In terms of development application and approval, both the RCWMD and the RCDEH review all development applications within unincorporated Riverside County. Project conditions of approval are required by these departments as deemed appropriate for implementation of and compliance with the various County solid waste regulations and programs, including the CIWMP. Nothing proposed by the project, GPA No. 960, would interfere with or alter this process. Nor would project changes preclude the attainment of CIWMP policies, plans or goals. Any future development would be required to comply with the CIWMP as part of standard project conditions of approval. Also, no land use changes are proposed for lands within existing or proposed Riverside County landfills. For these reasons, the project's effects on compliance with federal, state and local statutes and regulations, including the CIWMP, would be less than significant. No project-specific mitigation is needed.

b. Regulatory Compliance for Impact 4.17.C-2

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, a variety of existing regulations, programs, plans, policies and existing mitigation measures from prior EIR No. 441 would further reduce this already insignificant impact. See discussion under "Existing Regulatory Compliance" for Impact 4.17.C-1, above.

c. Finding on Significance for Impact 4.17.C-2

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on the implementation or achievement of existing federal, state and local statutes and regulations related to solid waste, including the CIWMP. In addition, compliance with the above-listed existing regulatory programs, standards and General Plan policies, as well as existing Mitigation Measures 4.15.3A through 4.15.3F from EIR No. 441, would further reduce or avoid the insignificant impacts associated with the project.

F. Solid Waste Management – Level of Significance After Mitigation

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on solid waste disposal facilities, programs, statutes and regulatory programs. In addition, compliance with the above-listed existing regulatory programs, standards and General Plan policies, as well as existing Mitigation Measures 4.15.3A through 4.15.3F from EIR No. 441, would further reduce or avoid the insignificant impacts associated with the project.

4.17.5 Schools

A. Schools – Existing Environmental Setting

Public schools and educational facilities are mandated by the California Department of Education and administered by the Riverside County Board of Education and Riverside County Office of Education (RCOE). Educational facilities within unincorporated Riverside County have their own state-mandated requirements to ensure a high quality of education is provided for all of the citizens of Riverside County. School districts offer education to all school-aged residents of the region, but operate entirely independent of the Riverside County government. ~~Specifically, school~~ *School* districts were created by the State of California and are subject to the

overview *by the* ~~of the~~ State Legislature. Elected governing school boards are responsible for budgeting and decision-making. The California Department of Education establishes school sites and construction standards.

Within Riverside County, the RCOE provides educational and administrative support services to the 23 school districts and over 430,000 students living in Riverside County. It also acts as an intermediary between the State of California and the local school districts. The RCOE also supports or directly provides a variety of specialized needs, such as Special Education for the severely handicapped, Head Start, Migrant Education, Alternative Education through independent study, Community Schools and Juvenile Court Schools and Career Technical Education programs designed to teach workforce skills aiding future employment.

A total of 23 school districts serve Riverside County. Most of these are "Unified School Districts" providing schooling for grades K (kindergarten) through 12. Occasionally, differing grades are provided by separate districts. Perris Union High School District serves grades 9-12 and four additional districts serve elementary grades (K-8): Perris, Romoland Union, Nuview Union and Menifee Union School Districts. The RCOE reports a total of 467 K-12 school sites, including 17 charter schools, 273 elementary sites, 75 middle/junior high sites, 69 high school sites and 33 continuation/ adult education sites. The County also offers 16 Head Start/preschool program sites. The RCOE also reports that the average State funding per pupil is $5,011 for elementary districts, $6,022 for high school districts and $5,239 for unified districts. The Riverside County Public School Directory for 2010-2011 indicates there are more than 18,742 teachers and 17,476 non-teaching school employees serving Riverside County.

Table 4.17-Q (Total School Enrollment for Riverside County School Districts), below, indicates student enrollment levels for the 2009-2010 and 2010-2011 school years. It also indicates the number of schools or sites for each type of school. The 18 charter schools and four "independent study" schools located in Riverside County are privately run and not included in the table. Since provision of private educational services, such as charter schools, is based on economic factors, rather than state mandate, they are not further discussed or analyzed in this section. Figure 4.17.5 shows the locations of the public schools within Riverside County.

Table 4.17-Q: Total School Enrollment for Riverside County School Districts

School District	2010 – 2011 Total Enrollment[1]	Number of Schools[2]/ Sites

Community Colleges	68,058	n/a	n/a	n/a	7

Footnotes:
1. Projected enrollment.
2. Elementary schools K-5 (or K-8); middle schools 6-8, (or intermediate 5-6 and middle 7-8), junior highs 7-9, high school 9-12. "Other" represents continuation, alternative education, independent study and/or adult education schools and may cover a variety of grades as well.
3. Includes California School for the Deaf and Sherman Indian High.
4. Includes four elementary schools listed by the State as being "Critically Overcrowded," as of April 2003.
5. For this category, "other" includes preparatory schools covering grades K-12 (K-10 for one).

Source: Riverside County Public Schools Directory, 2010-2011.

Overcrowding in public schools is caused by increases in student enrollment. In April 2003 (the most recent year of data available), the State Department of Education established a list of schools and school districts identified as overcrowded under criteria set by the State of California. To be classified as a "Critically Overcrowded School," a school must have a pupil density greater than 115 pupils per acre for grades K through 6 and 90 pupils per acre for grades 7 through 12. Within Riverside County, five elementary schools within the Riverside Unified School District were identified as such. No other schools or school districts within Riverside County were included in the State's list.

In Riverside County there are also several Community College Districts that provide advanced educational instruction. The Riverside Community College District has three campuses, one in Norco, Moreno Valley and Riverside City. The Mount San Jacinto Community College District has campuses in San Jacinto and in Menifee. The Palo Verde Community College District has one campus, and the College of the Desert, located in Palm Desert, has a single campus as well. There are ~~also~~ a number of private, public and technical/professional schools of higher education that also serve the students of Riverside County.

B. Policies and Regulations Addressing Schools

1. State Regulations

Assembly Bill (AB) 16: In 2002, AB 16 created the Critically Overcrowded School Facilities program, which supplements the new construction provisions within the School Facilities Program (SFP). The SFP provides State of California funding assistance for new facility construction projects and modernization projects. The Critically Overcrowded School Facilities program allows school districts with critically overcrowded school facilities, as determined by the California Department of Education (CDE), to apply for new construction projects in advance of meeting all SFP new construction program requirements. Districts with SFP new construction eligibility and school sites included on a CDE list of source schools may apply.

Leroy F. Greene School Facilities Act (SB 50): Senate Bill 50 (SB 50) was enacted by the State Legislature in 1998 and made significant amendments to existing state law governing school fees. In particular, SB 50 amended prior California Government Code (CGC) Section 65995(a) to *prohibit* state or local agencies from imposing school impact mitigation fees, dedications or other requirements in excess of those provided in the statute in connection with "any legislative or adjudicative act...by any state or local agency involving...the planning, use, or development of real property...."

RIVERSIDE COUNTY PLANNING DEPARTMENT

PUBLIC SCHOOL LOCATIONS

This page intentionally left blank

The legislation also amended CGC Section 65996(b) to prohibit local agencies from using the inadequacy of school facilities as a basis for denying or conditioning approvals of any "legislative or adjudicative act [involving] the planning, use or development of real property." Further, SB 50 established the base amount of allowable developer fees: $1.93 per square foot for residential construction and $0.31 per square foot for commercial. These base amounts are commonly called "Level 1 fees" and are the same caps that were in place at the time SB 50 was enacted. Level 1 fees are subject to inflation adjustment every two years.

In certain circumstances, for residential construction, school districts can impose fees that are higher than Level 1 fees. School districts can impose Level 2 fees, which are equal to 50% of land and construction costs if they: (1) prepare and adopt a school needs analysis for facilities; (2) are determined by the State Allocation Board to be eligible to impose these fees; and (3) meet at least two of the following four conditions:

- At least 30% of the district's students are on a multi-track year-round schedule.
- The district has placed on the ballot within the previous four years a local school bond that received at least 50% of the votes cast.
- The district has passed bonds equal to 30% of its bonding capacity.
- Or, at least 20% of the district's teaching stations are relocatable classrooms.

Additionally, if the State of California's bond funds are exhausted, a school district that is eligible to impose Level 2 fees is authorized to impose even higher fees. Commonly referred to as "Level 3 fees," these fees are equal to 100% of land and construction costs of new schools required as a result of new developments.

2. Existing County General Plan Policies

As stated previously, the General Plan does not contain a Public Services Element. The following Land Use (LU) Element policy is provided in the General Plan to encourage the County to coordinate with public service agencies.

Policy LU 5.2: Monitor the capacities of infrastructure and services in coordination with service providers, utilities, and outside agencies and jurisdictions to ensure that growth does not exceed acceptable levels of service.

C. Thresholds of Significance for Schools

The proposed project would result in a significant impact to schools if it would:

Result in substantial adverse physical impacts associated with the provision of new or physically altered schools. Or, result in the need for new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for any schools.

D. Effect of GPA No. 960 on the General Plan and on Schools

The proposed update to the General Plan (pursuant to General Plan Amendment No. 960) includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in concentrated areas throughout Riverside County. As with the current General Plan, future development accommodated by GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas or increase densities of existing areas. The resultant increase in population would increase the number of students enrolled in existing schools and create the need for new or expanded school facilities.

The tables below summarize projected theoretical student populations, as an indicator of the need for schools and educational facilities and staff, for three scenarios. Again, these calculations are all labeled "theoretical" because they use the same basic set of assumptions and factors to allow for valid comparisons between and amongst scenarios. In the real world, a number of additional factors that are beyond the scope of this analysis would apply (funding availability, jurisdiction, available staff, etc.). The actual planning, locations and development of schools and the provision of all associated services is under the purview of the respective school districts.

Table 4.17-R shows the student populations associated with the existing (baseline) level of development currently estimated to be present on the portions of the county directly affected by proposed land use-related changes; compared against the full build out of all of the same areas as they would be permitted under the updated General Plan (e.g., pursuant to the changes proposed in GPA No. 960). For the purposes of effects on schools, changes proposed by the project are relevant only if they would result in an ultimate increase in population. Changes that do not adversely affect (increase or reallocate) populations within unincorporated Riverside County are not discussed further here.

The build out scenario for Table 4.17-R (Theoretical Student Generation With and Without the Project) includes regions where the updated General Plan is the same as that which would occur under the existing (current General Plan's) mapped LUDs. As such, these areas do *not* represent new areas of growth attributable to the project, GPA No. 960, but rather simply reflect the anticipated build out of the Riverside County General Plan that would occur with or without the project. Thus, in order to focus on the areas where the proposed project would actually result in *new* development potential (i.e., potential impacts), a second scenario was developed. As shown in Table 4.17-S (Theoretical Student Generation for New Development Potential Areas), this second scenario includes only those areas proposed for a change that would result in an increase in future development density or intensity. This also includes all parcels in which an LUD was changed (except those being assigned to OS-CH).

The third table, Table 4.17-T (Theoretical Student Generation at General Plan Build Out), shows a comparison between the build out conditions of the General Plan as it currently exists and as it would exist if the proposed project is approved and fully implemented. This third table indicates the relative effects of the project on long-range planning, rather than environmental impacts per se.

Upon build out of Riverside County pursuant to the existing (2008) General Plan, as shown in Table 4.17-T, the County of Riverside as a whole would generate a student population of 435,800. Under the updated General Plan, amended per GPA No. 960, this build out total would decrease to 406,300. This represents roughly 29,500 fewer students than originally anticipated in the General Plan, a decrease of 6.8%. This reduced population and need would be reflected in any of several ways, including through a reduction in the capacity needed within existing schools, by delaying the need for construction of new schools or by reducing the size of new schools constructed. For this reason, on a *comparative* basis, the proposed project would contribute to fewer impacts to the

environment at build out, since fewer schools would need to be constructed to serve the expected student populations.

Further, the proposed project would result in a net decrease in the overall number of students generated across each category – elementary, middle and high school. It can reasonably be projected that students requiring special programs, such as Head Start or continuation school, would similarly increase incrementally in proportion to the overall population growth in a given school district. As a result, fewer new or expanded facilities would be required to accommodate the expected population.

Table 4.17-R: Theoretical Student Generation With and Without the Project

School Type	Generation Factors	Projected Total Students		
		Existing Land Uses[1]	General Plan Build Out, With GPA No. 960[1]	Difference
	Population[2]	***16,520 persons***	***46,370 persons***	*+ 29,840 people*
Elementary School	0.369 students per dwelling unit	**2,160**	**6,120**	+ 3,960 students
Middle School	0.201 students per dwelling unit	**1,180**	**3,330**	+ 2,160 students
High School	0.246 students per dwelling unit	**1,440**	**4,080**	+ 2,640 students
	Total Students	***4,780***	***13,520***	***+ 8,750 students***

Footnotes:
1. These two scenarios encompasses the 111,440-acre area of known spatial project changes.
2. Populations calculated as per General Plan Appendix E-1 standards. See Section 4.1 (Environmental Assumptions and Methods) for more information. All results rounded to the nearest 10. Each school district determines and implements actual needs.

Table 4.17-T: Theoretical Student Generation at General Plan Build Out

School Type	Generation Factors	Theoretical Total Students		
		Existing General Plan Build Out *	General Plan Build Out With GPA No. 960*	Difference
	Build Out Population	***1,736,700 persons***	***1,599, 000 persons***	***- 137,800 people***
Elementary School	0.369 students per dwelling unit	**197,100**	**183,800**	- 13,300 students
Middle School	0.201 students per dwelling unit	**107,400**	**100,100**	- 7,300 students
High School	0.246 students per dwelling unit	**131,400**	**121,500**	- 8,900 students
	Student Totals	***435,800***	***406,300***	***- 29,500 students***

* Build out of Riverside County as per the directives and maps in the existing General Plan, with and without the project.

Source: Riverside County Planning Dept., Project application data and analysis, 2010. Riverside County, EIR No. 441, 2003, for service standards.

In terms of actual changes expected from existing baseline conditions, as indicated in Table 4.17-S, when examining student population growth attributable directly to GPA No. 960 changes, the project would introduce roughly 3,500 new students to the schools of Riverside County. This population would arise from numerous individual locations throughout the county, however, rather than be localized to any single school district. As such, for most areas of Riverside County, adverse effects to any single school would be small to negligible. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary facilities and staff. To determine specifically to what extent the individual school districts of Riverside County would be affected by the proposed project, land use-related impacts were analyzed according to their region (by area plan) and by school district. The results of this analysis is shown in Table 4.17-U (Total Project-Related Student Population Changes by School District), below.

In terms of regional effects, as with other public services, the same patterns of growth and future development intensity increases were apparent in the student generation data. Roughly one-third (1,040) of the new students generated would fall within the Elsinore Area Plan due to the two new Rural Village Overlays. The Palo Verde Valley Area Plan would see roughly 810 additional students. Jurupa, Western Coachella Valley and Mead Valley Area Plans would each see between 400-470 students. The San Jacinto Valley Area Plan would see a small increase (130 students) and seven area plans would see increases of between 2-60 students. One region, Eastvale Area Plan, was forecast to lose one student.

In terms of effects on specific school districts, as shown in Table 4.17-U a number of districts would either have no change (0 students gained or lost) or a negative change (for example, due to a higher residential density being replaced with lower density residential or a non-residential use). Four districts would see minor (20 or fewer) or moderate (21 to 100) increases in student populations. However, three districts are forecast to see large increases in student populations: Palm Springs Unified (722 additional students), Palo Verde Unified (534 additional students) and Perris Union High (145 additional students). Since these projected increases are forecast to occur over a roughly 50-year period, none of the minor or moderate increases would result in a significant adverse effect to those districts, including the 'Critically Overcrowded' Riverside Unified School District. Additionally, school impact mitigation fees would be used to accommodate the needs of these students and reduce effects for all of these districts.

Table 4.17-U: Total Project-Related Student Population Changes by School District

Decrease in Number of Students (at project build out)[1]	
Banning Unified (-1)[2]	Jurupa Unified (-123)
Coachella Valley Unified (-570)	Lake Elsinore Unified (-838)
No Change in Number of Students (No Students Gained or Lost)	
Beaumont Unified (0)	Nuview Union (0)
Coachella Valley Unified (0)	San Jacinto Unified (0)
Colton Joint Unified[3] (0)	Val Verde Unified (0)
Menifee Union (0)	
Minor Increase in Number of Students (1 to 20 Additional Students)	
Alvord Unified (+1)	Riverside Unified (+6)
Moreno Valley Unified (+3)	Romoland (+17)
Moderate Increase in Number of Students (21 to 100 Additional Students)	
Corona-Norco Unified (+59)	Murrieta Valley Unified (+25)
Desert Sand Unified (+28)	Perris (+84)
Hemet Unified (+33)	Temecula Valley Unified (+37)
Large Increase in Number of Students (100 or More Additional Students)	
Palm Springs Unified (+722)	Perris Union High (+145)
Palo Verde Unified (+534)	

Footnotes:

1. Comparison of theoretical number of students generated by land use changes proposed under GPA No. 960 compared to theoretical student generation associated with existing land uses for the same parcels of land.

2. Value in parenthesis is total change in number of students. All values rounded to nearest whole number.
3. Included here because the District does include a portion of Riverside County. Only land use change proposed, however, is acquisition/designation of vacant land as Open Space-Conservation.

Source: Riverside County GIS Dept., Analysis of project application and GIS data, 2010.

For the remaining three districts, student population increases could be substantial and require expansion of existing or construction of new additional facilities to serve these new students. As such, environmental impacts would be associated with construction of new school sites/facilities to the extent their location, construction methods and operations affect the surrounding area. Data indicate that each of these Area Plans contain thousands of acres of vacant lands. This vacant land availability means that situating new school sites for these areas could be achieved in a manner that minimizes environmental impacts.

E. Schools – Impacts and Mitigation

The following impacts related to schools that would result from implementation of the proposed project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered schools? Or, would it result in the need for new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for any schools?

Impact 4.17.D – Cause Adverse Environmental Effects Due to the Need for Schools: Future development consistent with GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County resulting in a comparable increase in population, including students requiring educational services. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and the associated population expected to occur within Riverside County over the next 50 years. In terms of actual changes to existing student populations and service levels, localized development increases would incrementally generate additional students creating demand for additional school facilities, services and personnel in specific areas, particularly within the Palm Springs School District, Palo Verde Unified School District and Perris Union High School District. Outside of these three districts, none of the project-related population increases would trigger the need for new or improved facilities. The additional students generated over the next 50 years could readily be accommodated at existing facilities and such districts would not have a significant impact. For the remaining three districts, however, compliance with existing laws (Senate Bill 50, in particular) and the policies of the Riverside County General Plan would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.17.D

New development would introduce additional people to Riverside County who require school services. This would result in the need for additional classroom space, teaching and support staff where increases exceed current capacity. Where increases trigger new school facilities or expansion of existing facilities, environmental impacts could potentially occur.

As shown in Table 4.17-T, above, existing standards indicate that full build out of the existing General Plan would accommodate a population of roughly 1.7 million people within unincorporated Riverside County. Using standard student generation factors, this population is estimated to include a total of roughly 436,000 students

throughout Riverside County. The land use changes associated with GPA No. 960 would reduce expected population of Riverside County by nearly 138,000 people. The total student population would be similarly reduced (by roughly 29,500) to a total of roughly 406,000. Accordingly, environmental impacts associated with construction of new or improved school facilities would be avoided or postponed.

In terms of the project's effects on baseline environmental conditions, as indicated in Table 4.17-R, beyond the growth anticipated in the area under the existing General Plan, GPA No. 960 would result in changes that could introduce 3,500 additional new students to schools in Riverside County. This total, however, represents the net increase for all affected schools across the county. When examined by school district, however, it was found that some districts would have little to no change, some would show decreases in student populations and three show large increases in population. See Table 4.17-U. Specifically, three districts are forecast to see large increases in student populations: Palm Springs Unified (720 additional students), Palo Verde Unified (530 additional students) and Perris Union High (150 additional students). Since these projected increases are forecast to occur over a roughly 50-year period, for all but the three districts mentioned above, the project would not have any significantly adverse effects. This includes the 'Critically Overcrowded' Riverside Unified School District. Also, with the increases occurring incrementally over several decades, the districts would have ample time for long-range planning and provision of necessary school services as need arose.

For the remaining three districts, student population increases could be substantial and require expansion of existing or construction of new additional facilities to serve these new students. As such, environmental impacts would be associated with construction of new school sites/facilities to the extent their location, construction methods and operations affect the surrounding area. Data indicate that each of the Area Plans in which these new school sites would be located contain hundreds of acres of vacant lands. This vacant land availability means that situating new school sites for these areas could be achieved in a manner that minimizes environmental impacts.

2. Regulatory Compliance for Impact 4.17.D

As detailed and explained below, compliance with the following existing laws, programs and General Plan policies would be sufficient to ensure that impacts to schools as a result of GPA No. 960 would be less than significant.

Leroy F. Greene School Facilities Act (SB 50): Development fees are required to be paid pursuant to development Conditions of Approval. Pursuant to this law, the payment of these school fee amounts provided for in CGC Sections 65995, 65995.5 and 65995.7 would constitute full and complete mitigation for school facilities.

Compliance with Existing Riverside County General Plan Policies: General Plan Policy LU 5.2 aids in preventing significant impacts to schools. It directs the County of Riverside to take action to ensure that development does not cause growth to exceed acceptable levels of service. In terms of schools, this is implemented through requirements for development fees to be paid as part of project Conditions of Approval. See Section 4.17.5.B for full text of the policy.

F. Schools – Level of Significance After Mitigation

SB 50 states that the exclusive method of mitigating the impact of school facilities according to CEQA is to pay the maximum school fees and that such fees are "deemed to provide full and complete school facilities mitigation" related to the adequacy of school facilities when considering the approval or the establishment of conditions for the approval of a development project (Government Code 65996(a) and (b)). Because the

Government Code states that compliance with SB 50 would provide full and complete mitigation, no significant impact would occur.

4.17.6 Libraries

A. Libraries – Existing Environmental Setting

The County of Riverside operates a system of ~~32~~ *35* libraries and two book mobiles (one serving Coachella Valley and one serving western Riverside County) to serve unincorporated populations. The names and locations of these Riverside County libraries are presented in Table 4.17-V (County Libraries Serving Riverside County), below. Figure 4.17.6 shows the locations of the public libraries within Riverside County.

Table 4.17-V: County Libraries Serving Riverside County

Library	Location
Anza	57430 Mitchell Road, Anza
Cabazon	*50425 Carmen Avenue, Cabazon*
Calimesa	908 Park, Calimesa
Canyon Lake	31508 Railroad Canyon Road, Canyon Lake
Cathedral City	33-520 Date Palm Drive, Cathedral City

Woodcrest	16625 Krameria Ave., Riverside

Source: Riverside County Library System, http://rivlib.info/riverside-County-library-system/, accessed April, 2011.

In addition, the Riverside County Library System operates an automated network that currently deploys over 350 computer/terminal workstations in the library branches of the Riverside County Library System, Riverside Public Library, Moreno Valley Library, Murrieta Public Library, Murrieta Valley High School and College of the Desert. The network can also be accessed by Riverside County residents via the Internet. The library system manages the library catalog of the 1.3 million items in the library system and the annual checkout of over 3.5 million books, audios and videos. For 2010, the Riverside County Library System reported a total of 681,117 'registered borrowers' utilizing county library services.

According to data published by the County of Riverside in its "Financial Highlights (Fiscal Year 2008-2009)," within Riverside County the County Library System circulated 3,464,550 items (books, videos, etc.) and answered nearly 382,800 reference questions to a patron door-count of over 3,170,400 library visitors. There were also over 5,600 programs offered that were attended by over 127,700 people.

In addition to providing the opportunity to review and/or check-out materials for personal use, the County of Riverside also operates a number of specific programs including adult and family literacy, and after-school and pre-school programs. Riverside County's ability to support the needs of future growth is dependent upon its ability to secure sites for, construct, and stock new libraries on a timely basis. At present, there is no specific funding mechanism for expansion of library facilities.

The Riverside County library system did not indicate that it maintained a specific numerical factor to analyze the needs created by new development. However, the American Library Association suggests that an appropriate service criteria would be availability of convenient library facilities and book reserves at a rate of 0.5 square foot of library space and 2.5 volumes per capita. The County's ability to support the needs of future growth is dependent upon its ability to secure sites for, construct and stock new libraries on a timely basis. At present, there is no specific funding mechanism for expansion of library facilities. Based on 2010 reported registered borrowers (681,117) and current square footage of library facilities available (333,884), at present facilities provide approximately 0.49 square feet of space per registered borrower (not the Riverside County population as a whole).

B. Policies and Regulations Addressing Libraries

Ordinance No. 659 – Development Impact Fee Program: This ordinance establishes the need for addressing impacts caused by new development of residential, commercial and industrial uses. Thus, the ordinance establishes a development impact fee (DIF) program by which new development is charged fees to address the increased need for additional facilities, services and also open space. For each category of land use (single-family residential, multi-family residential, commercial and industrial), DIF charges are determined based on the location of the property to be developed (fees vary by Area Plan), as well as the density/intensity of the proposed use. Residential fees are charged on a per-dwelling unit basis and run from roughly $3,000 to $7,300. For commercial, industrial and surface mining, fees are charged on a per-acre basis and can run from between $20,000 to $35,000 for commercial uses, $10,000 to $18,000 for industrial uses and roughly $4,500 to nearly $9,000 for surface mining. See the ordinance for specific values.

The DIF ordinance does establish fees to be collected for "library books" as $341 per dwelling unit for single-family homes and $286 per dwelling unit for multi-family homes. The ordinance enforces the program by stating that "no building permit shall be issued for any development project except upon the condition that the development impact fees required by this ordinance are paid."

RIVERSIDE COUNTY PLANNING DEPARTMENT

PUBLIC LIBRARY LOCATIONS

\\agency\tlmagis\Projects\Planning\SafetyElement\Hospitals.mxd

This page intentionally left blank

2. Proposed New or Revised County General Plan Policies

The General Plan, although it does not include a Public Services Element, does include a policy addressing the effects of future development on library facilities. This policy would help ensure adequate library facilities as development occurs.

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and ~~child~~ day care centers ~~(i.e. infant, toddlers, preschool and school age children)~~, transportation systems and fire/ police/medical services.

C. Thresholds of Significance for Libraries

The proposed project would result in a significant impact on libraries if it would:

Result in substantial adverse physical impacts associated with the provision of new or physically altered library facilities. Or, result in the need for new or physically altered library facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for libraries.

D. Effect of GPA No. 960 on the General Plan and on Libraries

The proposed GPA No. 960 update to the General Plan includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in concentrated areas throughout Riverside County. As with the current General Plan, future development accommodated by GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas. The resultant increase in population would similarly increase the number of people using library services and create the need for new or expanded library facilities and inventory.

Table 4.17-W (Theoretical Library Services Need Projections), below, summarizes estimated library service needs (as indicated by library floor space and book volumes) for three scenarios. The first two scenarios compare existing (i.e., baseline) conditions of actual current (2008) uses of land and derived populations for the same against build out (fully developed) conditions that would occur if the lands in question were developed according to the updated General Plan (i.e., changed per GPA No. 960). Thus, this scenario represents the change associated with the project plus currently planned growth. The second scenario represents a subset of the first. In this one, only areas in which GPA No. 960 would result in an increase or change in density or intensity are included. Deleted are the areas in which development potential would be equal to or less than that currently planned under the existing General Plan. This serves to isolate just the areas in which the project would increase an effect, preventing reductions elsewhere from masking potential environmental effects. Lastly, scenario three shows build out conditions for all of unincorporated Riverside County, not just the areas of foreseeable spatial effects associated with the project, for the existing and proposed updated General Plans. This provides a side-by-side snapshot of how GPA No. 960 would affect the ultimate need for library services in Riverside County over time.

Again, these calculations are all labeled "theoretical" because they use the same basic set of assumptions and factors to allow for valid comparisons between and amongst scenarios. In the real world, a number of additional factors that are beyond the scope of this analysis would apply (funding availability, jurisdiction, etc.). For the

purposes of effects on libraries, changes proposed by the project are relevant only if they would result in an ultimate increase in population. Changes that do not adversely affect (increase or reallocate) populations within the unincorporated county area are not discussed further here.

Upon build out of Riverside County pursuant to the existing (2008) General Plan, as shown in Table 4.17-W, Riverside County as a whole would require roughly 868,000 square feet of library space and 4.3 million volumes (including existing facilities and resources). Under the updated General Plan, amended per GPA No. 960, this build out total would decrease roughly 8% to just under 800,000 square feet and 4 million volumes. Thus, on a comparative basis, the proposed project would result in fewer impacts on the environment due a reduced need for libraries. Such a reduced need would be reflected in any of several ways, including through a reduction in the capacity needed within existing libraries, by delaying the need for construction of libraries or by reducing the size of new libraries constructed.

In terms of specifically that future development increasing as a result of the project, however, the project would result in just over 13,000 additional new residents in Riverside County. These residents would trigger the need for a total of approximately 6,500 square feet of additional library space and the need for 35,500 additional volumes. This total represents demand across Riverside County, however. The actual increases would be spread throughout the 19 Area Plans of unincorporated Riverside County, plus the remainder area of eastern desert not in an Area Plan. As such, the adverse effects on most individual regions would be small to negligible. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary services.

To examine effects to the individual regions of Riverside County, the library data was further broken down by Area Plan. This analysis indicated that effects would vary regionally, in the same pattern previously described. Approximately 30% of the increased demand would be concentrated in the Elsinore Area Plan region as a result of GPA No. 960, due primarily to future development of the proposed Meadowbrook and Good Hope Rural Village Land Use Overlays. The Mead Valley Area Plan is also affected by these RVOs, but to a lesser degree (900 square feet as opposed to Elsinore's 1,900). The Palo Verde Valley and Jurupa Area Plans would need an additional 1,410 and 1,010 square feet, respectively. The Western Coachella Valley Area Plan would see an increase of roughly 700 square feet and the San Jacinto Valley Area Plan would see 210 square feet. Four other area plans (Temescal Canyon, Southwest, Eastern Coachella Valley and the Harvest Valley/Winchester) would also see lesser increases (120, 90, 80 and 60, respectively). Of the remaining seven regions, three would have 20 square feet or less in additional library floor space needs, three would have no increase and one (Eastvale) would actually see demand decrease very slightly (-7 square feet). The need for additional volumes would increase (or decrease) in the same proportions.

In terms of General Plan changes, the project would only incrementally affect most of Riverside County's Area Plans; in amounts not large enough to trigger the need for an additional library in many county areas. Not surprisingly, the increased demand for library services show up most clearly in the areas being planned for urbanization – the Meadowbrook and Good Hope Rural Village Overlays, in particular. In terms of environmental effects, future development accommodated by GPA No. 960 would contribute incrementally to the need for additional library services throughout Riverside County to ensure adequate levels of service. The environmental impacts and mitigation needed, if any, associated with these additional service needs are discussed in the section that follows, below.

Table 4.17-W: Theoretical Library Services Need Projections

Service Item	Generation Factors[1]	Existing Condition (No Project)	Revised Condition (With Project)	Difference
Scenario 1: Existing Conditions / Updated General Plan Build Out, Full Project Spatial Area[2]				
	Population[1]	***16,520 persons***	***46,370 persons***	***+ 29,840 people***
Library Floor Space	0.5 square feet per person	8,300 sq feet	23,200 sq feet	+ 14,900 sq feet
Volumes	2.5 per person	41,300 vols	115,900 vols	+ 74,600 vols
Scenario 2: Existing Conditions / Updated General Plan Build Out, Areas of New Development Potential Only[3]				
	Population[1]	***6,590 persons***	***19,610 persons***	***+ 13,020 people***
Library Floor Space	0.5 square feet per person	3,300 sq feet	9,800 sq feet	+ 6,500 sq feet
Volumes	2.5 per person	16,500 vols	49,100 vols	+ 35,500 vols
Scenario 3: Build Out of Current General Plan / Updated (per GPA No. 960) General Plan, Countywide[4]				
	Population[5]	***1,736,700 persons***	***1,599,000 persons***	***- 137,800 people***
Library Floor Space	0.5 square feet per person	868,400 sq feet	799,500 sq feet	- 68,900 sq feet
Volumes	2.5 per person	4,341,800 vols	3,997,400 vols	- 344,400 vols

Footnotes:

1. Populations calculated as per General Plan Appendix E-1 standards. See Section 4.1 (Environmental Assumptions and Methods) for more information. All results rounded to the nearest 10 for population in scenarios 1 and 2, and nearest 100 for everything else.
2. Theoretical population estimated for the land uses associated with the 111,440-acre area of known spatial project changes. Existing condition is the current uses of land within these areas. Revised condition is the build out (development) of the same areas pursuant to the General Plan as updated per GPA No. 960.
3. Encompasses just the 10,690 acres proposed for new or increased development intensity or density under GPA No. 960. Eliminates growth effects from areas that would develop per the existing General Plan, isolating just the effects of the proposed project. Existing condition is the current uses of land within the limited area. Revised condition is the build out of the same area per the General Plan as updated per GPA No. 960.
4. Existing condition is the build out of unincorporated Riverside County pursuant to the existing (2008) General Plan. Revised condition is build out of the same pursuant to the General Plan as updated by GPA No. 960.
5. Population data provided by Riverside County Center for Demographic Research, 2010.

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Library service standards from EIR No. 441.

E. Libraries – Impacts and Mitigation

The following impacts to library services that would result from implementation of the proposed project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered library facilities? Or, would it result in the need for new or physically altered library facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for any library services?

Impact 4.17.E – Cause Adverse Environmental Effects Due to the Need for Library Services: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and the associated population expected to occur within Riverside County over the next 50 years. In terms of actual changes relative to baseline environmental conditions, localized new development would incrementally increase populations creating demand for additional library services – as indicated by floor space and volumes. Because the increases are spread throughout Riverside County and would occur over roughly 50 or more years, the additional 6,500 square feet of library floor space and 35,500 additional volumes needed as a result of new development potential from the project would be met through current long-range library planning and existing development impact mitigation programs (such as Ordinance No. 659). For these reasons the project would not have a significant adverse effect on library services.

1. Analysis of Impact 4.17.E

New development would introduce additional people to Riverside County library services. This would result in additional use of existing facilities and work for existing staff. When demand is great enough in a given region, an additional library would be built. However, in areas where development remained sparse, development of new libraries would be unlikely.

As discussed in Section 4.17.6.D, above, existing standards indicate that full build out of the existing General Plan would accommodate a population of roughly 1.7 million people within unincorporated Riverside County. To serve this population, the Riverside County library system would require an estimated total of 868,000 square feet of library space and roughly 4.3 million volumes. The land use changes associated with GPA No. 960 would reduce expected population of Riverside County by nearly 138,000 people and require 69,000 square feet less library floor space and roughly 344,000 fewer library books. Educational, reference, mobile book delivery and other library service needs would be similarly reduced. Accordingly, environmental impacts associated with construction of new or improved facilities would be avoided or postponed.

At the Area Plan level, however, as shown in Table 4.17-W, GPA No. 960 would allow for additional future development that would increase Riverside County's population by roughly 13,000 people, mostly spread incrementally throughout Riverside County. This increase would require an estimated 6,500 additional square feet of library floor space and roughly 35,500 additional volumes. Overall, because some portions of Riverside County would experience a population decrease or neutral change, many areas of Riverside County would not have any significant adverse impact to library services as a result of future development pursuant to this project.

Some areas would have minor increases. In these areas, future development as a result of the project would not result in significant adverse impacts on library services and facilities. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary services.

The three areas covered by the Elsinore, Jurupa and Palo Verde Valley Area Plans, however, would need larger numbers of volumes (17,000, 5,000 and 7,000, respectively). In these areas in particular, additional library services and volumes would be required to continue to provide adequate levels of service within the communities. The regulatory compliance below outlines measures that would be necessary to provide for the needed additional services in order to ensure impacts to libraries are less than significant. No project-specific mitigation is needed.

It should also be remembered that the build out of the new development leading to this population growth is projected to take roughly 50 years. This is ample time to allow for adequate long-range planning and provision of additional services as need arises. In addition, GPA No. 960 is projected to result in roughly 138,000 fewer people at build out than originally planned for under the current General Plan and would similarly reduce the need for additional library services. This change would be reflected in any of several ways, including through a reduction in the capacity needed within existing libraries, by delaying the need for construction of new libraries or, by reducing the size of new libraries constructed.

2. Regulatory Compliance for Impact 4.17.E

As detailed and explained below, compliance with the following existing Riverside County ordinance and General Plan policies is sufficient to ensure that impacts to libraries as a result of GPA No. 960 would be less than significant.

a. Compliance with Existing Riverside County Policies and Ordinances

Ordinance No. 659 – Development Impact Fees Program: Under this ordinance, all new residential, industrial and commercial development is required to pay development impact fees commensurate with the level of new development proposed in order to offset impacts to existing and future public facilities. For library services, the ordinance establishes a base per-dwelling unit fee for both single- and multi-family homes; $341 and $286 per dwelling unit respectively. The ordinance enforces the program by stating that "no building permit shall be issued for any Development Project except upon the condition that the Development Impact Fees required by this ordinance are paid." These funds are collected and used to provide both library services and construction of new facilities pursuant to the Public Facilities Needs List maintained by the County of Riverside and updated annually.

Riverside County General Plan Policies: Policy LU 5.1 in the Riverside County General Plan aids in the prevention of significant impacts to libraries. It directs the County of Riverside to take action to ensure that development does not cause growth to exceed acceptable levels of service. In terms of libraries, this is implemented through requirements for development fees to be paid as part of project Conditions of Approval. See Section 4.17.6.B for full text of the policy.

b. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measure 4.15.6A was imposed to reduce impacts to libraries to less than significant. This measure remains applicable to this project and would lessen impacts to libraries by setting a performance standard that must be met by new development proposals. This standard is implemented with funds collected pursuant to County Ordinance No. 659, as discussed above.

Existing Mitigation Measure 4.15.6A: Riverside County shall provide a minimum of approximately 0.5 square foot of library space and 2.5 volumes per county resident.

F. Libraries – Level of Significance After Mitigation

With the implementation of the above-listed existing General Plan policies and existing Mitigation Measure 4.15.6A from EIR No. 441, GPA No. 960 would have a less than significant impact on libraries.

4.17.7 Medical Facilities

A. Medical Facilities – Existing Environmental Setting

The County of Riverside operates the Riverside County Regional Medical Center (RCRMC) located in Moreno Valley at 26520 Cactus Avenue. The RCRMC also operates a number of adjunct clinics. The Riverside County Department of Public Health operates ten separate clinics located throughout Riverside County. Additional medical facilities and services, such as private/for profit and municipal facilities, exist within Riverside County that are not addressed in this analysis.

The RCRMC is a 520,000-square foot state-of-the-art tertiary care and level II adult and pediatric facility, licensed for a total of 439 beds. This includes 362 licensed beds in the main acute-care hospital and 77 licensed beds in a separate psychiatric facility (in the Arlington area of Riverside). All of its rooms are single-bed rooms. A Joint

Commission-accredited teaching hospital with a staff of approximately 2,100, the RCRMC can provide 200,000 annual patient visits in its specialty outpatient clinics and upwards of 100,000 annual patient visits to its emergency room/trauma unit. The RCRMC has 12 operating rooms, a helipad located directly adjacent to the Trauma Center and advanced digital radiology services, including magnetic resonance imaging (MRI) and computerized tomography (CT) equipment. There are also adult, pediatric and neonatal intensive care units, a birthing center and complete pulmonary services, including hyperbaric oxygen treatment facilities. The facility also offers a pharmacy, occupational and physical therapy, complete clinical laboratory services and diagnostic services, as well as an infusion center for outpatient intravenous treatment. (Communication from S. Lefebvre)

The community-based clinics operated by the Riverside County Department of Public Health provide a wide array of family care services in a locally based setting. The clinic in Mecca operates out of a Riverside County-owned site through an agreement with a non-profit community care provider. See Table 4.17-X (Riverside County Family Care Clinics and Related Facilities) for full list of clinics and locations. The Family Care Centers (FCC) will see any patient regardless of residency or insurance status. Each FCC has at least one family medicine physician on staff and is open from 8:00 a.m. to 5:00 p.m., Monday through Friday. The general services provided by each FCC include:

- Primary care, including ambulatory care for urgent and chronic illnesses for adults and children
- Pediatric and adult immunizations
- Confidential HIV testing
- Tuberculosis testing and screening
- Testing and treatment for sexually-transmitted disease
- Family planning
- Comprehensive perinatal (post-birth) services
- Child health examinations
- Nutrition services

Table 4.17-X: Riverside County Family Care Clinics and Related Facilities

Facility Name	Facility Location	Notes
Banning Family Care Center	3055 W. Ramsey Ave., Banning	
Blythe Family Health Clinic	321 W. Hobsonway, Blythe	Clinic operated under agreement with non-profit provider
Corona Family Care Center	505 S. Buena Vista Ave., Suite #101, Corona	
Hemet Family Care Center	880 North State Street, Hemet	
Indio Family Care Center	47-923 Oasis Street, Indio	
Jurupa Family Care Center	9415 Mission Blvd., Riverside	
Lake Elsinore Family Care Center	2499 E. Lakeshore Drive, Lake Elsinore	Also provides travel immunizations
Mecca Family Health Clinic	91275 66th Avenue, Suite #500, Mecca	Clinic operated under agreement with non-profit provider
Palm Springs Family Care Center	1515 North Sunrise Way, Palm Springs	(Also provides travel immunizations and HIV/AIDS primary care)
Perris Family Care Center (Dr. Robert Bruce Reid Health Clinic)	308 E. San Jacinto Ave., Perris	(Also provides urgent care, travel immunizations, HIV/AIDS primary care and occupational health services)
Riverside Neighborhood Health Center	7140 Indiana Ave., Riverside	
Rubidoux Family Care Center, (Don Schroeder Family Care Center)	5256 Mission Blvd., Riverside	(includes the Rubidoux Dental Office operating 7:30 am to 5 p.m., Mon. - Friday at this same location)
Temecula Neighborhood Healthcare	41715 Winchester Road, Temecula	(Clinic operated under agreement with non-profit provider)

RIVERSIDE COUNTY PLANNING DEPARTMENT

MAJOR HOSPITAL LOCATIONS

This page intentionally left blank

Medical services are provided throughout Riverside County by a complex network of both public and private providers. In some cases, both populations of patient are served by the same providers and facilities. For a variety of reasons, full data on all of the medical encounters occurring within Riverside County are not available. However, the County of Riverside has published data on its services. According to Riverside County's "Financial Highlights (Fiscal Year 2008-2009)" report, the Riverside County Community Health Agency provided nearly 125,800 patient visits and performed 466,800 patient services including family planning, primary health care, prenatal care, urgent care, child health and disability prevention. The RCRMC also provided nearly 88,550 treatments and over 9,700 mental health services through its emergency department (emergency room), nearly 129,200 clinic visits and 23,250 admissions with a total of over 118,450 patient-days of in-patient care provided.

According to the 2008 Regional Medical Facility Profile report, in 2005, there were 80,932 licensed hospital beds in California, a rate of 2.2 beds per 1,000 residents. Riverside County had 2,880 licensed beds, a rate of 1.47 beds per 1,000 residents, 33% lower than the California rate. No specific adopted criteria are maintained for determining future needs for public hospital or medical clinics. The Riverside County Department of Public Health reports that Riverside County only has 50% of the needed hospital beds necessary to meet current needs. According to the Department, while the FCCs are sized to meet current needs, approximately one additional clinic of 15,000 to 20,000 square feet (or corresponding increase in size of an existing clinic) would be needed for every 250,000 person increase in population. (Communication from M. Osur)

B. Policies and Regulations Addressing Medical Facilities

Although the Riverside County General Plan does not include a Public Services Element, it does include the following Land Use (LU) Element policy that addresses the effects of future development on medical facilities by ensuring that development does not exceed adequate medical services.

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and ~~child~~ day care centers ~~(i.e. infant, toddlers, preschool and school age children)~~, transportation systems, and fire/police/medical services.

C. Thresholds of Significance for Medical Facilities

The proposed project would result in a significant impact on medical facilities if it would:

Result in substantial adverse physical impacts associated with the provision of new or physically altered medical facilities. Or, result in the need for new or physically altered medical facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any medical facilities.

D. Effect of GPA No. 960 on the General Plan and on Medical Facilities

The proposed update to the General Plan (pursuant to GPA No. 960) includes land use overlays, land use designation (LUD) changes and new or revised policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in concentrated areas throughout Riverside County. As with the current General Plan, future development consistent with GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas. The resultant increase in population would

similarly increase the use of existing medical and health care services and facilities, as well as contribute incrementally to demand for new or expanded services and facilities.

The tables below summarize projected theoretical medical encounters (E.R. visits, inpatient and outpatient needs, etc.) to indicate the need for various types of medical services and facilities. Again, three scenarios are presented and all calculations are all labeled "theoretical" because they use the same basic set of assumptions and factors to allow for valid comparisons between and amongst scenarios. In the real world, a number of additional factors that are beyond the scope of this analysis would apply (funding availability, market conditions, available staff, etc.). The actual planning, locations and development of medical facilities is under the purview of a variety of authorities.

Table 4.17-Y (Theoretical Medical Service Needs With and Without the Project) shows representative medical statistics associated with the existing (baseline) level of development currently estimated to be present on the portions of Riverside County affected by proposed land use-related changes. These are compared against full build out of the same areas as they would be permitted under the updated General Plan (e.g., per the changes proposed in GPA No. 960). For the purposes of effects on medical services, changes proposed by the project are relevant only if they would result in an ultimate increase in population. Changes that do not adversely affect (increase or reallocate) populations within the unincorporated county area are not discussed further here.

Again, in order to focus on the areas where the proposed project would actually result in *new* development potential (i.e., potential impacts), a second scenario was developed. As shown in Table 4.17-Z (Theoretical Medical Needs for Areas of New Development Potential), this second scenario includes only those areas proposed for a change that would result in an increase in future development density or intensity. This also includes all parcels in which an LUD was changed (other than those being assigned to OS-CH, which has essentially no development potential).

The final table, Table 4.17-AA (Theoretical Medical Service Needs at General Plan Build Out), shows a comparison between the build out conditions of the General Plan as it currently exists and as it would exist if the proposed project is approved and fully implemented. This third table indicates the relative effects of the project on long-range medical planning, rather than environmental impacts per se.

Table 4.17-Y: Theoretical Medical Service Needs With and Without the Project

Staffing Item	Generation Factors (per 1,000 population)	Existing Uses of Land Total Needs[2]	GPA No. 960 Build Out Total Needs[2]	Difference
	Population[1]	***16,520 persons***	***46,370 persons***	***+ 29,840 people***
Hospital Beds	1.9 beds	30 beds	90 beds	+ 60 beds
Hospital Admissions	95 admits	1,570 admits	4,400 admits	+ 2,840 admits
ER Visits	275 visits	4,540 visits	12,750 visits	+ 8,210 visits
Outpatient Visits	275visits	4,540 visits	12,750 visits	+ 8,210 visits
Inpatient Days	493 days	8,150 days	22,860 days	+ 14,710 days
TOTAL MEDICAL ENCOUNTERS[3]		**17,230 encounters**	**48,360 encounters**	**+31,130 encounters**

Footnotes:
1. Theoretical population estimated for the land uses associated with the 111,440-acre area of known spatial project changes. Populations calculated as per General Plan Appendix E-1 standards. See Section 4.1 (Environmental Assumptions and Methods) for more information. All results rounded to the nearest 10.
2. Existing land uses indicate current (baseline) conditions. The second represents medical needs associated with build out (development) of the same areas pursuant to the General Plan as updated per GPA No. 960.
3. Total of patient-contact statistics (outpatient visits, hospital admissions and hospital inpatient days).

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Medical service standards for California from www,StateHealthFacts.org, 2008.

Upon build out of Riverside County pursuant to the existing (2008) General Plan, as shown in Table 4.17-AA, the County of Riverside as a whole would generate roughly 1.8 million medical service encounters per year and need a

total of 3,300 hospital beds (including those presently existing). Under the updated General Plan, as amended per GPA No. 960, this build out total would decrease roughly 8% to just under 1.6 million encounters and 3,000 beds. Thus, on a comparative basis the proposed project would result in fewer impacts on the environment due a reduced need for medical facilities. Such a reduced need would be reflected in any of several ways, including through a reduction in the capacity needed within existing facilities, by delaying the need for construction of additional medical facilities or by reducing the size of new facilities constructed.

Table 4.17- Z: Theoretical Medical Needs for Areas of New Development Potential

Staffing Item	Generation Factors (per 1,000 population)	Existing Uses of Land Total Needs[2]	GPA No. 960 Build Out Total Needs[2]	Difference

Source: Riverside County General Plan, 2008. Riverside County Planning Dept., project land use data, 2011. Medical service standards for California from www.StateHealthFacts.org, 2008.

Using the demand factor for additional health clinics issued by the County Department of Public Health (one additional 15,000 to 20,000 square-foot facility for every 200,000 population increase), the additional population (13,020) arising from future development directly attributable to project changes (i.e., Table 4.17-Z) would represent an increment increase of 6.5% of the total need for an additional clinic. However, the total represents demand across Riverside County. The actual increases would be spread throughout the 19 Area Plans of unincorporated Riverside County, plus the remainder area of eastern desert not in an Area Plan. As such, the adverse effects on most individual regions would be small to negligible. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary services.

To examine effects to the individual regions of Riverside County, the medical statistics were further broken down by Area Plan. Analysis indicated that effects would vary regionally, in the same pattern previously described. Approximately 30% of the increased demand would be concentrated in the Elsinore Area Plan region, with Palo Verde Valley (22%), Jurupa (16%), Mead Valley (14%) and Western Coachella Valley (11%) Area Plans accounting for another 8,300 medical encounters (roughly 60% total). The remaining 9% is distributed throughout Riverside County. Generally, the need for additional hospital beds, clinic space and staff would increase (or decrease) in the same proportions.

In terms of General Plan changes, the project would only incrementally affect most of Riverside County's Area Plans; in amounts not large enough to trigger the need for an additional medical clinic, for example, in any single county area. Not surprisingly, however, the increased demand for medical services shows up most clearly in the areas being planned for urbanization – the Meadowbrook and Good Hope Rural Village Overlays, in particular. In terms of environmental effects, future development accommodated by GPA No. 960 would contribute only incrementally to the need for additional medical facilities and staff throughout Riverside County to ensure adequate levels of service. Associated environmental impacts and mitigation associated with these additional needs are discussed below.

E. Medical Facilities – Impacts and Mitigation

Impacts to medical facilities and services that would result from implementation of the proposed project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered medical facilities? Or, would it result in the need for new or physically altered medical facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any medical facilities?

Impact 4.17.F – Cause Adverse Environmental Effects Due to the Need for Medical Facilities: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, resulting in a small overall population increase that would contribute incrementally (by about 6.5%) to the need for an additional community clinic and generating roughly 13,500 medical encounters. However, since the population increase would be spread throughout unincorporated Riverside County and occur over 50 years, associated impacts to medical facilities and services would be negligible. In terms of overall General Plan build out, the project would result in a net decrease of roughly 143,700 Riverside County residents. Thus, for long-range provision of needed medical facilities and services, the project would slightly lower (by roughly 8%) the expected increase in demand for new or expanded medical facilities and services over time. In total, the project would not have a significant adverse effect on medical facilities or services, nor would it cause significant adverse environmental impacts by necessitating construction of new facilities.

1. Analysis of Impact 4.17.F

New development would introduce additional people within Riverside County to medical services. This would result in additional use of existing facilities and work for existing staff. When demand is great enough in a given region, an additional clinic or other medical facility would be built. However, in areas where development remained sparse, development of new facilities would be unlikely.

As discussed in Section 4.17.7.D, above, existing standards indicate that full build out of the existing General Plan would accommodate a population of roughly 1.7 million people within unincorporated Riverside County. To serve this population, the medical system (both county and private) would require an estimated total of 3,300 hospital beds and generate roughly 1.8 million medical service encounters. The land use changes associated with GPA No. 960 would reduce expected population of Riverside County by nearly 138,000 people and require 300 fewer beds and generate 143,700 fewer encounters. Diagnostic, laboratory, surgical, rehabilitation, mental health, pharmacy and other medical service needs would be similarly reduced. Accordingly, environmental impacts associated with construction of new or improved facilities would be avoided or postponed.

At the Area Plan level, however, as shown in Table 4.17-X, GPA No. 960 would allow for additional future development that would increase Riverside County's population by 13,000 people, mostly spread widely throughout Riverside County. This increase would require an additional 25 hospital beds and generate an additional 13,570 medical encounters. Overall, because some portions of Riverside County would experience a population decrease or neutral change, many areas of Riverside County would not have any significant adverse impact to medical services as a result of future development pursuant to this project.

Some areas would have minor increases. In these areas, future development as a result of the project would not result in significant adverse impacts on medical services and facilities. Also, these increases would occur incrementally over the next several decades, allowing ample time for long-range planning and provision of necessary services.

The three areas covered by the Elsinore, Palo Verde Valley and Jurupa Area Plans, however, would need more additional facilities and services (for example, 7, 6 and 4 more hospital beds, respectively). In these areas in particular, additional medical services and facilities would be required to continue to meet the community demand for care.

It should also be remembered that the build out of the new development leading to this population growth is projected to take roughly 50 years. This is ample time to allow for adequate long-range planning and provision of additional services as need arises. In addition, GPA No. 960 is projected to result in roughly 138,000 fewer people at build out than originally planned for under the current General Plan and would similarly reduce the need for additional medical services. This change would be reflected in any of several ways, including through a reduction in the capacity needed within existing facilities, by delaying the need for construction of new facilities or by reducing the size of new medical facilities constructed. In total and based on the 6.5% increase in community demand attributable to project-related new development potential, the project would not have a significant adverse effect on medical facilities or services. No project-specific mitigation is needed.

2. Regulatory Compliance for Impact 4.17.F

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following General Plan policy and existing mitigation measures from prior EIR No. 441 would further reduce or minimize this already insignificant impact.

a. Compliance with Proposed New or Revised Riverside County General Plan Policies

General Plan Policy LU 5.1 would further contribute to ensuring development impacts to medical services and facilities are less than significant. The policy directs the County of Riverside to take action to ensure that development does not cause growth to exceed acceptable levels of service for medical facilities. See Section 4.17.7.B for full text of the policy.

b. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.15.7A and 4.15.7B were imposed to reduce impacts to medical facilities and services to less than significant. Although the potential impacts of this project are already less than significant, these measures were programmatic in nature and thus remain applicable to this project.

Existing Mitigation Measure 4.15.7A: Riverside County shall perform a periodic medical needs assessment to evaluate the current medical demand and level of medical service provided within each Area Plan. A periodic medical needs assessment shall be conducted every three years.

Existing Mitigation Measure 4.15.7B: Riverside County shall fund the new construction and/or expansion of existing medical facilities according to the level of demand for medical services. The level of demand would be based on and determined by the outcome of the periodic medical needs assessments.

F. Medical Facilities – Level of Significance After Mitigation

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on medical services and facilities. In addition, compliance with the above-listed existing General Plan policy and existing Mitigation Measures 4.15.7A and 4.15.7B from EIR No. 441, would further reduce or avoid the insignificant impacts associated with the project.

Section 4.18

Transportation and Circulation

Section 4.18 Transportation and Circulation

4.18.1 Introduction

This section assesses the potential impacts on Riverside County's Transportation and Circulation network that could result from future development and circulation system changes pursuant to the proposed project, General Plan Amendment No. 960 (GPA No. 960).

Given the comprehensive nature of the land use and policy changes, the analysis of transportation and circulation impacts are presented on a countywide basis. This analysis is organized around nine major impact areas, corresponding to the major transportation sub-topics typically addressed in transportation studies. These nine major impact areas are identified below in Table 4.18-A (Major Transportation Impacts).

Table 4.18-A Major Transportation Impacts

Impact Number	Issue	Description
4.18.A	County Roadways	Considers how land use, roadway network and policy changes under GPA No. 960 will affect Riverside County roadways
4.18.B	CMP Network/Policies	Evaluates the effect of land use and transportation changes under GPA No. 960 will affect the CMP network and policies
4.18.C	Air Travel	Assesses how GPA No. 960 will affect existing and proposed air travel facilities
4.18.D	Waterborne or Rail	Assesses how GPA No. 960 will affect existing and proposed waterborne and rail travel
4.18.E	Transportation Safety	Evaluates how GPA No. 960 will affect safety for drivers, transit users, bicycles, and pedestrians
4.18.F	Road Maintenance	Considers the effect upon a need for new or altered maintenance of roads
4.18.G	Effects during Construction	Evaluates the effect upon circulation during the project's construction
4.18.H	Emergency Vehicle Access	Considers how GP960 will effect access by emergency vehicles
4.18.I	Alternative Transportation	Assesses whether GPA No. 960 will affect use of the transportation system by transit users, bicycles, and pedestrians

Due to comments received regarding GPA No. 960 and the original draft of EIR No. 521, certain land use and network modifications have been incorporated into GPA No. 960 and have been evaluated as part of this traffic analysis for this recirculated version of EIR No. 521. These modifications include, in part, the removal of the Villages of Lakeview project land use and circulation network designations from the Lakeview/Nuevo Area Plan. The original General Plan land uses have been substituted in place of the Villages of Lakeview land uses. The circulation network has been modified to remove the circulation plan for the Villages of Lakeview, but does reflect the current status of planning for the MidCounty Parkway with respect to interchange locations. This factor, together with the Lakeview Design Guidelines have resulted in some minor modifications to the original General Plan circulation network, and are now presented in GPA No. 960, as currently proposed.

With these modifications, the traffic model was rerun in order to assess the consequence of these changes for both the GPA No.960 scenario and the 2003 General Plan scenario. The traffic model results generally show a reduction in traffic volumes on the local Arterial network in the immediate Lakeview/Nuevo area, including the Mid-County Parkway. The 2003 General Plan scenario indicates a slight increase in MidCounty Parkway traffic volumes easterly of the Lakeview/Nuevo area. There is also a slight reduction of traffic volume on the I-215 that changed its Volume to Capacity ratio by 1%, but none of the changes are significant enough to make any real difference to the analysis. Several figures in Appendix E have been updated to illustrate the findings of this evaluation. The new figures are dated December 18, 2014. The removal of the Villages at Lakeview project does have the localized impact of reducing forecast traffic volumes, but has no discernable influence on countywide traffic patterns or levels of service. As such, the only change to the previously circulated traffic analysis is to augment the analysis for the Lakeview/Nuevo area to evaluate the currently proposed land use and circulation plans which, in general, reflect the pre-Villages at Lakeview condition.

4.18.2 Baseline Environmental Setting Transportation and Circulation

A. Baseline Data Sources

Pursuant to CEQA, the descriptions of the physical environmental conditions provided in this EIR are as they exist at the time of the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting will constitute the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant.

Because of the countywide scope of this project, the lengths of time required to survey and assess baseline conditions, and because this is a programmatic EIR, the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). Accordingly, the data set that is representative of the 2009 baseline conditions is used for purposes of assessing impacts, but more recent data is also presented in some instances to provide a fuller and more detailed analysis. In these instances, a discussion of how the more recent data is or is not expected to differ from the baseline conditions is provided. The decision to reflect more recent data, where available, was made to ensure the fullest possible disclosure of potential impacts, and to provide the most robust discussion of potential impacts based on available substantial evidence. It should be noted here that 'substantial evidence' refers to "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact," (PRC Section 21080(e) (1)). Further, 'substantial evidence' does not include 'argument, speculation, unsubstantial opinion or narrative, evidence of social or economic impacts that do not contribute to, or are not caused by, physical impacts on the environment.'

B. Baseline Roadways

Due to the interrelationship of urban and rural activities (employment, housing and services), and the low average density of existing land uses, the private automobile is the dominant mode of travel within Riverside County. Trips by mass transit currently represent less than 2% of all trips made in Riverside County. Public transportation, where service is available, is utilized primarily by a transit-dependent population (senior citizens, students, low-income residents, and the physically disabled) that generally do not have access to automobiles.

Riverside County's industrial and agricultural economies depend on safe and efficient goods movement. The County of Riverside is responsible for maintaining an extensive network of low-volume rural roads in sparsely settled areas to service goods movement and the agricultural industry. Large trucks are the primary means of transporting such goods. In addition, freight rail is an important backbone of the goods movement industry in Riverside County.

Riverside County is linked to Los Angeles and Orange Counties principally by State Route 60 (SR-60, Pomona Freeway), Interstate 10 (I-10, San Bernardino Freeway), SR-91 (Riverside Freeway), and SR-74 (Ortega Highway). Interstate 15 freeway (I-15) and other minor conventional highways provide links to San Diego County. Links to San Bernardino County are provided by I-15 and I-215, as well as by other major and minor local roadways. I-10 freeway provides a connection to destinations in Arizona; I-15 and I-215 provide access through San Bernardino County to Nevada including its primary recreation areas (Lake Mead and Las Vegas). In addition, I-15 provides access south to San Diego and its many tourist and recreational amenities, and to Mexico via I-5 and I-805.

The highway system includes numerous county roadways, as well as roadways within each of the 28 cities in Riverside County. Some of the major roadways in Riverside County include Alessandro Boulevard, Cajalco Road, Center Street, Domenigoni Parkway, Grand Avenue, La Sierra Avenue, Magnolia Avenue, Monterey Avenue, Murrieta Hot Springs Road, Palm Drive, Ramon Road, Ramona Expressway, Rancho California Road, Temescal Canyon Road, Van Buren Boulevard, Washington Street, and others.

Operating conditions on a roadway system are often described using a concept called "Level of Service." ~~The 2010 (5th Edition) of the Highway Capacity Manual (HCM) defines the term Level of Service (LOS) thusly:~~

> ~~*"A quantitative stratification of a performance measure or measures that represent quality of service, measured on an A – F scale, with LOS A representing the best operating conditions from the traveler's perspective and LOS F the worst."*~~

LOS is basically a qualitative characterization of the operational conditions of various freeway, arterial and intersection facilities, as well as alternative modes of transportation. It is a simple means of describing a very complex interrelationship between factors affecting system capacity and travel demand.

"The task of driving involves a progression of continuously changing action/reaction conditions based on an infinite number of variables and ever-changing conditions. During the past century, scientists and engineers have sought methods and systems to describe, evaluate, simulate and predict traffic flows under various conditions. During this time, physicists, psychologists, human behaviorists, statisticians, physiologists and many others have collaborated with traffic engineers to create a more accurate picture of driver behavior and traffic flow."

In analyzing the performance of transportation facilities, it is important to identify the level of analysis needed based upon the scope of the project being evaluated. At times an analysis may seek to describe or evaluate the interaction of individual vehicles in order to determine intersection LOS and recommend appropriate design features such as lane configuration and traffic signal timing. This is a mirco level analysis, often utilized when evaluating proposed intersection improvements or the impact of individual development projects. On the other hand, engineers and planners may need to evaluate a transportation network or system, looking into the distant future to forecast demand and provide a context for recommended capacity enhancements. This is a macro level analysis and reflects an aggregate overall measure of traffic conditions, as in the analysis of the General Plan buildout. LOS parameters have been developed for both types of analysis and for various facility types.

Descriptions of highway traffic flow are generally correlated to the type of access control used on the facility and the level of analytical detail sought in the analysis. Traffic moving on facilities such as freeways, multilane highways and two-lane rural roadways is largely unaffected by intersection controls such as traffic signals and stop signs. Traffic flow under these conditions is broadly referred to "uninterrupted flow." Traffic flow under these conditions is governed by the interaction of adjacent vehicles as drivers accelerate, decelerate and change lanes in response to the movement of other vehicles and the design features of the roadway. In contrast, traffic in an urban setting with multiple intersections and direct driveway access must be periodically stopped to avoid conflicts. This is typically accomplished through the use of traffic control devices, such as stops signs or traffic signals. These regular starting and stopping conditions effectively regulate the characteristics and amount of flow on such roadways. Traffic operating under these conditions is referred to as "interrupted flow."

There are various factors that affect traffic flow; speed, vehicle density, the mix of vehicle types, access controls, terrain, presence of pedestrians and bicyclists, roadway design geometrics, lane widths, number of lanes, plus many more. One of the most significant factors affecting traffic flow is the number of vehicles desiring to use a certain segment of roadway. As the volume of traffic increases, the density of vehicles increases, speed is reduced, a driver's freedom of lane choice is limited. Theoretically, at some point, when the traffic volumes exceed the "capacity" of a facility the system breakdowns and traffic no longer flows. The Highway Capacity Manual defines capacity as "the maximum hourly rate at which persons or vehicles reasonably can be expected to traverse a point or a uniform section of a lane or roadway during a given time period under prevailing roadway, traffic and control conditions."

The Highway Capacity Manual provides the following definitions of LOS to describe traffic flow characteristics for both uninterrupted flow and interrupted flow type facilities (signalized intersections).

Table 4.18-B (Uninterrupted Traffic Flow Facilities Level of Service) provides a qualitative description of the various levels of service for facilities with uninterrupted flow, basically freeways, facilities where the mainline does not stop for cross traffic. Table 4.18-C (Interrupted Traffic Flow Facilities Level of Service) provides the same type of qualitative description of the various levels of service for facilities that do have interrupted flow. These include conventional state highways and local surface streets that intersect with other highways and streets. For facilities with interrupted flow, the primary constraint is usually the delay experienced at intersections. For both conditions, the HCM provides detailed instruction on how to calculate the level of service based on existing or future operating characteristics.

Table 4.18-B Uninterrupted Traffic Flow Facilities Level of Service

LOS	Definition
A	Describes completely free-flow conditions. The operation of vehicles is virtually unaffected by the presence of other vehicles, and operations are constrained only by the geometric features of the highway and by driver preferences. Maneuverability within the traffic stream is good. Minor disruptions to flow are easily absorbed without a change in travel speed.
B	Also indicates free flow, although the presence of other vehicles becomes noticeable. Average travel speeds are the same as in LOS A, but drivers have slightly less freedom to maneuver. Minor disruptions are still easily absorbed, although local deterioration in LOS will be more obvious.
C	The influence of traffic density on operations becomes marked. The ability to maneuver within the traffic stream is clearly affected by other vehicles. Minor disruptions can cause serious local deterioration in service, and queues will form behind any significant traffic disruption.
D	The ability to maneuver is severely restricted due to traffic congestion. Travel speed is reduced by the increasing volume. Only minor disruptions can be absorbed without extensive queues forming and the service deteriorating.
E	Represents operations at or near capacity; an unstable level. Vehicles are operating with the minimum spacing for maintaining uniform flow. Disruptions cannot be dissipated readily, often causing queues to form and service to deteriorate to LOS F.
F	Represents forced or breakdown flow. It occurs either when vehicles arrive at a rate greater than the rate at which they are discharged or when the forecast demand exceeds the computed capacity of a planned facility. Although operations at these points – and on sections immediately downstream – appear to be at capacity, queues form behind these break-downs. Operations within queues are highly unstable, with vehicles experiencing brief periods of movement followed by stoppages.

Table 4.18-C Interrupted Traffic Flow Facilities Level of Service

Level of Service	Definition
A	Describes operations with a low control delay, up to 10 seconds per vehicle. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	Describes operations with control delay greater than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	Describes operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from only fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	Describes operations with control delay greater than 35 and up to 55 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high volume-to-capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	Describes operations with control delay greater than 55 and up to 80 seconds per vehicle. These high delay values generally indicate poor progression, long cycle lengths, and high volume-to-capacity ratios. Individual cycle failures are frequent.
F	Describes operations with control delay in excess of 80 seconds per vehicle. This level, considered unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high volume-to-capacity ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

Source: Transportation Research Board, Highway Capacity Manual, 5th Ed., 2010, pages 16-7 and 16-8.

Contemporary traffic models have been developed to predict travel patterns based upon forecasts of future socioeconomic and land use development characteristics. That travel demand is then translated into trips which are assigned to various modes of travel. Vehicular trips are then distributed to a coded roadway network based on trip productions vs trip attractions. For example, commercial and employment areas will attract trips generated in residential areas. The traffic volumes that the model assigns to the various roadway links is capacity constrained by the way that the roadway network is coded, i.e. freeway lanes have greater capacity than arterial lanes and arterial lanes have greater capacity than collector lanes. The number of lanes of various classifications of roadways will also affect their capacity. Even so, the traffic model can assign more traffic to a facility than it has the capacity to handle if there are no viable alternative routes available to accommodate the traffic. In such cases, the network is then reevaluated to see where additional capacity can be added.

For the purposes of General Plan analysis, Riverside County has established daily traffic volume range breaks for Circulation Element roadways, which correspond to various levels of service for each facility type. These range breaks, indicating maximum two-way daily volumes for LOS C, D and E, by facility type are presented in Table 4.18-D *Capacity volumes for freeways, expressways and mountain arterials are reflective of facilities with uninterrupted flow, while the capacity values for arterial, major, secondary and collector designations recognize that these facilities are generally more urban in nature and are subject to interrupted flow conditions. It may be noted that the traffic volume values for a two-lane mountain arterial are greater than for a two-lane collector, but that a four-lane mountain arterial has less capacity than a four-lane arterial. This because the arterial in general does have a relatively high degree of access control, while the capacity of the mountain arterial is more constrained due to the effect of topography on horizontal and vertical roadway alignment. Likewise, urban arterials are anticipated to have a high degree of access control, but not to the extent that would be anticipated with a freeway or expressway. Thus, the LOS thresholds for a six-lane expressway are much higher than for a six-lane urban arterial.* ~~(Segment Volume Capacities/ Level of Service for Riverside County Roadways). These figures have been prepared in accordance with transportation professional standards and practices, to represent the level of service standards contained in the 2010 HCM.~~

Table 4.18-D Segment Volume Capacities/Level of Service for Riverside County Roadways

Roadway Classification	Number of Lanes	Maximum Two-Way Average Daily Traffic (ADT) Volume		
		Level of Service C	Level of Service D	Level of Service E
Collector	2	10,400	11,700	13,000
Secondary	4	20,700	23,300	25,900
Major	4	27,300	30,700	34,100
Arterial	4	29,600	33,400	37,000
Mountain Arterial	2	12,900	14,500	16,100
Mountain Arterial	4	25,500	28,700	31,900
Urban Arterial	6	45,000	50,600	56,300
Urban Arterial	8	69,000	78,000	87,000
Expressway	4	53,000	58,000	64,000
Expressway	6	79,000	87,000	95,000
Expressway	8	106,000	119,000	132,000
Freeway	4	80,000	91,000	100,000
Freeway	6	102,000	123,000	132,000
Freeway	8	136,000	164,000	176,000
Freeway	10	169,000	205,000	220,000
Ramp(1)	1	16,000	18,000	20,000

Footnotes:
1. Ramp Capacity is given as a one-way traffic volume.
Source: Riverside County Transportation Department

The values displayed in Table 4.18-D are an updated version to the values found in the 2003 General Plan. The prior figures had not been updated since 2001. The revised values were developed based upon research of values used for neighboring counties, a review of current recommended practices and methodologies as endorsed by the Institute of Transportation Engineers, and field observations of existing operating characteristics.

The LOS volume capacity values for five of the roadway classifications did not change at all. The volume figures for the four-lane Mountain Arterial were reduced by about 14% due to added consideration of the effects of both vertical and horizontal geometric design factors. Four-lane Arterial and six-lane Urban Arterial capacity values increased an average of between 3 and 4 ½ %. This is due in large part to improved traffic control measures such as signal coordination and signal timing, which result in greater through put on the roadway link segments.

The largest increases in capacity are shown for the eight-lane Urban Arterial and Expressway classifications, with increases of 20 to 62 %. These values also reflect enhanced traffic flow due to improved traffic control measures and in addition take into account very restrictive access control on these types of roadways. Observations of similar facilities in Orange County indicate that these values reflect reasonable expectations with respect to LOS.

Capacity volumes for Freeways were also increased, anywhere from 5% for a ten-lane facility to more than 30% for a four-lane facility. These values are largely based on field observations that have seen freeway volumes increase dramatically over the past decade, but have not resulted in the decline in LOS that had previously been anticipated.

These values were used to evaluate the traffic model results and make refinements to the roadway network designations. As these values are part of the technical data used for the purposes of traffic analysis, they are not a policy element of the General Plan and thus are no longer included in the General Plan document. LOS criterion is included in the General Plan Transportation and Circulation policies to provide guidance in the evaluation of traffic impacts as part of the development review process. The following are the current General Plan policies relative to LOS.

Policy C 2.1: *Maintain the following countywide target Levels of Service:*

LOS "C" along all County maintained roads and conventional state highways. As an exception, LOS "D" may be allowed in Community Development areas, only at intersections of any combination of Secondary Highways, Major Highways, Arterials, Urban Arterials, Expressways, conventional state highways or freeway ramp intersections.

LOS "E" may be allowed in designated community centers to the extent that it would support transit-oriented development and walkable communities. (AI 3)

Policy C 2.2: *Apply level of service standards to new development via a program establishing traffic study guidelines to evaluate traffic impacts and identify appropriate mitigation measures for new development. (AI 3)*

In addition, the following margin notes are included in the current General Plan to further describe LOS and the rationale behind the lower LOS target of "D" in Community Development (Urban) areas, and LOS "E" in designated community centers, in order to support transit-oriented development and walkable communities.

> ***Level of Service***
>
> *A qualitative measure describing the efficiency of traffic flow. Level of Service designations are used to describe the operating characteristics of the street system in terms of the level of congestion or delay experienced by traffic.*
>
> *To achieve the true intent of community center design, Level of Service designations are typically lower (LOS E) to minimize the impacts of accommodating uncongested roadways and to maximize pedestrian use. Higher level of service designations (LOS A, B, C) require wider road widths, and as a result, would create circulation systems that are more accommodating to automobiles than pedestrians.*

Per the current policies, LOS "D" is allowed at the intersection of any General Plan roadways designated as a secondary highway or greater classification within areas designated as Community Development, that is those areas generally designated for urban type growth. Further, the General Plan currently allowed LOS "E" in designated community centers to the extent that it would support transit-oriented development and walkable communities.

GPA No. 960 proposes to revise the current LOS policy. There are several factors which influenced the decision to propose LOS policy changes. One of those factors was a review of the LOS policies of other agencies. It was discovered that most of the neighboring cities and counties, as well as the vast majority of cities within Riverside County generally target LOS D as their benchmark, with exceptions that permit even lower levels of service in certain instances. Imperial County and the eastern region of San Bernardino County along with the Cities of Banning, Calimesa, Lake Elsinore, Murrieta and Wildomar are the only adjacent jurisdictions that currently target LOS "C" for General Plan roadways during peak hours. The City of Banning has a general Plan amendment in process at present that will revise the City's LOS threshold to LOS "D." Table 4.18-E includes a comparison of LOS targets by jurisdiction.

The LOS policy revision as originally proposed has been further modified in response to several comments received from the public, in concert with additional review of the specifics of some of the policies of neighboring jurisdictions. The LOS policy as now proposed no longer calls for a Countywide LOS target, however, LOS "C" will continue to be the target LOS for the vast major of the County unincorporated area, including most of the eastern desert region and the San Jacinto Mountains, those areas that are most rural and adjacent to other jurisdictions that currently have an established LOS target of "C."

In the review of LOS policies for neighboring jurisdictions, it was discovered that San Diego County allows LOS "E" to include areas where the addition of travel lanes to achieve a lower LOS would have a significant adverse impact on environmental and cultural resources such as habitat, wetlands, MSHCP preserves, wildlife movement, stands of mature trees, historic landmarks, or archaeological sites. As adverse impacts to such sensitive resources are also a major concern in Riverside County, similar language was originally recommended in the revised Policy C 2.1. The current proposal has removed this language and instead recognizes that the Board of Supervisors, due to their discretionary powers, may approve a project that fails to meet the LOS targets in order to balance congestion management considerations in relation to benefits, environmental impacts and costs, provided an Environmental Impact Report, or equivalent, has been completed to fully evaluate the impacts of such approval. Any such approval must incorporate all feasible mitigation measures, make specific findings to support the decision, and adopt a statement of overriding considerations.

While the current policy allows LOS "E" as a matter for staff determination and only in community centers to the extent that it would support transit-oriented development and walkable communities, the approval decision is now elevated to the level of the Board of Supervisors to determine if LOS "E" should be allowed. This does not eliminate input from any other bodies that typically provide feedback or approvals on such matters. In practice, staff would be responsible for recommending whether a project satisfies the criteria for allowing LOS "E," as well as the Planning Commission, but the ultimate decision will rest with the Board of Supervisors.

Roadway construction projects undertaken by the County as lead agency will now need to evaluate project priorities based upon the new LOS targets. As such, it is anticipated that some roadway widening projects will be delayed, reduced in scope or eliminated. For construction projects mitigating traffic impacts to LOS "E" the Board of Supervisors need make findings that the project is consistent with the new LOS policy.

Another reason for the proposed LOS revisions is that the wording of the current policy is often misconstrued. The current policy begins by stating; "Maintain the following countywide target Levels of Service: LOS C along all County maintained roads and conventional state highways." This opening statement is often misconstrued as meaning that LOS "C" is the Countywide target everywhere, but this is not the case. Even in that opening declaration it states; "target Levels of Service," plural. There are various target levels of service at present. LOS "D" is allowed currently in any area with a foundation Land Use Designation of Community Development. This includes all urban or urbanizing areas of the unincorporated County. Many newly incorporated cities have adopted the County General Plan, at least on an interim basis. This would mean that their minimum target LOS is "D" with LOS "E" allowed in community centers as well. The proposed policy revisions do go beyond just clarifying the current policies, but it is hoped that the revised wording will be more easily understood.

~~Current Riverside County LOS policies call for a target minimum LOS C, with exceptions for Community Development Areas where LOS D is generally deemed acceptable, and in community centers promoting Transit Oriented Development and walkable communities where LOS E may be allowed. However, most of the neighboring cities and counties, as well as the vast majority of cities within Riverside County generally target LOS D as their minimum level of service, with exceptions that permit even lower levels of service in certain instances. Table 4.18-E (LOS Comparison by Jurisdiction) presents a comparison of LOS standards by jurisdiction. These policies are in keeping with generally accepted engineering practices within the transportation profession.~~ *The revised policy language as now proposed* ~~As such, GPA No. 960 is proposing revisions to the LOS policies for Riverside County which~~ will bring Riverside County's LOS policy in line with the policies of other local jurisdictions in the region. While allowing marginal increased levels of traffic, this change in policy will serve to support other policies promoting alternative modes of transportation and reduce the need to expand certain street and highway facilities, thus reducing future infrastructure costs and providing a more favorable environment for pedestrians and bicyclists.

The change in LOS will also serve as a deterrent to incompatible land uses in outlying areas by reducing the potential of infrastructure encroachment on sensitive adjacent land uses.

To assess the performance of the existing roadway system in the County, the LOS on segments of the County's roadway system was determined by cross referencing the values contained in Table 4.18-D with existing daily traffic volumes and facility characteristics. Figures 4.18.1.1 to 4.18.5.21, located in Appendix EIR-4.E, provide specific information related to existing roadway network, traffic flow/volumes, and level of service.

The results indicate that in areas governed by the current LOS C policy, most roadways continue to operate at LOS C or better, with fewer than 100 miles of roadway in this category, vastly scattered throughout Riverside County, that are forecast to operate at LOS D. Table 4.18-F (Roadways Under Current LOS C Target Policy which are Forecast to Operate at LOS D) identifies these facilities by Roadway Classification and number of centerline miles.

Table 4.18-F Roadways Under Current LOS C Target Policy Forecast to Operate at LOS D

Roadway Classification	Sum of Centerline Miles
Collector	12.94
Secondary	5.84
Major	6.3
Arterial	20.90
Urban Arterial	3.97
Freeway/Expressway	9.74
TOTAL	**59.69 miles**

Source: Riverside County Transportation Department

The current Riverside County Roadway System consists of more than 2,100 miles. The centerline miles shown above, which indicate the number of miles of County of Riverside roadway affected by the proposed change in LOS policy, represent less than 3% of the total road system.

Further details of the affected roadways are presented in Appendix EIR-4.F. *Data is grouped by road name and Area Plan, along with indicating the project LOS for both the 2003 General Plan and GPA No. 960.* ~~which groups the data by road name and Area Plan, while indicating the projected LOS for both the 2003 General Plan and GPA No. 960 scenarios.~~

For all other General Plan roads included in the analysis, the majority of Riverside County's roadway and highway system operates at LOS D or better, meaning that motorists on most roadways do not experience substantial delays, even during peak travel hours, and roadway segments are generally operating under capacity.

There are also a number of heavily congested roadway and highway segments within the County of Riverside. Table 4.18-G (Baseline Roadway Levels of Service for Freeways and State Routes) identifies segments of interstate and state routes where the daily traffic volumes indicate LOS E or F conditions. The source for the existing traffic volumes in Table 4.18-G is the 2009 Caltrans publication *Traffic Volumes on California State Highways*. This source is used to reflect baseline conditions on state and interstate routes, since it represents the most recently available uniform and consistent compilation of traffic volumes on state routes. As the information in Table 4.18-G indicates, under existing conditions, there are a number of interstate and state route segments in Riverside County that operate at or over capacity (e.g., LOS E or LOS F). These segments are highlighted.

Using Riverside County's traffic volume range breaks, I-10 is the only major freeway in Riverside County that is not operating at or over capacity for its entire length through the County of Riverside. I-15, I-215 and SR-60, on the other hand, operate at or over capacity on a number of segments through Riverside County. SR-91

operates at LOS F for the entire length between the Orange County line and the SR-91 junction with SR-60/I-215.

Some of the non-freeway state routes also operate at or over capacity. These include:

- SR-62: Indian Avenue to San Bernardino County at LOS F.
- SR-74: through the City of Lake Elsinore at LOS F and a segment west of Hemet at LOS E.
- SR-79: between Benton Road and Simpson Avenue at LOS F; however, Riverside County's widening project on this facility is underway and will bring the LOS to within acceptable levels under existing conditions.
- SR-111: several segments in the Indian Wells/Palm Desert area at LOS E.

All other freeways and state routes have daily traffic volumes that indicate LOS D or better.

3. Caltrans, Traffic Counts on State Highways, 2009.
4. Based on County of Riverside traffic volume range breaks for LOS.
5. Exempt from CMP requirements.

Source: Riverside County Transportation Department; other sources per footnotes.

The LOS values shown in Table 4.18-G may differ from the LOS reported in the CMP. This can occur because the CMP is based on a different methodology than this table or because lanes have been added to the facility since the time it was declared to be exempt 1991.

Table 4.18-H (Baseline Roadway Levels of Service for Roadway Segments One Mile or Greater (Arterial Road Network)) is similar to Table 4.18-G and identifies non-State facilities where the daily traffic volumes indicate LOS E or F conditions. For purposes of readability, only the roadway segments that are one mile in length or greater are shown in Table 4.18-H. For a complete list of roadway segments with corresponding LOS refer to Appendix EIR-4.A. The daily traffic volumes are taken from the Riverside County Traffic Analysis Model (RIVTAM) validated base year model. Referencing Table 4.18-G and Table 4.18-H, many segments operate at LOS E or LOS F. The majority of the local, interstate, and state route facilities with LOS worse than LOS D are located in the western portion of Riverside County. In addition, most of the roadway segments that are at or over capacity are on the freeway system and other major arterials. Excluding the freeway system, approximately 32 miles of the Circulation Element roadways operate at LOS E

(approximately 11 miles unincorporated and 20 miles incorporated) and approximately 97 miles operate at LOS F (approximately 28 miles unincorporated and 69 miles incorporated) under baseline conditions.

Table 4.18-H Baseline Roadway Levels of Service for Roadway Segments One Mile or Greater (Arterial Road Network)

Source: RIVTAM validated base year model, 2007.

C. Park and Ride Facilities

Park and Ride facilities provide resources that encourage increased vehicle occupancy, which reduces the number of vehicles using roadways and highways in Riverside County. In western Riverside County, Park and Ride facilities are operated by Caltrans, the Riverside County Transportation Commission (RCTC), and private commercial developments. Park and Ride facilities that are operated by Caltrans typically are located within the right-of-way of state highways and are owned and maintained by Caltrans. As of 2009, there were nine Park and Ride facilities providing 1,024 spaces operated by Caltrans in western Riverside County. RCTC Park and Ride facilities are typically located on private parking lots under a one-year lease agreement and may include all spaces or just a designated portion of the spaces of the parking lot. RCTC ensures that the Park and Ride facilities that they lease are paved, well lit and maintained facilities that are within one mile of a state highway. As of 2009, there were twelve Park and Ride facilities providing 859 spaces operated by RCTC. Other private commercial developments, such as large malls along state routes, have been required to provide a portion of their parking lot for Park and Ride usage as a condition of approval for the development from the approving local jurisdiction. As of 2009, there were four privately operated Park and Ride facilities providing 320 spaces in western Riverside County. There were a total of 25 Park and Ride facilities providing 2,203 spaces in western Riverside County as of 2009. The locations of these Park and Ride facilities are shown on Figure 4.18.6 within Appendix EIR-4.E.

RCTC's website (http://www.rctc.org/commuters/ie511) provides commuters with the location of Park and Ride facilities in western Riverside County as well as other useful commuter information, such as real-time

traffic conditions, bus and rail line information, and carpool lane locations. RCTC monitors the usage of the Park and Ride facilities that it leases once every quarter to actively evaluate the capacity and demand for their Park and Ride facilities. RCTC also monitors the usage of Caltrans and privately operated Park and Ride facilities once per year and provides this information to the Park and Ride operator if a contact is known. All of the above 2009 data was provided by RCTC from their Park and Ride monitoring data. The demand for Park and Ride facilities is influenced by numerous economic factors, and it has shown an increase in demand during recent years as employees have experienced income reductions and increasing gas prices. Generally the demand for Park and Ride facilities is expected to increase as highway traffic continues to increase.

Currently, there are no Park and Ride locations established in the Coachella Valley area of Riverside County. Caltrans and other agencies involved in traffic management for the desert region have not detected traffic patterns that indicate that there is sufficient demand to warrant the creation of Park and Ride facilities in the Coachella Valley at this time. Caltrans conducts annual monitoring of traffic patterns in the desert region and will consider creating Park and Ride facilities for that region if sufficient demand develops.

D. Existing Public Transit Systems

Fixed-route transit services and demand response (dial-a-ride) transit services are provided by the Riverside Transit Agency (RTA) in the western portion of Riverside County and by the SunLine Transit Agency (SunLine) in the Coachella Valley. The most recent information available as of December 2010 is used to describe the base conditions for RTA. RTA operates 36 fixed bus routes, eight commuter bus routes, and demand responsive services within a 2,500-square mile area of western Riverside County. RTA's fixed routes have been designed to establish transportation connections between all the cities and unincorporated communities in western Riverside County and to make commuter connections with transit services in neighboring counties. RTA participates with OmniTrans in San Bernardino County to provide express bus service between downtown Riverside and downtown San Bernardino, connecting with express service to Ontario. RTA also coordinates with OCTA in Orange County and Metrolink to provide connecting service, and operates service between Murrieta/Temecula and the Oceanside Transit Center in San Diego County. As of December 2010, RTA operates 97 full-size compressed natural gas (CNG) buses, 97 dial-a-ride vans, 74 fixed-route vans, and ten trolleys. In Fiscal Year 2010, approximately 7.9 million passengers boarded vehicles operated by RTA. An average of 26,535 passengers boarded RTA vehicles on weekdays, and an average of 10,764 passengers on weekend days. All RTA vehicles are wheelchair accessible, and all full-size buses are equipped with bike racks.

SunLine provides public transit services for the Coachella Valley area, covering approximately 1,120 square miles and home for about 435,000 residents. As of *2014* ~~September 2010 (most recent data at the time of EIR preparation)~~, SunLine operates *14* ~~13~~ fixed routes, with 524 stop locations, serving about 3.6 million passengers annually.

The agency also operates the SunDial System, which provides curb-to-curb demand responsive (dial-a-ride) service for members of the community requiring such assistance. As of December 2010 (most recent data at the time of EIR preparation), SunLine has a fleet of 125 vehicles, including buses and SunDial vans. In 2010 SunLine received an award from the U.S. Environmental Protection Agency (US EPA) for its leadership in using buses with clean air technology.

In addition to fixed route and demand-responsive services provided by RTA and SunLine, specialized public transportation services are also available through services operated by four municipal operators - the City of Riverside, City of Corona, City of Banning, and City of Beaumont. Additionally, RCTC supports a number of specialized transportation programs including shared ride and vanpool services, social service dial-a-ride, and specialized services for seniors and persons with disabilities.

Greyhound Bus Lines provides private transportation services that link the principal population centers of the County of Riverside with other regions. This includes east-west service connecting Blythe, Indio, Palm Springs, Banning/Beaumont and Riverside (via San Bernardino). The service continues westward to downtown Los Angeles and intermediate stops. North-south service connects Riverside with Temecula, continuing southward to San Diego.

RTA, SunLine, OmniTrans in San Bernardino County, the Orange County Transportation Authority (OCTA), and each of the city transit service providers coordinate their respective schedules and transfer stops to provide for an enhanced level of transit service. RTA's main terminal in Riverside is located between University Avenue and Mission Inn Avenue, one block west of Market Avenue. RTA also provides connections to selected Metrolink stations for both inbound and outbound trains. Existing bus routes are shown in Figure 4.18.7 of Appendix EIR-4.E.

E. Existing Waterways / Waterborne Travel

Unlike other parts of the United States, Riverside County does not have navigable waterways providing for significant transport of people and goods between destinations. Water travel is limited to recreational uses in designated regional and local recreational areas.

F. Existing Passenger Rail

Two types of rail passenger services are available in Riverside County: Intercity service provided by AMTRAK and commuter rail service operated by Metrolink.

Along rail routes between the West Coast and points east, AMTRAK serves Riverside County at two train stations plus several locations where AMTRAK provides bus links to train stations. In the Coachella Valley, the Palm Springs AMTRAK station provides access to AMTRAK's Texas Eagle and Sunset Limited Services, which provide connections to points west including Los Angeles and to points east including Tucson, Arizona and El Paso, Texas. The downtown Riverside Metrolink/AMTRAK station serves the western portion of Riverside County as a stop along AMTRAK's Southwest Chief Service. The Southwest Chief provides connections to Los Angeles and points east including Flagstaff, Albuquerque, St. Louis and Chicago.

Three Metrolink commuter rail lines serve western Riverside County and provide connections to destinations in Los Angeles, Orange, San Bernardino and Ventura Counties. The Riverside Line is operated between the downtown Riverside station and Union Station in Los Angeles, via Ontario and Pomona. En route, trains stop at the Pedley station along with others in San Bernardino and Los Angeles Counties. The 91 Line is also operated between downtown Riverside and Union Station, via Fullerton and Norwalk, with stops at Riverside-La Sierra, Corona-North Main, and West Corona, along with others in Orange and Los Angeles Counties, The Inland Empire Line is operated between San Bernardino and Oceanside in San Diego County, via Riverside, and Irvine. En route, trains stop at Riverside-La Sierra, Corona-North Main, and West Corona, along with others in Orange County. Service is available seven days a week. As of December 2010 (most recent data at the time of EIR preparation), five commuter rail stations serve Riverside County: Riverside-Downtown, Pedley, Riverside-La Sierra, Corona – North Main and West Corona. Existing passenger rail routes are presented on Figure 4.18.8 in the Appendix EIR-4.E.

G. Aviation Services

There are approximately 60 airports in the Southern California region. The majority of passenger air traffic is handled by seven commercial airports in Southern California: Los Angeles International, San Diego International, Ontario International, Palm Springs International, John Wayne/Orange County, Bob

Hope/Burbank and Long Beach Airport. Palm Springs International Airport, located within the City of Palm Springs, is the only airport within Riverside County providing passenger air service; however, Ontario International Airport in San Bernardino County is located close to the northwesterly boundary of Riverside County and provides a convenient travel option for residents of western Riverside County. The County of Riverside owns and operates five public use general aviation airports: French Valley, Hemet-Ryan, Jacqueline Cochran Regional, Chiriaco Summit and Blythe. Four of these airports are located in unincorporated Riverside County; Hemet-Ryan Airport is located within the City of Hemet. Bermuda Dunes Executive Airport, a privately-owned public-use general aviation airport, is located in the unincorporated community of Bermuda Dunes in the Coachella Valley. Four additional public use general aviation airports (not under County of Riverside ownership or management) are located in Riverside County cities: Banning Municipal, Corona Municipal, Palm Springs International, and Riverside Municipal. There are also two privately-owned public-use airports in the cities of Jurupa Valley and Perris: Flabob and Perris Valley. The March Joint Air Reserve Base/Inland Port Airport is located in Riverside County along Interstate 215 northerly of the City of Perris. This is a joint use facility. In addition to its military functions, the facility is permitted to accommodate up to 21,000 civilian airport operations per year. This airport has provided regional air cargo service in the recent past and may be expected to do so in the future. Additionally, development of general aviation facilities at this airport is envisioned in the near future.

The Riverside County Airport Land Use Commission (RCALUC) adopts and implements Airport Land Use Compatibility Plans (ALUCPs) establishing criteria for acceptable land uses in the vicinity of airports (known as Airport Influence Areas) that are intended to protect and promote the safety and welfare of the residents of the airport vicinity and users of the airports while ensuring the continued operation of the airports. The RCALUC is composed of appointees that represent the Riverside County Board of Supervisors; cities in the County of Riverside, as elected by a City Selection Committee; airport managers, and the public within the vicinity of the airports. State law (Public Utilities Code) provides that local agencies such as cities and counties with land within Airport Influence Areas must submit their General Plans to ALUCs for a determination as to whether the General Plan is consistent with applicable adopted ALUCPs. If the General Plan is determined to be consistent, only certain types of projects or cases (general plan amendments, ordinance amendments, specific plans and specific plan amendments) are required to subsequently be submitted to the ALUC for consistency determinations. However, if the General Plan has not been determined to be consistent with the applicable ALUCP, all proposed land uses within that Airport Influence Area must be submitted to the RCALUC for review and a determination of consistency or inconsistency with the applicable ALUCP. A determination of consistency may be subject to conditions of approval recommended by RCALUC for application to the project by the local agency.

The March Joint Powers Authority (March JPA) is the federally-designated reuse authority for the March Joint Air Reserve Base/Inland Port Airport. Within its boundaries, land use authority has been transferred from the County of Riverside to the March JPA.

All airports operating within Riverside County are subject to oversight by the Federal Aviation Administration (FAA) and the Division of Aeronautics of the California Department of Transportation. The five Riverside County-owned public airports are operated by the Riverside County Economic Development Agency. The four city-owned airports are operated by departments of the respective cities in which they are located. The three privately-owned public use airports are operated by private commercial owners. The March Inland Port Airport Authority is responsible for development and operation of the March Inland Port Airport as a governing body under the governing umbrella of the March Joint Powers Authority. Existing airport locations are presented on Figure 4.18.10 in Appendix EIR-4.E.

H. Existing Goods Movement

1. Truck Travel

The 2010 *Highway Capacity Manual* defines a truck as a heavy vehicle engaged primarily in the transport of goods and materials or in the delivery of services other than public transportation. The HCM also defines a heavy vehicle as a vehicle with more than four wheels touching the pavement during normal operation. Primary generators of truck traffic in Riverside County are agricultural and industrial uses. Since agriculture is transitioning to an urban land use pattern in many portions of Riverside County, overall truck traffic volume generated by agricultural uses is expected to decline in the future. However, relocation and replacement of individual agricultural processing plants and other new industries can significantly alter both regional and localized patterns and concentrations of truck traffic in cities and established communities in the County of Riverside. As healthy industrial growth is expected within Riverside County, the scale of industrial-related truck traffic will continue to increase. Overall, truck trips are expected to increase as the County of Riverside approaches build out. Currently, trucks comprise at least 15% of the daily traffic volume on some of the primary goods movement corridors in Riverside County: I-15 from Temecula to Ontario, SR-60 westward from I-215 and I-10 in the Coachella Valley and San Gorgonio Pass areas.

Because of the operational characteristics of trucks, their net effect on traffic flow is two to three times that of an equivalent number of passenger cars on level terrain, and could be considerably more than that on long upgrades, such as I-215/SR-60 eastbound in the Box Springs (Riverside) area and I-10 westbound west of Palm Springs. Traffic engineers describe the effect of trucks in terms of passenger car equivalents or PCEs. Thus, a roadway with 15% of the traffic as trucks could be regarded as having 30 to 45% of its capacity consumed by trucks in terms of PCEs. In most cases, the truck percentage in the peak commuting periods is lower (usually no more than 4 to 6%), as the passenger car volume is higher and some trucks tend to avoid those hours because of the slower speeds. Table 4.18-I (Daily Truck Volumes on Freeways in Riverside County (Bi-Directional)) lists the daily truck volumes for selected facilities and locations in Riverside County. Appendix EIR-4.C presents truck traffic volumes on all state facilities in Riverside County.

Table 4.18- I Daily Truck Volumes on Freeways in Riverside County (Bi-Directional)

Location	Daily Truck Volume
I-10, Junction Route 111	13,800
I-10, Banning	12,300
SR-60, East of Moreno Valley	5,800
SR-60, East of I-15	19,100
I-15, at SR-79	15,100
I-15 at SR-60	39,100
SR-91 at Main St	23,200
SR-91 at 14th St	8,600
I-215, Perris	7,500
I-215/SR-60, Spruce St	13,000

Source: Caltrans, 2009 Annual Average Daily Truck Traffic on the California Highway System, 2010.

2. Rail Freight

The Union Pacific (UP) and the Burlington Northern Santa Fe (BNSF) Railroads provide freight service in Riverside County, connecting the County of Riverside with major markets in California and the nation. Freight terminals and service to specific industries are located throughout Riverside County. The Southern California Association of Governments (SCAG) Regional Transportation Plan estimates train volume on the UP line between Colton and Indio to be 26 daily. An estimated 28 to 50 daily trains move on the Riverside-to-Atwood portion of the BNSF line.

It is likely that the predominant mode for freight movements in the County of Riverside will continue to be by truck in the foreseeable future. This is certainly the trend expected for raw agricultural commodities moving to packing and processing facilities. For long-distance trips (i.e., outside the 800-mile threshold), SCAG has estimated that trains will carry approximately 50% of the freight into the region, by tonnage.

4.18.3 Regulations and Programs for Transportation and Circulation

A. Federal Regulations

Federal rules and regulations govern many facets of the County's transportation and circulation system, including: transportation planning and programming; funding; design, construction and operation of facilities; and others. The County of Riverside complies with all applicable rules and regulations of the Federal Highway Administration (FHA), the Urban Mass Transportation Administration, the Federal Railroad Administration, the Federal Aviation Administration and other federal agencies. In addition, the County of Riverside coordinates with federal resource agencies, where needed, in the environmental clearance process for transportation facilities.

B. State Regulations

As it complies with federal rules and regulations, the County of Riverside also complies with applicable State of California rules and regulations and coordinates with state resource agencies.

1. Complete Streets Act (AB 1358)

The California Complete Streets Act of 2008 was signed into law on September 30, 2008. Beginning January 1, 2011, AB 1358 required circulation elements to address the transportation system from a multi-modal perspective. The bill states that streets, roads and highways must "meet the needs of all users…in a manner suitable to the rural, suburban, or urban context of the general plan." Essentially, this bill requires a circulation element to plan for all modes of transportation where appropriate – including walking, biking, car travel, and transit.

The Complete Streets Act also requires circulation elements to consider the multiple users of the transportation system, including children, adults, seniors and the disabled. For further clarity, AB 1358 tasks the Governor's Office of Planning and Research to release guidelines for compliance with this legislation by January 1, 2014.

2. Global Warming Solutions Act (Assembly Bill 32)

With the passage of the Global Warming Solution Act of 2006, the State of California committed itself to reducing greenhouse gas (GHG) emissions to 1990 levels by 2020. The California Air Resource Board (ARB), which is coordinating the response to comply with AB 32, is currently on schedule to meet this deadline.

In 2007, ARB adopted a list of early action programs that could be put in place by January 1, 2010. In 2008, ARB defined its 1990 baseline level of emissions, and by 2011 it completed its major rule making for reducing GHG emissions. Rules on emissions, as well as market-based mechanisms like the proposed cap and trade program, came into effect January 1, 2012. The cap and trade program controls pollution by a governing agency selling permits on the amount of pollutants a firm can emit. A firm's pollutants cannot exceed the

limit. Firms requiring the need to increase their emissions must purchase permits from other firms requiring fewer permits.

3. Sustainable Communities and Climate Protection Act (Senate Bill 375)

On December 11, 2008, the ARB adopted its Proposed Scoping Plan for AB 32. This scoping plan included the approval of SB 375 as the means for achieving regional transportation-related GHG targets. SB 375 provides guidance on how curbing emissions from cars and light trucks can help the state comply with AB 32.

There are five major components to SB 375. First, SB 375 will address regional GHG emission targets. ARB's Regional Targets Advisory Committee will guide the adoption of targets to be met by 2020 and 2035 for each Metropolitan Planning Organization (MPO) in the State of California. These targets, which MPOs may propose themselves, will be updated every eight years in conjunction with the revision schedule of housing and transportation elements.

Second, MPOs will be required to create a Sustainable Communities Strategy (SCS) that provides a plan for meeting regional targets. The SCS and the Regional Transportation Plan (RTP) must be consistent with each other, including action items and financing decisions. If the SCS does not meet the regional target, the MPO must produce an Alternative Planning Strategy that details an alternative plan to meet the target.

Third, SB 375 requires that regional housing elements and transportation plans be synchronized on eight-year schedules. In addition, Regional Housing Needs Assessment (RHNA) allocation numbers must conform to the SCS. If local jurisdictions are required to rezone land as a result of changes in the housing element, rezoning must take place within three years.

Fourth, SB 375 provides CEQA streamlining incentives for preferred development types. Residential or mixed-use projects qualify if they conform to the SCS. Transit oriented developments (TODs) also qualify if they: 1) are at least 50% residential; 2) meet density requirements; and, 3) are within one-half mile of a transit stop. The degree of CEQA streamlining is based on the degree of compliance with these development preferences.

Finally, MPOs must use transportation and air emission modeling techniques consistent with guidelines prepared by the California Transportation Commission (CTC). Regional Transportation Planning Agencies, cities, and counties are encouraged, but not required, to use travel demand models consistent with the CTC guidelines.

4. State Transportation Improvement Program

The State Transportation Improvement Program (STIP) is a multi-year capital improvement program for transportation projects on and off the State Highway System, funded with revenues from the Transportation Investment Fund and other funding sources. STIP programming generally occurs every two years. The programming cycle begins with the release of a proposed fund estimate in July of odd-numbered years, followed by California Transportation Commission (CTC) adoption of the fund estimate in August (odd years). The fund estimate serves to identify the amount of new funds available for the programming of transportation projects. Once the fund estimate is adopted, Caltrans and the regional planning agencies prepare transportation improvement plans for submittal to the CTC by December 15th (odd years). Caltrans prepares the Interregional Transportation Improvement Program (ITIP) and regional agencies prepare the Regional Transportation Improvement Plans (RTIPs). Public hearings are held in January (even years) in both northern and southern California. The STIP is adopted by the CTC by April (even years).

5. Senate Bill 743: Amending CEQA with Respect to Evaluating Transportation Impacts

Senate Bill 743, amending CEQA with respect to how transportation impacts are to be evaluated, was signed by Governor Brown on September 27, 2013. Since then, the California Office of Planning and Research (OPR) has been developing new guidelines which would eliminate the use of LOS measures in evaluating transportation impacts in CEQA documents in favor of a methodology which focuses on vehicle miles of travel (VMT). The following is quoted from the OPR website as to why alternative methodologies to LOS analyses are needed.

> *"Level of service has been applied in ways that discourage both infill development and construction of infrastructure for transit, cycling, and walking. Urban infill projects, for example, often rate poorly in traffic studies because they increase population and potential traffic in a given area. However, evidence shows that the residents and consumers who live, work, and shop in these areas are less likely to rely on cars for their transportation needs.*
>
> *Focus on LOS also discourages planning for projects that support alternatives to driving such as public transit, bicycle lanes, and pedestrian safety features. Dedicating road lanes for bicycles or buses might exceed LOS thresholds by removing a lane of auto traffic, potentially leading to delay or congestion.*
>
> *When employed in isolation, LOS can lead to ad hoc roadway expansions that deteriorate conditions on the network as a whole.*
>
> *Use of level of service in the CEQA context has been criticized for several reasons. First, it focuses on a social impact (driver delay), not an environmental impact. Second, roadway widening is the typical mitigation for projects that lower LOS. However, wider roads can result in adverse environmental, public health, and fiscal impacts. Wider roads are more expensive to maintain and enable driving at faster speeds, which leads to more pollution, noise, and higher risks to bicyclists and pedestrians. A presentation summarizing these issues is available.*

These concerns, among others, have led some local governments to accept low LOS ratings or to move away from level of service entirely as a measure of transportation impacts."

The OPR critique of using LOS as the primary means of analyzing transportation impacts is persuasive. The OPR supports the lowering of LOS targets as means to achieve land use patterns that support transit usage and other alternative means of transportation, such as walking and bicycling. Toward this end, there are several policies within the General Plan aimed at encouraging transit and other alternative travel modes.

The draft guidelines from OPR, which are still in the process of review, call for an analysis of VMT as a preferred measure of transportation impacts instead of LOS. At the time of this writing, OPR has not yet provided a methodology which can be implemented in order to conduct a VMT analysis to determine if a project has transportation impacts under CEQA. The goal of changing analysis methods from LOS to VMT is to encourage alternate modes of travel, such as walking, bicycling and public transit.

The LOS policy changes presented in GPA No. 960/EIR No. 521, while not written from the standpoint of VMT, are supportive of the new analysis methods for transportation impacts, and are intended to be compliant with the new VMT standards required by OPR once upon their release . As the OPR VMT guidelines move toward final approval, there is nothing at this time in the current General Plan LOS Policies as proposal that would pose a significant conflict with the current draft OPR guidelines.

The County of Riverside will continue to support and promote alternative travel modes, and actively participate in the planning of public transit facilities, as well as enhancements to public roadways aimed at improving safety and comfort for bicyclists and pedestrians. The County has a keen interest in preserving and enhancing the high standard of living that most County residents enjoy for future generations. This can be accomplished by implementing the many policies in the new General Plan, as currently proposed, which call for ongoing cooperative and collaborative planning efforts with the various transportation planning agencies in the region; SCAG (Regional Transportation Plan/Sustainable Communities Strategy), RTA and Sunline (Short Range Transit Plans), RCTC (Mobilty 21 and Congestion Management Program), WRCOG and CVAG (TUMF programs and updates), Caltrans (Cooperation and coordination on freeway, conventional highway and interchange improvements and planning) cities and counties (Various issues of mutual concern, from local design standards to regional transportation corridors).

When OPR finalizes statewide policies and procedures for the use of VMT as the means to measure transportation impacts in CEQA documents, the County will respond affirmatively to implement these. At this time, it is not believed that these forthcoming policies and procedures will necessitate amendments to the Riverside County General Plan.

C. Regional Regulations

1. SCAG 2012 Regional Transportation Plan/Sustainable Communities Strategy

The Regional Transportation Plan (RTP) is developed, maintained, and updated by SCAG, Southern California's state-designated MPO. SCAG encompasses six Southern California counties: Los Angeles, Orange, Riverside, San Bernardino, Ventura and Imperial, as well as the cities within these counties. On April 4, 2012, SCAG's Regional Council adopted the 2012-2035 Regional Transportation Plan/ Sustainable Communities Strategy (RTP/SCS): Towards a Sustainable Future with the primary goal of increasing mobility for the region's residents and visitors, while also emphasizing sustainability and integrated planning. The vision of the RTP/SCS encompasses three principles that collectively work as the key to the region's future: mobility, economy, and sustainability.

The 2012–2035 RTP/SCS includes a strong commitment to reduce emissions from transportation sources to comply with SB 375, improve public health, and meet the National Ambient Air Quality Standards as set forth by the federal Clean Air Act. As such, the 2012–2035 RTP/SCS contains a regional commitment for the broad deployment of zero- and near-zero emission transportation technologies in the 2023–2035 time frame and clear steps to move toward this objective. The RTP/SCS provides a blueprint for improving quality of life for the region's residents by providing more choices for where they will live, work and play, and how they will move around.

The RTP/SCS contains a host of improvements to the region's multimodal transportation system. These improvements include closures of critical gaps in the network that hinder access to certain parts of the region, as well as the strategic expansion of the transportation system where there is room to grow, in order to provide the region with the mobility it needs. The RTP/SCS also contains a financial plan that identifies how much money is available to support the region's transportation investments. The plan includes a core revenue forecast of existing local, state and federal sources along with funding sources that are reasonably available over the time horizon of the RTP/SCS.

In addition to numerous roadway improvements identified in Riverside County, Metrolink commuter rail service is planned to be extended by the construction of the Perris Valley Line (PVL). PVL is a 24-mile extension that will connect the Downtown Riverside Metrolink Station with a new South Perris station. Additionally, there will be three other new stations located at Hunter Park Area, Moreno Valley/March Field and Perris. The Environmental Impact Report for the PVL, which will extend service to Perris, was certified by the RCTC on July 25, 2011. The earliest that construction is anticipated to start is 2014. Long-term plans call for an extension of the Riverside Transit Corridor, in accordance with performance standards, along the San Jacinto branch line to the cities of Hemet and San Jacinto.

Within the RTP, the SCS demonstrates the region's ability to attain and exceed the GHG emission-reduction targets set forth by the ARB. The SCS outlines a plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The SCS focuses the majority of new housing and job growth in high-quality transit areas and other opportunity areas in existing main streets, downtowns and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and complements the proposed transportation network that emphasizes system preservation, active transportation and transportation demand management measures. Finally, the RTP/SCS fully integrates the two subregional SCSs prepared by the Gateway Cities and Orange County Council of Governments.

2. Western Riverside County Association of Governments Transportation Uniform Mitigation Fee

Implemented in 2003, the Transportation Uniform Mitigation Fee (TUMF) is the largest multi-jurisdictional fee program in the nation. Under the TUMF, western Riverside County is divided into five zones. The TUMF is structured so that 48.7% of funds generated in each zone go back to that zone to be programmed for projects. Another 48.7% is allocated to regional inter-zone projects programmed by RCTC, and 2.6% is allocated for regional transit projects programmed by the Riverside Transit Agency.

3. Coachella Valley Association of Governments TUMF

A regional fee program for the Coachella Valley Association of Governments (CVAG), first implemented in 1989, has been periodically updated since then. This fee program collects funds from development projects and funds local and regional improvements throughout the Coachella Valley.

4. Riverside County Congestion Management Program

The passage of Proposition 111 in June 1990 established a process for each metropolitan county in California, including Riverside, to prepare a Congestion Management Plan (CMP). The CMP, which was prepared by RCTC in consultation with the County of Riverside and its cities, is an effort to align land use, transportation and air quality management efforts, to promote reasonable growth management programs that effectively use statewide transportation funds, while ensuring that new development pays its fair share of needed transportation improvements.

The focus of the CMP is the development of an Enhanced Traffic Monitoring System in which real-time traffic count data can be accessed by RCTC to evaluate the condition of the Congestion Management System (CMS) as well as meet other monitoring requirements at the state and federal levels. Per the adopted Level of Service target of "E," when a CMS segment falls to "F," a deficiency plan is required. Preparation of a deficiency plan will be the responsibility of the local agency where the deficiency is located. Other agencies identified as contributors to the deficiency will also be required to coordinate with the development of the plan. The plan must contain mitigation measures, including Transportation Demand Management (TDM) strategies and transit alternatives and a schedule of mitigating the deficiency. To ensure that the CMS is appropriately monitored to reduce the occurrence of CMP deficiencies, it is the responsibility of local agencies, when reviewing and approving development proposals, to consider the traffic impacts on the CMS.

D. County Regulations

Ordinances specifically applicable to the circulation system are presented below.

Ordinance No. 413 – Vehicle Parking: Ordinance No. 413 establishes regulations to vehicle parking on Riverside County roadways.

Ordinance No. 452 – Speed Limits: Ordinance No. 452 pertains to prima facie speed limits on Riverside County roadways and establishes or amends prima facie speed limits on certain Riverside County roads.

Ordinance No. 460 – Subdivision of Land: Ordinance No. 460, in conjunction with the Subdivision Map Act, establishes regulations for the division of land and describes procedures. The ordinance also includes the provisions for the establishment of Road and Bridge Benefit Districts and associated fees.

Ordinance No. 461 – Road Improvement Standards and Specifications: Ordinance No. 461 adopts Road Improvement Standards and Specifications.

Ordinance No. 499 – Encroachments in County Highways: Ordinance No. 499, subject to the control of the Board of Supervisors, delegates to the Riverside County Transportation Director the administration of the use of county highways, including county roads, for excavations and encroachments; construction, operation and maintenance of utility facilities; planting, maintenance and removal of trees; and the issuance, modification, and revocation of permits for such uses.

Ordinance No. 659 – Development Mitigation Fee for Residential Development (DIF Program): Ordinance No. 659 establishes a development impact fee (DIF) for the development of infrastructure, including County roadways and the installation of traffic signals.

Ordinance No. 671 – Consolidated Fees for Land Use and Related Functions: Ordinance No. 671 establishes a consolidated fee program for land use and related functions. This is a deposit-based fee (DBF) program and provides for unused fees to be refunded to the applicant.

Ordinance No. 673 – Establishing a Transportation Uniform Mitigation Fee (TUMF Program): Ordinance No. 673 establishes a TUMF program for the Coachella Valley. The fees are collected by the County of Riverside and administered by CVAG to make roadway improvements in the Coachella Valley. TUMF funds are intended for use solely for the engineering, construction, and right-of-way acquisition for regional facilities. TUMF funds may not be used to defray operational and maintenance expenses. Regional facilities are designated by CVAG and updated periodically. They include streets, arterials and road improvements as defined in the ordinance. CVAG prioritizes projects annually based on established prioritization criteria.

Ordinance No. 748 – Mitigation of Traffic Congestion Through Signalization: Ordinance No. 748 establishes a fee program for the installation of traffic signals based on a priority list. The fee would also have a component for the installation of traffic signal interconnect, and a component for the application of intelligent transportation systems technologies.

Ordinance No. 824 – Western Riverside County Transportation Uniform Mitigation Fee (TUMF) Program: Ordinance No. 824 establishes a TUMF program for the western portion of Riverside County. The fees are collected by the County of Riverside and administered by the Western Riverside Association of Governments (WRCOG) to make roadway improvements in the WRCOG area. TUMF funds are intended for use solely for the engineering, construction and right-of-way acquisition for regional facilities. TUMF funds may not be used to defray operational and maintenance expenses. Facilities eligible for TUMF are designated by WRCOG and updated periodically. They include streets, arterials and road improvements as defined in the ordinance.

Ordinance No. 859 – Establishing Water-Efficient Landscaping Requirements: Ordinance No. 859 establishes water-efficient landscape requirements.

The Riverside County ordinances cited above and all other Riverside County ordinances are available for viewing on the Riverside County Clerk of the Board website.

E. Proposed New or Revised County General Plan Policies

Several changes are proposed to the current General Plan Policies in regards to transportation and circulation. Many of the changes are purely editorial in nature, reworded to better reflect the intent and purpose of the policy. Some have been revised to reflect changes in terminology as proposed to other elements of the General Plan. Others have been revised due to changes in state or federal rules and regulations. This section details 104 changes and additions to transportation and circulation policies of the General Plan. Most of these changes are not substantive in nature. There are, however, seven policy changes that are significant and warrant further explanation.

1. Significant Policy Changes

Policy C 2.1: : This revision in policy *removes reference to a* ~~changes the~~ countywide target level of service *and instead defines target levels of service by Area Plan.* ~~from C to D.~~ *LOS C is retained as the target LOS for much of the Riverside County unincorporated area, including the Mount San Jacinto Mountains and the outlying desert regions in the eastern portion of the County. Any lands not included in an Area Plan also fall under the LOS C target.* At present, LOS D may be allowed in Community Development areas~~,~~. *The revised policy allows LOS D as the minimum LOS in all of the urbanizing Area Plans of Western Riverside County and the Western Coachella Valley.* ~~and in Community Centers promoting transit-oriented development (TOD) and walkable communities where~~ LOS E ~~may~~ *continues to* be allowed *by the Board of Supervisors within designated areas where transit-oriented development and walkable communities are proposed*. These areas represent the more urbanized areas of the unincorporated County of Riverside. This change in policy would expand where LOS D is deemed to be acceptable. This change in policy is proposed in order to bring Riverside County in line with other surrounding jurisdictions and the *majority of the* incorporated cities within Riverside County, and is in keeping with generally accepted engineering practices within the transportation profession. This change in policy does not in and of itself have any effect on traffic volumes or LOS, but it does alter Riverside County's response to increased traffic and congestion.

The likely result*s of the LOS policy as currently proposed* will be narrower improvement widths in order to mitigate traffic impacts due to the lower threshold of significance. *The reduction in pavement width is generally considered to have positive environmental effects, rather than negative, as the footprint of disturbance required for construction is reduced.* This will provide cost saving not only in terms of construction costs, but also in ongoing maintenance costs. The reduction in improvement width will also serve to support Riverside County's policy of supporting alternative modes of transportation such as bicycle and pedestrian travel by providing a more favorable environment for these activities. It will also serve to make the use of public transit a more attractive option as well.

The policy changes are not expected to have significant adverse impacts; in fact our analysis indicates that fewer than 100 miles of roadway currently covered by the LOS "C" criteria are projected to operate at LOS "D."

The policies do not dictate that any roadways operate at LOS "D" or "E," they merely guide how the County reacts to the traffic that is present or that is anticipated as a result of specific development proposals. It is expected that several roadways will not need to be widened as significantly as would otherwise be required or that the widening can be delayed. Also, the reduction in pavement width also provides a substantial cost saving not only in terms of construction costs, but also in ongoing maintenance costs.

Not every intersection or roadway segment will operate at LOS "D" or "E." As is the situation today, there are many roadways operating at LOS "A," B" and "C" in areas which would currently allow LOS "D" and "E." That will continue to be true under the new policies.

Likewise, the shift from LOS "C" to LOS "D" will not automatically result in the maximum amount of additional delay at intersections. The difference in delay when analyzing interrupted flow or intersections analysis can cause average delay per vehicle to increase by as much as 20 seconds. However, the resulting average delay per vehicle can also be as little as 1 second per vehicle. The policy goes to on to state criteria by which the Board of Supervisors, by virtue of their discretionary powers, may approve a project that fails to meet these minimum LOS targets.

The detailed language for this policy change is presented in Section 2, Circulation Policy Amendments.

~~***Policy C 2.8:*** This is a new policy which states an existing practice of the Riverside County Transportation Department, which is to maintain a LOS threshold table and to periodically update that table. This table is used to determine LOS at a macro level based on forecast link traffic volumes. The methodology used to develop these figures is constantly evolving as new data and research becomes available. Thus, it is important that the Department have the ability to update these figures based upon the latest facts, without need for a General Plan Amendment or other legislative action. The result will be to verify that the most up-to-date information is available to aide in the decision-making process relative to traffic and circulation issues. The latest update of this table is presented in the proposed General Plan (GPA No. 960), Figure C- 3 (Segment/Volume Capacity/Level of Service for Riverside County Roadways). The detailed language for this policy change is presented in Section 2, Circulation Policy Amendments.~~

The original NEW Policy 2.8 has been removed in its entirety. An additional NEW Policy 2.8 has now been inserted in its place. This policy calls for coordination with Caltrans, RCTC and adjacent local jurisdictions in conformance with the Riverside County Congestion Management Program to determine the appropriate LOS threshold for determining significance when reviewing development proposals that directly impact nearby State Highway facilities or city streets. The intent of this policy is to further clarify how traffic impacts are evaluated when it comes to roadways facilities that are not under County jurisdiction.

Policy C 3.3: This policy revision is proposed to clarify how to transition from one roadway classification standard to another, and how the lane geometrics and right of way required to make those transitions are to be handled. The result may be minor additional improvement width and right-of-way in order to accommodate these transition standards. The detailed language for this policy change is presented in Section 2, Circulation Policy Amendments.

Policy C 7.6: The current policy supports the development of an internal East-West CETAP Corridor with a new Orange County CETAP connection. The CETAP Corridor project falls under the authority of the RCTC. The RCTC has placed planning efforts for this future facility on hold and is currently exploring a wide variety of highway and transit options in order to increase capacity to accommodate the travel demand between Riverside and Orange County. It is also proposed that this corridor be removed from the Circulation Element, Figure C-1 of the proposed General Plan (GPA No. 960). The policy as revised continues to support major capacity enhancements to SR-91.

Policy C 9.2: This is a revision to an existing policy generally supporting the efforts of transit operators to increase transit usage. The revised policy specifically mentions support for efforts to expand and enhance Metrolink services, as well as the implementation of bus rapid Transit (BRT) services, and to make other express and local bus service improvements. The detailed language for this policy change is presented in Section 2, Circulation Policy Amendments.

Policy C 11.6: This policy to encourage transit-only lanes on freeways and to consider the development of preferential/priority treatment measures to expedite bus movements is deleted in its entirety. Instead, Policy C 9.2, as discussed above, specifically promotes the implementation of BRT services and other transit improvements which accomplishes the same objective.

Policy C 21.8: This policy which advocates the installation of one way streets and reversible lanes is deleted in its entirety. This is not an option which the Transportation Department wishes to endorse on a countywide level, however, such strategies could still be considered on a case-by-case basis.

2. Circulation Policy Amendments

The following section provides detailed mark-ups of the changes for each of the policies being modified. Only those policies that are being revised, removed or new policies added are shown. All other transportation and circulation policies are to remain in effect.

Policy C 1.3: Support the development of transit connections *between Riverside County and regional activity centers in other counties as well as transit connections* that link the community centers located throughout the county and as identified in the Land Use Element and in the individual ~~area plans~~ *Area Plans*.

Policy C 1.6: Cooperate with *and where appropriate lead* local, regional, state, and federal agencies to establish an efficient circulation system.

NEW **Policy C 1.8:** *Ensure that all development applications comply with the California Complete Streets Act of 2008 as set forth in California Government Code Sections 65040.2 and 65302.*

Policy C 2.1: ~~Maintain the following countywide target Levels of Service: LOS CD along all County maintained roads designated in the Circulation Element and conventional along state highways,. As an exception, LOS D may be allowed in Community Development areas, only at intersections along all County-maintained roads and along of any combination of Secondary Highways, Major Highways, Arterials, Urban Arterials, Expressways, conventional state highways, and at or freeway ramp intersections.~~

The following minimum target levels of service have been designated for the review of development proposals in the unincorporated areas of Riverside County with respect to transportation impacts on roadways designated in the Riverside County Circulation Plan (Figure C-1) which are currently County maintained, or are intended to be accepted into the County maintained roadway system:

LOS C shall apply to all development proposals in any area of the Riverside County not located within the boundaries of an Area Plan, as well those areas located within the following Area Plans: REMAP, Eastern Coachella Valley, Desert Center, and Palo Verde Valley.

LOS D shall apply to all development proposals located within any of the following Area Plans: Eastvale, Jurupa, Temescal Canyon, Lake Mathews/Woodcrest, Elsinore, Mead Valley, Highgrove, Reche Canyon/Badlands, Lakeview/Nuevo, Sun City/Menifee Valley, Harvest Valley/Winchester, Southwest Area, The Pass, San Jacinto Valley, and Western Coachella Valley.

LOS E may be allowed *by the Board of Supervisors with*in designated a*reas where* ~~community centers to the extent that it would support~~ transit-oriented development and walkable communities *are proposed.* ~~and on roadways where the addition of travel lanes would have a significant adverse impact on environmental and cultural resources such as habitat, wetlands, Multiple Species Habitat Conservation Plan (MSHCP) preserves, wildlife movement, stands of mature trees, historic landmarks, or archaeological sites.~~

~~Other levels of service may be allowed by the Board of Supervisors for a plan, program or project for which an environmental impact report, or equivalent, has been completed, based on the Board's policy decision about the balancing of congestion management considerations in relation to the benefits, impacts and costs of future plans, programs and projects.~~

Notwithstanding the forgoing minimum LOS targets, the Board of Supervisors may, on occasion by virtue of their discretionary powers, approve a project that fails to meet these LOS targets in order to balance congestion management considerations in relation to benefits, environmental impacts and costs, provided an Environmental Impact Report, or equivalent, has been completed to fully evaluate the impacts of such approval. Any such approval must incorporate all feasible mitigation measures, make specific findings to support the decision, and adopt a statement of overriding considerations.

Policy C 2.2: *Require that new development prepare a traffic impact analysis as warranted by the Riverside County Traffic Impact Analysis Preparation Guidelines or as approved by the Director of Transportation* ~~and. a~~ *A*pply level of service ~~standards~~ *targets* to new development ~~via a program establishing~~ *per the Riverside County* ~~traffic study guidelines~~ *Traffic Impact Analysis Preparation Guidelines* to evaluate traffic impacts and identify appropriate mitigation measures for new development.

Policy C 2.3: Traffic studies prepared for development entitlements (tracts, ~~plot plans,~~ public use permits, conditional use permits, etc.) shall identify project related traffic impacts and determine the ~~A~~"significance" of such impacts in compliance with CEQA *and Riverside County Congestion Management Program requirements.*

Policy C 2.4: The direct project related traffic impacts of new development proposals shall be mitigated via conditions of approval requiring the construction of any improvements identified as necessary to meet level of service ~~standards~~ *targets*.

Policy C 2.6: Accelerate the construction of transportation infrastructure in the Highway 79 *corridor between Temecula, Hemet, San Jacinto, and Banning* ~~Policy Area (Figure C-2)~~. The County *of Riverside* shall require that all new development projects demonstrate adequate transportation infrastructure capacity to accommodate the added traffic growth. The County *of Riverside* shall coordinate with cities ~~adjacent to the policy area~~ *in the Highway 79 corridor* to accelerate the usable revenue flow of existing funding programs, thus ~~assuring that~~ *expediting the development of the* transportation infrastructure ~~is in place when needed~~.

Policy C 2.7: ~~Establish~~ *Maintain* a program to reduce overall trip generation in the Highway 79 Policy Area ([General Plan] Figure C-2) by creating a trip cap on residential development within this policy area which would result in a net reduction in overall trip generation of 70,000 vehicle trip per day from that which would be anticipated from the General Plan Land Use designations as currently recommended. The policy would generally require all new residential developments proposals within the Highway 79 Policy Area to reduce trip generation proportionally, and require that residential projects demonstrate adequate transportation infrastructure capacity to accommodate the added growth.

~~NEW Policy C 2.8: To ensure that Riverside County's traffic volume range breaks for the various facility types used to determine LOS (Figure C-3) stay current, review and update the thresholds periodically.~~

NEW Policy C 2.8: *Riverside County shall coordinate with Caltrans, RCTC and adjacent local jurisdictions in conformance with the Riverside County Congestion Management Program to determine the appropriate LOS threshold for determining significance when reviewing development proposals that directly impact nearby State Highway facilities or city streets.*

Policy C 3.1: Design, construct, and maintain *Riverside* County roadways as specified in the *Riverside* County Road Improvement Standards and Specifications. *The standards shown in [General Plan]* Figure C-4 *may be modified by Specific Plans, Community Guidelines, or as approved by the Director of Transportation if alternative roadway standards are desirable to improved sustainability for the area.*

Policy C 3.3: Implement design guidelines that identify intersection improvements consistent with the ~~following~~ lane geometrics *in [General Plan] Table C-2 unless additional lanes are needed to maintain consistency with Policy 2.2.* ~~in the Circulation Element.~~ *Where roadway classifications change on a continuous alignment, the standards of the higher classification will normally be transitioned on a portion of the roadway that has the lower classification, particularly where*

the change takes place at roadway intersections. This may result in additional right of way or lanes being required above the standards shown in [General Plan] Figure C-4 *for the segment with the lower classification to accommodate the transition.*

Policy C 3.4: Allow roundabouts or other innovative design solutions *such as triple left turn lanes, continuous flow intersections, or other capacity improvements,* when a thorough traffic impact assessment has been conducted demonstrating that such an intersection design alternative would manage traffic flow, and improve safety, if it is physically and economically feasible.

Policy C 3.6: Require private developers to be primarily responsible for the improvement of streets and highways ~~service~~ *that serve as* access to developing commercial, industrial, and residential areas. These may include road construction or widening, installation of turning lanes and traffic signals, and the improvement of any drainage facility or other auxiliary facility necessary for the safe and efficient movement of traffic or the protection of road facilities.

Policy C 3.14: Design curves and grades to permit safe movement of vehicular traffic at the road's design speed. Design speed should be consistent with and complement the character of the adjacent area.

Policy C 3.15: Provide adequate sight distances for safe vehicular movement at a road's design speed and at all intersections.

Policy C 3.17: Ensure dedications are made, where necessary, for additional rights-of-way or easements outside the road right*s*-of-way ~~that are~~ needed to establish slope stability*, or* drainage and *related* structures. These dedications shall be made by land dividers or developers to the responsible agency during the land division and land use review process.

Policy C 3.24: Provide a street network with quick and efficient routes for emergency vehicles, meeting necessary street widths, turn-around radius, *secondary access,* and other factors as determined by the Transportation Department in consultation with the Fire Department and other emergency service providers.

Policy C 4.3: Assure *and facilitate* pedestrian access from developments to existing and future transit routes and terminal facilities through project design.

Policy C 4.7: *Make reasonable accommodation for* ~~Encourage~~ safe pedestrian walkways that comply with the Americans with Disabilities Act (ADA) requirements within commercial, office, industrial, mixed use, residential, and recreational developments.

~~**Policy C 4.8:** Encourage, where feasible, the construction of overpasses or undercrossings where trails intersect arterials, urban arterials, expressways, or freeways.~~ [Relocated to policy C 15.6]

Policy C *4.8* (Previously C 4.9): Coordinate with all transit operators to ensure that *ADA compliant* pedestrian facilities are provided along and/or near all transit routes, whenever feasible. New land developments may be required to provide pedestrian facilities due to existing or future planned transit routes even if demand for pedestrian facility ~~is~~ *may* not *be* otherwise warranted.

Policy C *4.9* (Previously C 4.10): Review all existing roadways without pedestrian facilities when they are considered for improvements ~~(whether maintenance or upgrade)~~ to determine if new pedestrian facilities are warranted. New roadways should also be assessed for pedestrian facilities.

Policy C 6.3: Limit access points and intersections of streets and highways based upon the road's General Plan classification and function. *Require that* access points ~~must~~ be ~~located a sufficient distance away from major intersections to allow for safe, efficient operation~~ *located so that they comply with Riverside County's minimum*

intersection spacing standards. Under special circumstances the Transportation Department may consider exceptions to this requirement.

Policy C 6.6: Consider access implications associated with adjacent development and circulation plans.~~,~~ ~~and~~ Promote efficient and safe access ~~improvements on~~ *for* airport facilities.

Policy C 7.1: Work with incorporated cities to mitigate the cumulative impacts of incorporated and unincorporated development on the countywide transportation system.

Policy C 7.3: Incorporate the Regional Transportation Plan *of the Southern California Association of Governments (SCAG) and*~~,~~ the Riverside County Congestion Management Program~~, and the Riverside County Short- and Long-Range Transit Plans~~ into the Circulation Element, and, ~~encourage~~ *with* the active participation of Caltrans, ~~in working~~ *work to expedite* the design *and implementation* of state highway capital improvement projects.

Policy C 7.6: Support ~~the development of a new internal East-West CETAP Corridor in conjunction with a new Orange County CETAP connection. Such corridor(s) would be constructed simultaneously to avoid further congestion on the I-15 Freeway. Or, in the alternative, the East-West Corridor would be constructed simultaneously with~~ major capacity enhancements on ~~the~~ State Route 91, between ~~Pierce St~~ *the counties of Riverside* and ~~the~~ Orange ~~County line, and the capacity improvement of the 15 (north) to westbound 91 overpass.~~

Policy C 7.7: Support the analysis of the feasibility of ~~a~~ *developing* Pigeon Pass Road *and Reche Canyon Road as four-lane facilities to link the Moreno Valley area and San Bernardino County.* ~~extension as part of the Moreno Valley to San Bernardino County CETAP Corridor.~~

Policy C 7.8: Collaborate with all incorporated cities and all adjacent counties to implement and integrate right-of-way requirements and improvement standards for General Plan roads that cross jurisdictional boundaries. Detailed procedures have been developed and include the following:

a. For development under ~~the~~ *Riverside* County jurisdiction but within the sphere of influence (SOI) of a city having roadway standards different from ~~the~~ *Riverside* County, city and *Riverside* County staff will cooperate and agree on a reasonable choice of design standards for the particular circumstances involved, and negotiate logical transitions from city to *Riverside* County standards.

b. In general, for such development under *Riverside* County jurisdiction but within the SOI of an incorporated jurisdiction, city standards should apply if the staffs concur that annexation to the City will logically occur in the short to intermediate range future. Where annexation seems doubtful into the long term future, *Riverside* County standards should apply.

c. Transition areas at meeting points of roadways designed to differing city and *Riverside* County standards or differing functional classifications should be individually designed to facilitate satisfactory operational and safety performance. Further, *Riverside* ~~the~~ County should update the road standards to reflect the intent of this policy and standards agreed upon by the County *of Riverside* and other local agencies.

Policy C 7.9: Review development applications in cooperation with RCTC and as appropriate, to identify the precise location of CETAP corridors and act to preserve such areas from any permanent encroachments, pending dedication or acquisition. *Coordinate with RCTC to evaluate and update the CETAP corridors periodically as conditions warrant.*

Policy C 8.3: Use annexations, ~~re~~development agreements, revenue-sharing agreements, tax allocation agreements and the CEQA process as tools to ensure that new development pays a fair share of costs to provide local and regional transportation improvements and to mitigate cumulative traffic impacts.

Policy C 8.4: Prepare a multi-year Transportation Improvement Program (TIP) that establishes improvement priorities and scheduling for transportation project construction over a period of ~~5 to 7~~ *two or more* years. The TIP will be reviewed and updated annually.

Policy C 8.7: Review and update the County *of Riverside* Road and Bridge Benefit District fee structure ~~for~~ *and* development impact fees ~~annually~~ *periodically* to ensure that capacity expansion projects are developed and constructed in a timely manner.

Policy C 8.8: Seek all available means to finance improvements, including state and federal grants, to ~~ensure that a non-motorized system is implemented~~ *offset the local cost of system improvements where appropriate.*

Policy C 9.1: Support all operator efforts to maximize revenue sources for short and long range transit needs that utilize all funding mechanisms available including federal grants, state enabling legislation, and farebox revenue. This can be accomplished through the Riverside County Transportation Commission (RCTC) and development of the Short and Long Range Transit Plans *by the Riverside Transit Agency (RTA) and SunLine Transit.*

Policy C 9.2: Support *the expansion and enhancement of Metrolink service and* transit operators' programs to ~~foster~~ *increase* transit usage *to implement bus rapid transit (BRT) services, and to make other express and local bus service improvements.*

Policy C 11.1: *Where appropriate,* ~~R~~*r*eserve right-of-way to accommodate ~~for~~ designated transit service.

~~**Policy C. 11.6:** Encourage the designation of exclusive transit only lanes on freeways. Where appropriate, consider the development of preferential/priority treatment measures to expedite bus movements.~~

Policy C *11.6* (Previously C 11.7): Promote development of transit centers and park-n-rides for use by all transit operators, including development of multi-modal facilities.

Policy C 12.2: Support the development of high-speed transit linkages, *bus rapid transit (BRT)* or express routes, between community centers and other major nodes of activity.

Policy C 13.3: Support implementation of the San Jacinto Branch Line to serve ~~planned industrial development~~ *commuter uses.*

Policy C 13.4: Construct new grade separations or reconstruct existing grade separations as necessary for the smooth flow of traffic within ~~the~~ *Riverside* County consistent with plans developed by *RCTC*, WRCOG and CVAG.

Policy C 13.5: Provide additional *railroad* grade crossing improvements as determined by the California Public Utilities Commission and the County *of Riverside.*

Policy C 14.1: Promote coordinated long-range planning between ~~the~~ *Riverside* County, airport authorities, businesses and the public to meet the County *of Riverside* and the region's aviation needs.

Policy C 14.2: Apply a variety of land use planning techniques to maintain the viability of ~~the~~ *Riverside* County's airports. ~~(See Land Use Policy LU 14.6)~~

Policy C 15.1: Implement *a two-tiered system of trails,* and later expand *it into* an effective non-motorized transportation system.

Policy C 15.2: Seek financing to implement an effective non-motorized transportation system. This funding can include such *potential sources* ~~things~~ as state and federal grants, *Riverside County transportation funds, "in-lieu" fees, special assessments,* ~~redevelopment agency funds,~~ *parking meter revenues, other public and non-profit organization funds, developer contributions, and other sources*.

Policy C 15.3: Develop a trail system which connects *Riverside* County parks and recreation areas while providing links to open space areas, equestrian communities, local municipalities, and regional recreational facilities (including other regional trail systems), *and ensure that the system contains a variety of trail loops of varying classifications and degrees of difficulty and length*.

Policy C 15.4: *Periodically* ~~R~~*r*eview and update the *Trails and Bikeways Plan ([General Plan] Figure C-7* ~~Regional Trail Map~~ in accordance with the review procedures and schedule of the General Plan, in order to *ensure* ~~assure~~ *its* compatibility with the other ~~elements~~ *components* of the *Riverside* County General Plan, and with the similar plans of *agencies, such as* Western Riverside County Council of Governments *(WRCOG)*, Coachella Valley Association of Governments *(CVAG)*, Riverside County Transportation Commission *(RCTC)*, *Regional Conservation Authority, Riverside County Habitat Conservation Agency* and all jurisdictions within and abutting Riverside County. *This shall include consistency with the WRCOG and CVAG non-motorized planning documents.*

Policy C 15.5: Compliance with the Americans with Disabilities Act (ADA) standards will be assured so as to make ~~the~~ trails ~~system~~ user-friendly*, as much as reasonably feasible*.

Policy C *15.6* (Previously C 4.8): *Provide,* ~~Encourage,~~ where feasible, the construction of overpasses or undercrossings where trails intersect arterials, urban arterials, expressways, or freeways.

Policy C 16.1: Implement the *Riverside* County trail system as depicted in the Bikeways and Trails Plan, *[General Plan]* Figure C-*7*.

Policy C 16.2: Develop a multi-purpose ~~recreational~~ trail network with support facilities which provide a linkage with regional facilities, *and require trailheads and staging areas that are equipped with adequate parking, bicycle parking, restrooms, informative signage, interpretive displays, maps, and rules of appropriate usage and conduct on trails accessed from such facilities.*

Policy C 16.3: Require that trail alignments either provide access to or link scenic corridors, schools, parks*, bus stops, transit terminals, park and ride commuter lots,* ~~and other natural areas~~ *and other areas of concentrated public activity, where feasible.*

~~a. Require that all development proposals located along a planned trail or trails provide access to, the trails system.~~ [Relocated to C 16.4]

~~i) Ensure that existing and new gated communities, do not preclude trails from traversing through their boundaries.~~ [Relocated to C 16.4]

~~b. Require that existing and proposed trails within Riverside County connect with those in other neighboring jurisdictions.~~ [Relocated to C 16.4]

NEW **Policy C 16.4:** *Require that all development proposals located along a planned trail or trails provide access to, dedicate trail easements or right-of-way, and construct their fair share portion of the trails system. Evaluate the locations of existing and proposed trails within and adjacent to each development proposal and ensure that the appropriate easements are established to preserve planned trail alignments and trail heads.*

a. Require that all specific plans and other large-scale development proposals include trail networks as part of their circulation systems.

b. Ensure that new gated communities, and where feasible, existing gated communities, do not preclude trails accessible to the general public from traversing through their boundaries.

c. Provide buffers between streets and trails, and between adjacent residences and trails.

d. Make use of already available or already disturbed land where possible for trail alignments.

e. Require that existing and proposed trails within Riverside County connect with those in other neighboring city, county, state, and federal jurisdictional areas.

Policy C *16.5* (Previously C 16.4): Identify all existing rights-of-way which have been obtained for trail purposes through the land development process. ~~d.~~ Once the above task has been accomplished, analyze the existing rights of-way and determine the most expedient method for connecting the parts.

Policy C *16.6* (Previously C 16.5): Examine the use of public access utility easements for trail linkages to the regional trails system and/or other open space areas*, as feasible*. These potential corridors include*, but are not limited to,* the rights-of-way for:

a. water mains;

b. water storage project aqueducts;

c. irrigation canals;

d. flood control;

e. sewer lines; ~~and~~

f. fiber optic cable lines,

g. gas lines,

h. electrical lines, and

i. fire roads, railroads, and bridges.

Policy C *16.7* (Previously C 16.6): Adhere to the following trail-development guidelines when siting a trail:

a. ~~Permit urban trails to be located in or along transportation rights-of-way in fee, utility corridors, and irrigation and flood control waterways so as to mix uses, separate traffic and noise, and provide more services at less cost in one corridor.~~ *Require, where feasible, trails in urban areas to be located either outside of road rights-of-way or within road rights-of-way with the additional dedication right-of-way or easements in fee title to the County of Riverside requiring dual use of utility corridors, irrigation and flood control channels so as to mix uses, separate traffic and noise, and provide more trail services at less cost.*

b. Secure separate rights-of-way for non-motorized trails when physically, financially and legally feasible. Where a separate right-of-way is not feasible, maintain recreation trails within the County *of Riverside or Flood Control* right-of-way, *where feasible*.

c. *Develop and implement* ~~Use~~ trail design standards which will minimize maintenance due to erosion or vandalism.

d. Maximize visibility and physical access to trails from streets and other public lands.

e. Provide a trail surface material that is firm and unyielding to minimize erosion and injuries.

~~d~~*f.* When a trail is to be ~~reserved~~ *obtained* through the development approval process, base the precise trail alignments on the physical characteristics of the property, assuring connectivity through adjoining properties.

~~e~~g. Consider the use of abandoned rail lines as multipurpose rail-trails *corridors through the "Rails-to-Trails" program.* ~~for multi-purpose trails.~~

~~f~~*h.* Place all recreation trails ~~a~~ safe distance*s* from the edge*s* of active aggregate mining operations and separate them by physical barriers, *such as fences, berms, and/or other effective separation measures.* ~~i~~ Avoid placing a trail where it will cross an active *mined materials* haul route.

~~g~~*i.* Install warning signs indicating the presence of a trail at locations where regional or community trails cross public roads with high amounts of traffic. *Design and build trail crossings at intersections with proper signs, signals, pavement markings, crossing islands, and curb extensions to ensure safe crossings by users. Install trail crossing signs signal lights (as appropriate) at the intersections of trail crossings with public roads to ensure safe crossings by users.*

~~h~~*j.* *Design and construct trails that properly account for* ~~Take into consideration~~ such issues as sensitive habitat areas, *cultural resources,* flood*ing* potential~~s~~, access to neighborhoods and open space, safety, alternate land uses, and usefulness for both transportation and recreation. ~~when designing and constructing trails.~~

~~i~~*k.* Coordinate with other agencies and/or organizations (such as the U.S. Fish and Wildlife Service*, National Park Service, Bureau of Land Management, U. S. Army Corp of Engineers, U. S. Bureau of Reclamation,* and the *California* Department of Transportation) to encourage the development of multi-purpose trails. Potential joint uses may include historic*, cultural resources,* and environmental interpretation, access to fishing areas and other recreational uses, opportunities for education, and access for the disabled.

~~j~~*l.* Work with landowners to address concerns about privacy, liability, security, and trail maintenance.

m. Regional Urban and Rural, and Regional Open Space trails should be designed so as to be compatible with the community contexts in which the trails are being sited.

n. Driveway crossings by trails should be designed and surfaced in a manner compatible with multipurpose trails usage. Except for local, neighborhood-serving trails that are not intended as primary community linkages, select routes for trails that minimize driveway crossings.

o. Benches, fencing, water fountains, trees and shading, landscape buffers, rest stops, restrooms, and other trail-related amenities shall be provided where appropriate.

p. All trails along roadways shall be appropriately signed to identify safety hazards, and shall incorporate equestrian crossing signals, mileage markers, and other safety features, as appropriate.

q. Information about Riverside County's trail system shall be provided at the Riverside County Park and Open Space District and online in order to make the public aware of Riverside County's trail system.

r. Trails shall not be sited along sound walls, project boundary walls, and other walls that effectively obstruct visibility beyond the edge of a trail.

s. All trail surfacing shall be appropriate to an array of users of the trail. Soft-surfaced trails shall have smooth, firm, slip-resistant surfacing so as to minimize foot and ankle injuries.

t. Use already available or disturbed land for trails wherever possible for new or extended trails.

u. Use pervious pavement or bio-swales along paved trails to assist in maintaining water quality.

Policy C *16.8* (Previously C 16.7): Require the installation (where appropriate *and pursuant to County of Riverside standards) of the appropriate styles of fencing along trail alignments that separate trails from road right-of-ways (ROWs), or where trails are located within road ROWs, that provide adequate separation from road traffic, in order to adequately provide for public safety. Examples of such fence types include simulated wood post and rail fencing constructed of PVC material, wood round post and rail, and wood-textured concrete post and rail fencing.* ~~a simulated split rail fence with 2 to 3 rails constructed of white PVC material separating road rights of way from adjacent trail easements.~~

Policy C 17.1: Develop Class I Bike Paths, Class II Bike Lanes and Class I Bike Paths/Regional Trails (Combo Trails) as shown in the Trails Plan (*[General Plan]* Figure C-*7*), to the design standards as outlined in the California Department of Transportation Highway Design Manual, *adopted County Design Guidelines (for communities that have them), the Riverside County Regional Park and Open Space Trails Standards Manual,* and other *Riverside* County guidelines.

Policy C 17.3: Ensure that the bikeway system incorporates the following:

a. Interconnection *throughout and between* ~~of~~ cities and unincorporated communities.

b. ~~Provision of~~ *Appropriate* lanes to specific destinations such as state or county parks.~~;~~

c. ~~Provision for~~ *Appropriate opportunities for recreational bicycle riding and* bicycle touring.~~; and~~

d. ~~Encouragement of~~ *Opportunities for* bicycle commuting~~.~~ *and golf cart commuting within a community, as appropriate for the terrain, traffic levels and proximity to surrounding destinations.*

e. Bikeways connecting to all urban transit centers and systems (bus stops and Metrolink stations) in the vicinity.

f. Bicycle parking at transit stops and park-and-ride lots.

Policy C 17.4: Ensure that alternative modes of motorized transportation, such as buses, trains, *taxi cabs,* etc., plan and provide for transportation of recreational and commuting bicyclists and bicycles on public transportation systems. *Coordinate with all transit operators to ensure that bicycle facilities are provided along and/or near all transit routes, whenever feasible. New land developments shall be required to provide bicycle facilities to existing or future planned transit routes.*

Policy C 18.1: *TRAIL* ACQUISITION

a. Promote public/private partnerships for trail acquisition.

b. Seek ways to build a trail system affordably, and seek partners in doing so within a reasonable time frame, possibly in stages, to serve all trail communities, and upgrade the system of linkages/destinations.

~~b~~*c.* Determine which public and/or private agencies have *existing* easements or ~~existing~~, unused rights-of-way, which potentially could be incorporated as trail linkages throughout Riverside County. Such agencies may include the Riverside County Flood Control *and Water Conservation* District, *regional and local park districts and transportation agencies, cities, federal or state land management entities,* various utility companies/ districts, and railroad companies. ~~, leverage – u~~*Use* roads, dirt roads, *and other easements* as trails routes.~~,~~ *to f*~~F~~oster partnerships~~, get~~ *which serve to facilitate* the *siting, building and management of* trails ~~built and managed, etc~~.

~~c~~*d.* Evaluate the potential use of private-landowner tax credits for acquiring necessary trail easements and/or rights-of-way. A system such as this would allow a landowner to dedicate an easement for trail purposes in exchange for having that portion of the property assessed as open-space instead of a higher land-use category.

e. Seek to connect existing cul-de-sacs to each other, and to trail networks. In rare occasions, this may entail purchasing homes at the ends of streets, constructing the connections, and reselling the homes.

f. Wherever possible and to the extent consistent with overall trail system objectives, use trail designs and locations that minimize construction and maintenance costs.

Policy C 18.2: *TRAIL MANAGEMENT AND* MAINTENANCE

a. Implement maintenance options such as the use of volunteers, associations, or private landowner maintenance agreements, and/or adopt-a-trail programs sponsored by various groups.

b. Implement methods to discourage unauthorized use of trails by motorized vehicles, which may cause trail deterioration, create an unsafe environment, and/or disrupt the enjoyment of the trails by legitimate trail users. These methods may include the installation of gates and motorcycle barriers, posting signs prohibiting unauthorized activities, or implementing educational programs to encourage the proper use of trails.

c. Research the potential for, and consider establishing a countywide trail management entity that will facilitate the acquisition of adequate funds for trail maintenance.

d. Research the potential for, and consider establishing a separate agency within ~~the~~ *Riverside* County to manage and maintain ~~the~~ *Riverside* County's trails system.

e. Use trail designs that remove or limit injury/safety liability concerns.

f. Use trail designs that minimize trail maintenance costs.

Policy C 18.3: *TRAIL* FUNDING

a. Solicit all possible sources of funding to plan, acquire, and construct recreational trails. Sources can include, but not be limited to, development mitigation fees, private foundation grants~~, and/or~~ funds~~/~~ *or assessments* from local, regional, state, ~~and~~ *or* federal government entities.

b. Persuade local communities to finance their own community trail systems through the use of special tax *assessment* districts. If applicable, these districts should also provide adequate regulation for the keeping of horses.

~~**Policy C 19.2:** Wind turbine generators have proven to be a unique tourist attraction.~~

Policy C 20.1: Ensure preservation of trees identified as superior examples of native vegetation within road rights-of-way through development proposals review process. *Where the County of Riverside deems preservation to be infeasible, relocation and/or replacement shall be evaluated by a qualified arborist to ensure that impacts are mitigated.*

Policy C 20.3: Locate roadways outside identified flood plains whenever possible.

NEW **Policy C 20.4:** *New crossings of watercourses by local roads shall occur at the minimum frequency necessary to provide for adequate neighborhood and community circulation and fire protection. Wherever feasible, new crossings shall occur using bridging systems that pass over entire watercourses and associated floodplains and riparian vegetation in single spans. Dip or culvert crossings shall be avoided, but, where their use is unavoidable, they shall be designed to minimize impacts on watercourses.*

NEW **Policy C 20.5:** *In order to protect the watershed, water supply, groundwater recharge, and wildlife values of watercourses, the County of Riverside will avoid siting utility infrastructure and associated grading, fire clearance, and other disturbances within or adjacent to watercourses, if there are feasible alternatives available, and discourage special districts and other governmental jurisdictions outside of Riverside County's authority, from doing so. Where such watershed utility siting locations cannot be avoided, the impacts on watercourses shall be minimized.*

Policy C *20.6* (Previously C 20.4): Control dust and mitigate other environmental impacts during all stages of roadway construction.

Policy C *20.7* (Previously C 20.5): Protect all streets and highways located within identified blow sand areas from blowsand hazards to the extent practicable.

Policy C *20.8* (Previously C 20.6): Protect *Riverside* County residents from transportation generated noise hazards. Increased setbacks, walls, landscaped berms, other sound absorbing barriers, or a combination thereof shall be provided along freeways, expressways, and four-lane highways in order to protect adjacent noise-sensitive land uses from traffic-generated noise impacts. Additionally, noise generators such as commercial, manufacturing, and/or industrial activities shall use these techniques to mitigate exterior noise levels to no more than 60 decibels.

Policy C *20.9* (Previously C 20.7): Incorporate specific requirements of the Western Riverside County Multiple Species Habitat Conservation Plan and the Coachella Valley Multiple Species Habitat Conservation Plan into transportation plans and development proposals.

Policy C *20.10* (Previously C 20.8): Avoid, where practicable, disturbance of existing communities and biotic resource areas when identifying alignments for new roadways, or for improvements to existing roadways and other transportation system improvements.

Policy C *20.11* (Previously C 20.9): Implement the Circulation Plan in a manner consistent with federal, state, and local environmental quality standards and regulations.

Policy C *20.12* (Previously C 20.10): Review ~~and monitor~~ proposals for expansion of pipelines for the transport of suitable products and materials~~, and require mitigation of environmental impacts. In particular, require mitigation of~~. *Any project proponent of such a pipeline shall mitigate impacts, particularly* the potential for hazardous chemical or gas leakage and explosion~~.~~*, in accordance with local, state and federal regulations.*

Policy C *20.13* (Previously C 20.11): Incorporate specific requirements of the General Plan Air Quality Element into transportation plans and development proposals where applicable.

Policy C *20.14* (Previously C 20.12): Encourage the use of alternative non-motorized transportation and the use of non-polluting vehicles.

Policy C *20.15* (Previously C 20.13): Implement National Pollutant Discharge Elimination System Best Management Practices relating to construction of roadways to control runoff contamination from affecting the groundwater supply.

Policy C 21.1: Encourage the installation and use of HOV lanes. Such lanes should be continuous, linking major population centers with employment centers. If HOV lanes are used, consider making them available for mixed flow traffic during non-peak periods where warranted and feasible. *Consider and implement, where feasible and needed, direct HOV connections between freeways and arterial to freeway exclusive HOV ingress/egress ramps.*

~~**Policy C 21.2:** Consider the use of HOV lanes when any widening project is undertaken on urban arterials and expressways.~~

Policy C *21.2* (Previously C 21.3): Consider creating HOV lanes by adding additional travel lanes instead of removing existing mixed-flow traffic lanes.

Policy C *21.3* (Previously C 21.4): Give priority to TSM *(transportation systems management)* strategies to improve level of service, particularly in areas that are fully developed.

Policy C *21.4* (Previously C 21.5): Construct and improve traffic signals at appropriate intersections. Whenever possible, traffic signals should be spaced and operated as part of coordinated systems to optimize traffic operation *and reduce congestion*.

Policy C *21.5* (Previously C 21.6): Consider roadway expansion at public expense to relieve congestion only after the determination has been made that TSM *(transportation systems management)* measures will not be effective.

Policy C *21.6* (Previously C 21.7): Install special turning lanes whenever necessary to relieve congestion and improve safety.

~~**Policy C 21.8:** Install one-way streets and exclusive or reversible lanes where applicable.~~

Policy C *21.7* (Previously C 21.9): Encourage development of bus-only lanes and signal synchronization so that transit can help to alleviate congestion.

~~**Policy C 23.4:** Support provisions to physically separate heavily traveled rail lines from heavily traveled streets and roads.~~

Policy C *23.4* (Previously C 23.5): Create grade separations that locate arterials under or over rail lines that carry substantial amounts of freight from the ports along critical routes such as the Los Angeles-Orangethorpe-Riverside rail freight corridor.

~~**Policy C 23.6:** Address alternatives for intermodal shipment for industries affected by abandonment of rail facilities.~~

***NEW* Policy C 23.5:** *Support provisions to physically separate heavily traveled rail lines from heavily traveled streets and roads.*

Policy C *23.6* (Previously C 23.7): Encourage the efficient movement of goods by rail through development of efficient intermodal freight facilities and a shift of a portion of the goods previously moved by trucks onto the rail freight system.

Policy C *23.7* (Previously C 23.8): Identify street and highway improvement and maintenance projects that will improve goods movements and implement projects that are economically feasible.

NEW **Policy C 23.8:** *Restrict truck through-traffic in residential areas and on streets with specific facilities that have high density of people/users; through planning and design of developments, direct truck traffic to major transportation corridors.*

~~**Policy C 23.9:** Study commercial truck movements and operations in the County and establish truck routes away from noise-sensitive areas where feasible.~~

~~**C 23.10:** Limit truck traffic in residential and commercial areas to designated truck routes; limit construction, delivery, and truck through-traffic to designated routes; and distribute maps of approved truck routes to County traffic officers~~

Policy C *23.9* (Previously C 23.11): Encourage the construction of truck-only lanes*, climbing lanes or turnouts* where appropriate.

Policy C 25.1: Promote and encourage efficient provisions of utilities such as water, wastewater, and electricity that support ~~the~~ Riverside County's Land Use Element at build out.

Policy C 25.2: Locate new and relocated utilities underground when possible *and feasible*. All remaining utilities shall be located or screened in a manner that minimizes their visibility by the public.

4.18.4 Thresholds of Significance for Transportation and Circulation

The Riverside County Environmental Assessment which complies with the State CEQA Guidelines identifies that a proposed project would result in a significant impact to the circulation system if it would:

A. Conflict with an applicable plan, ordinance or policy establishing a measure of effectiveness for the performance of the circulation system, taking into account all modes of transportation, including mass transit and non-motorized travel and relevant components of the circulation system, including, but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit.

B. Conflict with an applicable congestion management program, including, but not limited to level of service targets and travel demand measures, or other targets established by the county congestion management agency for designated roads and highways.

C. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks.

D. Alter waterborne, rail or air traffic.

E. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

F. Cause an effect upon, or a need for a new or altered maintenance of roads.

G. Cause an effect upon circulation during the project's construction.

H. Result in inadequate emergency access or access to nearby uses.

I. Conflict with adopted policies, plans or programs regarding public transit, bikeways or pedestrian facilities, or otherwise substantially decrease the performance or safety of such facilities.

4.18.5 Analysis of Project Impacts and Determination of Significant Impacts

The analysis of project impacts and determination of significance considers nine main issues including:

- County roadways
- Regional roadways
- Air travel
- Waterborne or rail
- Transportation safety
- Road maintenance
- Effects during construction
- Emergency vehicle access
- Alternative transportation modes

A. Would the project have a substantial adverse impact on traffic conditions for County roadways?

Impact 4.18.A – Conflict with an Applicable Plan, Ordinance or Policy Establishing a Measure of Effectiveness for the Performance of the Circulation System, Taking into Account All Modes of Transportation, Including Mass Transit and Non-Motorized Travel and Relevant Components of the Circulation System, Including, but Not Limited to Intersections, Streets, Highways and Freeways, Pedestrian and Bicycle Paths and Mass Transit: GPA No. 960 proposes to revise the LOS threshold for determining adverse impacts to Riverside County roadways. At present, the countywide threshold for significance is LOS C, with LOS D and E allowed in certain instances. When a roadway facility is projected to operate at a deficient LOS, this situation is often remedied by upgrading the facility designation to a higher classification, thus providing more capacity. By lowering the LOS threshold, fewer facilities would need to be upgraded in order to meet the new proposed LOS target. However, even with the lower LOS threshold and upgrades in roadway classifications, several roadways are still projected to operate at a deficient LOS. In addition, a number of roadways that would operate at an acceptable LOS if their classification were upgraded, cannot be upgraded due to physical or environmental constraints.

Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County relative to existing conditions, and increase travel demand within Riverside County. Compliance with existing laws, rules, regulations and policies, both existing and proposed, together with revisions to the Circulation Element for Riverside County will reduce impacts to the maximum extent feasible and practical; however, even with these measures impacts to the Riverside County roadway system will be significant and unavoidable.

1. Analysis of Impact 4.18.A

For Riverside County roadway facilities, GPA No. 960 is identified as having a significant and adverse effect on traffic conditions if the following criteria are met: a roadway segment is projected to operate at LOS E or F.

The analysis utilized long-range traffic forecasting data provided by sub-regional traffic model known by the acronym RIVTAM. RIVTAM was developed by the County of Riverside Transportation Department (RCTD), with the cooperation of WRCOG, CVAG, RCTC, SCAG and Caltrans, which completed the development of RIVTAM in May 2009. RIVTAM is a TransCAD model, based on SCAG's Regional Transportation Model that it used in developing the 2035 Regional Transportation Plan (2008 RTP). TransCAD is the name of a commercially available software package used for transportation system modeling by many agencies in the United States and abroad.

SCAG's Regional Transportation Model encompasses a large geographic area that consists of the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura. Because of the size of the area, the SCAG model lacks the degree of detail that is often necessary for transportation planning at the county and local jurisdiction levels. RIVTAM incorporates a great deal of detail in Riverside County, while maintaining consistency with the SCAG Regional Model.

RIVTAM has been validated to a finer level of detail than the SCAG Regional Model. The SCAG model has been validated for 2003 as the base year. Model validation is the process whereby model generated traffic volumes for individual roadways are compared to actual ground counts on those roadways. For RIVTAM, the validation base year is set at 2007. Traffic counts were made at over 300 locations late in 2007 and early 2008. These counts, supplemented by counts available from Caltrans and local jurisdictions, were used in the RIVTAM validation process. The SCAG Regional Model validation within Riverside County addressed five traffic flow corridors and about 50 individual segments in these corridors. For RIVTAM, about 46 traffic flow corridors and about 350 individual roadway segments within these corridors were analyzed.

The Traffic Analysis Zone (TAZ) system in RIVTAM is more detailed than the SCAG Regional Model. Within Riverside County, the SCAG model has 478 Traffic Analysis Zones (TAZ's). These 478 TAZs were subdivided into 1,814 in RIVTAM. This finer level of TAZ disaggregation, coupled with a finer roadway network, yields better traffic forecasts on individual roadway segments.

RIVTAM has a more detailed roadway network than the SCAG Regional Model. RIVTAM added 570 centerline miles of roadways to the network in the SCAG Regional Model. RIVTAM incorporates all facilities in the Riverside County General Plan, classified as Secondary and above. In addition some Collectors are included, as necessary, to insure that all TAZs are connected to the network of General Plan roadways.

RIVTAM is consistent with the SCAG Regional Model in all technical and procedural aspects. RIVTAM does not alter any of the SCAG Regional Model assumptions and parameters. Data inputs for areas outside of Riverside County are identical to the SCAG Regional Model. Within Riverside County, more refined data is incorporated as described above.

RIVTAM is the product of a cooperative multi-agency effort. Staff of the participating agencies met at the policy and technical levels on over 30 occasions to review work products, provide direction to the project consultant, and to discuss a variety of matters. The agencies also collaborated by providing applicable data, reports and other information.

Additional information on the specifics of the RIVTAM model and the validation of the model is summarized in the *Final Report – Riverside County Transportation Analysis Model (RIVTAM) Model Development & Validation Report and Users Guide* (February 2009) which is available in Appendix EIR-4.D.

In order to forecast future traffic conditions at the theoretical build out of Riverside County, including a cumulative analysis of build out of the cities within Riverside County, socioeconomic data (SED) were developed to represent the land use plans of Riverside County and cities. SED is used as major input to the RIVTAM traffic forecasting model. RIVTAM, like the SCAG model, uses 52 socioeconomic variables as model inputs. Those variables include primary data such as population, households, school enrollments, household income, workers, and employment (or jobs). Land use was converted to SED using the General Plan's Appendix E-1: Socioeconomic Build Out Projections, Assumptions and Methodology. With this input, it is possible to forecast future traffic volumes on a system wide macro level. Traffic models are a valuable tool in evaluating future travel demand and afford decision makers the ability to compare the effects of various scenarios.

a. Methods of Analysis

The analysis of Impact 4.18.A considers the changes proposed by GPA No. 960 in terms of five items:

a. Regulatory Compliance

b. Trip Generation

c. Vehicle Miles Traveled (VMT)

d. Vehicle Hours Traveled (VHT)

e. Levels of Service (LOS)

For items *b* through *e* above, several analysis scenarios were completed to provide information to disclosure of the impacts associated with GPA No. 960. These scenarios are summarized below:

- **Baseline Conditions** – Existing conditions as described earlier in this chapter.

- **Baseline-Plus Project Conditions** – Existing land use and roadway network for all locations outside of Riverside County boundaries (e.g., within the cities), and build out of GPA No. 960 land use and roadway network for all Riverside County facilities. This scenario demonstrates the impacts associated with changes proposed by GPA No. 960 in relation to existing conditions not under Riverside County jurisdiction.

- **Existing General Plan** – Represents build out of the 2003 General Plan (adopted) and build out of areas and roadways not under Riverside County jurisdiction. This scenario was developed for comparison purposes to see not only how the changes proposed in GPA No. 960 affect the roadway network, but also includes the cumulative impacts of all of the incorporated cities as well. While this scenario reflects the 2003 General Plan land use, it does not include the internal East-West CETAP Corridor with the Orange County extension in the roadway network, as RCTC has placed planning this facility on hold while they explore other options. This scenario is not used for impact

determination, but it provides valuable information for the decision makers to understand the differences between the Existing General Plan and GPA No. 960. Since it is not used for impact determination, operational characteristics of this scenario are only provided in the summary comparisons of the analysis results.

- **GPA No. 960** – Represents build out of GPA No. 960 plus build out of all area land use and circulation improvements not under Riverside County jurisdiction. This cumulative analysis when compared to the Existing General Plan clearly indicates the impacts associated with changes associated with GPA No. 960.

For purposes of this assessment, GPA No. 960 includes the following major modifications compared to the Existing General Plan Conditions:

Changes to the General Plan Circulation Element are categorized as follows:

- **Roadway Additions:** Additions to the existing Circulation Element are proposed due to changes in incorporated areas, due to approved Specific Plans in the unincorporated areas, for reasons of providing network continuity, for consistency with regional planning efforts, and in response to the findings of studies addressing specific areas.

- **Roadway Deletions:** Deletions to the existing Circulation Element are proposed due to changes in incorporated areas; the approval of Specific Plans in unincorporated areas; findings of studies addressing specific areas demonstrating that a roadway segment would not be needed; unavailability of right-of-way (ROW) and/or expectation of extreme difficulty in acquiring ROW; and other constraints, such as environmental sensitivity. The most significant of these deletions is the internal East-West CETAP Corridor with an extension into Orange County. The RCTC has placed planning efforts for this future facility on hold and is currently exploring a wide variety of highway and transit options in order to increase capacity to accommodate the travel demand between Riverside County and Orange County.

- **Roadway Re-alignments:** Roadway re-alignments are proposed for purposes of avoiding steep grades, to avoid disrupting adjacent communities, or to take advantage of availability of ROW.

- **Re-classification:** Changes in classification, to downgrade or upgrade, are proposed due to changes in incorporated areas, in response to the findings of studies addressing specific areas, due to unavailability of ROW and/or expectation of extreme difficulty in acquiring additional ROW.

- **Miscellaneous Graphic Changes:** Miscellaneous administrative changes are proposed for such matters as graphically marking the location of crossings of flood control channels, railroad grade separations, improvement of graphic representations, addition of street names, and other miscellaneous changes. This category of changes would not have traffic impacts.

- **Policies:** A series of proposed policy changes within the Circulation Element have been identified and are described earlier in this chapter.

Figures 4.18.1.1 to 4.18.31.21 contained in Appendix EIR-4.E present information related to the analysis scenarios described above, including roadway network assumptions, Metrolink and BRT/expressbus assumptions, traffic flow and levels of service. . The differences between the existing Circulation Element and the proposed Circulation Element are detailed in Figures 4.18.23.1 to 4.18.23.21 in Appendix EIR-4.E.

Trip Generation

Table 4.18-J (Population, Household, Employment and Trip Generation Comparison) summarizes the population, household, employment, and trip generation estimates for each of the scenarios described above. The information was developed using the land use estimates for each scenario, and by summing the inbound and outbound vehicle trips to/from each zone within the RIVTAM model.

Table 4.18-J Population, Household, Employment and Trip Generation Comparison

	Baseline	Baseline + Project	Existing General Plan	GPA No. 960
Population	2,030,649	3,141,125	~~4,795,157~~*4,754,888*	~~4,775,846~~*4,735,577*
Households	653,858	974,093	~~1,489,444~~*1,476,900*	~~1,483,735~~*1,471,191*
Employment	731,232	1,132,510	~~2,114,052~~*2,118,938*	~~2,055,489~~*2,060,375*
Trip Generation	8,180,157	10,526,266	~~17,918,938~~*17,833,993*	~~17,669,642~~*17,591,508*

Source: Riverside County Staff. SED data and trip generation based on information from the RIVTAM model. 2012.

As shown in the table above, all analysis scenarios will generate additional population and, therefore, additional vehicle trips compared to the baseline scenario. Key summaries of the data are summarized below:

- Growth in GPA No. 960 only (e.g., Baseline-Plus Project Conditions) increases trip generation in Riverside County by 29% compared to Baseline Conditions.
- The Existing General Plan (including build out of the cities) would increase to total number of vehicle trips by ~~119~~*118*% compared to Baseline Conditions.
- GPA No. 960 (including growth in the cities) would increase countywide trip generation by ~~116~~*115*%. This represents a ~~3~~*1*% reduction in total trips compared to the Existing General Plan.

Thus, GPA No. 960 results in in a slight reduction in growth from the current General Plan, which translates into a slight reduction in travel demand in terms of trips generated. This reduction is attributable to reductions in households and employment when compared to the Existing General Plan.

Vehicle Miles Traveled

Vehicle Miles Traveled (VMT) is determined by multiplying each roadway's segment mileage by the number of vehicles that traveled on the segment on an average weekday, or Average Daily Trip (ADT). This measure is influenced by the total number of vehicles using a roadway and the distances the vehicles have to travel between their points of origin and destination.

Daily VMT is influenced by several factors including the number of daily trips generated, system circuity and system congestion. If the number of trips is increased and there are no changes in the circulation system, VMT will increase. VMT can be reduced if system circuity is decreased by creating more direct connections between points where trips want to go. System congestion can cause VMT to increase. When system roadways are congested beyond their capacities, excess trips will seek out alternative paths on more circuitous paths. Daily VMT is shown in Table 4.18-K (VMT Summary) for all analysis scenarios.

Table 4.18-K Vehicle Miles Traveled (VMT) Summary

	Baseline	Baseline + Project	Existing General Plan	GPA No. 960
Population	2,030,649	3,141,125	~~4,795,157~~*4,754,888*	~~4,775,846~~*4,735,577*
VMT	54,527,493	78,913,568	~~155,196,166~~*147,032,566*	~~146,483,727~~*137,403,000*
VMT Per Person	26.85	25.12	~~32.37~~*30.92*	~~30.67~~*29.02*

Source: Riverside County Staff. VMT based on information from the RIVTAM model.

Recent legislative developments are currently focusing attention on alternative measures to determine transportation impacts. Senate Bill 743, amending CEQA with respect to how transportation impacts are to be evaluated, was signed by Governor Brown on September 27, 2013. Since then the California Office of Planning and Research (OPR) has been developing new guidelines which would eliminate the use of LOS measures in evaluating transportation impacts in CEQA documents in favor of a methodology which focuses on vehicle miles of travel (VMT).

The draft guidelines from OPR, which are still in the process of review, call for an analysis of VMT as a preferred measure of transportation impacts. At the time of this writing, OPR has not yet provided a methodology which can be implements to use VMT to determine if a project has transportation impacts under CEQA.

It is, however, relevant to note ~~The results indicate~~ that the Baseline-Plus Project scenario produces the smallest VMT per person, even lower than the baseline level, and the lowest increase in overall VMT. However, the Baseline-Plus Project scenario does not address the cumulative impacts of growth within the incorporated cities. As such, it is a purely hypothetical scenario. The Existing General Plan and GPA No. 960 scenarios both provide analysis which includes cumulative city growth. The GPA No. 960 scenario provides better than a ~~5~~*6*% reduction in both VMT per person and overall VMT as compared to the Existing General Plan. This measure of transportation system performance indicates that there are transportation benefits from GPA No. 960 associated with reduced Daily VMT when compared to the Existing General Plan Conditions.

Vehicle Hours Traveled

Daily Vehicle Hours Traveled (VHT) is the sum of time of the ADT spent traversing a roadway. The RIVTAM traffic model tracks the time required to travel over each segment as it analyzes trips, and accounts for the effect of traffic slowing due to traffic congestion on the amount of time it takes to cross a segment.

Factors that influence VHT include the number of trips generated, roadway capacity on routes of travel and operating speeds at free flow and congested conditions. As roadways become more congested due to additional traffic, traffic speeds decrease, causing travel time to increase. VHT is an excellent measure of the efficiency of the circulation system which can indicate if roadway capacity is allocated where there is travel demand.

Table 4.18-L (VHT and Average Travel Speed Summary) shows the total vehicle hours of travel (VHT) and average speeds under the analysis scenarios. These measures are good indicators for a general comparison of the overall amount of travel and quality of travel (average speed).

Table 4.18-L Vehicle Hours Traveled (VHT) and Average Travel Speed Summary

	Baseline	Baseline + Project	Existing General Plan	GPA No. 960
VHT	1,957,669	2,883,439	~~8,161,713~~*7,782,465*	~~7,064,338~~*6,685,158*
Average Speed (MPH)	~~25.00~~*27.85*	~~25.00~~*27.37*	~~23.25~~*18.89*	~~23.93~~*20.55*

Source: Riverside County Staff. VHT and average speed based on information from the RIVTAM model.

The results indicate that VHT for the GPA No. 960 Conditions would result in approximately ~~13~~*14*% less travel time countywide compared to the Existing General Plan. However, as additional population is added to Riverside County, VHT will increase countywide compared to Baseline Conditions.

Looking at the average travel speed, the scenario that performs the worst is the Existing General Plan as it has the lowest average travel speed. Although GPA No. 960 does decrease average vehicle speed relative to the Baseline and Baseline-Plus Project scenarios, it provides a higher average vehicle speed relative to the Existing General Plan, and reduces the Baseline ~~and Baseline-Plus Project~~ average speed of ~~25~~*27.85* miles per hour by only ~~4.3~~*26.2*%.

Vehicle Levels of Service

The RIVTAM model was used to project future operating conditions under each of the analysis scenarios summarized above. The results are summarized below for the Baseline-Plus Project, Existing General Plan, and GPA No. 960 Conditions.

The following results summarize only facilities that are operating at unacceptable levels. EIR Appendices 4-A and 4-B provide the complete list of facility operations.

b. Results for Baseline-Plus Project Conditions

The results of the Baseline-Plus Project Conditions are summarized in Table 4.18-M (Baseline and Baseline-Plus Project (County Growth) Freeway and State Route Segment LOS) for freeway segments and in Table 4.18-N (Baseline and Baseline-Plus Project Roadway Comparison for Segments One Mile or Longer (Arterial Road Network)) for roadway segments. The table also summarizes Baseline Conditions for comparison.

Footnote: Shaded cells indicate impact.
Source: Riverside County staff.

The results of the forgoing analysis indicate that, with build out of the GPA No. 960 land use in Riverside County and build out of Riverside County's Circulation Element, some facilities would improve to an acceptable level that currently operate unacceptably. However, as shown in Table 4.18-M and Table 4.18-N, the shaded cells are locations where GPA No. 960 would increase traffic to facilities already operating at an

unacceptable level or GPA No. 960 would add traffic to facilities currently operating at an acceptable level such that they would operate unacceptably. Based on the significance criteria described above, the addition of GPA No. 960 traffic to the existing baseline would result in significant impacts at those locations.

c. Results for GPA No. 960 Conditions

The proposed Circulation Element, illustrated in Figures 4.18.22.1 to 4.18.22.21 in Appendix EIR-4.E, is assumed for the analysis of GPA No. 960. This scenario assumes land use designations of the proposed General Plan Amendment. The differences between the existing Circulation Element and the Proposed Circulation Element are also presented in Figures 4.18.23.1 to 4.18.23.21 in Appendix EIR-4.E. The changes in the incorporated areas are for informational purposes only and reflect the best information available from the cities as of late 2009.

The results of the evaluation of GPA No. 960 are presented in a series of figures similar to those for the previously evaluated scenarios.

Error! Reference source not found.-O (Baseline to GPA No. 960 Freeway and Expressway Comparison) summarizes the Freeway and State Route Facilities that are projected to operate at an unacceptable LOS E or LOS F, while Table 4.18-P (Baseline to GPA No. 960 Comparison of Segments One Mile or Greater (Arterial Road Network)) summarizes the results of roadway operations on Riverside County facilities. All facilities operating at an unacceptable level, where the LOS is the same or worse than the Baseline Conditions, and where GPA No. 960 is expected to add traffic is identified as a significant impact.

Table 4.18-O Baseline to GPA No. 960 Freeway and Expressway Comparison

Note: Shaded cells indicate project impact.
Source: Riverside County staff.

As shown in Table 4.18-O and Table 4.18-P, even with the updated policies identified in GPA No. 960, numerous facilities are expected to operate at an unacceptable level. Based on the significance criteria described above, although GPA No. 960 is generally less impactful compared to the Existing General Plan, it would still result in a significant impact to those study facilities.

d. Summary of Level of Service Assessment Results

The information below provides a summary for non-state facilities related to operating characteristics. Table 4.18-Q summarizes the total miles of Riverside County and city roadway segments that will operate at LOS D or better, LOS E, and LOS F. Table 4.18-R summarizes similar information, but presents the data as total lane miles within Riverside County (e.g., accounts for number of lanes on the roadway, not just the length of the segment).

The following conclusions can be inferred from reviewing the data in Table 4.18-Q (Summary of Operating Characteristics – Miles of Roadways – Arterial Road Network) and Table 4.18-R (Summary of Operating Characteristics – Lane Miles of Roadway – Arterial Road Network):

Table 4.18-Q Summary of Operating Characteristics – Miles of Roadways – Arterial Road Network

Source: Riverside County staff.

This page intentionally left blank

- The Baseline-Plus Project Conditions will more than double the number of miles of roadway that will operate at LOS E or LOS F compared to Baseline Conditions.

- GPA No. 960 will result in approximately 14.4% of roadways in Riverside County and the cities operating at LOS E or LOS F. This is approximately 4.5% less roadway segment miles when compared to the Existing General Plan.

The findings relative to roadway lane miles is similar:

- The Baseline-Plus Project Conditions will increase the percentage of roadways operating at LOS E or LOS F from 4.4% to 8.6%.

- GPA No. 960 will result in 15.9% of all lane miles operating at LOS E or LOS F, approximately 2.5 % less than the Existing General Plan.

Table 4.18-S (Matrix for Comparing Scenarios and Impacts (County Roads)) summarizes all Riverside County impacted locations under all analysis scenarios.

Table 4.18-T (Matrix for Comparing Scenarios and Impacts (City Roads)) summarizes all impacted city locations under all analysis scenarios. These facilities are not under Riverside County jurisdiction, and most of the impacts to these facilities are as a result growth within the cities. Any changes in roadway designation to address LOS deficiencies would need to be addressed within the context of the affected jurisdiction. The County of Riverside will work with all affected jurisdictions to coordinate transportation and circulation system standards and alignments.

GPA No. 960 (with or without city growth) will increase the number of facilities and the total roadway lane miles projected to operate at LOS D or E compared to Baseline Conditions. As such, this is considered a significant impact based on the significance criteria described above. However, GPA No. 960 (with or without city growth) shows improved operations when compared to Existing General Plan Conditions, but the impacts are still considered to be significant.

2. Regulatory Compliance for Impact 4.18.A

The existing Riverside County General Plan and GPA No. 960 include policies which contribute towards the reduction of impacts on Riverside County roadways. These policies are described below.

There are multiple policies which address travel by modes other than automobiles. For example, Circulation Element Policy C 1.2 addresses the need to provide a multi-modal transportation network that includes all modes of travel ranging from automobiles to pedestrians. Providing a robust transportation network that accommodates transit users, bicyclists and pedestrians will reduce the dependence on automobile travel, which should reduce vehicular travel and congestion. Policy C1.3 specifically addresses transit users by supporting the development of local and regional transit facilities. Additional transit patronage will also reduce vehicular travel, with a commensurate reduction in congestion. Policy C 1.7 addresses land use patterns that will reduce vehicular travel such as pedestrian-oriented development and mixed-use community centers. There are also specific policies related to pedestrian travel. Policy C 4.1 relates to the provision of pedestrian facilities within developments.

Other policies are oriented towards reducing impacts associated with individual developments. Policy C 2.4 requires that new development proposals mitigate their direct traffic impacts. Mitigating cumulative and indirect

traffic impact through fee programs and other similar methods is addressed through Policy C 2.5. Policy C 2.7 establishes at trip cap for the Highway 79 Policy Area which requires residential projects to limit their trip generation and provide sufficient infrastructure to support their development.

a. Compliance With Existing Mitigation Measures from EIR No. 441

EIR No. 441 was the document used to evaluate the 2003 General Plan. The following mitigations are included in EIR No. 441 with respect to transportation and circulation impacts:

Existing Mitigation Measure 4.16.1A: As part of its review of land development proposals, the County [of Riverside] shall require project proponents to make a "fair share" contribution to required intersection and/or roadway improvements. The required intersection and/or roadway improvements shall be based on maintaining the appropriate level of service (LOS D within Community Development Areas designated by the 2003 Riverside County General Plan and within adjacent jurisdictions; LOS C within those portions of unincorporated Riverside County outside of Community Development Areas). The fair share contribution shall be based on the percentage of project-related traffic to the total future traffic.

Existing Mitigation Measure 4.16.1B: As part of its review of land development proposals, the County [of Riverside] shall ensure sufficient right-of-way is reserved on critical roadways and at critical intersections to implement the approach lane geometrics necessary to provide the appropriate levels of services.

Existing Mitigation Measure 4.16.1C: The County [of Riverside] shall add a transportation corridor to its General Plan Circulation Element, if feasible, showing a connection between I-15 and the Orange County freeway system, and complete that portion of the CETAP program involving the bi-county corridor to Orange County as a means of relieving traffic congestion along State Route 91. The transportation corridor shall provide an alternative route for traffic on State Route 91 between I-15 and State Route 241.

GPA No. 960 is in compliance with Mitigation Measure 4.16.1B, however, Mitigation Measure 4.16.1A is affected by the proposed change in the LOS threshold for significance. New policies will impose similar mitigation measures and continue to provide for "fair share" participation in improvement measures to maintain appropriate levels of service. Mitigation Measure 4.16.1C included the bi-county corridor through the Cleveland National Forest. This corridor is not actively being studied by the RCTC at this time and was not included in the modeling for GPA No. 960. The County of Riverside has no jurisdiction over the planning for this facility and can no longer count on this facility as mitigation, as such, the facility is proposed to be removed from the Riverside County Circulation Element. The removal of this facility has been analyzed as part of the traffic modeling to evaluate the impacts of GPA No. 960.

b. Summary of Roadway Mitigation Recommendations for Impact 4.18.A

Table 4.18-U (Mitigation Recommendations for GPA No. 960 (Build Out)) summarizes the recommended roadway designation changes needed to mitigate impacted roadway facilities located in the unincorporated areas of Riverside County under the GPA No. 960 Build Out scenario. The table includes the proposed road designation as well as the designation necessary to mitigate roadway impacts. The last column of Table 4.18-U contains Recommendation Codes indicating whether the County of Riverside can adopt the Mitigation Designation for the respective roadway or if constraint(s) exists that would preclude the County of Riverside from implementing the Mitigation Designation. The codes are summarized below:

1. Recommend adoption of mitigation designation.

2. Implementation of mitigation would require coordination with other public agencies such as cities, Caltrans, Metropolitan Water District of Southern California (MWD), March JPA, federal agencies, etc.

3. Mitigation is affected by design constraints such as terrain, road standard exceptions and geometrics.

4. Implementation of mitigation would require overcoming development constraints such as pre-existing development limiting the ability to acquire right-of-way or provide widening of roads.

Of the 153 identified roadways in the table, 99 roadways have mitigation designations recommended for adoption. The remaining 54 roadways require coordination with other jurisdictions and/or are constrained by existing development or environmental considerations. These roadways have the recommendation cells shaded in gray.

Table 4.18-U contains all of the roadways that are subject to Riverside County's jurisdiction which were also listed in the several comparison Tables 4.18-M through 4.18-P. All of the other roadways listed fall outside the jurisdiction of Riverside County (i.e. State of California and cities). These roadways similarly have impacts which require mitigation measures. However since these roadways are not within the jurisdiction of Riverside County, the impacts may potentially remain significant unless improved by others to standards that are higher than those modeled.

Table 4.18-U Mitigation Recommendations for GPA No. 960 (Build Out)

Footnote: Recommendation Codes:
1 Recommend adoption of mitigation designation
2 Implementation of mitigation would require coordination with other public agencies such as cities, Caltrans, MWD, March JPA, federal agencies, etc.
3 Mitigation is affected by design constraints such as terrain, road standard exceptions and geometrics.
4 Implementation of mitigation would require overcoming development constraints such as pre-existing development limiting the ability to acquire right-of-way or provide widening of roads.

3. Findings of Significance for Impact 4.18.A

The implementation of GPA No. 960 will generally improve traffic conditions throughout Riverside County compared to the build out of the Existing General Plan. This is due to the decreased population estimates, decreased employment estimates, a refined roadway network and implementation of revised policies that provide more realistic parameters for mobility planning. However, the build out of GPA No. 960 will still result in increased traffic levels in the future that will contribute to deficient operations within its proposed circulation network. The proposed policies incorporated in GPA No. 960 in the Circulation and Land Use Element will partially address these deficient conditions. However; these policies will not fully address these deficiencies as shown in the foregoing tables, nor will the proposed revisions to the Riverside County Circulation Element fully mitigate these impacts. Therefore, the impacts to Riverside County roadways are considered to be significant and unavoidable.

B. Would the project conflict with an applicable Congestion Management Program (CMP)?

Impact 4.18.B - Conflict with an Applicable Congestion Management Program, Including, but Not Limited to Level of Service Targets and Travel Demand Measures, or Other Targets Established by the County Congestion Management Agency for Designated Roads or Highways: The local Congestion Management Program (CMP) is administered by the RCTC. The level of significance established in the CMP is LOS E. If a facility fails to operate at LOS D or better the local responsible agency is required to develop and implement a deficiency plan intended to bring the facility into compliance. The program also establishes criteria for the development of transportation models to evaluate future traffic conditions, as well as monitoring criteria to evaluate existing system operation and performance, and includes criteria for the analysis of development impacts on the CMP network of regionally significant roadways. Riverside County is in compliance with the applicable CMP and has policies to address impacts to regional roadways. GPA No. 960 will not adversely affect the local CMP and does, in fact, include policies to support the goals and objectives of the CMP. Therefore, the impact is considered less than significant.

1. Analysis of Impact 4.18.B

This analysis applies the RIVTAM model described in Section 4.18.5.1. The primary basis for analysis is compliance with applicable regulatory requirements.

At least biennially, RCTC will determine if the County of Riverside and cities are conforming to the CMP, including, but not limited, to the following:

a. Consistency with levels of service targets, except as provided in Section 65089.4.

b. Evaluation of performance of the transportation system.

c. Adoption and implementation of a deficiency plan pursuant to Section 65089.4 when highway and roadway level of service standards are not maintained on portions of the designated system.

In addition to conformity requirements referenced in specific sections of the Government Code, the County of Riverside and cities must work with the Congestion Management Agency (CMA) to provide Level of Service (LOS) monitoring information along the CMP System. To insure that the CMP System is appropriately monitored to reduce the occurrence of CMP deficiencies, proposed development projects can be evaluated by each affected agency to determine potential regional and sub-regional impacts along the CMP Systems. Riverside County actively participates in the RCTC CMP and is in full compliance of all requirements.

GPA No. 960 contains a number of policies which reduce the impact upon regional roadways, including Circulation Element Policy C 7.3 which directs the County of Riverside to incorporate regional planning documents such as the RTP and input from agencies such as RCTC and Caltrans to expedite the implementation of improvements to the state highway system. Policy C 7.4 addresses coordination between Riverside County and other agencies such as Caltrans, WRCOG and CVAG regarding future studies to address improvements, toll lanes and transportation corridor planning. These policies will assist with the timely delivery of regional roadway improvements, which will reduce congestion for persons traveling along the regional roadway system. In addition, Policy C 2.1, which raises the LOS threshold of significance to LOS D, is in compliance with LOS standards of the CMP, as the CMP only considers a facility to be deficient if it exceeds LOS E. This evaluation is based upon actual operating characteristics, not future forecasts. The traffic model used to assess the impacts of GPA No. 960 was developed in coordination with the RCTC and is in compliance with all CMP criteria.

Should the deficiencies forecast for implementation of GPA No. 960 actually come to pass, the CMP requires the development of deficiency plans to address the deficiencies and implement strategies to correct the deficiencies.

2. Findings of Significance for Impact 4.18.B

With the implementation of GPA No. 960, many freeway and expressway lane miles would operate at LOS E or F. The Existing General Plan polices and the revised policies will partially address these deficient conditions. However, these policies will not fully address these deficiencies and additional implementation actions may be needed once these conditions actually manifest. The CMP requires the development of deficiency plans to address actual operating deficiencies. GPA No. 960 will not adversely affect the local CMP and does, in fact, include policies to support the goals and objectives of the CMP. Therefore, the impact is considered less than significant.

C. Would the project result in a change in air traffic patterns?

Impact 4.18.C - Result in a Change in Air Traffic Patterns, Including Either an Increase in Traffic Levels or a Change in Location that Results in Substantial Safety Risks: Riverside County has 16 municipal airports located throughout the county. One of these facilities is the March Air Reserve Base, which not only serves military aircraft and missions, but also has a civilian component. In addition, the County of Riverside has developed a Land Use Compatibility Plan for the Chino Airport. Although Chino Airport is situated within the

County of San Bernardino, it is included within the Riverside County Airport Land Use Compatibility Plan because its impacts extend into Riverside County. Palm Springs International Airport is the only airport in Riverside County that has regularly scheduled commercial passenger flights.

Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. Compliance with existing laws, rules and regulations, including the Riverside County Airport Land Use Compatibility Plan would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.18.C

Analysis of this impact includes an evaluation of current and proposed policies, as well as consideration whether GPA No. 960 will result in any direct impacts to existing or proposed air facilities.

GPA No. 960 contains several policies related to air facilities. The most directly related policy is C.14.1, which directs the County of Riverside to coordinate planning efforts related to aviation facilities with airport authorities and other agencies. Several other policies, such as Policy LU 14.6, direct the County of Riverside to implement land use planning techniques to maintain the existing aviation facilities. Any development that might potentially impact existing airport facilities would be evaluated based upon the Riverside County Airport Land Use Compatibility Plan.

GPA No. 960 is not proposing any new airports or changes to the scale or operations of any of the existing airports. Should the County of Riverside propose to become the operator of, or to exercise its land use authority over, any new airports or alterations in the scale of any existing airport that would change air traffic patterns, increase air traffic levels or change air travel locations in ways that result in a substantial safety risk, the County of Riverside will comply with all applicable federal and state regulations to mitigate such risks.

2. Findings of Significance for Impact 4.18.C

GPA No. 960 will not affect air travel or air facilities. Therefore, the impact is considered less than significant.

D. Would the project alter waterborne or rail traffic?

Impact 4.18.D – Alter Waterborne or Rail Traffic: Riverside County does not have navigable waterways providing transport of people and goods. Therefore, the Circulation Element does not contain any policies related to waterborne travel. A number of intercontinental railway facilities do pass through Riverside County. These rail lines carry a substantial amount of produce and goods. In addition, many of these same rail lines service rail passengers within the region, accommodating such services as Amtrak and Metrolink.

Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. Compliance with existing laws, rules and regulations would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.18.D

The analysis of this topic focuses on regulatory compliance to ensure that there are appropriate policies to address the waterborne and rail travel. GPA No. 960 provides several policies which directly touch on the issue of waterborne and rail travel.

Policy C 13.1 addresses the need to support a rail network and continue to expand new rail lines and stations. Policy C 13.4 relates to constructing grade separated facilities to improve traffic flow. Policy C 13.7 focuses on right-of-way dedication for future transit centers in community centers and/or major activity areas.

As discussed in 4.18.2-E, Riverside County does not have navigable waterways providing transport of people and goods. Therefore, the Circulation Element does contain any policies related to waterborne travel.

2. Findings of Significance for Impact 4.18.D

GPA No. 960 will not adversely affect waterborne and rail travel and does, in fact, encourage future improvement of rail systems. Therefore, the impact is considered less than significant.

E. Would the project substantially increase hazards due to a design feature or incompatible uses?

Impact 4.18.E - Substantially Increase Hazards Due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses (e.g., Farm Equipment): Riverside County policies and design standards currently reflect state and federal rules, regulations and standards with respect to roadway design. Nothing proposed in GPA No. 960 would alter roadway design criteria. Several new policies will reinforce Riverside County's commitment to public safety in roadway design. Compliance with existing laws, rules and regulations would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.18.E

The analysis of this topic focuses on regulatory compliance to ensure that there are appropriate policies to address the safety of transportation users. GPA No. 960 provides several policies which directly touch on this issue of safety for transportation users as described below.

Policy C 3.4 allows Riverside County to use a variety of design techniques such as continuous flow intersections, provided that a detailed study has been completed showing that these facilities could improve safety. Policy C 3.23 directs Riverside County to consider the use of traffic calming techniques to improve safety in neighborhoods. Policy C 6.5 recommends the placement of access locations for properties to maximize safety.

2. Findings of Significance for Impact 4.18.E

GPA No. 960 will not adversely affect transportation safety. New policies proposed as part of GPA No. 960 encourage the use of design features to enhance public safety. Therefore, the impact is considered less than significant.

F. Would the project cause an effect upon or a need for new or altered maintenance of roads?

Impact 4.18.F - Cause an Effect Upon, or a Need for New or Altered Maintenance of Roads: Future development accommodated by GPA No. 960 would result in the construction of new roadways to service this growth. Compliance with existing laws, rules, regulations, policies and design standards would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.18.F

The analysis of this topic focuses on regulatory compliance to ensure that there are appropriate policies to address the maintenance of roads.

Three relevant policies, Policy C 3.1, C 3.2, and C 8.4, address the maintenance of roads. Policy C 8.4 describes the ongoing construction and maintenance projects through a multi-year Transportation Improvement Program (TIP). Additionally, a project identified under the TIP assesses whether demand levels justify the construction of the project which ensures roads are added to the county-maintained road system as they are needed. Other policies such as Policy C 3.7 and 3.8 focus on limiting heavy vehicle traffic to designated road systems to reduce the maintenance rate on other roads.

2. Findings of Significance for Impact 4.18.F

Although GPA No. 960 identifies the ultimate roadway network for Riverside County, actual construction of roads that would be accepted into the maintained system undergo a review process that identifies the timing of when roads are actually needed. This also includes ensuring that proper road maintenance is supported by the demand levels which contribute to maintenance revenue. This impact is, therefore, considered less than significant.

G. Would the project cause effect upon circulation effects during construction?

Impact 4.18.G - Cause an Effect Upon Circulation During the Project's Construction: No specific construction projects are proposed as a part of GPA No. 960. The amendment does, however, set the parameter for future construction of the General Plan network. Construction impacts will be evaluated and appropriate control measures enforced at the time of construction.

1. Analysis of Impact 4.18.G

The analysis of this topic focuses on regulatory compliance to ensure that there are appropriate policies to address the impacts of construction activities and traffic associated with GPA No. 960.

GPA No. 960 is a programmatic document and does not propose to construct any transportation facilities. Rather, it provides a framework with which subsequent plans and projects will be developed and processed. Similar to the Road Maintenance described above, according to Policy C 8.4 the County of Riverside prepares the TIP which establishes priorities and schedules the construction of Riverside County roadway projects. Policy C 20.6 and Policy C 20.15 address dust control and runoff during all stages of roadway construction. A project undergoes design and environmental review which provides a traffic control plan for the construction period of the project to maintain traffic circulation.

2. Findings of Significance for Impact 4.18.G

GPA No. 960 includes adequate policies to ensure construction-related impacts are reduced so that traffic circulation is maintained. This impact is, therefore, considered less than significant.

H. Would the project result in inadequate emergency vehicle access?

Impact 4.18.H - Result in Inadequate Emergency Access or Access to Nearby Uses: Current and proposed policies require provisions for adequate emergency access. Compliance with existing laws, rules, regulations, policies and design standards would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.18.H

The analysis of this topic focuses on regulatory compliance to ensure that there are appropriate policies to ensure adequacy of emergency vehicle access.

Policy C 3.24 requires Riverside County to provide a street network which ensures efficient routes by emergency vehicles. This policy also requires that the County of Riverside coordinate with the Fire Department and other emergency service providers during roadway planning and design efforts.

2. Findings of Significance for Impact 4.18.H

As discussed above, GPA No. 960 incorporates policies to ensure adequate emergency vehicle access. Therefore, this impact is considered less than significant.

I. Would the project conflict alternative modes of transportation?

Impact 4.18.I - Conflict with Adopted Policies, Plans or Programs Regarding Public Transit, Bikeways or Pedestrian Facilities, or Otherwise Substantially Decrease the Performance or Safety of Such Facilities: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, thus, increasing the demand for alternative modes of transportation. GPA No. 960 provides multiple policies which are intended to promote the provision of alternative transportation facilities. Compliance with existing and proposed policies would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.18.I

The analysis of this topic focuses on regulatory compliance to ensure that there are appropriate policies related to transit users, bicyclists, and pedestrians. GPA No. 960 provides multiple policies which are intended to promote the provision of active transportation facilities.

Policy C 1.2 addresses the need to provide a multi-modal transportation network that includes all modes of travel ranging from automobiles to pedestrians. Policy C 1.3 specifically addresses transit users by supporting the development of local and regional transit facilities. Additional transit patronage will also reduce vehicular travel, with a commensurate reduction in congestion.

Policy C 4.1 relates to the provision of pedestrian facilities within developments. Policy C 4.2 limits barriers to pedestrian travel. Policy C 4.6 states that the County of Riverside can require the development proposals provide pedestrian facilities as a condition of approval.

Facilities for bicyclists are addresses in policies such as C 16.1, which direct the County of Riverside to implement the proposed Trail System. Policy C 16.2 requires that the County of Riverside develop the supporting

infrastructure for the trails system including parking, signage, maps, and other related items. Policy C 17.1 directly addresses proposed bicycle facilities to be developed in GPA No. 960.

Regulatory compliance for this impact relates to existing General Plan policies and revised General Plan policies.

2. Findings of Significance for Impact 4.18.I

GPA No. 960 incorporates policies to ensure adequate transit, bicycle, and pedestrian facilities. Therefore, this impact is considered less than significant.

4.18.6 Significance After Mitigation for Transportation and Circulation

Development and implementation activities resulting from the proposed project, GPA No. 960, would be subject to a number of existing state and federal laws, General Plan policies, Riverside County ordinances; Transportation Department procedures, standards and individual project conditions of approval. Implementation of and compliance with these laws, rules, regulations, policies, standards and mitigation measures will ensure that significant impacts to the circulation system are either avoided or minimized. Compliance with existing laws will ensure resources are appropriately identified and protected. Compliance with existing and proposed General Plan policies will ensure that any future development activities appropriately identify any known significant circulation impacts and fully mitigate or avoid any impacts to the greatest extent possible.

However, as identified in Section 4.18.5, a significant and unavoidable impact would occur with implementation of GPA No. 960: Impact 4.18.A related to level of service transportation policies.

A. Effectiveness of Proposed General Plan Policies

The Circulation Element policies provide a framework for development and implementation of the proposed multi-modal transportation system envisioned by the proposed General Plan. However, even with the specific identified policies, numerous faculties will operate at an unacceptable LOS. This is primarily due to physical barriers that prevent an alternative roadway from being implemented, environmental constraints that limit the ability to widen roadways beyond what is identified in the Circulation Element, or roadway classifications that are consistent with regional planning efforts (even though they may not provide sufficient roadway capacity). In conjunction with the proposed General Plan policies, the following mitigation measures will be implemented.

B. Mitigation Measures

NEW **Mitigation Measure 4.18.1A-N1:** As part of its review of land development proposals, the County of Riverside shall require project proponents to make a "fair share" contribution to required intersection and/or roadway improvements. The required intersection and/or roadway improvements shall be based on maintaining the appropriate level of service (LOS D or better). The fair share contribution shall be based on the percentage of project-related traffic to the total future traffic.

NEW **Mitigation Measure 4.18.1B-N1:** As part of its review of land development proposals, the County of Riverside shall ensure sufficient right-of-way is reserved on critical roadways and at critical intersections to implement the approach lane geometrics necessary to provide the appropriate levels of services.

NEW **Mitigation Measure 4.18.1C-N1:** Where needed and where appropriate, the County of Riverside shall seek ways and means to increase the capacity of Circulation Element roadways by such measures as adding through travel lanes or additional turning lanes without increasing the right-of-way width requirement for the classification of the facility

NEW **Mitigation Measure 4.18.1D-N1:** Where needed and where appropriate, the County of Riverside shall collaborate with Caltrans and other appropriate agencies to add auxiliary and mainline lanes on the freeway system within available right of way.

NEW **Mitigation Measure 4.18.1E-N1:** The County of Riverside shall collaborate with Caltrans and other appropriate agencies to develop direct connections between the HOV/HOT lanes at the following freeway interchanges: I-15 at SR-91, SR-60 at SR-91/I-215 West junction, SR-60 at I-215 East junction and at other locations as needed. To the extent that such improvements may be possible within existing rights-of-way, environmental impacts would be less than significant.

NEW **Mitigation Measure 4.18.1F-N1:** Where appropriate, the County of Riverside shall collaborate with Caltrans and other appropriate agencies to develop HOV lanes along the entire length of I-215 within Riverside County and along I-10 between the San Bernardino County line and Indio.

C. Significance after Mitigation

Although the identified policies and measures will reduce the impacts of GPA No. 960, there are still numerous roadways that are not expected to operate at an acceptable level. *Also, due to the multijurisdictional nature of many some of the noted mitigation measures, such as New Mitigation Measures 4.18.1E-N1 and 4.18.1F-N1, the County cannot guarantee the development of HOV and HOT lanes as the interstates are under the purview of Caltrans.* As such, the identified significant impacts are considered significant and unavoidable and are subject to a finding of overriding consideration.

This page intentionally left blank.

Section 4.19

Water Resources

Section 4.19 Water Resources

4.19.1 Introduction

Ensuring reliable water resources to meet essential water demands and maintaining water quality are critical for the continued growth, health and prosperity of Riverside County's populace. Accordingly, the purpose of this EIR chapter is to provide information on Riverside County's water resources issues, with a particular focus on current and projected supplies in comparison to current and projected demands, and to highlight the potential effects of the proposed project, General Plan Amendment No. 960 (GPA No. 960), on water resources. The ultimate aim is to assist the County of Riverside in making land use decisions for this proposed General Plan Amendment in a manner that recognizes and accounts for the various factors affecting water resources and ensures the continued availability of a safe, sufficient and reliable water supply.

The existing environmental setting information in this chapter is presented in three parts: first, hydrology is described, then statewide and regional water supplies and, lastly, local water supplies are discussed. The regional information also includes a brief summary of information addressing recent environmental, legal and regulatory issues affecting water supply and demand. Further details are provided in Appendix EIR-8, along with a variety of other background information on water supply. The information and analyses regarding current and projected local water supplies and water demands are presented from the perspective of recent 2010 Urban Water Management Plans prepared by regional wholesale and local retail water agencies throughout Riverside County that provide water service to the areas affected by GPA No. 960. This discussion also addresses the areas of GPA No. 960 that are not currently within the boundaries of a water purveyor. Additionally, there is a section on project effects and, in the final section, potential environmental impacts to water resources are analyzed based on the information provided herein and in Appendix EIR-8.

Given the complexity of the task for a county that spans roughly 7,200 squares miles, multiple major watersheds and dozens of individual water districts and other water agencies, it should be remembered that this EIR chapter takes a programmatic approach suitable for the broad nature of the General Plan changes proposed under GPA No. 960. Further, as explained in greater detail below, since no specific land use development is proposed as part of GPA No. 960, the water supply assessment requirements of Senate Bill 610 (California Water Code [CWC] Section 10910 *et seq.*) and the written verification requirements of Senate Bill 221 (California Government Code [CGC] Section 66473.7) do not apply. Rather, in accordance with CGC Section 65302.2 and its related provisions, the water supply analysis for GPA No. 960 has been prepared by using and relying upon the information and analyses for current and projected supplies and demand developed by regional and local urban water suppliers in Riverside County under their recently adopted 2010 Urban Water Management Plans. Other current and relevant documentation, such as the California Water Plan Update 2009, various integrated regional water management plans and other regional and local water resource information, have also been referenced, utilized and relied upon in preparing this analysis.

The end result is a comprehensive, robust and candid evaluation that ensures Riverside County's decision-makers have all of the necessary current and relevant information at hand to understand the environmental and water-related consequences of their decisions and to provide a framework for implementing programmatic measures, if necessary, to reduce environmental impacts to water resources at the county level that may be associated with the proposed project in accordance with applicable CEQA standards.

A. Background

Historically, water supplies and water supply issues in California have been unique and variable. ~~Indeed, while California as a whole is not a 'water-short' state,~~ *Several* factors *relating to California's water supply* such as annual hydrology, distribution capabilities, competing demands and regulatory constraints have presented significant challenges. At the same time, however, these challenges have fostered new opportunities and innovative paths to more effective and efficient water use practices. Water supply planning in California has evolved to fit this ever-changing set of circumstances. As always, capture and storage of water in above-normal years for use in below-normal years is critical to statewide, regional and local water supply sufficiency. Similarly, adequate infrastructure, storage and conveyance facilities continue to be essential. Diversification is key when maximizing the treatment and use of recycled water, stormwater runoff and brackish, and other deteriorated sources, *as these* will play a vital role in local water supplies. Moreover, emerging technologies and evolving approaches to desalination suggest that the ocean will provide an increasing percentage of the state's water supply by the year 2030 and beyond. And recently, perhaps more than ever before, water conservation and demand management efforts are being developed and implemented, from both a legal and a lifestyle perspective, as a means of ensuring long-term water supply sufficiency while allowing statewide, regional and local growth to proceed along forecasted patterns to accommodate increases in California's population.

As set forth in greater detail below, wholesale and retail water agencies throughout Riverside County maintain and manage diversified water supply portfolios (imported supplies, local surface water supplies, groundwater, recycled water, desalinated supplies, etc.) The water supply and demand analyses undertaken by those agencies as part of their 2010 Urban Water Management Plans (UWMPs) are particularly current and constitute the best available information for use in preparing the water supply analysis for GPA No. 960, as those UWMPs have been recently prepared pursuant to the requirements of the Urban Water Management Planning Act (CWC Section 10610 *et seq.)* and the Water Conservation Act of 2009 (CWC Section 10608 *et seq.*), also referred to by its Senate bill identifier, SBX7-7. The information and analyses are based on long-term, 20-year projections and beyond, and specifically account for normal, single-dry and multiple-dry year periods. Indeed, the 2010 UWMP analyses fully recognize that California will experience variable hydrologic conditions, including multi-dry year periods, and they account for that variability in their projected supply forecasts.

Over the past three years, California developed drought conditions due to a lack of rain and snowfall. In 119 years of recorded history, 2013 was the driest year for the state of California. The launch of 2014 saw the longest stretch of winter with no rain ever recorded. In January 2014, Governor Edmund G. Brown Jr. declared a drought State of Emergency as conditions continue to worsen. On April 1, 2014, the California Department of Water Resources measured the statewide water content of snowpack at 32% of the average historical April 1 snowpack measurement. This figure is crucial, as this is when snowpack normally peaks and begins to melt into streams and reservoirs. On April 25, 2014, Governor Brown issued an executive order to speed up actions necessary to reduce harmful effects of the drought. During times of drought, vegetation is visibly dry, stream and river flows decline, water levels in lakes and reservoirs fall, and the depth to water in wells increases. As drought persists, long-term impacts can emerge such as groundwater level declines, land subsidence, increased wildfire risk and ecosystem damage.

The U.S. Drought Monitor depicts western Riverside County in Extreme Drought, central Riverside County in Severe Drought and Eastern Riverside County in Moderate Drought. As mentioned above, Riverside County maintains a diverse water supply portfolio,

which helps prepare for dry times. Reliance on groundwater increases during droughts usually occurs, due to a decreased availability on surface water. Water agencies also put drought contingency plans into place to help conserve water and prevent waste.

As detailed in later subsections, the UWMP analyses also include specific responses to potential water supply reductions, ranging from water supply allocation plans to ordinances that impose indoor and outdoor water budgets, tiered-rate structures, landscape efficiencies and other measures to achieve extraordinary conservation. These types of measures manage demand during dry periods while specifically allowing forecasted growth to occur. The UWMP analyses further show that it is common for the wholesale and retail water agencies in Riverside County to exceed the minimum analytical requirements and prepare their demand forecasts based on SCAG data, plus local economic studies and other demographic trends. This is a conservative approach, but it provides particularly relevant data for planning and environmental review purposes. As shown herein, the water demands associated with GPA No. 960 are part of demands that have been forecasted and accounted for by the relevant wholesale and retail agencies throughout Riverside County.

B. Project Summary and Focus

GPA No. 960 is a periodic update to the Riverside County General Plan to ensure the existence of a clear and consistent set of directions for implementing the Riverside County Vision for the next five to eight years and into the future. GPA No. 960 specifically includes Land Use Element changes, which involve elimination or implementation of study areas, policy areas and overlays, as well as changes in land use designations, which may allow for intensification or redistribution of land uses in certain areas.

Although GPA No. 960 is countywide in overall scope, the focus of its effects on water resources can be narrowed based on spatial factors. There is a focused range of items within GPA No. 960 with the potential to specifically affect future water usage. These revolve chiefly around the aspects of the project affecting land use and future build out within certain areas of Riverside County.

Accordingly, to determine the appropriate focus for this chapter, spatial analysis of potential water use areas was performed. Specific land use changes (for example, proposed changes to General Plan Land Use Designations [LUDs]) were identified and sorted geographically according to water provider, if any. In this way, it was determined that only a handful of the more than three dozen water providers in Riverside County would be directly affected by the land use-related items in GPA No. 960. Accordingly, this chapter focuses on the specific agencies and districts expected to see future land use changes as a result of the proposed project. A brief overview of the areas and water supply agencies affected by the land use-related changes under GPA No. 960 is provided in Table 4.19-A (Summary of Water and Sewer Providers Within Riverside County), below. This table identifies the water agencies in which a land use change having the potential to affect water demand is proposed. Additional information on these districts is provided in Section 4.19.4. Figure 4.19.1 (Water Districts Serving Western Riverside County) and Figure 4.19.2 (Water Districts Serving Eastern Riverside County) show the water supply agencies serving Riverside County.

Of the roughly 111,500 acres addressed directly by GPA No. 960, a total of approximately 5,000 acres are served by water supply agencies in western Riverside County and roughly 3,800 acres are served by water supply agencies in eastern Riverside County. Roughly 70,500 acres of the total are proposed land use changes in areas currently outside the water service boundaries of an existing water supply agency. However, aside from changes related to the Blythe Airport area, the majority of the proposed changes under GPA No. 960 for such out-of-agency areas are for extremely low-density (e.g., 1 home per 20 acres) rural residential uses, including the areas of reduced development potential within the Aguanga and Anza Rural Village Study Areas (6,100 acres and 71,000 acres, respectively). Lastly, over 22,000 acres of vacant (undeveloped) land would be designated as 'Open Space-Conservation' (OS-CH) under the proposed project to denote their acquisition for habitat conservation. These

conservation lands are not addressed as part of the water supply and demand analyses of this chapter, as no water supply or demand is associated with them.

Lastly, it should be noted that since this project proposal and EIR predate the incorporation of the cities of Jurupa Valley and Eastvale, project components within these two cities are included in this EIR analysis. Though the County of Riverside no longer has discretionary authority *over* ~~the lands now in these~~ *Jurupa Valley and Eastvale*, their inclusion in this document *provides* a more complete picture of the water supplies and resources affected by development within western Riverside County.

C. Background on Water Thresholds

Except as specifically noted, this water supply analysis for GPA No. 960 provides a programmatic level of review according to the standards set forth by CEQA. A program EIR is typically prepared for an agency plan, program or series of actions that can be characterized as one large project, such as a general plan. Under CEQA and its implementing regulations, 'tiering' refers to the concept of a multilevel approach to preparing environmental documents (State CEQA Guidelines, Sections 15152 and 15168). The water supply analysis provided herein is intended to be utilized as a 'first tier' document to evaluate the environmental impacts to water resources potentially resulting from the adoption of GPA No. 960 as an initial planning decision upon which subsequent, more specific land use decision making can be based in the future.

Accordingly, this water supply analysis does not necessarily address the specific potential impacts that may result from any of the future site/project-specific development proposals that may occur in areas affected by GPA No. 960. CEQA requires that subsequent development projects be evaluated for their particular site-specific impacts. Such site-specific analyses would be encompassed in 'second tier' documents, such as a project EIR, focused EIR or negative declaration to evaluate the potential environmental impacts of specifically defined projects to be proposed in accordance with the large-scale planning decisions adopted under GPA No. 960.

Thus, for purposes of this analysis and in accordance with the standards set forth by CEQA, significant impacts to water resources would result under the following scenarios:

1. Result in water supplies insufficient or unavailable to serve the project from existing entitlements and resources, or result in the need for new or expanded entitlements.

2. The project would substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted).

3. The project would substantially degrade water quality.

4. The project would violate any water quality standards or waste discharge requirements.

5. The project would exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board.

6. Result in a determination by a wastewater treatment provider which serves or may serve the project that it would not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

7. The project would require or result in the construction of new water or wastewater facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects.

8. The project would substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site.

9. The project would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

10. The project would require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

Table 4.19-A: Summary of Water and Sewer Providers Within Riverside County

Wholesale and Retail Water Entities	Local Supply			Imported Supply	Imported Water Supplier[1]	Waste-water		NOTES	Study Area[2]

Key: CR = Colorado River; MWC = Mutual Water Company; MWD = Municipal Water District; --- = Does not utilize; SWC = State Water Contractor; SWP = State Water Project; WD = Water Company; WD = Water District

Notes:

1. State Water Contractor (SWC).
2. Wholesale provider only. No retail water connections.
3. Wholesale provider and also retail provider.
4. Provides water treatment (pre-distribution).
5. Also receives water from EMWD.
6. Imports water from both EMWD and WMWD, and has direct connection to MWD.
7. City of Beaumont is served by Beaumont-Cherry Valley Water District.
8. Serves newly incorporated cities of Jurupa Valley and Eastvale.
9. Absorbed by WMWD in 2005.
10. Multi-county service area: serves portion of Riverside County in addition to San Bernardino County (except for CVWD which serves Riverside County plus a portion of Imperial County).
11. Provides 'groundwater management' duties according to LAFCO Municipal Service Review reports.
12. Non-potable water supplier only. No domestic water service.
13. The majority of this agency's purveyors are in San Bernardino County (and are not listed here). See Table 4.19-AH.
14. *Also provides groundwater management.*

Footnotes:

1. State Water Contractors and major wholesalers in bold. Sub-agencies not predominantly serving unincorporated Riverside County areas are denoted in *italics* immediately following their associated wholesale provider.
2. Diamond denotes water entity with project (GPA No. 960) land use changes identified within its service boundaries.

In light of the thresholds identified above, it is important to recognize that the California courts have provided specific guidance with respect to the requirements of a water supply analysis that is undertaken for a long-range development project or other long-range land use planning decision, such as a general plan update. In particular, the courts have drawn a clear distinction between long-term development projects and planning decisions, on the one hand, and short-term project-specific approvals, on the other hand. In drawing this distinction, the courts have consistently upheld the rule that far less water supply certainly is required at the early stages of planning and development in comparison to the higher degree of certainty that is required at the point of authorizing a specific land use entitlement, such as a tentative tract map.

In this regard, the California Supreme Court has stated: "Requiring certainty when a long-term, large-scale development project is initially approved would likely be unworkable, as it would require water planning to far outpace land use planning. Examination of other state statutes specifically addressing the coordination of land use and water planning supports our conclusion [that] CEQA should not be understood to require assurances of certainty regarding long-term future water supplies at an early phase of planning for large land development projects" (Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova, 2007, 40 Cal.4th 412, 432). The court further stated: "[T]he burden of identifying likely water sources for a project varies with the stage of project approval involved; the necessary degree of confidence involved for approval of a conceptual plan is much lower than for issuance of building permits." Indeed, it added, to "interpret CEQA itself as requiring such firm assurances of future water supplies at relatively early stages of the land use planning and approval process would put CEQA in tension with these more specific water planning statutes." In light of these rules, the court found that: "CEQA does not demand such certainty at the relatively early planning stage involved here…to satisfy CEQA, an EIR for a specific plan need not demonstrate certainty regarding the project's future water supplies." Without question these standards articulated by the Vineyard Court apply to water supply analyses prepared for purposes of the general planning process, as that stage of land use planning is even more preliminary than the specific plan stages of land use decision-making addressed by Vineyard.

In the more recent case of Watsonville Pilots Association v. City of Watsonville (2010, 183 Cal.App. 4th 1059), the EIR for the Watsonville Vista 2030 General Plan was challenged on various grounds, including water supply. Quoting from the Vineyard decision, the Court of Appeal in Watsonville Pilots upheld the water supply analysis on various grounds and determined that "[t]he burden of identifying likely water sources for a project varies with the state of project approval involved; the necessary degree of confidence involved for approval of a conceptual plan is much lower than for issuance of building permits." The EIR in that case acknowledged that water supply for the general plan area would be provided from an already overdrafted groundwater basin. The court found that the EIR contained considerable information and discussion of how the overdraft may be addressed in the future and stated: "It is not necessary for an EIR for a general plan to establish a likely source of water. Such a conceptual EIR need only adequately address the reasonably foreseeable impacts of supplying water to the project, note any uncertainties that preclude the identification of future water sources and discuss the reasonably foreseeable alternatives and environmental impacts of those alternatives."

The court held that the Final EIR satisfied this standard because it: identified the likely source of water for new development in the affected general plan area (groundwater); noted the unknown and variable factors related to the basin's overdraft condition; discussed the various measures that were being undertaken to address the long-term overdraft situation; and concluded that water demands resulting from the new development would be offset by conservation, conversion of agricultural lands to urban uses and other measures. As the Court of Appeal noted: "[T]he long-term overdraft problem will continue to be a concern regardless of the 2030 General Plan."

In another recent case, Sonoma County Water Coalition v. Sonoma County Water Agency (2010, 189 Cal.App.4th 33), the Court of Appeal upheld the legal sufficiency of a 2005 UWMP prepared by the Sonoma County Water

Agency. In that case, the court likened the long-range water supply planning function of an UWMP to the long-range development plan reviewed in Vineyard. Of particular relevance to the long-term water supply planning horizon analyzed in this EIR for purposes of GPA No. 960, the Court of Appeal reasoned: "[S]ome level of uncertainty is a permanent, inherent feature of modern water management. It arises from a wide range of scientific and legal regulatory factors that cannot be avoided. Water management is subject to the vagaries of climate, competing demands from agricultural, industrial and residential uses, environmental constraints and overlapping regulatory regimes at both the federal and state levels." The court also noted that for purposes of preparing a long-term water supply analysis there is an implicit legislative recognition that such planning and analysis "involves expectations and not certainties." While new or expanded water supply sources always have the possibility of not materializing, water agencies must have some ability to reasonably rely on planned future water projects and programs; a long-term water supply analysis is not required to assume or analyze contingencies upon contingencies for theoretical circumstances that might never arise.

Accordingly, these issues are taken up at the first tier level in this EIR; see Section 4.19.7 (Project Effects) and Section 4.19.8 (Impacts and Mitigation). The rest of this EIR chapter's sections, as well as the information included in Appendix EIR-8, serve as the basis for the conclusions made in these two aforementioned sections.

4.19.2 Existing Environmental Setting - Hydrology

A. Baseline, Data Sources and Documents Used

Pursuant to CEQA, the description of the physical environmental conditions provided in this EIR are as they existed on or about April 13, 2009, at the time the Notice of Preparation (NOP) was issued. This environmental setting will constitute the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant.

Because of the countywide scope and nature of this project and its programmatic EIR, as well as the nature of the project's water supplies and water resources, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence is used and a discussion of how it is or is not expected to differ from existing physical conditions is provided. It should be noted here that 'substantial evidence' refers to "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact" (Public Resources Code [PRC] Section 21080(e)(1)). Further, substantial evidence does not include "argument, speculation, unsubstantial opinion or narrative, evidence of social or economic impacts that do not contribute to, or are not cause by, physical impacts on the environment."

For the baseline data presented herein and as referenced in other sections of this chapter, the sources of information and analysis that were utilized and relied upon were each determined to be the best-supported and best available information. These sources of information and analyses generally represent the most recently adopted policies, plans, data and statistics for each subject matter and for each respective agency as they relate to GPA No. 960. The 2009 California Water Plan Update (CWP, herein) provides an accurate and appropriate baseline description of the prevailing water resource conditions for Riverside County, including those areas expected to be directly affected by GPA No. 960.

The CWP is published once every five years and constitutes a comprehensive policy and strategy document to address water related issues at a statewide level based on specific regional settings. See, e.g., CWC Section 10004(b)(1). The CWP update process offers a broad public forum to discuss various statewide strategies, including, but not limited to, those relating to the development of new water storage facilities, water conservation,

water recycling, desalination, conjunctive use and water transfers that may or may not be pursued to help meet future water needs of the State of California. The stated objectives of the CWP include expanding regional water management, using water more efficiently, protecting water quality and expanding environmental stewardship, reducing energy consumption, investing in new technology and improving flood management.

As set forth in further detail below, the 2009 CWP expressly endorses the water management activities being carried out by the regional wholesale and local retail water agencies that serve Riverside County, including the areas affected by GPA No. 960. For instance, the South Coast Regional Report section of the CWP states:

> *Wholesale and retail water agencies, groundwater agencies and watershed managers are working together to meet current and future demands of municipal, industrial, agricultural users and the environment, and sustain the region's economy. To achieve this they are planning and implementing large and diverse water supply and water quality projects and water use efficiency projects. Cooperation between agencies and organizations, and use of integrated resources planning have improved the flexibility and diversity of the region's water supplies.*

The Regional Report further recognizes: "The South Coast region implements to some extent nearly all of the resource management strategies in the Water Plan's Volume 2." The Colorado River Regional Report in the 2009 CWP indicates that:

> *The region is actively engaged in IRWM [Integrated Regional Water Management] planning efforts that empower stakeholders to develop integrated solutions and diversify water management portfolios to meet regional water management challenges. In combination with local and statewide planning, IRWM efforts serve a vital role to provide for sustainable water use, water quality and environmental functions.*

The information, analyses and conclusions contained in the Regional Reports that pertain to Riverside County and areas affected by GPA No. 960, in particular, are supported and confirmed by the comprehensive and more detailed sets of information and analyses contained in the 2010 UWMPs prepared by the wholesale and retail water supply agencies that serve the areas affected by GPA No. 960. These agencies, their UWMPs and applicable data are further discussed in the sections below, in Section 4.19.7 in particular, with supplementary information in Appendix EIR-8.

B. Hydrology

For planning, analytical and other specified purposes, the California Department of Water Resources (DWR) has organized the state into ten major surface water drainage regions, two of which (the South Coast region and the Colorado River region) include portions of Riverside County and encompass the areas affected by GPA No. 960. Detailed information and analyses have been prepared for these regions by DWR and that information is updated on an ongoing basis as part of the California Water Plan process.

Generally, the western one-third of Riverside County lies within the South Coast region, west of the San Jacinto Mountains, and the eastern two-thirds of Riverside County lie within the Colorado River region. Designated watershed areas are included within each region, several of which partially lie within Riverside County. Figure 4.19.3 (Major Watersheds Within Riverside County) shows the major watersheds as they fall within Riverside County. Additional information about the conditions existing in these watersheds, as set forth in the California Water Plan 2009 Update, is provided below. For the rest of this sub-section, unless otherwise noted, the information in the following discussion is derived from the 2009 CWP.

1. South Coast Hydrologic Region

The South Coast Hydrologic Region is California's most urbanized and populous region. As shown in Figure 4.19.4 (South Coast Hydrological Region), it encompasses 54% of the state's population and covers 11,000 square miles (7% of the state). It extends from the Pacific Ocean east to the Transverse and Peninsular Ranges, and from the Ventura-Santa Barbara county line south to the international border with Mexico. The region includes all of Orange County and portions of Ventura, Los Angeles, San Bernardino, Riverside and San Diego Counties. Topographically, most of the South Coast Hydrologic Region is composed of several large, undulating coastal and interior plains. Several prominent mountain ranges occur from its northern and eastern boundaries, including the San Gabriel and San Bernardino Mountains. Most of the region's rivers drain into the Pacific Ocean and many terminate in lagoons or wetland areas that serve as important coastal habitat. Many river segments on the coastal plain, however, have been concrete-lined or in other ways modified for flood control operations. The information presented here focuses on the Riverside County portion of the region to the extent practicable, which essentially includes all of western Riverside County (i.e., everything west of the San Gorgonio Pass and the San Jacinto Mountains).

The coastal and interior valleys of the South Coast Hydrologic Region feature Mediterranean climates characterized by mild, wet winters and warm, dry summers. Most (75%) of the region's precipitation falls between December and March, with varying averages. However, the region is marked by substantial climactic variability, with fluctuations in rainfall that can lead to periodic drought conditions. As an example, according to the State of California, the region experienced precipitation extremes between 2000 and 2005, with particularly dry conditions, roughly 30% of normal, occurring in 2002. Then in 2005, precipitation was above average, roughly 220-250% of normal.

Roughly 40% of the South Coast Hydrologic Region is developed with urban or suburban uses. Although agricultural land uses remain important in the region, such uses are increasingly giving way to urbanization. Of the total water supply to the region, more than half is used by native vegetation, evaporates to the atmosphere, is used for agricultural crops and managed wetlands, or flows to other states, the Pacific Ocean and salt sinks, like saline groundwater aquifers. The remaining portion, identified as consumptive use of applied water, is distributed among urban and agricultural uses, or diverted to managed wetlands. Water supply dedicated to environmental management in the region includes instream flows for fisheries, aquatic vegetation and water quality protection. As applied to Riverside County, this includes managed wetlands maintained through discharge of reclaimed water supplies, such as the Hemet/San Jacinto Multi-Purpose Constructed Wetlands and the San Jacinto Wildlife Area. There are also constructed wetlands behind Prado Dam.

a. Santa Ana Planning Area Watersheds

The Santa Ana Planning Area has experienced some of the most rapid urbanization in the state over the past 10 to 15 years, which has created numerous challenges in balancing growth with water supplies, flood protection and ecosystem preservation. The planning area consists of one major watershed, the Santa Ana River watershed, plus a few sub-watershed areas including the San Diego Creek subwatershed and the San Jacinto River subwatershed. Watershed-scale planning is provided by the Santa Ana Watershed Project Authority (SAWPA) Integrated Water Resources Management Plan (One Water One Watershed). This plan was supported by a number of subwatershed integrated plans, including the Central Orange County Integrated Regional and Coastal Watershed Management Plan, the North Orange County Integrated Regional and Coastal Watershed Management Plan, the Integrated Regional Management Plan for San Jacinto River Watershed, the Upper Santa Ana River Watershed Integrated Regional Water Management Plan and the Western Municipal Water District Integrated Regional Water Management Plan.

According to the CWP, the 2,800-mile Santa Ana River watershed is the largest coastal stream system in Southern California and spans parts of Los Angeles, Orange, San Bernardino and Riverside Counties. Approximately 400 square miles of the watershed are located in Riverside County. The Santa Ana River is the principle river in the watershed. Its headwaters are in the San Bernardino Mountains; it travels from there through the San Bernardino Valley, into Riverside County and through the coastal plains of Orange County, where it drains into the Pacific Ocean near the City of Newport Beach. Most of the river channel in Orange County has been altered for flood management purposes. Upstream, however, the river is in its natural state. Flows in the Santa Ana River are perennial and 'effluent dominated.' That is, without effluent discharges from area wastewater treatment plants into the river, surface flow within Riverside County would be rare during dry weather. A minimum flow to protect downstream water rights and groundwater recharge (measured at Prado Dam) is maintained through wastewater discharges to the Santa Ana River.

The watershed also contains several human-made water storage facilities, including Lake Perris, Lake Mathews and Big Bear Lake. Other flood control facilities along the river include Prado Dam and Seven Oaks Dam. Most of the watershed has both urban and agricultural land use activities. Generally, the northwest portion of Riverside County, north of the Santa Margarita River and west of the San Jacinto and San Bernardino Mountains, lies within the Santa Ana River watershed.

The 765-square mile San Jacinto River subwatershed is in western Riverside County and is a subwatershed to the Santa Ana River watershed. It extends from the San Bernardino National Forest in the San Jacinto Mountains to Lake Elsinore in the west. Flows in the San Jacinto River occasionally reach Canyon Lake and more rarely reach Lake Elsinore. Water from Lake Elsinore may discharge into Temescal Wash, which is a tributary of the Santa Ana River. In this way, the Santa Ana River watershed and the San Jacinto subwatershed are linked. The lower portion of the San Jacinto subwatershed is being urbanized while the upper portion is a mixture of high- and low-density urbanization, agriculture and undeveloped land. Within Riverside County, this area's surface water storage occurs in Lake Hemet, Canyon Lake, Lake Elsinore and (periodically) Mystic Lake.

Deep alluvial deposits make up the large groundwater basins in the Santa Ana River watershed, several of which are recharged by the Santa Ana River and its tributaries. The Riverside County portion of the Santa Ana River hydrologic unit contains a number of groundwater resources, as shown in Figure 4.19.14 (see Section 4.19-2.L for more information on groundwater). The San Jacinto River recharges a deep graben as it leaves the mountains and several other basins on its way to Lake Elsinore. (A 'graben' is a depressed block of land bordered by parallel faults. For more on this and other terms used in this chapter, see the water glossary included in Appendix EIR-8). Groundwater resources in the Riverside County portion of the San Jacinto River hydrologic unit include the Perris, San Jacinto and Elsinore Valley hydrologic areas, which are further discussed below in connection with the water supplies available to those areas (see Section 4.19-2.L).

The climate of the Santa Ana River watershed area is considered Mediterranean with dry summers and mild, wet winters. Average annual rainfall in the area is approximately 15 inches, with most of it falling between December and March. When rainfall in the region occurs over a period of only a few days, flooding can result. Major earthquake faults in the area include the San Andreas Fault and its large branches, the San Jacinto Fault and the Elsinore-Whittier Fault. The San Jacinto Fault splits off the San Andreas near San Bernardino and affects groundwater flows associated with both the Santa Ana and San Jacinto rivers. The Elsinore-Whittier Fault passes under Prado Dam. There are also many branching and parallel faults in the region.

b. San Diego Planning Area Watersheds

The San Diego Planning Area has nine major watersheds, including the Santa Margarita watershed which partially lies within Riverside County. The planning area includes one major watershed, the Santa Margarita River

watershed, plus a few sub-watershed areas within the Riverside County portion. The Santa Margarita River watershed totals approximately 750 square miles, of which approximately 560 square miles lie within southwestern Riverside County. This portion of the watershed drains the southern part of the Perris fault block and southern end of the Santa Ana Mountains. The Santa Margarita River is formed by the confluence of Murrieta and Temecula creeks. It empties into the Pacific Ocean near Camp Pendleton, north of Oceanside in San Diego County.

The primary surface water storage area within the Riverside County portion of this area is Vail Lake, while Lake Skinner and the Eastside Reservoir (i.e., Diamond Valley Lake) provide drinking water storage. The majority of the area's water supply is imported from the Colorado River with some water from Northern California via the State Water Project (SWP).

Groundwater basins in the Riverside County portion of the San Diego Planning Area watersheds are divided into the San Juan, Santa Margarita and San Luis Rey hydrologic units. Groundwater resources in the San Juan hydrologic unit within Riverside County include the Mission Viejo and San Mateo Canyon hydrologic areas. Groundwater resources within the Santa Margarita hydrologic unit include the Ysidora, DeLuz, Murrieta, Auld, Pechanga, Wilson, Cave Rocks, Aguana and Oak Grove hydrologic areas. Groundwater resources in the San Luis Rey hydrologic unit include the Monserate hydrologic area.

The climate in this area is considered mild. Precipitation varies widely in the Santa Margarita River watershed from 10 inches at the coast (in San Diego County) to more than 40 inches in the mountains of Riverside County. Surface runoff, with accompanying stream discharge, peaks significantly after storm events in the Santa Margarita River system and has caused significant flooding in the Murrieta and Temecula areas. Flows in some parts of the river are considered ephemeral in the absence of these significant storm events.

2. Colorado River Hydrologic Region

The Colorado River is the major watercourse in the American Southwest, spanning six states and reaching into Mexico. The river's headwaters originate as far north and east as Wyoming, Colorado and New Mexico. The Lower Colorado River basin, originating at Lake Powell on the border between Utah and Arizona, encompasses most of Arizona, as well as parts of New Mexico, Nevada and California. The River forms the boundary between California and Arizona from the southern tip of Nevada to Baja Mexico. It also forms the eastern-most boundary of the County of Riverside. Within Riverside County, the Colorado River basin extends from the eastern slopes of the San Bernardino and San Jacinto Mountains east to the state border. Figure 4.19.5 (Colorado River Hydrological Region) shows the Colorado River Hydrologic Region.

Over the years, a number of dams have been built along the Colorado River. The Palo Verde Divesion Dam occurs within the portion of the River edging Riverside County. Parker Dam to the north near Lake Havasu is the other primary dam upstream of the county segment and is also the origin point for the Colorado River Aqueduct, which runs west and south to its terminus at Lake Mathews in western Riverside County. From there, 156 miles of distribution lines, including eight tunnels, deliver water to member cities. Along the way, some of the water is diverted via the San Diego Canal, part of the San Diego Aqueduct that delivers water to San Diego County.

The Lower Colorado is navigable by moderate to large-sized craft, but it is not used for commercial navigation, such as shipping. The lower river from Davis Dam to Yuma, Arizona, however, is navigable by large paddlewheel boats and river barges. Most of the rest of the river and its lakes and reservoirs, excluding the rapids in the canyons, is navigable by small to moderate-sized river craft and power boats. As such, recreational pleasure craft are by far the predominant users of the river.

Figure 4.19.5

COLORADO RIVER HYDROLOGIC REGION

This page intentionally left blank

According to the U.S. Bureau of Reclamation, about 88% of the total annual flow of water in the Lower Colorado River basin originates in northern Arizona from the natural runoff of precipitation and snow melt in the mountains of Colorado, Utah and New Mexico. Once water enters the lower Colorado River mainstream, its use is subject to the 'Law of the River,' a collection of laws, regulations and agreements that dictate how and where Colorado River water is distributed. The Law of the River is further discussed below and more fully in Appendix EIR-8.

The CWP identifies three prominent watershed areas within Riverside County: the easternmost Imperial Reservoir watershed; the Salton Sea Transboundary watershed which is the westernmost basin and includes the Salton Sea, Coachella Valley and the eastern San Jacinto Mountains; and the Southern Mojave watershed, which lies between the two. See Figures 4.19.3, 4.19.4 and 4.19.5.

A distinctive geographical feature of the region, the Salton Trough is a structural extension of the Gulf of California. The trough encompasses Coachella and Imperial valleys, with the Salton Sea lying between the two in the lowest part of the area. The Salton Sea was formed most recently by an overflow of the Colorado River between 1905 and 1907, and is California's largest inland body of water. The Sea's water supplies come from drainage of agricultural irrigation return water and stormwater runoff, in addition to treated and untreated municipal and industrial wastewater.

The Sea also features the Sonny Bono Salton Sea National Wildlife Refuge, an important wetland area, particularly for migratory birds. Because the Sea's drainage is internal (i.e., no outlet to the ocean), salts tend to concentrate in its water and excess nutrients build up, leading to algal blooms and, at times, fish kill-offs due to low dissolved oxygen levels in the water.

Geologically, ancient streams preceding the Colorado River laid down deep alluvial deposits of silt, clay and sand. Later, the Coachella and Imperial valleys were created when the Colorado River formed a delta, isolating the Salton Trough from the Gulf of California. At various times, the Trough has contained lakes, further depositing silt and organic matter into the soils. For these reasons, parts of the region, such as the Palo Verde Mesa, feature rich deposits of fertile soils suitable for agricultural uses. Development near the Colorado River includes the agricultural areas of the Palo Verde and Bard valleys, as well as the City of Blythe. Scattered mining operations also occur in the area. The sediments in the groundwater basins of this region are generally weakly consolidated to consolidated. The San Andreas Fault cuts across the region bordering the northeast side of the Salton Trough. The Borrego Valley is formed by the San Jacinto Fault. Valleys, mountains and dry lakes are oriented by the major fault systems. These systems also influence groundwater flow.

According to the CWP, the nearly all of the region's water comes from the Colorado River, with the Colorado Aqueduct and All American Canal (to the south, near the Mexico border) carrying nearly all of the region's water inflow. The New River also contributes a minor amount (3%) of inflow from Mexico into the watershed. Water from the Colorado River supplies both wholesale and retail domestic water purveyors, as well as irrigation districts. As mentioned earlier, the Colorado River is also a key source of imported water for the South Coast Hydrologic Region. MWD imports water from this source via the 242-mile Colorado River Aqueduct (CRA) and a regional conveyance system. See Figure 4.19.10 for a general schematic of the state's water conveyance infrastructure, including the CRA.

As with nearly all of Southern California, water use from the Colorado River is facing growing challenges in terms of allocations amongst competing entities, as well as water quality, climate change, drought stresses and other environmental issues. Water demands in the Colorado River region are met through a combination of imported surface water, supplies from the Colorado River, local groundwater basins (wells) and recycled water supplies. The CWP reports that Colorado River supplies meet either all or most of the agricultural and urban water

demands in the Imperial, Coachella and Bard valleys. The Palo Verde Irrigation District (PVID), for example, supplies water to agricultural users directly from the river. The recently concrete-lined Coachella Valley Canal transports river water into the Coachella Valley for agricultural and some urban uses. In remote areas of the desert without existing infrastructure, water supplies generally depend on self-supplied groundwater, e.g., private wells.

Within the region overall, agriculture accounts for the majority of the region's land uses and water use. In Riverside County, the region's agriculture is concentrated in the Palo Verde and Coachella valleys. Most of the region's urban uses are concentrated in the Coachella Valley, which has undergone tremendous growth in the last two decades. Scattered urban areas also occur elsewhere throughout the region. In recent years, land fallowing programs, in addition to economic conditions, have affected the region's totals for planted and harvested croplands. In the Palo Verde Valley, land fallowing programs are a result of an agreement between PVID and MWD, with PVID swapping its excess (conserved) water with MWD. The Imperial Irrigation District (IID) is also fallowing ground to meet Salton Sea mitigation conditions pursuant to the Quantification Settlement Agreement (QSA). See Section 4.19.3, as well as Appendix EIR-8, for more information on the QSA.

According to the CWP, in 2005 the Colorado River Hydrologic Region used 3.42 million acre-feet (AF) of water from the Colorado River, 429,000 AF of groundwater (normally about 7.5%), 134,000 AF from SWP, 6,000 AF of surface supplies and 7,000 AF of recycled water supplies. As the region has no direct connection to the SWP, supplies from Northern California are obtained through an exchange agreement between the Coachella Valley Water District (CVWD), the Desert Water Agency (DWA) and MWD. Combined SWP allocations for the CVWD and DWA are released by MWD from its Colorado River Aqueduct into the Whitewater River. These releases recharge the upper groundwater basin of the Coachella Valley and are later pumped by the region's providers.

Most of the Colorado River Hydrologic Region has a subtropical desert climate with hot summers and short, mild winters. The San Jacinto and San Bernardino Mountain ranges create a rainshadow effect, with most of the region's rainfall occurring on the western sides of the ranges, contributing to the arid desert conditions within the Colorado River Hydrologic Region. According to the CWP, annual rainfall amounts range between a little over 6 inches to less than 3 inches, with most of the precipitation occurring in the winter and spring. Monsoonal thunderstorms fed by subtropical air from the south, do occur in the summer and can generate significant rainfall in some years. The mountain ranges also experience higher annual rainfall amounts and milder summer temperatures. Within the Colorado River region, the minimum daily average temperature runs between 23-54 degrees Fahrenheit and the maximum daily average temperature runs between 48-81 degrees.

Since 1999, the Colorado River watershed has been experiencing drier than normal conditions. The CWP reports annual maximum and minimum temperatures were slightly higher than long-term averages between 2000 and 2005. Precipitation amounts were generally below average between 2000 and 2003, with 2002 being extremely dry, and rainfall totals were above average for 2005.

a. West Basin of the Colorado River Watershed

The West Basin, on the Coachella Valley half of eastern Riverside County, is divided into six planning areas, all but two of which drain into the Salton Trough. This area is the driest in California with very little rain. Most of the precipitation that falls evaporates or is used by vegetation during evapotranspiration. Hence, the area is characterized mainly by ephemeral streams which contain water only for short periods after thunderstorm events in the summer and, rarely, in the winter. The few perennial streams in the western half of the watershed are predominantly fed by agricultural runoff and are also used by local communities as a water supply.

Water sources are scarce in this area. Surface water is a minor source of supply and groundwater supplies, though more substantial than in the East Basin, cannot fully meet total demands. Thus, water is imported from the Colorado River to fulfill demands. Irrigation needs in the Coachella Valley are met almost exclusively by this imported supply. Historical groundwater production in the Coachella Valley led to overdraft conditions; extensive groundwater recharge efforts are currently being undertaken by the Coachella Valley Water District, which recharges groundwater basins with Colorado River water via spreading basins.

b. East Basin of the Colorado River Watershed

The East Basin is a 200-mile long strip of land with an east-west width of up to 40 miles in the easternmost portion of San Bernardino, Riverside and Imperial Counties. Its boundaries are the Nevada state line, the Colorado River, Mexico and the California stream drainage area tributary to the Colorado River. The Californian streams are bound by surrounding desert peaks of up to approximately 4,000 feet elevation. The area includes the Palo Verde and Bard valleys.

Winters in this basin are mild and summers hot. Precipitation is 3 to 4 inches annually with half coming from summer thunderstorms and the other half from mild winter storms. All drainage is to the Colorado River except for a small portion which flows into the Colorado River Aqueduct via MWD's Gene Wash and Copper Basin Reservoirs. Irrigation and domestic water are provided by the Colorado River, with only about 1% of demands being met with groundwater.

Groundwater is generally unconfined in the watershed's basins with sediments up to 700 feet in depth. Approximately 10,000 AF of precipitation percolates to the groundwater table annually. The combined total groundwater storage of the East Colorado River basin is found at a depth of at least 200 feet and is approximately 35 million AF, with approximately 20% stored within Riverside County. The groundwater basin in this area is the Colorado Hydrologic Unit.

C. Water Quality Within the Hydrological Regions

1. Water Quality in the South Coast Hydrologic Region

Water quality is a core issue in the South Coast Hydrologic Region. Population and economic growth not only affect water demand, but add contamination challenges from increases in wastewater and industrial discharges, urban runoff, agricultural chemical usage and livestock operations. Urban and agricultural runoff can contribute to local surface water sediment from disturbed areas. Oil, grease and toxic chemicals from automobiles, nutrients and pesticides from turf and crop management, viruses and bacteria from failing septic systems and animal waste, road salts and heavy metals all threaten local water supplies and quality. Three areas that are receiving intense interest are nonpoint source (NPS) pollution control, salinity management and emerging contaminants.

Surface and groundwater salinity is an ongoing challenge for South Coast water supply agencies. Higher levels of treatment are needed following long-range import of water supplies because the level of total dissolved solids (TDS), essentially, a measure of a water's 'saltiness,' increases during conveyance (as water evaporates, any salts present become more concentrated). Chemical and microbial constituents that have not historically been considered as contaminants are increasingly present in the environment due to municipal, agricultural and industrial wastewater sources and pathways. Established and emerging contaminants of concern to the region's drinking water supplies include pharmaceuticals and personal care products, disinfection byproducts, chemicals associated with rocket fuel, such as perchlorate and nitrosodimethylamine, naturally-occurring chemicals, such as

arsenic, chemicals associated with industrial processes, such as hexavalent chromium and methyl tertiary butyl ether (MTBE), a gasoline additive.

In the Santa Ana Planning Area watersheds within Riverside County, one of the most pressing water quality issues is the buildup of dissolved minerals, or salts, in the ground and surface waters. TDS and nitrogen levels in the area must meet the water quality objectives set by the Santa Ana RWQCB to protect beneficial uses of the ground and surface waters. Meeting those regulatory standards will continue to be a pressing challenge and priority for the RWQCB, water purveyors and parties that discharge to the protected waters. Among other factors, increased TDS and nitrates can be attributed to use of imported water supplies, evaporation or evapotranspiration, reduced return flows, fertilizers, dairy operations, municipal and industrial wastewater and utilization of recycled water supplies. One of the principal causes of the mineralization problem in the region is irrigated agriculture, particularly citrus, which in the past required large applications of water, resulting in large losses due to evaporation. TDS and nitrate concentrations are increased both by this reduction in volume of water and the addition of minerals through direct application of salts (e.g., fertilizers for example). As further discussed below, several desalter facilities, which help remove salts from the groundwater and produce a usable supply, are either in operation or planned for the region. These include the existing Arlington, Chino Basin, Riverside/Colton, Temescal and Menifee desalters.

Groundwater contamination is another water quality concern in the region. For example, the Stringfellow Acid Pits Federal Superfund site is located approximately 9 miles northwest of downtown Riverside. From 1956 to 1972, it was used as a hazardous waste disposal facility, where industrial wastes, primarily from metal finishing, electroplating and pesticide production were deposited in evaporation ponds. In 1969, excessive rainfall caused the ponds to overflow and contaminate Pyrite Creek. Cleanup of the site has removed approximately 6.3 million gallons of waste, yet groundwater in the area still contains volatile organic compounds (VOCs) and heavy metals. A groundwater treatment system and other clean-up efforts are gradually reducing the risk of further contamination to the surrounding area, restoring beneficial uses to the nearby ground and surface water sources.

In the San Diego Planning Area watershed of Riverside County, water quality within the Santa Margarita River watershed has been affected by non-point source runoff associated with suburban development. While programs to control point and non-point source pollution are being implemented, rapid development in the Temecula and Murrieta areas has increased stormwater runoff and will continue to present challenges to maintaining water quality standards established by the RWQCB. Using highly saline Colorado River water and recycled water for irrigation may present additional water quality concerns for the region.

2. Water Quality in the Colorado River Hydrologic Region

Water quality concerns exist in all watersheds of the Colorado River Hydrologic Region. The highest priority water quality issues, those with regional importance according to the CWP, include: the need for surface water quality monitoring, the quality of imported water, the need for onsite treatment systems, nitrate levels, leaking underground storage tanks and impacts from animal feed lots and dairy operations. The Salton Sea is a particular challenge for the region. It is the largest body of water in the region, but it has a TDS concentration of about 46,000 milligrams per liter (mg/L), which is about 40% saltier than ocean water, according to the CWP.

In the West Basin of the Colorado River watershed, the primary water quality issues are increasing salinity of the Colorado River and historic overdraft conditions in the Coachella Valley. The salinity of the Colorado River can substantially limit the reuse of irrigation runoff or recycled water supplies. As a practical matter, high salinity can increase agricultural costs by necessitating larger quantities of water to dilute the root zone and can increase urban costs by requiring higher levels of recycled water treatment to allow for reuse in irrigation and groundwater recharge projects.

The Salton Sea is a substantial water quality concern. With no natural outlet and a drainage area of approximately 7,500 square miles, it acts as a natural salt sink for the surrounding area. The Salton Sea's replenishment is generally from irrigation runoff and occasionally from storm runoff. Thus, to the extent the quality of irrigation or stormwater runoff declines, so does the water quality condition of the Salton Sea. According to the CWP, the salinity of the Salton Sea is currently above 40,000 mg/L TDS and is rising. Fish that live in the Sea may not be able to survive and reproduce in water that is above 45,000 mg/L TDS. The salinity of the Sea is projected to rise 1-2% per year if no salinity control measures are taken. Selenium from agricultural return flows is also a water quality concern in the Salton Sea, along with other chemicals found in agricultural runoff, such as nitrate and pesticides. Many options for water quality management of the Salton Sea, including those proposed for the Quantification Settlement Agreement (discussed below) are under investigation.

Water quality concerns in the East Basin of the Colorado River watershed are mostly related to the increasing salinity of Colorado River supplies, as the river is the major source of water supply to the area. As with the West Basin, high salinity can increase agricultural costs by requiring larger quantities of water to dilute salts building up in plants' root zones and can increase urban costs by requiring higher levels of recycled water treatment to allow for reuse in irrigation and groundwater recharge projects.

In some parts of the region, water quality issues, particularly salt levels (TDS), make groundwater unsuitable for potable water use. The Coachella Valley Storm Water Channel, which stretches from near Indio to the Salton Sea, does not meet federal water quality standards due to elevated pathogen levels. Leaching of septic systems into groundwater is also a major concern, particularly for areas that rely predominantly on groundwater. Perchlorate levels, salinity and the outfall of untreated wastewater into surface waters are also of concern for the region. See Section 4.19.5, as well as Appendix EIR-8, for additional information on water quality issues.

D. Stormwater, Wastewater and Urban Runoff

In California, the Porter-Cologne Water Quality Control Act is the preeminent law addressing water quality. Per this act (CWC Section 13050(d)), 'waste' is broadly defined to include sewage, all other waste of human or animal origin associated with human habitation, as well as that from any producing, manufacturing or processing operations. In contrast, 'urban runoff' is defined by the State of California to include those discharges from residential, commercial, industrial and construction areas, but excludes discharges from (unimproved) open space, feedlots, dairies, farms and agricultural fields. Urban runoff discharges consist of stormwater and non-stormwater surface runoff for drainage sub-areas with various, often mixed, land uses within all of the hydrologic drainage areas that discharge into Waters of the U.S. Urban runoff also does not include background pollutant loads or naturally occurring flows. 'Stormwater' is simply water that originates from a precipitation or snow event (i.e., rain, hail, sleet or snowfall). When it does not soak into the ground, it becomes 'surface runoff' and either flows directly into surface waterways or is channeled into storm sewers, which themselves eventually discharge to surface waters.

1. Regulatory Background

The State Water Resources Control Board ('State Board') in California has exclusive jurisdiction over wastewater as well as ultimate authority over state water quality policy. Nine Regional Water Quality Control Boards (RWQCBs) oversee water quality at the more local levels – three cover parts of Riverside County (see below).

The federal Clean Water Act (CWA) established a national policy designed to help maintain and restore the physical, chemical and biological integrity of the nation's waters. In 1972, the CWA established the National Pollutant Discharge Elimination System (NPDES) permit program to regulate the discharge of pollutants from

point sources to 'Waters of the U.S.' From 1972 to 1987, the main focus of the NPDES program was to regulate conventional pollutant sources such as sewage treatment plants and industrial facilities. As a result, on a nationwide basis, non-point sources, including agricultural runoff and urban runoff, now contribute a larger portion of many kinds of pollutants than the more thoroughly regulated sewage treatment plants and industrial facilities.

The National Urban Runoff Program (NURP) final report to the Congress (USEPA, 1983) concluded that the goals of the CWA could not be achieved without addressing Urban Runoff discharges. Thus in 1987, CWA amendments established a framework for regulating Urban Runoff. Pursuant to these amendments, the state's RWQCBs began regulating discharges from municipal separate storm sewer systems ('MS4s') in 1990.

In addition to these federal standards, the State of California's Porter-Cologne Act also regulates the discharging of waste without regard to the source of the pollutant or waste (CWC Section 13263). The CWA NPDES program requires point-source dischargers, including dischargers of stormwater associated with industrial and construction activities to obtain permits to ensure their compliance with strict water quality standards. Municipal operations, such as MS4s, are also addressed by both state and federal regulations.

Orders from the RWQCBs establish the area-wide NPDES MS4 Permit for their respective permit areas in accordance with Section 402 (p) of the CWA and all requirements applicable to an NPDES permit issued under the issuing authority's discretionary authority. The requirements included in the Order are consistent with the CWA, the federal regulations governing urban stormwater discharges, the Water Quality Control Plan for the respective basins (Basin Plans, e.g., Santa Ana River Basin, Upper Santa Margarita River Basin, Whitewater River Basin), the California Water Code and the State Board's plans and policies.

The basin plan is the basis for the RWQCB's regulatory programs and is developed in accordance with relevant federal and state law and regulation, including the CWA and the Water Code. As required, basin plans designate the 'beneficial uses' of the waters of the region and specify water quality objectives intended to protect them. (Beneficial uses and water quality objectives together with an anti-degradation policy, comprise a federal water quality standard.) The basin plan also specifies an implementation plan, which includes certain discharge prohibitions. If available, a basin plan will include pollutant water quality objectives for specified management zones, management strategies applicable to both surface and ground waters and various total maximum daily loads (TMDLs), as well as TMDL Implementation Plans that had been adopted for the 'impaired waterbodies' within the region.

Accordingly, the County of Riverside operates MS4s under three permits issues by the three RWQCBs with jurisdiction over portions of Riverside County. The Whitewater River watershed is within the Colorado River Hydrologic Region. The other two watersheds are part of the South Coast Hydrologic Region. The areas covered by each of these three permits are shown in Figure 4.19.6 (Whitewater River Region MS4 Permit Area), Figure 4.19.7 (Santa Ana River Region MS4 Permit Area) and Figure 4.19.8 (Santa Margarita River Region MS4 Permit Area), below. See also Section 4.19.5.B for more information.

- **Region 7, Colorado River RWQCB:** Oversees the Whitewater River region (watershed); MS4 Permit No. ~~R7-2008-001~~ *R7-2013-0011*, NPDES Permit No. ~~CAS617702~~ *CAS617002*, for which the Riverside County Flood Control and Water Conservation District (FWCD) and County of Riverside itself are co-principal permittees, with nine municipalities plus the Coachella Valley Water District as co-permittees.

- **Region 8, Santa Ana River RWQCB:** Oversees the Santa Ana River region (watershed), MS4 Permit No. R8-2010-0033, NPDES Permit No. CAS601833, for which FCWCD is the principal permittee and the County of Riverside plus 13 municipalities are co-permittees.

- **Region 9, San Diego RWQCB:** Oversees the Upper Santa Margarita region (watershed), MS4 Permit No. R9-2010-0016, NPDES Permit No. CAS0108766, for which FCWCD is the principal permittee and the County of Riverside plus the cities of Menifee and Temecula are co-permittees.

Areas of Riverside County excluded or not addressed by the stormwater regulations and areas not under jurisdiction of the permittees were excluded from the areas covered by the MS4 Permits. These include the following areas and activities:

- Federal lands and state properties, including, but not limited to, military bases, national forests, hospitals, highways, colleges and universities.
- Native American tribal lands.
- Open space (undeveloped) and rural (non-urbanized areas).
- Agricultural lands (return flows from irrigated agriculture and non-point source agricultural activities are exempted under the CWA).
- Utilities, railroads and special districts (including school districts, park districts, publicly-owned treatment works and water utilities, etc.).

The RWQCBs recognize that the permittees should not be held responsible for discharges from such facilities or pollutants in those discharges. However, to the extent that the permittees authorize the connection of the discharges from these facilities into their MS4s, the MS4 permits require the permittees to notify these facilities in writing of the state and local post-construction standards and other applicable requirements of the MS4 permits.

As water flows over streets, parking lots, construction sites and industrial, commercial, residential and municipal areas, it may intercept pollutants from these areas and transport them to Waters of the U.S. Urban runoff may contain pathogens, sediment, trash, fertilizers, oxygen-demanding substances, pesticides, heavy metals and petroleum products. If not properly managed and controlled, urbanization may adversely impact water quality and quantity in the receiving waters.

Studies conducted in the Southern California area have established stormwater runoff from urban areas as significant sources of pollutants in surface waters. If not properly controlled, urban runoff could be a significant source of pollutants in the Waters of the U.S. Table 4.19-B (Pollutant Sources and Effects on Waters of the United States) lists the major pollutants, their potential sources and some of the adverse environmental consequences mostly resulting from urbanization.

2. Impaired Waterbodies in Riverside County

In general, Section 303(d) of the federal Clean Water Act (CWA) requires each state to establish Total Maximum Daily Loads (TMDLs) for waters for which certain effluent limitations are not stringent enough to achieve applicable water quality standards. (A TMDL is the maximum amount of a pollutant that a waterbody can assimilate while still meeting water quality standards.) In its 2005 manual, "California Impaired Waters Guidance," CalWater notes that the State Board's TMDL program was created to implement the CWA and State of California's minimum water quality standards to achieve clean water "where traditional controls...have proven inadequate."

Accordingly, each RQWCB routinely monitors and assesses the quality of the waters under their jurisdiction per CWA Section 303(b). If this assessment indicates that beneficial uses are not met, then the waterbody must be listed under Section 303(d) of the CWA as an impaired waterbody. In preparing its impaired waterbodies list, the State Board and Regional Water Quality Control Boards assess water quality data for California's waters every two years to determine if they contain pollutants at levels that exceed protective water quality criteria and standards. In October 2011, the USEPA issued its final decision regarding the water bodies and pollutants identified in California's 2010 303(d) list.

From the State of California's most recent (2010) Integrated Report (on CWA Section 303(d) Water Quality-Limited Segments), the waterbodies that occur in Riverside County are indicated in Table 4.19-C (Impaired Waterbodies in Riverside County), below, along with information on the applicable pollutants and TMDLs, as applicable. The beneficial uses of waterbodies, including impaired ones, addressed under Riverside County's three MS4 permits are addressed in Table 4.19-D (Beneficial Uses of Select Waterbodies in Riverside County). Water quality pollutants in general are summarized in Table 4.19-B.

3. Watershed Characteristics

The background provided here comes from Riverside County's Drainage Area Management Plan (DAMP) which addresses both the Santa Ana River and Santa Margarita River regions pursuant to the MS4 permits for these regions. The information on the Whitewater River region comes directly from the MS4 permit (order) for that region. See below for additional information on these permits and plans.

a. Santa Ana Region Watershed

(1) Physiography and Geology

The Santa Ana River (SAR) watershed represents one of nine major California watershed systems between Santa Barbara and the US-Mexico Border at Tijuana. The SAR is located in the Peninsular Ranges and Transverse Ranges Geomorphic Provinces of Southern California. The highest elevations (upper reaches) of the Riverside County region of the watershed occur in the San Bernardino Mountains (San Gorgonio Peak with elevation 11,485 feet) and in the San Jacinto Mountains (Peninsular Ranges Province, Mt. San Jacinto with elevation 10,804 feet). The primary slope direction is northeast to southwest, with secondary slopes controlled by local topography.

Table 4.19-B: Pollutant Sources and Effects on Waters of the United States

Pollutants	Sources	Effects and Trends
Toxins (e.g., biocides, PCBs, trace metals, heavy metals)	Industrial and municipal wastewater; runoff from farms, forests, urban areas, and landfills; erosion of contaminated soils and sediments; vessels; atmospheric deposition	Poison and cause disease and reproductive failure; fat-soluble toxins may bioconcentrate, particularly in birds and mammals, and pose human health risks. Inputs into Waters of the U.S. have declined, but remaining inputs and contaminated sediments in urban and industrial areas pose threats to life.
Pesticides (DDT, diazinon, chlorpyrifos)	Urban runoff, agricultural runoff, commercial, industrial, residential and farm use	The use of legacy pesticides (DDT, chlordane, dieldrin) has been banned or restricted; still persists in the environment; some of the other pesticide uses are curtailed or restricted.
Biostimulants (organic wastes, plant nutrients)	Sewage and industrial wastes; runoff from farms and urban areas; nitrogen from combustion of fossil fuels	Organic wastes overload bottom habitats and deplete oxygen; nutrient inputs stimulate algal blooms (some harmful), which reduce water clarity and alter food chains supporting fisheries. While organic waste loading has decreased, nutrient loading has increased.

Pollutants	Sources	Effects and Trends
Petroleum Products (oil, grease, petroleum hydrocarbons, PAHs)	Urban runoff and atmospheric deposition from land activities; accidental spills; oil and gas production activities; natural seepage; and PAHs from internal combustion engines	Petroleum hydrocarbons can affect bottom organisms and larvae; spills affect birds, mammals and aquatic life. While oil pollution from accidental spills and production activities has decreased, diffuse inputs from land-based activities have not.
Radioactive Isotopes	Atmospheric fallout, industrial and military activities	Bioaccumulation may pose human health risks where contamination is heavy.
Sediments	Erosion from farming, construction activities, forestry, mining, development; river diversions; coastal dredging and mining	Reduce water clarity and change bottom habitats; carry toxins and nutrients; clog fish gills and interfere with respiration in aquatic fauna. Sediment delivery by many rivers has decreased, but sedimentation poses problems in some areas.
Plastics and Other Debris	Ships, boats, fishing nets, containers, trash, urban runoff	Entangles aquatic life or is ingested; degrades lake shores, beaches, near shore habitats and wetlands. Floatables (from trash) are an aesthetic nuisance and can be a substrate for algae and insect vectors.
Thermal (heat)	Cooling water from power plants and industry, urban runoff from impervious surfaces	Kills some temperature-sensitive species; and displaces others. Generally, less a risk to marine life than thought 20 years ago.
Noise	Vessel propulsion, sonar, seismic prospecting, low-frequency sound used in defense and research	May disturb marine mammals and other organisms that use sound for communication.
Pathogens (bacteria, protozoa, viruses)	Sewage, urban runoff, livestock, wildlife and discharges from boats and cruise ships.	Pose health risks to swimmers and consumers of aquatic life. Sanitation has improved, but standards have been raised.
Alien Species	Ships and ballast water, fishery stocking, aquarists	Displace native species, introduce new diseases; growing worldwide problem.

As is true for much of California, the geology of the SAR is defined and created by seismic activity. The dominant structural feature is the San Andreas fault zone, which trends in a southeast-northwest direction at the base of the San Bernardino Mountains. The major fault structures in the SAR include the San Jacinto fault zone and the Elsinore fault zone; the San Jacinto Mountains are caused by motion from both the San Andreas and San Jacinto zones. The area between the San Jacinto zone and the Elsinore Zones is a down-dropped block that is partly in-filled with sediments from the surrounding mountains.

There are too many geologic units in the SAR to describe separately, but the predominant features are intrusive rocks of the Southern California batholith (granitic and andesitic rocks) that have been uplifted/eroded to form the mountain ranges, alluvial/fluvial sediments (materials eroded from the mountains and deposited in the basins) and semi-consolidated sedimentary units.

Table 4.19-D: Beneficial Uses of Select Waterbodies in Riverside County

Waterbody[1]	Hydraulic Unit	Beneficial Uses *(see key below)*
Santa Ana River Watershed (Santa Ana RWQCB - Region 8)		
Upper Santa Ana River		
Santa Ana River, Reach 3*	801.21, 801.25, 801.27	AGR, GWR, REC1, REC2, WARM, WILD, RARE, SPWN
Santa Ana River, Reach 4*	801.27, 801.44	GWR, REC1, REC2, WARM, WILD, SPWN
Temescal Creek, Reach 1*	801.25	REC1, REC2, WARM, WILD
Temescal Creek, Reach 2	801.32, 801.25	INTERMIT – AGR, IND, GWR, REC1, REC2, LWARM
Temescal Creek, Reach 3	*See Lee Lake*	
Temescal Creek, Reach 4	801.34	RARE, INTERMIT – AGR, GWR, REC1, REC2, WARM, WILD
Temescal Creek, Reach 5	801.35	AGR, GWR, REC1, REC2, WARM, WILD, RARE

Cucamonga Creek, Reach 1	801.21	GWR, REC1, REC2, LWARM, WILD
San Jacinto River		
San Jacinto River, Reaches 1 and 6	802.31, 802.32, 802.21	INTERMIT – MUN, AGR, GWR, REC1, REC2, WARM, WILD
San Jacinto River, Reaches 3, 4 and 5	802.11, 802.14, 802.21	INTERMIT - AGR, GWR, REC1, REC2, WARM, WILD
San Jacinto River, Reach 2	*See Canyon Lake*	
San Jacinto River, Reach 7	802.21	MUN, AGR, GWR, REC1, REC2, COLD, WILD
Bautista Creek	802.21, 802.23	MUN, AGR, GWR, REC1, REC2, COLD, WILD
Strawberry Creek	802.21	MUN, AGR, GWR, REC1, REC2, COLD, WILD
Fuller Mill Creek	802.22	MUN, AGR, GWR, REC1, REC2, COLD, WILD
Stone Creek	802.21	MUN, AGR, GWR, REC1, REC2, COLD, WILD
Salt Creek	802.12	INTERMIT - REC1, REC2, WARM, WILD
Logan, Black Mountain, Juaro Canyon, Indian, Hurkey, Poppet, Potrero Creeks and Tributaries	802.21, 802.22	INTERMIT – MUN, AGR, GWR, REC1, REC2, WARM, WILD
Lakes in the Santa Ana Region		
Lake Elsinore*	802.31	REC1, REC2, WARM, WILD
Canyon Lake*	802.11	MUN, AGR, GWR, REC1, REC2, WARM, WILD
Lake Hemet	802.22	MUN, AGR, GWR, POW, REC1, REC2, WARM, COLD, WILD, SPWN
Lake Fulmor*	802.21	MUN, AGR, REC1, REC2, WARM, COLD, WILD
Lake Perris	802.11	MUN, AGR, IND, PROC, GWR, REC1, REC2, COMM, WARM, COLD, WILD
Lake Evans	801.27	REC1, REC2, WARM, COLD, WILD
Lake Mathews	801.33	MUN, AGR, GWR, REC1, REC2, COLD, WARM, WILD
Lee Lake	801.34	MUN, AGR, IND, PROC, GWR, REC1, REC2, WARM, WILD, RARE
Mockingbird Reservoir	801.26	AGR, REC1, REC2, WARM, WILD
Santa Margarita Watershed (San Diego RWQCB - Region 9)		
De Luz Creek*	902.21	MUN, AGR, IND, REC1, REC2, WARM, COLD, RARE, WILD, SPWN
Long Canyon*	902.32	MUN, AGR, IND, PROC, REC1, REC2, WARM, COLD, WILD, SPWN
Murrieta Creek*	902.31, 902.32, 902.52	MUN, AGR, IND, PROC, GWR, REC1(P), REC2, WARM, WILD
Santa Margarita River (Upper) *	902.21, 902.22	MUN, AGR, IND, REC1, REC2, WARM, COLD, WILD, RARE
Temecula Creek*	902.51, 902.52, 902.81, 902.83, 902.91, 902.92	MUN, AGR, IND, PROC, GWR, REC1(P), REC2, WARM, WILD
Whitewater River Watershed (Colorado River RWQCB - Region 7)		
Coachella Valley Stormwater Channel[2]*	719.47	FRESH, GWR, REC1[3], REC2[3], WARM, WILD, RARE
Little Morongo Creek	719.10	MUN, AGR, GWR, REC1, REC2, WARM, WILD

Waterbody[1]	Hydraulic Unit	Beneficial Uses *(see key below)*
Palm Canyon Creek	719.43	MUN, AGR, GWR, REC1, REC2, WARM, WILD
San Gorgonio River	719.30	MUN, AGR, GWR, REC1, REC2, COLD, WILD
Tahquitz Creek	719.47	MUN, GWR, REC1, REC2, COLD, WILD
Whitewater River[4]	719.00	MUN, AGR, GWR, REC1, REC2, INTERMIT - WARM, COLD, WILD, POW
Washes[5] (Ephemeral Streams)	719.00	MUN, AGR, GWR, REC1, REC2, WARM, WILD

KEY: Existing beneficial use designations:

AGR: agricultural supply
AQUA: aquaculture (fish farms)
COLD: cold freshwater habitat
FRSH: freshwater replenishment
GWR: groundwater recharge
IND: industrial service supply
INTERMIT: intermittent use
LWARM: limited warm freshwater habitat
(P) Potential
MUN: municipal and domestic supply
POW: hydropower generation
RARE: rare, threatened or endangered species
REC1: water-contact recreation
REC2: non-contact water recreation
SPWN: spawning, reproduction and development waters
WARM: warm freshwater habitat
WILD: wildlife habitat

Footnotes:

1. Asterisk (*) marks waterbodies listed as impaired on the 2010 Final Integrated Report/California CWA Section 303(d) List of Water Quality Limited Segments. See Table 4.19-C for more information.
2. Applies to the section of perennial flow from approximately Indio (Dillon Road) to the Salton Sea.
3. Unauthorized use.
4. Includes the section of flow from the headwaters in the San Gorgonio Mountains to (and including) the Whitewater recharge basins near Indian Avenue crossing in Palm Springs.
5. Washes – Intermittent or Ephemeral Streams, including the section of ephemeral flow in the Whitewater River and the CVSC from Indian Avenue to approximately 0.5 mile west of Monroe Street crossing.

(2) Surface Water

As the SAR is arid, there is little natural perennial surface water. Surface waters start in the upper erosion zone of the watershed - primarily the San Bernardino, Santa Ana and San Jacinto Mountains. This upper zone has the highest gradient and soils/geology that do not allow large quantities of percolation of surface water into the ground. Flows consist mainly of snowmelt and storm runoff from the lightly developed San Bernardino National Forest.

From the City of San Bernardino to the City of Riverside, the Santa Ana River flows perennially, mostly due to treated discharges from wastewater treatment plants. From the City of Riverside to Prado Dam, the flow in the Santa Ana River consists of highly treated wastewater and groundwater discharges, potable water transfers, irrigation runoff, groundwater forced to the surface by shallow/rising bedrock and minor amounts of urban runoff. Urban runoff provides a proportionately greater contribution to the flow of the river during significant storm events.

Lake Elsinore is the only natural freshwater lake of any size in the SAR. A variety of water storage reservoirs (e.g., Lake Perris, Canyon Lake, and Lake Mathews) and flood control areas (Prado Dam area) have been created to hold surface water in Riverside County.

The San Jacinto watershed is part of the southernmost portion of the Santa Ana watershed. It is tributary to the Santa Ana River through Lake Elsinore and Temescal Wash. The 780-square mile watershed includes 18.1 square miles regulated by Lake Perris and Pigeon Pass dam. Major tributaries include Bautista Creek, Poppet Creek, Potrero Creek, Perris Valley Drain and Salt Creek.

The San Jacinto watershed is bounded by two strike-slip fault zones: the San Jacinto fault zone to the northeast and Elsinore fault zone to the southwest. The San Jacinto Valley is among the most seismically active of the major

strike-slip fault zones in Southern California and also the site of rapid subsidence (20 mm per year) due to tectonic activity and groundwater withdrawal. The rapid rate of subsidence has resulted in the formation of a strike-slip *graben* ('pull-apart basin') that has developed along parallel fault strands in the fault zone. The Elsinore fault zone is also a strike-slip fault zone and subsidence along the fault formed Lake Elsinore. Due to the large amount of flood storage available in Lake Elsinore, flows from the San Jacinto River rarely reach the Santa Ana River.

Lake Elsinore and Canyon Lake are located at the terminus of the San Jacinto River watershed in southwestern Riverside County. Lake Elsinore is one of the few natural lakes in Southern California. It was formed in a geologically active graben area and has been in existence over thousands of years. Due to the Mediterranean climate and watershed hydrology, lake level fluctuations in Lake Elsinore have been extreme, with alternate periods of a dry lakebed and extreme flooding. These drought/flood cycles have a great impact on lake water quality. Fish kills and excessive algal blooms have been reported in Lake Elsinore since the early 20th century. As a result, in 1994, the Santa Ana RWQCB placed Lake Elsinore on the CWA Section 303(d) list of impaired waters due to excessive levels of nutrients.

Canyon Lake, located approximately five miles upstream of Lake Elsinore, was formed by the construction of Railroad Canyon dam in 1928. Approximately 735 square miles of the 780-square mile San Jacinto River watershed drains to Canyon Lake. Only during wet or moderately wet years does Canyon Lake overflow to Lake Elsinore; during most years, runoff from the watershed terminates at Canyon Lake without reaching Lake Elsinore, resulting in the buildup of nutrients in Canyon Lake. While Canyon Lake does not have as severe an eutrophication problem as Lake Elsinore, there have been periods of algal blooms. In 1998, the RWQCB added Canyon Lake to the CWA Section 303(d) list of impaired waters due to eutrophication.

The high subsidence rate of the San Jacinto valley along the fault zone has resulted in a closed depression that periodically fills with water to form the ephemeral Mystic Lake. In very wet years, the surface area of Mystic Lake can expand up to 4,000 acres. The San Jacinto River makes a 90-degree turn and flows southwest at Mystic Lake. The very low river gradient westward from Mystic Lake forms a broad fluvial plain. The San Jacinto River then flows through the narrow Railroad Canyon, Canyon Lake and exits the Perris Block into the lower Elsinore basin created by the Elsinore fault zone.

One-fifth of Riverside County drains into waterbodies within the Santa Ana River. Surface waterbodies receiving these flows include Canyon Lake, Lake Perris, Lake Elsinore, Lake Hemet, Lee Lake, Lake Mathews and Mockingbird Reservoir. Major rivers and streams in the watershed include the Santa Ana River, Temescal Creek, Temecula Creek, Day Creek, the San Jacinto River, San Timoteo Creek, Little San Gorgonio Creek and a number of streams in the San Jacinto Mountains, including Bautista Creek, Hurkey Creek, Strawberry Creek, etc. See Table 4.19-C for full list of drainages.

As shown in Table 4.19-D, beneficial uses of these surface water bodies include: municipal and domestic supply, agricultural supply, industrial service supply, industrial process supply, groundwater recharge, water contact recreation, non-contact water recreation, warm freshwater habitat, cold freshwater habitat, wildlife habitat, and preservation of rare and endangered species. The ultimate goal of the DAMP is to protect the beneficial uses of the receiving waters from impacts related to urban runoff.

(3) Municipal Separate Storm Sewer Systems

The MS4 facilities operated by FCWCD in the SAR consist of an estimated 75 miles of underground storm drains and 59 miles of open channels. The MS4 facilities operated by the co-permittees include approximately 395 miles of underground storm drains and 65 miles of open channels. (See below for full details on MS4 permits.)

(4) Current Water Quality Issues

Urban runoff discharged to MS4s in Riverside County ultimately flow to various surface water bodies (inland streams, lakes and reservoirs) and typically carries pollutants that originate from numerous dispersed and uncontrolled sources. Examples of pollutants that may be present in urban runoff are fertilizer, heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals and litter.

Because the SAR is large and has many land uses, the water quality concerns in sub-watersheds vary. However, each land use can potentially contribute pollutants to nearby streams, rivers and lakes. The infrastructure that supports people's activities (e.g., roads, parks, MS4, and wastewater collection and treatment facilities) may contribute to water quality concerns if not properly managed. Other sources of stormwater runoff, including agricultural areas, are exempt from the requirements of the NPDES permitting program established under the CWA. In addition, some pollutants, such as total suspended solids, may be found at elevated levels in runoff from non-urban land uses. Further, certain activities that generate pollutants present in urban runoff are beyond the ability of the permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities and leaching of naturally occurring minerals from local geography.

Some receiving waters in the SAR (for example, Reaches 3 and 4 of the Santa Ana River, Cucamonga Creek and Mill Creek) are identified as impaired due to causes such as nutrients (nitrogen and/or phosphorus), pathogens (including coliform), sediment and unknown toxicity. See Table 4.19-C for full list. The Santa Ana RWQCB has also identified receiving waters that require additional monitoring to improve the quantity and/or quality of data used to develop the Section 303(d) list. Currently, some receiving waters within the SAR have been designated as needing additional monitoring data for parameters such as metals (aluminum, copper, silver, and zinc), salinity, chlorides or TDS.

(5) Total Maximum Daily Loads

Lake Elsinore: According to the Lake Elsinore and Canyon Lake Nutrient Total Maximum Daily Loads (TMDLs) staff report, prepared by the Santa Ana RWQCB (dated May 21, 2004), Lake Elsinore and Canyon Lake are located at the terminus of the San Jacinto River watershed in southwestern Riverside County. The entire San Jacinto River watershed encompasses 780 square miles. Lake Elsinore is one of the few natural lakes in Southern California. It was formed in a geologically active graben area and has been in existence over thousands of years. Due to the Mediterranean climate and watershed hydrology, lake level fluctuations in Lake Elsinore have been extreme with periods of dry lake bed during some drought cycles. These drought cycles have a great impact on lake water quality.

Fish kills and excessive algae blooms have been reported in Lake Elsinore since the early 20th century. As a result, the RWQCB placed Lake Elsinore on the 1994 Section 303(d) list of impaired waters due to excessive levels of nutrients. In December 2004 a nutrient TMDL was established for Lake Elsinore and Canyon Lake. Stormwater and non-storm water discharges from septic systems, agriculture, dairy, urban, forested and open space lands, as well as in-lake sediments, have been identified as potential sources of impairment.

Canyon Lake: According to the Lake Elsinore and Canyon Lake Nutrient Total Maximum Daily Loads staff report, prepared by the Santa Ana RWQCB (revised 5/21/04), Canyon Lake, located approximately five miles upstream of Lake Elsinore, was formed by the construction of Railroad Canyon dam in 1928. Approximately 735 square miles of the 780-square mile San Jacinto River watershed drains to Canyon Lake. Only in wet years does Canyon Lake overflow to Lake Elsinore; during most years, runoff from the watershed terminates at Canyon Lake without reaching Lake Elsinore, resulting in the buildup of nutrients in Canyon Lake.

While Canyon Lake does not have as severe an eutrophication problem as does Lake Elsinore, the RWQCB believes there have been periods of algal blooms and occasional fish kills. The RWQCB added Canyon Lake to the 1998 CWA 303(d) list of impaired waters due to eutrophication. Stormwater and non-storm water discharges from septic systems, agriculture, dairy, urban, forested and open space lands have been identified as potential sources of impairment. In December 2004 a nutrient TMDL was established for Lake Elsinore and Canyon Lake.

Santa Ana River, Reach 3 (Middle Santa Ana River): According to Santa Ana RWQCB Resolution R8-2005-001, the Santa Ana River Reach 3 watershed covers approximately 488 square miles and lies largely in the southwest corner of San Bernardino County and the northwestern corner of Riverside County. A small part of Los Angeles County (Pomona/Claremont area) is also included.

Several waterbodies within, and including the Middle Santa Ana River, have been listed for pathogen indicator impairments. These waterbodies include Middle Santa Ana River, Chino Creek Reaches 1 and 2, Mill Creek (Prado Area), Cucamonga Creek Reach 1, and Prado Park Lake. The Santa Ana RWQCB placed these waterbodies on the 1998 Section 303(d) list of impaired waterbodies for pathogen indicators. In 2005, the RWQCB adopted a pathogen indicator TMDL for these same waterbodies. Potential sources of the impairment include stormwater and non-storm water discharges from agricultural lands, dairy lands, urban lands, failed septic systems, open space areas, forested lands and natural background sources. Recreational use of these waterbodies may also serve as a source of pathogens.

b. Santa Margarita Region Watershed

The Santa Margarita River (SMR) watershed represents one of nine major California watershed systems between Santa Barbara and the US-Mexico Border at Tijuana. The basin includes a watershed area of 746 square miles, ranking it as a moderately large system among coastal drainages. Physiographically, the basin is split into a mountainous highland (upper drainage basin) and broad, flat topped sea terrace (coastal drainage basin). The boundary between the upper drainage basin and the coastal drainage basin transitions at the county line between Riverside and San Diego Counties.

The Upper Santa Margarita watershed includes two major basins, drained by Temecula and Murrieta Creeks. Over 50% of the Santa Margarita River watershed has been controlled by the construction of Vail Dam in 1949 and Skinner Reservoir in 1974, which created significant storage capacity in the upper watershed. Due to this storage capacity, peak flow rates during major flow events for both existing and future land use conditions will be lower than under natural conditions (assuming average storage conditions in the reservoirs). Temecula Creek has a drainage area of 366 square miles, with steep rugged topography in the Palomar and Thomas Mountain areas and rolling hills below. The upper 316 square miles of this basin is controlled by Vail Lake (completed in 1949). Murrieta Creek has a drainage area of 222 square miles, with over 50 square miles controlled by Skinner Reservoir (completed in 1974). Although the watershed area is somewhat smaller and less rugged than the Temecula Basin, flood flows have the potential to create greater damage as they flow through the cities of Temecula and Murrieta.

Temecula and Murrieta creeks join along the Elsinore fault zone at the head of Temecula Canyon to form the Santa Margarita River. The Temecula Canyon is approximately five miles long and is a steep, narrow and rocky canyon. The San Diego-Riverside County line crosses through Temecula Canyon. From here, the river traverses 27 miles through San Diego County to the Pacific Ocean.

(1) Urbanization Patterns

Additionally, within the SMR, approximately 155 square miles are owned by the federal government (28%) and not under the control of the permittees. Although runoff from these areas may be discharged into the MS4 owned and operated by the permittees, the permittees do not have direct or indirect authority over these areas.

In 1956, only 0.3% of the SMR (less than two square miles) was urbanized. Almost half a century later, even with a significant rate of growth in population relative to the state and neighboring counties, 94% of the SMR remains in non-urban land uses (rural residential, agriculture, preserves and open space, state lands, federal lands and tribal lands). Further, almost one-third of the SMR consists of federal, state and tribal lands that are not under the jurisdiction of the permittees' MS4 programs. Assuming that the urbanized area increases proportional to population, 92% of the SMR would remain in non-urban land uses in 2010. Much of the remaining lands will ultimately be incorporated into the Western Riverside County Multi-Species Habitat Conservation Plan (MSHCP). The MSHCP requires the ongoing conservation of 500,000 acres within Riverside County, a large portion of which are in the SMR.

(2) Hydrology

The upper drainage basin is formed almost solely by Murrieta Creek. Murrieta Creek is a major tributary of the greater 750-square-mile Santa Margarita River watershed. This watershed consists of three major portions; the Murrieta Creek sub-watershed to the north, Temecula Creek sub-watershed to the southeast and Santa Margarita River to the southwest.

The watershed currently contains three major water storage reservoirs: Lake Skinner and the recently completed Diamond Valley Reservoir, which are both part of the Murrieta Creek sub-watershed, and Vail Lake, which is part of the Temecula Creek sub-watershed. These reservoirs control over 50% of the Santa Margarita watershed. Runoff entering the reservoirs is initially stored. Excess flows (depending on available storage volume) are discharged downstream. The combined reservoirs have a substantial storage capacity capable of significantly reducing downstream flows from the natural condition.

(3) Physiography and Geology

Murrieta Creek flows between two lengthy strands of the Elsinore fault zone on land that has been downdropped, relatively, by the faulting. Murrieta Creek flows southeasterly from the Wildomar area through the cities of Murrieta and Temecula to the confluence with Temecula Creek. It courses through the Elsinore trough at an average elevation of 1,100 feet above sea level. The lower 12.5 miles of Murrieta Creek drops in elevation 200 feet from an elevation of 1,200 feet. Physiographic features to the southwest include the Santa Rosa Plateau and the foothills of the Elsinore and Santa Ana Mountains which rise as much as 2,200 feet above Murrieta Creek. Land to the northeast of the creek consists of rolling hills and valleys which rise much less abruptly and are known as the 'Perris block,' a structural geologic feature that has been uplifted relative to the creek. Over the first 1.5 miles northeast of the creek, these rolling hills rise gradually to about 300 feet above the creek. Ultimately, they reach as much as 1,025 feet above the creek.

Geologically, the Upper Santa Margarita watershed may originally have been a part of the Santa Ana River drainage system with the ancestral Temecula-Murrieta Creek flowing westward through Lake Elsinore. Over geologic time, the Santa Margarita River eroded the coastal mountain ridge headward sufficiently to 'capture' the ancestral stream and eventually reverse the direction of Murrieta Creek. These processes are continuing due to

continued down-faulting and soils conditions, leading to significant natural erosion and sedimentation processes along the SMR.

(4) Surface Water

Murrieta and Temecula creeks are perennial interrupted streams, that is, they include reaches in which the flow is continuous and others where flow is ephemeral. The areas of perennial flow are located in mountain area tributaries. The perennial flows disappear by seeping into the sands and gravels and resurfacing upstream of the confluence of Murrieta and Temecula creeks. The creeks in the urbanized areas of the watershed, located primarily in the valley, are ephemeral and flows are observed only during and immediately after significant storm events. During major storms, after initial wetting, periods of intense rainfall result in rapid increases in stream flow in steep foothill and mountain areas. Runoff in streams in the watershed is derived primarily from rainfall and as a result, stream flow exhibits monthly and seasonal variations similar to those shown by the precipitation records. Absence of snow pack in the tributary watershed results in a rapid decrease in stream flow at the conclusion of the winter precipitation season. Following severe storms, discharge in the larger streams often increases in a few hours' time from practically no flow to a rate of thousands of cubic feet per second. Stream flows vary greatly from month to month and from season to season.

Rising groundwater is currently observed in Murrieta Creek below its confluence with the Santa Gertrudis Channel. This is consistent with the observations with the rising groundwater conditions observed by the State of California in 1956. Rising groundwater is also observed in Temecula Creek approximately one-quarter mile upstream of the Interstate 15 bridge. In 1956, rising groundwater was observed as far upstream as the Highway 74 bridge. Based on the virtual absence of non-stormwater flows and the rising groundwater conditions in lower Murrieta and Temecula creeks observed prior to development of the watershed, there is no evidence that the rising groundwater is due to urban runoff or that urban runoff has affected the quality of rising groundwater. However, use and disposal of reclaimed water, and agricultural and landscape irrigation in the watershed may affect groundwater quality. Until October 2002, the Rancho California Water District augmented the flow of the Santa Margarita River with reclaimed water at a point about five miles upstream from the Temecula gage station. Since that time, the Rancho California Water District has discharged imported water downstream of the confluence of Murrieta and Temecula creeks.

For the average annual event, it is estimated that approximately 89% of the volume of runoff in the SMR is due to non-urban land uses not regulated under the federal stormwater program. For the 100-year 24-hour event, 93% of the volume of runoff would be due to non-urban land uses. These estimates are based on the assumption that precipitation is constant across the watershed. However, precipitation (and resultant runoff volumes) in the non-urbanized upland areas is as much as four times greater than that from the urbanized valley areas.

Approximately 8% of Riverside County drains into surface waterbodies within the SMR. These inland surface waters include the Santa Margarita River, Murrieta Creek, Warm Springs Creek, Diamond Valley Reservoir, Santa Gertrudis Creek, Tucalota Creek, Lake Skinner, Temecula Creek, Vail Lake, Wilson Creek, Cahuilla Creek, Pechanga Creek and DeLuz Creek. See Table 4.19-C for full list.

The beneficial uses of these inland surface water bodies include: municipal and domestic supply, agricultural supply, industrial service supply, industrial process supply, groundwater recharge, water contact recreation, non-contact water recreation, warm freshwater habitat, cold freshwater habitat, wildlife habitat, and preservation of rare and endangered species.

(6) Municipal Separate Storm Sewer System

MS4 facilities operated by the permittees in the SMR consist of an estimated 145 miles of major MS4 facilities (e.g., storm drains, channels, retention basins, etc.). Each SMR permittee maintains a labeled map of their entire MS4 and the associated drainage areas.

(7) Current Water Quality Concerns and Issues

Urban runoff discharged to MS4s in Riverside County ultimately flows to various surface water bodies (inland streams, lakes, and reservoirs) and typically carries pollutants that originate from numerous dispersed and uncontrolled sources. Examples of pollutants that may be present in Urban runoff are fertilizer, heavy metals, nutrients, petroleum products, sediment, bacteria, chemicals and litter.

Because the SMR is large and has many land uses, the water quality concerns in sub-watersheds vary. However, each land use can potentially contribute pollutants to nearby streams, rivers and lakes. The infrastructure that supports people's activities (e.g., roads, parks, MS4, and wastewater collection and treatment facilities) may contribute to water quality concerns if not properly managed. Other sources of stormwater runoff, including agricultural areas, are exempt from the requirements of the NPDES permitting program established under the CWA. In addition, some pollutants, such as total suspended solids, may be found at elevated levels in runoff from non-urban land uses. Further, certain activities that generate pollutants in urban runoff are beyond the ability of the permittees to eliminate. Examples include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear, residues from lawful application of pesticides, nutrient runoff from agricultural activities and leaching of naturally occurring minerals from local geography.

Some receiving waters in the SMR (for example, Murrieta Creek and the Upper Santa Margarita River) are identified as impaired due to phosphorus. See Table 4.19-C. The San Diego RWQCB has also identified receiving waters that require additional monitoring to improve the quantity and/or quality of data used to develop the Section 303(d) list. Currently, some receiving waters within the SMR have been designated as needing additional monitoring data for parameters such as metals (iron, manganese), TDS, sediment or sulfates. No TMDLs have been established for receiving waters in the SMR.

c. Whitewater River Watershed

The Whitewater River region lies within the Whitewater River Hydrologic Unit of the California desert and is that river's major drainage course. Several distinct characteristics make this area unique relative to other MS4 regulated entities. There is perennial flow in the surrounding mountains, but because of diversions and percolation into the basin, this perennial flow infiltrates in the Whitewater River prior to reaching the urbanized area of the Coachella Valley.

The Coachella Valley Stormwater Channel (CVSC) is the constructed downstream extension of the Whitewater River channel starting near Indio. It serves as a drainage way for irrigation return flows, treated community wastewater and urban runoff. The Coachella Valley Water District (CVWD) operates and maintains the CVSC and the regional subsurface drainage collection system for the Coachella Valley. General information from CVWD 2006-07 Annual Review and Water Quality Report states approximately 245,900 AF of water was provided for irrigation.

(1) Climate

Precipitation in the Whitewater River region is typically only 3.6 inches per year in the urbanized areas of the Coachella Valley. In addition to the overall lack of precipitation in the Whitewater River region, there is no defined rainy (wet) season within the watershed; winter storms may occur during late fall and early winter months. However, the General Industrial Storm Water Permit defines the rainy season to be between October 1st and May 31st.

Commonly, winter storms result from moisture-laden air from extra-tropical cyclones. Winter storms tend to be low intensity storms that cover large areas of the Whitewater River watershed. The Whitewater River region is also subject to summer thunderstorms, common from July through September. These summer storm events occur when moist and unstable air is subject to convective lifting. Summer thunderstorms tend to be highly localized and commonly result in high intensity precipitation. Finally, the region is also subject to rare summer storms, which normally occur from July to September. These storms are the result of moisture-laden air originating over the Gulf of Mexico or the South Pacific Ocean. These storms can result in heavy precipitation and last several days.

(2) Urbanization Patterns

Although portions of the watershed are experiencing rapid growth, only 3.5% of the watershed is comprised of urban (residential, commercial and industrial) land uses. Non-urban land uses, including rural residential, agriculture and open space constitute the majority of the land uses. Assuming that the urbanized area of the watershed increases proportionally to population, 96% of the watershed would remain in non-urban land uses in 2010. Also, over half (57%) of the watershed consists of federal, state and tribal lands that are not under the jurisdiction of the permittees.

(3) Hydrology

Non-storm urban runoff discharges to the receiving waters in the Whitewater River region are relatively minor based on flow volume due to natural soils conditions and permittees' requirements that new development infiltrate urban runoff. The soils in the Whitewater River region consist primarily of sands that promote rapid infiltration of runoff. During most years, perennial mountain streams tributary to the Whitewater River infiltrate or evapotranspirate prior to reaching urbanized areas.

The CVSC has been identified as impaired for pathogens in that portion from Dillon Road to the Salton Sea and for toxaphene in that portion from Lincoln Street to the Salton Sea. Thus, further monitoring must be conducted to adequately characterize the impacts of non-storm water urban runoff discharges into the receiving waters.

The City of Banning, although included as a permittee on Riverside County's MS4 Permit, does not share an interconnected MS4 with the remainder of the permittees. The MS4 operated by the City of Banning discharges directly into the San Gorgonio River, a receiving water. Most MS4 discharges from Banning infiltrate (e.g., drain into the ground). During significant runoff events, storm drainage may flow as far as the CVWD infiltration basins near the City of Palm Springs, which are several miles upstream of urban runoff discharges from the MS4s operated by the other permittees. However, the City of Banning is included in this MS4 Permit to facilitate coordination with the regional programs implemented by the permittees and to reduce the administrative duties on the RWQCB.

Similarly, the City of Desert Hot Springs also does not share an interconnected MS4 with the remainder of the permittees. The MS4 operated by Desert Hot Springs drains to several washes tributary to the Little and Big Morongo Washes, which are receiving waters. Most discharges from the City of Desert Hot Springs infiltrate. Rarely, and only during significant storm events, does any storm drainage flow into the Whitewater River. However, Desert Hot Springs is likewise included in this MS4 Permit to facilitate coordination with the regional programs implemented by the permittees and to reduce the administrative duties.

(4) Salton Sea

The Salton Sea restoration legislation requires that the Secretary for Resources of the Salton Sea Ecosystem Restoration Program to undertake a restoration study to determine the preferred alternative for the restoration of the Salton Sea ecosystem and the permanent protection of wildlife dependent on that ecosystem. The Salton Sea ecosystem is defined to include, but not limited to, the Salton Sea, agricultural lands surrounding the Salton Sea and the tributaries and drains within the Imperial and Coachella valleys that deliver water to the Salton Sea. The CVSC is also tributary to the Salton Sea.

In June of 2007, the Secretary for Resources of the Salton Sea Ecosystem Restoration Program certified the Final Programmatic EIR in compliance with CEQA and in January 2008, the Legislative Analyst's Office released a report titled "Restoring the Salton Sea." The report discusses the history and current state of the Salton Sea and the legal and policy reasons for restoring the Salton Sea. The report also makes recommendations on how the California legislature should proceed with restoration.

(5) Urban Runoff Characterization

Urban runoff contains waste, as defined in the CWC, which contains pollutants that could adversely affect the quality of the Waters of the State. The discharge of pollutants in urban runoff from a MS4 is also a "discharge of pollutants from a point source into Waters of the United States" as defined in the CWA. Urban runoff includes discharges from residential, commercial, industrial and construction areas within the Whitewater River region.

Urban runoff may contain elevated levels of pathogens (bacteria, protozoa, viruses), sediment, trash, fertilizers (nutrients, compounds of nitrogen and phosphorus), pesticides (DDT, chlordane, diazinon, chlorpyrifos), heavy metals (cadmium, chromium, copper, lead, zinc) and petroleum products (oil, grease, petroleum hydrocarbons, polycyclic aromatic hydrocarbons). Urban runoff can carry these pollutants to receiving waters within the Whitewater River region and, in addition, although infrequently, the region's urban runoff can carry these pollutants to other receiving waters as well. These pollutants can then impact the beneficial uses of the receiving waters and cause pollution or create a nuisance.

Pathogens (from sanitary sewer overflows, septic system leaks and spills and leaks from portable toilets, pets, wildlife and human activities) may affect water-contact and non-contact water recreation. Floatables (from trash) are an aesthetic nuisance and may provide a substrate for algae and insect vectors. Oil and grease may coat birds and aquatic organisms, adversely affecting respiration and/or thermoregulation. Other petroleum hydrocarbon components may be toxic to aquatic organisms and may impact human health. Suspended and settleable solids (from sediment, trash and industrial activities) may be deleterious to benthic (deep water) organisms and may cause anaerobic conditions (lack of oxygen in the water). Sediments and other suspended particulates may cause turbidity, clog fish gills and interfere with respiration in aquatic fauna. Sediment and other suspended particles may also screen out light, hindering photosynthesis and normal aquatic plant growth and development.

Stormwater flows from non-urbanized areas such as National Forests, State Parks, wilderness and agricultural uses naturally exhibit high levels of suspended solids due to climate, hydrology, geology and geography. Runoff from these non-urbanized areas may flow into the MS4 and affect flow and water quality. Toxic substances (from pesticides, petroleum products, metals and industrial wastes) can cause acute and/or chronic toxicity, and may bioaccumulate in organisms to levels that may be harmful to human health. Nutrients (from fertilizer use, fire-fighting chemicals, decaying plants, confined animal facilities, pets and wildlife) can cause excessive algal blooms. These blooms may lead to problems with taste, odor, color and increased turbidity, and may depress the dissolved oxygen content leading to fish kills.

There is a direct correlation between urbanization and impacts to receiving water quality. In general, the more heavily developed the area, the greater the potential impact to receiving waters from urban runoff. During urban development two important changes may occur: Natural pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural soil can both absorb rainwater and remove pollutants, but pavement and concrete can do neither, thus, the absorptive characteristics of the land are greatly reduced. Secondly, urban development may create new pollution sources as human population density increases and brings with it proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc., which may either be washed into or directly dumped into the MS4. Because of these two changes, the runoff leaving a developed urban area may be significantly greater in volume, velocity and pollutant load than the predevelopment runoff from the same area. These effects are minimized when effective Best Management Practices (BMPs) to manage urban runoff are implemented and maintained.

Urban runoff may contain pollutants that may threaten human health. Individually and in combination, pollutants discharged from MS4s may cause or threaten to cause a condition of pollution (i.e., an alteration of water quality by waste to a degree which unreasonably affects the waters for designated beneficial uses and/or facilities which serve them), contamination or nuisance. The discharge of pollutants from MS4s may cause the concentration of pollutants to prevent attainment of applicable receiving water quality objectives and thereby impair or threaten to impair designated beneficial uses.

Within the Whitewater River region, a number of constituents of concern commonly associated with urban runoff can occur and are monitored. These include metals, such as arsenic, barium, cadmium, chromium, lead, mercury and selenium; the pathogen, *E. coli;* and nutrients, such as nitrogen (nitrate, nitrite, ammonia), ortho-phosphorous and TDS. See Table 4.19-C for full list.

(6) Objectives of MS4 Permit

The objectives of the MS4 Permit for the Whitewater River watershed are to:

- Renew Board Order No. 01-077 NPDES No. CAS617002, which regulates urban runoff within the Whitewater River watershed.
- Regulate the discharge of potential pollutants in urban runoff that discharge to surface waters in the Whitewater River region.
- Regulate non-storm water discharges associated with retrofit, maintenance and construction activities at permittees' maintenance yards, facilities or roads.

- Implement regulatory requirements prescribed in the Water Quality Control Plan for the Colorado River Basin Region of California (Basin Plan) and requirements of Section 402(p) of the CWA and Title 40 Code of Federal Regulations (40 CFR) Part 122.

4. Stormwater Management Plans

MS4 permits start with a Report of Waste Discharge (ROWD) as the application. Based on this, the applicable RWQCB issues an NPDES permit and waste discharge requirements 'Order' as the basis for the MS4 permit. The permittees must then develop stormwater management plans and local implementation plans to implement the details of the Order/MS4 Permit.

Towards this end, the County of Riverside developed a single Drainage Area Master Plan (DAMP) the addresses both the Santa Ana and Santa Margarita Regions. The Whitewater Region has its own Stormwater Management Plan (SWMP) and, to address post-construction urban runoff, a Water Quality Management Plan for Urban Runoff.

The DAMP addresses the requirements of the municipal separate storm sewer system (MS4) Permits issued to the Riverside County permittees by the Santa Ana RWQCB in 2002 and the San Diego RWQCB in 2004, and incorporates programs developed since 1993 and amendments since 2004. Since the DAMP addresses both regions, additional plans and programs specific to a given region, where different, are attached as appendices to the DAMP. For example, the requirements of the watershed SWMP are addressed throughout the DAMP but those specific to the Santa Margarita watershed are also addressed in an appendix (i.e., Appendix S) to the DAMP.

The DAMP describes a wide range of continuing and enhanced Best Management Practices (BMPs) and control techniques, which are being implemented during the five-year terms of the Third-term MS4 Permits and describes the overall Urban Runoff management strategies planned by the permittees in the Santa Ana and Santa Margarita regions of Riverside County. The DAMP has been prepared to meet the complex urban runoff management needs in the Santa Ana and Santa Margarita regions consistent with the MS4 Permits.

Among other provisions, the MS4 Permits require the permittees to comply with the following in order to meet the provisions contained in Division 7 of the CWC and regulations adopted there under, and the provisions of the CWA, as amended and the regulations and guidelines adopted there under:

- Under CWA Section 122.26(d)(2)(i)(F), the Permittees must continue to prohibit illicit connections and illegal discharges (non-storm water) from entering their MS4.

- The discharge of urban runoff from each permittee's MS4 facilities to the waters of the U.S. containing pollutants that have not been reduced to the maximum extent practicable is prohibited.

- Discharges from the MS4 that cause or contribute to receiving water quality standards for surface or groundwater being exceeded are prohibited.

The permittees must also continue to effectively prohibit the discharge of non-storm water into their respective MS4s and to the Waters of the U.S., unless such discharge is authorized by a separate NPDES permit or specifically allowed by the following provisions. The Permittees are not required to prohibit the discharges identified below. If, however, any of the following allowable non-storm water discharges are identified as a significant source of pollutants, coverage under their own or other NPDES Permit or waste discharge requirements, may be required.

a. Discharges covered by a NPDES permit, Waste Discharge Requirements or waivers issued by a Regional Water Quality Control Board or the State Board. Unless a permittee is the discharger, the permittees are not responsible for any exceedances of receiving water limitations associated with such discharges.

b. Discharges from potable water line flushing and other potable water sources.

c. Discharges from landscape irrigation, lawn/garden watering and other irrigation waters.

d. Air conditioning condensate; dechlorinated swimming pool discharges.

e. Diverted stream flows; rising groundwaters and natural springs; and, flows from riparian habitats and wetlands.

f. Groundwater infiltration (as defined in 40 CFR 35.2005(20)) and uncontaminated pumped groundwater.

g. Passive foundation drains and passive footing drains; water from crawl space pumps.

h. Waters not otherwise containing wastes as defined in CWC Section 13050(d).

i. Other types of discharges identified and recommended by the permittees and approved by the RWQCB.

The RWQCB may issue Waste Discharge Requirements for discharges exempted from NPDES requirements, such as agricultural irrigation waters, if identified to be a significant source of pollutants. The RWQCB may also amend the MS4 Permit to add categories of allowable non-stormwater discharges based on a finding that they are not significant sources of pollutants, or remove categories of allowable non-storm water discharges listed above, based upon a finding that the discharges are a significant source of pollutants.

5. County Drainage Plans

Within western Riverside County, the FCWCD oversees implementation and compliance of both general and MS4 permits under the NPDES. Within the Coachella Valley, this function is maintained by the Coachella Valley Water District (CVWD). In addition, these agencies also oversee Riverside County's municipal storm drain systems for conveying stormwater flows. This is done via two main planning instruments: the master drainage plan and the area drainage plan.

According to FCWCD, a master drainage plan (MDP) addresses the current and future drainage needs of a given community. The boundary of the plan usually follows regional watershed limits. The proposed facilities covered by a MDP may include channels, storm drains, levees, basins, dams, wetlands or any other conveyance capable of economically relieving flooding problems within the plan area. The plans also include estimates of facility capacities, sizes and costs.

MDPs are prepared for a variety of purposes. First, the plans provide a guide for the orderly development of the County of Riverside. Second, they provide an estimate of costs to resolve flooding issues within a community and are used by the County of Riverside to determine capital project expenditures for each budget year. In addition, the MDPs can be used to establish Area Drainage Plan fees for a given community, which prevent existing taxpayers from having to shoulder the burden of land development costs.

An Area Drainage Plan (ADP) is a financing mechanism used to offset taxpayer costs for proposed drainage facilities. The State of California's Subdivision Map Act requires that agencies imposing *drainage* fees have a

general drainage plan for the fee area, a special fund for the fees and an equitable distribution of the fees prior to implementation. The ADP is essentially the master drainage plan for an area with additional language supporting the costs and distribution of the fee within the plan area. Under an ADP, fees are imposed on new development *projects* within the area covered by the ADP. *Not all areas within the County are within an MDP, nor do all MDP's have an associated ADP.*

Developments falling under the Subdivision Map Act (those requiring a division of lands) pay fees on a per-acre basis. Developments falling outside of the Subdivision Map Act (known as discretionary developments) can only be assessed fees based on their impacts to the watershed. The ADP Rules and Regulations state that these impacts can be related to the amount of impervious surface area that the development creates. Therefore, discretionary developments are charged not on a gross acreage basis, but on the total impervious acreage created by their development. The ADP Rules and Regulations also establish guidelines used in the administration of ADPs including design and construction responsibilities and fee credit determination.

As shown in Figure 4.19.9 (Master Drainage Plans in Riverside County) and Table 4.19-E (Riverside County Master Drainage Plans and Area Drainage Plans), there are presently 48 Master Drainage Plans within Riverside County, encompassing areas from the western edge of the county all the way out through the Coachella Valley region to the east and encompassing both incorporated city and unincorporated county territories.

MASTER DRAINAGE PLANS IN RIVERSIDE COUNTY

This page intentionally left blank.

4.19.3 Existing Environmental Setting – State and Regional Water Supply

Riverside County water supplies are comprised of both imported and local water resources. As shown in Figure 4.19.10 (Major California Water Conveyance Facilities), two primary sources of imported water supplies serve Riverside County from the water infrastructure that spans the state: the State Water Project (SWP) and the Colorado River. Sources of local water supplies include surface water, groundwater, recycled water, stormwater and desalinated and other remediated supplies. In addition and as further discussed below, urban and agricultural water conservation has been ~~aggressively~~ implemented since the 1990s, which has led to lower per-capita water use and more efficient irrigation and agricultural practices.

In recent years, various circumstances have converged to restrict the timing, availability and reliability of imported water supply deliveries. For instance, the state *has experienced and is currently experiencing* ~~recently experienced~~ a severe multi-year drought ~~period~~. In addition, environmental, legal and regulatory issues have reduced the amount of water available from the Sacramento-San Joaquin Delta through the SWP and the federal Central Valley Project (CVP). Other legal and regulatory issues have affected deliveries from the Colorado River. Global climate change is another factor having the potential to affect the timing, delivery amounts and reliability of the state's major water supply projects. All of these and other potentially limiting factors are briefly summarized below, as well as discussed in greater detail in Appendix EIR-8. This section also includes data and analysis on both the existing and future projected supply and demand for imported water from the SWP.

This section focuses on statewide and regional (i.e., imported) water supplies and large-scale factors affecting its availability. The subsequent section, 4.19.4, discusses water supplies from a more local perspective and includes discussions on groundwater and local water availability.

A. Major Imported Water Supplies Available to Riverside County

1. State Water Project (SWP)

Like more than two-thirds of California's residents, much of the drinking water used by Riverside County residents is SWP water originating from the San Francisco-San Joaquin Bay-Delta (the Delta). First approved in 1959, the SWP is the nation's largest state-built water and power development and conveyance system. See Figure 4.19.10. Planned, designed, constructed and now operated and maintained by the California DWR, this unique facility provides water supplies for 25 million Californians and 750,000 acres of irrigated farmland. California's SWP is a water storage and delivery system of reservoirs, aqueducts, power plants and pumping plants. Its main purpose is to store water and distribute it to 29 urban and agricultural water suppliers (State Water Contractors) in Northern California, the San Francisco Bay Area, the San Joaquin Valley, the Central Coast and Southern California. Of the contracted water supply, 70% goes to urban users and 30% goes to agricultural users. In all, the SWP makes deliveries to two-thirds of California's population. It also is operated to improve water quality in the Delta, control Feather River flood waters and to provide recreation and enhance fish and wildlife throughout the state. Statewide, the SWP includes 34 storage facilities, reservoirs and lakes, 20 pumping plants, four pumping-generating plants, five hydroelectric power plants and about 701 miles of open canals and pipelines.

The SWP's water supply capability depends on rainfall, snowpack, runoff, reservoir storage, pumping capacity from the Delta and legal environmental constraints on project operations. SWP water supply comes primarily from storage at Lake Oroville (fed from the Sierra Nevada Mountains) and high runoff flows in the Delta. Water

deliveries have ranged from 1.4 million AF in dry years to roughly 3.7 million AF in wet years (MWD RUWMP 2010).

The DWR governs the State Water Project and determines SWP water allocations to State Water Contractors (SWCs) according to a variety of factors, including watershed status relative to snowpack, precipitation, environmental needs and other factors (see discussion, below). The end result is the release of a delivery reliability report that forecasts SWP water yields. The SWP contracts lay out the contractors' and the State of California's obligations concerning delivery of water under both surplus and drought conditions. In each contract, there is a 'Table A' schedule that details how much water the contractor is 'entitled' each year. These 'entitlements' quantify the maximum delivery of SWP water that each contractor could expect, and the share of SWP costs for which the SWC would bear. These entitlements, however, do not guarantee water delivery.

Rather, SWP deliveries are based on the State of California's determination of water availability and for a variety of reasons can be less than the entitled amounts. For example, for 2010 the DWR initially approved 208,580 AF of Table A water for long-term SWP contractors in late November 2009. (One acre-foot of water equals 325,851 gallons; roughly equal to a year's water usage for a suburban family household). Subsequently, several factors including "existing storage in SWP conservation reservoirs [and] SWP operational constraints" lead the DWR to increase Table A supply allotments to a total of 625,800 AF in February 2010. This amount was 15% of the 4,172,000 AF total requested by SWCs. Then, as water availability became more certain, as 2010 progressed the DWR continued to raise the amount available to SWCs. By June 2010, the final Table A allocation total amounted to 2,086,000 AF, roughly 50% of most SWP contractors' 2010 requested Table A amounts. *It is difficult for the SWP to deliver a 100% allocation even in wet years, because of the Delta's pumping restrictions to protected threatened and endangered fish. The most recent 100% allocations occurred in 1999 and 2006.*

Due to the extreme drought conditions in California, the SWP is currently allocating a very limited amount of water to the requesting public agencies. The 2013 year recorded sparse snowpack, and many areas ended the year with the lowest rainfall amounts on record. The final SWP allocation for calendar year 2013 was 35% of the 4 million acre-feet requested. The drought continued into 2014, with the some of the driest periods on record. In January 2014, the DWR estimated that it would be able to deliver only 5% of the approximately 4 million acre feet requested from the SWP. See section 4.19.3-D for further discussion of factors that can affect water delivery reliability.

Since their inception, a variety of amendments to the State Water contracts have developed. Article 21 of the SWP contract provides for sale of surplus water available during periods of heavy flow. Under the Monterey Agreement, the Article 21 water surplus program was developed in 1995 to allow contractors to take delivery of water over and above approved and schedules contract deliveries on a short-term, interruptible basis. Both Table A and Article 21 water deliveries are based on the 2011 SWP Final Delivery Reliability Report.

2. Sacramento-San Joaquin Bay-Delta

As detailed in DWR's 2011 SWP Final Delivery Reliability Report, the Delta is a network of natural and artificial channels and reclaimed islands at the confluence of the Sacramento and San Joaquin rivers. The Delta forms the eastern portion of the San Francisco estuary, receiving runoff from more than 40% of the state's land area. It is a low-lying region where over the years sediment from the Sacramento, San Joaquin, Mokelumne, Cosumnes and Calaveras rivers has mingled with organic matter deposited by marsh plants. Covering 738,000 acres interlaced with hundreds of miles of waterways, much of the land is below sea level and relies on more than 1,100 miles of levees for protection against flooding. The SWP and the federal CVP, which delivers Delta water to the Central Valley, use Delta channels to convey water to the southern Delta for diversion, making the Delta ~~is~~ the focal point for water distribution throughout the state. In fact, the Delta is one of the few estuaries in the world that is used as a major source of drinking water supply: about one quarter of California's drinking water comes from the Delta

and two-thirds of all Californians get some portion of their drinking water from the Delta. However, the Delta also provides a unique estuarine habitat for many resident and migratory fish and birds, some of which are listed as threatened or endangered. Most of the region's native fish either migrate through the Delta or move into it for spawning.

While CVP pumps have a maximum pumping capacity of 4,600 cubic feet per second (cfs) and SWP pumps have a combined pumping capacity of 10,300 cfs, the pumping rates are often restricted and, therefore, water diversions are usually much lower than they would be if the pumps operated at maximum capacity. CVP and SWP reservoir releases and the resulting amount of water exported from the Delta must follow the Coordinated Operating Agreement, which sets guidelines for the sharing of supply and responsibility for meeting water quality standards in the Delta, as well as other regulatory mechanisms. During wet conditions, the SWP and CVP can often divert water considered as excess in the Delta and store it in other locations in-state for release during dry conditions. Diversions during excess Delta conditions are still governed by various determinations and rules.

Besides legal and regulatory constraints, the amount of water the SWP can deliver to State Water Contractors depends on key factors such as rainfall amounts, snowpack and stored water levels, and pumping capacity from the Delta. The inherent yearly variability in timing, amount, location and form of precipitation in California, as well as the frequently changing regulatory restrictions, introduce some unpredictability as to the availability of future SWP source water and resulting SWP deliveries. SWP operations are closely regulated by the State Water Resources Control Board (SWRCB) pursuant to Decision 1641 (D-1641) and, more recently, have been increasingly restricted due to regulations relating to certain fish species listed under the federal Endangered Species Act (FESA) and California Endangered Species Act (CESA).

3. Colorado River

In addition to SWP supplies, the other primary source of imported water supply utilized within Riverside County is the Colorado River. Since 1941, the Colorado River has played a critical role in supplying supplemental water to Southern California and Riverside County. As with the SWP, changed conditions and legal challenges involving Colorado River water have resulted in less water available for much of Southern California than in past years. However, the amount of Northern California water available to Southern California through the SWP can vary greatly with the weather and in an extremely dry year Southern California may be able to secure very little Northern California water for delivery. For this reason, Colorado River water remains vitally important to Southern California's water supply.

Seven states, including California, Nevada and Arizona, share usage of waters originating from the Colorado River, the second longest river in the continental United States. Division and use of this water is governed by 'the Law of the River,' a collection of laws, compacts and agreements established over the last century. In 1918, the seven states and the federal government began meetings in an attempt to settle the rights to the use of Colorado River water. This culminated in 1924 in the Colorado River Compact, which allocated 7.5 million AF per year (AFY) of river water between the seven states.

To satisfy a condition imposed by Congress in the Boulder Canyon Project Act, California's legislature enacted the Limitation Act in 1929, in which it agreed to limit California's consumptive use of Colorado River water to 4.4 million AFY, plus not more than one-half of any excess or surplus water unapportioned by the Colorado River Compact. In 1931, the Seven Party Agreement was signed and provides the basis for the priorities among California's contractors to use of Colorado River water made available to California. The Palo Verde Irrigation District (PVID), the Yuma Project, Imperial Irrigation District (IID), Coachella Valley Water District (CVWD) and MWD are the entities that currently hold the priorities. These priorities are included in the contracts that the

U.S. Department of the Interior executed with the California agencies in the 1930s for delivery of river water from Lake Mead.

As summarized in Table 4.19-F (Colorado River Seven-Party Agreement Priorities and Water Contracts), under Priorities 1 through 3, an amount not to exceed 3.85 million AF was apportioned to PVID, the Yuma Project, IID and CVWD, all agricultural suppliers, for beneficial consumptive use; MWD has the fourth and fifth priorities. However, the Seven Party Agreement did not specify individual quantities for each of the first three priorities; rather, the amount of water available under the third priority was limited to the amount unused by the holders of priorities 1 and 2 on designated areas of land. This lack of quantification among the agricultural priorities posed an obstacle to the acquisition of water from the agricultural entities for use by urban users in other service areas. The first four priorities total the 4.4 million AFY available to California. However, Arizona and Nevada did not use their full apportionment for many years and, until fairly recently, this water was available to California's lower-priority water rights holders.

In the 1980s, certain Indian reservations, federal wildlife refuges and other users, some but not all of whom were identified in the Seven Party Agreement, were found to also hold superior rights to Colorado River water. Consumptive use by these entities could reach as much as 61,000 AF annually. Because over 5.36 million AF of Colorado River water had already been allocated by California's Seven Party Agreement, it was not clear which rights would be affected by the use of the holders of these newly identified rights. At that time, no formal guidelines existed to determine whether surplus water would be available. Decisions regarding surplus water availability were to be made at the discretion of the U.S. Secretary of the Interior.

As a result, the year-to-year availability of Colorado River water to urban users became much more variable and unpredictable. The State of California acknowledged that urban users would obtain less water from the Colorado River in the future than they had in the past, but the lack of clearly quantified water rights hindered efforts to promote water management projects. The Secretary of the Interior asserted that California's users of Colorado River water had to limit their use to a total of 4.4 million AF per year, plus any available surplus water. Under the auspices of the State of California's Colorado River Board, these users developed a draft plan to resolve the problem, which was known as "California's Colorado River Water Use Plan" or the "California Plan." It characterized how California would develop a combination of programs to allow the State of California to limit its annual use of Colorado River water to 4.4 million AF per year plus any available surplus water.

Table 4.19-F: Colorado River Seven-Party Agreement Priorities and Water Contracts

Priority	Description	Water (AFY)
1	Palo Verde Irrigation District (PVID) – gross area of 104,500 acres of land in the Palo Verde Valley	3,850,000
2	Yuma Project (Reservation Division) – not exceeding a gross area of 25,000 acres in California	
3(a)	Imperial Irrigation District (IID) and land in Imperial and Coachella valleys[1] to be served by All American Canal	
3(b)	PVID – 16,000 acres of land on the Lower Palo Verde Mesa	
4	Metropolitan Water District of Southern California (MWD) for use on the coastal plain of Southern California	550,555
	Subtotal	**4,400,000**
5(a)	MWD for use on the coastal plain of Southern California	550,000
5(b)	MWD for use on the coastal plain of Southern California[2]	112,000
6(a)	IID and land in Imperial and Coachella valleys[1] to be served by the All American Canal	300,000
6(b)	PVID – 16,000 acres of land on the Lower Palo Verde Mesa	
7	Agricultural use in the Colorado River Basin in California	*Remaining surplus*
	Total Prioritized Apportionment	**5,362,000**

Footnotes:
1. The Coachella Valley Water District now serves Coachella Valley.
2. In 1946, the City of San Diego, the San Diego County Water Authority, MWD and the U.S. Secretary of the Interior entered into a contract that merged and added the City of San Diego's rights to store and deliver Colorado River water to the right of MWD. The conditions of that agreement have long since been satisfied.

B. State Water Contracts and Existing SWP Supplies

As outlined in chapter 3 of the DWR's 2011 SWP Final Delivery Reliability Report, during the 1960s, as the SWP was created, long-term contracts were signed by DWR and 29 urban and agricultural water suppliers ('SWP contractors') in various locations within California. The contracts are essentially uniform and will expire in 2035. This section explains the basics of SWP water contracts and the various types of SWP water, especially 'Table A' water. The discussion also outlines some of the factors influencing Table A water delivery. Unless noted otherwise, all data in this section comes from DWR's 2011 Final Delivery Reliability Report for the State Water Project (issued June 2012).

The SWP contractors are located in the south San Francisco Bay Area, along the Central Coast, in the San Joaquin Valley and in Southern California. They include cities, counties, urban water agencies and agricultural irrigation districts. Most contractors use the SWP water they receive for municipal purposes; a few use the water for agriculture. The SWP contractors mostly use project water to supplement local supplies, including groundwater, or other imported water. The State of California's 29 SWP contractors include 13 in Southern California, of which four serve Riverside County:

- Coachella Valley Water District
- Desert Water Agency
- Metropolitan Water District of Southern California
- San Gorgonio Pass Water Agency

1. How State Water Contracts Work

Under the terms of their long-term water supply contracts with DWR, the 29 SWP contractors receive specified amounts of water from the SWP each year, called 'annual allocations.'

The SWP's long-term water supply contracts define the terms and conditions governing water delivery and repayment of project costs. In return for the allocated water, the SWP contractors repay principal and interest on both the bonds that initially funded construction of the SWP and the bonds that paid for additional facilities. The contractors also pay all costs, including labor and power, to maintain and operate project facilities. They also pay transportation charges based on the distance between the Delta and each contractor's water delivery point. The contractors also contribute mitigation costs for any environmental impacts of SWP operations on fish and wildlife.

2. SWP 'Table A' Water

Table A is an exhibit to the SWP's water supply contracts. A number of factors affect the amount of Table A water available and the amount of such water actually delivered to SWP contractors in a given year.

The water supply-related costs of the SWP are paid for by SWP contractors. All water contracts signed in the 1960s included an estimate of the date that SWP water would first be delivered and a schedule of the amount of water the contractor could expect to be delivered annually. That amount of water, known as the contractor's annual Table A amount, was designed to increase gradually until the designated maximum for that SWP contractor was reached.

The total combined maximum Table A amount for all SWP contractors was initially 4.23 million AFY, assuming full development of the SWP. At that time, this amount was referred to as the 'maximum project yield.' As a result of amendments to the water supply contracts in the 1990s, the current combined maximum Table A amount is 4.172 million AFY. Of this amount, 4.133 million AFY is the maximum Table A water available for delivery from the Delta. It is recognized that deliveries will be less than the established maximum Table A amount in some years and more than this amount in other years.

The maximum Table A amount is the basis for apportioning water supply and costs to the SWP contractors. Once the total amount of water to be delivered is determined for the year, all available water is allocated in proportion to each contractor's annual maximum SWP Table A amount. To reiterate, however, in some years the SWP cannot deliver the maximum amount of 4.172 million AF, but in other years, the supply exceeds that amount. Additionally, in some years contractors receive other classifications of water from the SWP, such as Article 21 water and turnback pool water (see descriptions, below).

The established maximum Table A amounts for the 29 SWP contractors vary widely. The median is 42,000 AF; thus, the maximum allocations of Table A water for half of the SWP contractors exceed this amount and for the other half they are less. The largest Table A amount is held by the Metropolitan Water District of Southern California (MWD) at 1.912 million AF; the smallest is held by the Littlerock Creek Irrigation District at 2,300 AF.

The Table A amounts determine the maximum water a contractor may request each year from DWR. Table A amounts may also be used as a factor to allocate other available water supplies to each contractor. 'Table A,' or 'Table A water,' represents a portion or all of the annual Table A requested by the SWP water contractors and approved for delivery by DWR, based on hydrologic conditions, current reservoir storage and combined requests from the SWP water contractors. The DWR is not always able to deliver the quantity of water requested by contractors. In these cases, and under certain conditions, a lesser amount is allocated and delivered according to the long-term water supply contracts by prorating the amount in proportion to each SWP water contractor's maximum Table A amount.

Thus, the maximum Table A amount listed in any particular contract should not be read as a guarantee that the SWP contractor will receive that amount. Rather, the maximum Table A amount is a tool in an allocation process that defines an individual contractor's "slice of the pie" (and a factor in allocating each contractor's share of the SWP's costs).

SWP contractors will receive a certain percentage of the maximum Table A amounts in their contracts. As discussed below, the water year type and the contractors' demand levels are among the factors involved in determining the amount of Table A water that will be delivered by DWR to each contractor. At various times of the year, DWR issues projections of anticipated Table A allocations based on then-current conditions and updates those projections as warranted. Deliveries of Table A water to SWP contractors in Riverside County are shown by arrows in Figures 4.19.4 and 4.19.5. See Table 4.19-G (South Coast Region - SWP Table A Deliveries for Existing Conditions) and Table 4.19-H (Colorado River Region - SWP Table A Deliveries for Existing Conditions) for delivery data.

3. Factors Influencing SWP Table A Water Delivery Amounts

The percentage of its maximum Table A amount that an SWP contractor will receive in any given year will vary depending on a variety of factors. For example, the amount and timing of precipitation and ensuing runoff to streams are important in determining how much water will be physically available to the SWP to pump and export from the Delta. The type of precipitation matters as well, along with anticipated patterns of use and consumption

of the source water by entities other than the SWP. The answers to the following questions influence the amount of water delivered to contractors each year:

- How much rain and snow fell within the last year?
- Which parts of California received the precipitation and how much runoff resulted?
- Did rain come as a short intense storm or a long wet spell?
- Did more of the precipitation occur as snow in colder storms or were storms warmer, resulting in more rain that produced higher peak runoff?
- Was snowmelt fast or gradual, and when did the bulk of the runoff occur?

For example, if substantial snowfall occurs late in the wet season, Sierra Nevada rivers can be full of melting snow later than usual in the year, as occurred in 2011. This allows the SWP's Delta pumping to continue at or near capacity for an extended duration, increasing the percentage of Table A water delivered. Conversely, if rain falls on snow early in the year, the resulting early snowmelt results in less water available for Delta pumping later in the year. *Currently, the Sierra Nevada Mountains are experiencing a substantial decrease in snowpack over the past three years, when compared to historical averages. This has a significant and direct effect on how much water can be delivered through the SWP.* Other factors affecting SWP delivery reliability are discussed in more detail in Section 4.19.3.D.

A contractor's local diversion, storage and conveyance facilities are also important considerations in receiving water and in storing the water it receives. A contractor's water demands can also be affected by local weather patterns and water conservation measures. In some years, some contractors may rely more on water from sources such as groundwater or the Colorado River, while in other years they may rely more on the SWP.

The pattern of water demand on a water system can greatly affect the system's reliability. For example, if the demand occurs for only three months in summer, a water system with sufficient annual supply but insufficient water storage may not be able to reliably meet its customers' demands. If, however, the demand is distributed over the year, the system can more easily meet the demand because the need for water storage is reduced or storage could be increased.

4. Other Types of SWP Water

Regardless of water year type, Table A water is given first priority for delivery over other types of SWP water. Contractors have several options for what to do with the water that is allocated to them: use it, store it for later use or transfer it to another contractor. Each long-term water contract describes several types of SWP water that are available to SWP contractors to supplement Table A water: 'Article 21' water, carryover water and turnback pool water, as follows.

a. Article 21 Water

'Article 21 water' (so named because it is described in Article 21 of the water contracts) is water that SWP contractors may receive on a short-term basis in addition to their Table A water, if they request it. Because most SWP contactors often cannot meet their full demands with Table A water, Article 21 water should not be viewed as 'surplus' or 'extra' water. In fact, Article 21 water is used by many SWP contractors to help meet demands

when allocations are less than 100%. Article 21 water is available to an SWP contractor only if the following conditions are met:

- 'Excess water' is flowing through the Delta – that is, when releases from SWP and CVP reservoirs and unregulated flows into the Delta exceed Sacramento Valley water diversions, Delta exports and flows needed to meet Delta water quality and flow requirements. If this scenario occurs, it is usually during December through May.

- The contractor is able to use the surplus water, such as by offsetting the use of groundwater that would otherwise occur, or can store it in its own system. (That is, the water will not be stored in an SWP facility, such as San Luis Reservoir.)

- Delivering this water would not interfere with Table A allocations, other SWP deliveries or SWP operations.

SWP contractors requesting Article 21 water receive this water in the same proportion as their Table A water. Article 21 water becomes available only during wet months of the year, generally December through March. Unless the SWP contractor has facilities to routinely store or manage the Article 21 water it receives, such water is not likely to contribute significantly to local water supply reliability.

b. Carryover Water

'Carryover water' is SWP water that is allocated to an SWP contractor and approved for delivery to that contractor in a given year, but not used by the end of the year. (Note that SWP water deliveries are managed by calendar year, January 1 - December 31, while hydrology is measured by the 'water year,' which is measured October 1 - September 30, to place California's wet season at the year's start.) This water is exported from the Banks Pumping Plant, but instead of being delivered to the contractor, it is stored in the SWP's share of San Luis Reservoir, when space is available, for the contractor to use in the following water year.

Carryover water is like a water savings account that allows water managers flexibility in tough times, such as if the next year is a drought year and the contractor's allocation of SWP water is small. Carryover water was designed to encourage the most effective and beneficial use of water and to avoid obligating the contractors to use or lose the water by December 31 of each year.

With advance notice, SWP contractors can carry over water when they submit their initial request for Table A water or within the last 3 months of the delivery year. They might do this for various reasons, such as local wet conditions or exchange and transfer arrangements. Storage for carryover water, however, no longer becomes available to the contractors if it interferes with storage of SWP water for project needs.

c. Turnback Pool Water

SWP contractors may offer the portion of their allocated Table A water within the current year that exceeds their needs to a 'turnback pool,' where another contractor may purchase this water. DWR sets the price for water offered in turnback pools, which are established in February and March. Contractors that sell their extra Table A water in a turnback pool receive payments from contractors that buy the turnback pool water.

5. Existing SWP Deliveries

The Reliability Report includes an appendix listing historical annual deliveries from the Delta by various water classifications for each SWP contractor for 2001–2010. During this period, deliveries of SWP Table A water from the Delta for 2001–2010 ranged from an annual minimum of 1,049,000 AF to a maximum of 2,963,000 AF, with an average of 2.087 million AF. It is important to note that historical deliveries of SWP Table A water from the Delta over this 10-year period are less than the maximum of 4.132 million AF per year and the DWR indicates this trend is forecast to continue into the future. Tables 4.19-G and 4.19-H, below, detail the existing conditions SWP Table A water deliveries for the State Water Contractors within Riverside County for the South Coast and Colorado River regions, respectively. Future conditions are describes later in this section.

Table 4.19-G: South Coast Region - SWP Table A Deliveries for Existing Conditions

State Water Contractor (in thousands of acre-feet)	Delivery Without Article 56 Carryover	Article 56 Carryover	Total Table A Delivery	Max. Table A Amount	Percent of Max. Table A

C. State Future Water Forecasts

As reported in the 2009 California Water Plan (page 5-23), before the 2005 Update, state water planning assumptions were based on a "single 'likely' future." Today, the DWR issues three scenarios in order to provide "decision-makers, water managers and planners [with] more information about how different management actions might perform under a range of possible future conditions."

1. Three Baseline Water Scenarios

The 2009 CWP uses three scenarios to forecast "different, but plausible" estimates of future water demands: the 'current trends,' 'slow and strategic growth,' and 'expansive growth' scenarios. Together, these three scenarios are considered the state's 'baseline' because they "represent changes that are plausible and could occur without additional management intervention beyond those currently planned."

As outlined in the CWP, each scenario affects water demands and supplies differently and each includes assumptions about how various factors, such as population and amount of irrigated farmlands, would occur in and affect the future. The 'current trends' scenario assumes recent (as of roughly 2007) trends continue into the future. This includes a state population of nearly 60 million people, increased residential development in interior valleys and longer commuter trips, as well as decreases in irrigated croplands and increases in environmental water uses. It also includes the State of California facing lawsuits on a regular basis: from flood damages to water quality and endangered species protections, as well as regulations that are "not comprehensive or coordinated."

The 'slow and strategic growth' scenario estimates a future where population growth is lower, about 45 million people by 2050. Compact urban development is foreseen as having eased commuter travel and Californians as having "embrace[ed] water and energy conservation." Also, conversion of agricultural land to urban development has slowed and occurs mostly for environmental restoration and flood protection. Lastly, the expansive growth scenario is described as being more resource intensive and with faster population growth (reaching 70 million people in 2050, 60% greater than that of the slow growth scenario). Patterns of low-density suburban and rural development continue, though urban areas also expand while irrigated croplands decrease significantly. Water and energy conservation programs are implemented at a slower rate than earlier trends (5% instead of 10-15%) and protection of water quality and endangered species is driven "mostly by lawsuits, creating uncertainty."

2. Issues Affecting Future Water Demands

Key factors that will affect future water demand include those which are certain, if variable (for example, population growth rates), and those that are unpredictable and thus nearly unforeseeable (for example, the timing and location of 100-year floods due to rainfall). Together, these types of factors lead to "uncertainty" for future water availability – that is a high degree of variation and wide range in forecast precision. Demographic factors that affect future water demand and that are modeled varyingly for the three scenarios, include population, the number of single and multi-family homes, as well as the number of jobs in the state. Agricultural water needs are affected by the amount of irrigated land, climate and individual cropping patterns.

The results of "unmet environmental objectives," such as future environmental requirements or court decisions also affect supplies. In particular, the CWP [page 5-28] reports that none of the three scenarios include, "Additional water to protect species in the Delta resulting from the December 2008 Delta Smelt Biological Opinion issued by the [USFWS] or to protect salmon and several other species resulting from the June 2009 biological opinion issued by the National Marine Fisheries Service."

The scenarios are also subject to affects by future climate change, which can affect rain and snow levels, temperature, drought patterns and plant growing patterns, among others. Even without taking account climate change, general weather patterns, such as average annual precipitation levels, as well as the timing and location of rainfall, have a strong effect on future water supply and demand. Lastly, degree to which water conservation savings would be realized is also variable and unpredictable. (The three scenarios call for conservation rates of 10%, 15% and 5%, for current, slow and expansive trends, respectively.)

3. State Future Scenario Results

Figure 4.19.11 (Statewide – Change in Future Water Demand by Scenario) shows the statewide change in water demand for each sector (urban, agricultural and environmental) by scenario and then summed across all three sectors. The subsequent two figures show the same for the South Coast and Colorado River Hydrological regions. The change in water demand shown is the difference between the average demands for 2043-2050 (projected future) and 1998-2005 (historical). The change in water demand shown by the solid bar assumes a repeat of historical hydrology while the hatched bar shows the change in water demand when considering 12 different climate change scenarios. These climate change scenarios are based on recent scientific studies of future trends in precipitation and temperature, as described in Chapter 4 of the 2009 CWP. Both of these factors heavily influence water demand for outdoor landscaping and irrigated agriculture.

Without considering climate change, the annual combined statewide water demand shows a decrease of about 2.5 million AF under the slow-growth scenario and a 6 million AF increase with the expansive-growth scenario. The 'current trends' scenario lies between these, with a 2 million AF increase per year. With climate change, all three

scenarios show higher water demands than under a repeat of historical climates, reflecting a future "either warmer, drier, or both warmer and drier."

Overall, all three statewide scenarios also show an increase in urban water demand; ranging from under 1.5 million AF for slow-growth to 10 million AF for fast, with 6 million AF for current trends. All three scenarios also show a decrease in demand for agricultural water, due mainly to the projected continued loss of farmlands to development pressures, as well as environmental conservation needs. Similarly, all three scenarios also reflect water savings due to conservation programs, though the amounts saved vary as indicated previously. Lastly, as the CWP notes, "Having response packages for multiple future scenarios can help identify management responses that perform well across the array of possible future conditions."

4. Regional Future Scenario Results

The CWP (page 5-33) notes that the three baseline scenarios for 2050 would "play out differently in various hydrologic regions." The way these water demands change reflect a number of variables, including the relative amount of water demand in the region for cities, farms and environment; how the modeled factors (population, irrigated crop acreage and environmental water use) are expected to increase or decrease for each region; and how temperature and precipitation are projected to change. (For example, less precipitation during the growing season increases that need for applied irrigation water.) See Table 4.19-I (SWP Future Conditions Water Delivery Projections) for SWP estimates for year 2031.

a. South Coast Hydrologic Region

The CWP reports that hydrologic regions expecting higher population growth under the current trends and expansive growth scenarios, such as the South Coast Hydrologic Region, show higher changes in water demands. It adds, "Population growth also tends to drive urbanization of agricultural lands, reducing irrigated crop acreage." Accordingly, as shown in Figure 4.19.12 (South Coast Region – Change in Future Water Demand by Scenario) and reported by the CWP (page SC-59), the total forecast water demand for 2050 for the South Coast Hydrologic Region (above the current baseline demand value of 4.80 million AF and without including climate impacts) increase under both the current trends and expansive growth scenarios, by 1.33 million AF and 2.86 million AF, respectively, while the slow growth scenario manages to decrease its annual water demand by 0.14 million AF. When the increase in demand and variability forecast for climate change is taken into account, the scenarios' total water demands increase to an estimated 1.30-1.60 million AF for current and 2.80-3.20 million AF for expansive growth. The decrease associated with the slow-growth scenario lessens slightly, to a total demand of between 0.15 million AF less water to an increase of up to roughly 0.07 million AF more compared to today. Consistent with statewide trends, across all three scenarios for the South Coast Hydrologic Region, urban water demand increases and agricultural water demand lessens. For environmental water demand, the CWP (page SC-60) notes that the baseline is about 0.13 million AF and that no additional environmental water demands are assumed beyond current commitments.

b. Colorado River Hydrologic Region

As shown in Figure 4.19.13 (Colorado River Region – Change in Future Water Demand by Scenario) and reported by the CWP (page CR-41), the total forecast water demand for 2050 for this region (above current baseline demand, 4.0 million AF, and without including climate impacts) increases under both the current trends and expansive growth scenarios. These increases are slightly more modest compared to South Coast values, 0.30 million AF and 0.74 million AF, respectively. The slow growth scenario decreases its annual water demand by 0.38 million AF. When the increase in demand and variability forecast for climate change is taken into account,

the scenarios' total water demands increase to 0.25-0.45 million AF for current and 0.68-0.92 million AF for expansive growth. The decrease associated with the slow-growth scenario lessens slightly, to a total demand of between 0.25-0.41 million AF less water compared to today.

The increases and decreases in water demand seen in this region are generally similar to the statewide trends noted above, as well as those of the South Coast. For environmental water demand, the CWP (page CR-42) notes that the baseline is about 0.03 million AF with no additional environmental water demands assumed beyond current commitments as the State of California was unable to estimate additional environmental objectives in this case.

Table 4.19-I: SWP Future Conditions Water Delivery Projections

Future (2031) Conditions Scenarios	SWP Water Deliveries (in thousands of acre-feet)		
	Table A Water[4]	Article 21 Water	Total Delivery
Long-Term Average[1,2]	2,466	60	2,526
Long-Term Ave., Maximum[1]	4,063	291[3]	4,354
Long-Term Ave., Minimum[1]	443	4[3]	447
Single Dry Year (1977)[1,2]	443 (11%)	4	447
4-Year Drought (1931-1934)[1,2]	1,401 (34%)	50	1,451
Single Wet Year (1983)[1,2]	4,063 (98%)	291	4,354
4-Year Wet (1980-1983)[1,2]	3,396 (82%)	120	3,516

STATEWIDE - CHANGE IN FUTURE WATER DEMAND BY SCENARIO

This page intentionally left blank.

Water Demand Changes and Climate Change Variabilty

The graph under each scenario represents future **water demand change** (the difference between the average demands for 2043-2050 and 1998-2005.) This change could be either an increase (above baseline) or a decrease (below baseline) in water use.

Climate change adds another dimension of variability to demand changes. In figure at right, historical period shows actual demand (blue line). Each colored line represents 1 of 12 climate scenarios. This variability is represented on the water demand change graph by the hatched area.

5. Regional Water Balances

As a result of a number of factors, including SWP import availability (as outlined above) and a variety of external factors (as outlined below), the State of California has issued a series of water balance and water budget data for its hydrologic regions. The most recent data available for the two regions in which Riverside County is located are presented in Table 4.19-J (Regional Water Balance Data), below (2005 is the most recent year for which water balances were issued broken down by category).

Table 4.19-J: Regional Water Balance Data

Water Balance Data (in thousands of acre-feet)	2001 Water Data		2005 Water Data	
	South Coast	Colorado River	South Coast	Colorado River
Water Entering the Region				
Precipitation	9,327	4,770	15,344	9,755
Percent of Normal Precipitation[1]	92%	80%	143%	158%
Inflow from Colorado River	1,250	5,197	773	3,445
Inflow from Mexico	0	155	---	128

Subtotal	***- 1,068***	***- 180***	***- 200***	***+ 197***
Applied Water Total[4]	**4,633**	**4,714**	**4,564**	**3,681**

ns = not supplied in 2011 report.

Footnotes:

1. The precipitation percentages are based on a running 30-year average for the region and can vary from those published for other, earlier documents or data.
2. Total federal deliveries. However, federal Central Valley Project (CVP) deliveries were zero for both regions.
3. Consumptive use is the amount of applied water used and no longer available as a source of supply. Applied water is greater than consumptive use because it includes consumptive use, reuse and outflows.
4. Includes evaporation, evapotranspiration from native vegetation, groundwater subsurface outflows, natural and incidental runoff, agricultural effective precipitation and other outflows.
5. Total is sum of interior and exterior water uses.
6. Positive numbers equal water added to storage; negative numbers equal water removed from storage.
7. Change in groundwater storage values were based upon best available information. Both regions were calculated using the equation: GW change in storage = intentional recharge + deep percolation of applied water + conveyance deep percolation and seepage - withdrawals. This equation does not include unknown factors, such as natural recharge and subsurface inflow/outflow.

D. Factors Affecting Water Delivery Reliability

As noted in prior sections, a variety of factors affect water delivery reliability, for both local and imported water sources. Chapter 4 of the DWR's 2011 Final Delivery Reliability Report examines this very issue, as it relates to SWP water and its delivery. Since the chapter provides a concise and comprehensive summary of the issues, it is in essence reproduced here to explain the issues facing county water supplies. For the sake of clarity, edits and information related directly to Riverside County and this EIR are shown in brackets to differentiate them from the State of California's text. In some cases, headers are revised to suit this EIR section. Also, some text and figures not directly germane to Riverside County issues are omitted.

[Start of excerpt from SWP Final Delivery Reliability Report 2011]

This [portion of the 2011 Final Delivery Reliability Report] explains the concept of SWP water delivery reliability and how it is calculated by DWR [and] describe[s] the most important factors that combine to affect SWP water delivery reliability. Among these natural and human-created factors are the availability of source water, regulatory restrictions on SWP operations and the effects of climate change. Uncertainty also exists because of the potential for an emergency such as an earthquake striking in or near the Delta, which, if substantial enough, could interrupt SWP exports from the Delta. This [subsection] describes various statewide efforts by DWR and other agencies to reduce risks to the Delta and enhance emergency response capabilities.

1. About Water Delivery Reliability

Water delivery reliability is the annual amount of SWP water that can be expected to be delivered to SWP contractors with a certain frequency. But what does that actually mean in practice? In essence, it is a matter of probability – specifically, the likelihood that a contractor will receive a certain amount of water from the SWP in a particular year. From the contractor's perspective, water delivery reliability indicates an acceptable or desirable level of dependability of water deliveries to the people receiving the water.

Usually, a local water agency, in coordination with the public it serves, determines the level of water delivery reliability that it considers acceptable. The water agency then plans for new facilities, programs or additional sources of water to meet or maintain this level of reliability.

2. Calculating SWP Water Delivery Reliability

DWR calculates the water delivery reliability of the SWP using the CalSim-II computer model, which simulates existing and future operations of the SWP. No model or tool can predict what actual, natural water supplies will be for any year or years, but a system of probability can be used to calculate water delivery reliability. The analyses of SWP delivery reliability contained in Chapters 6 and 7 of [the 2011 Final Delivery Reliability Report; both of which are provided in Appendix EIR-8] are based on modeling conducted using 82 years of historical data (water years 1922–2003) for rainfall and runoff. Those data were adjusted to reflect current and future levels of development in the source areas. The resulting data were then used to forecast the amount of water available to the SWP under current and future conditions (with the effects of climate change factored into the modeling for future conditions). The annual amounts of estimated SWP water deliveries are ranked from smallest to largest and the probability that various quantities of SWP Table A water will be delivered to each SWP contractor is estimated.

3. Factors Influencing SWP Water Delivery Reliability

Forecasting water delivery reliability is a difficult task because California is such a large state with numerous microclimates. In a typical year, some areas receive as little as 2 inches of rain, while others receive more than 100 inches. In addition, the determinants of water delivery for a specific water supply system continually change over time and can be difficult to determine and/or model. For example, water use in Sacramento River watersheds has increased over time. The historical data upon which a water supply forecast is based must be adjusted to reflect the current and, if necessary, future use in these watersheds. The following factors affect the ability to estimate existing and especially future water delivery reliability:

- Water availability at the source.
- Water rights with priority over the SWP.
- Regulatory restrictions on SWP Delta exports (imposed by federal biological opinions [BOs] and State water quality plans).
- Climate change.
- Ongoing environmental and policy planning efforts.
- Delta levee failure.

4. Water Availability at the Source

This factor affects the SWP's water delivery reliability because it is inherently variable; availability of water at the source depends on the amount and timing of rain and snow that fall in any given year, the amount and timing of runoff, and the level of development (that is, the use of water) in the SWP's source areas. The location, amount

and form of precipitation in California in any given year cannot be accurately predicted, introducing the greatest variability in the availability of future SWP source water and hence future SWP deliveries.

Generally, during a single dry year or two, surface water and groundwater storage can supply most water deliveries, but dry years can result in critically low water reserves. Greater reliance on groundwater during dry years results in high costs for many users and increases groundwater overdraft. Further, the ability of some contractors to use local groundwater may be limited; some groundwater basins may be contaminated by toxins such as methyl tertiary butyl ether (commonly known as MBTE), an ingredient in gasoline, and other aquifers may be too deep to reach economically. This makes the availability of the SWP's surface water to contractors especially important.

DWR manually measures snowpack in the northern Sierra Nevada monthly between early January and early May to forecast snowmelt runoff. These surveys and real-time electronic measurements taken throughout the winter measure the snowpack's water content. The size of the snowpack in the Feather River watershed on April 1 – when snowpack water content normally is at its peak before the spring runoff – and the storage in Lake Oroville are key components of the SWP's delivery capabilities from April through September.

5. Water Rights with Priority Over the SWP

California's water rights system affects the SWP indirectly. There are two types of legally protected rights to surface water in California:

Appropriative water rights allow the user to divert surface water for beneficial use. The user must first have obtained a permit from the State Water Resources Control Board (State Water Board), unless the appropriative water right predates 1914. Appropriative water rights may be lost if the water has gone unused for 5 years. The SWP diverts water from the Delta under appropriative water rights.

Riparian water rights apply to lands traversed by or bordering on a natural watercourse. No permit is required to use this water, which must be used on riparian (adjacent) land and cannot be stored for later use.

Generally, the priority of an appropriative water right in California is "first in time, first in right;" therefore, an appropriative water right is subordinate to all prior water rights, whether appropriative or riparian. This means that if another entity with a prior water right increases its use of one of the SWP's sources of water supply – the Delta, the upstream Sacramento or San Joaquin rivers, or a tributary to either river – the overall amount of water available to the SWP will decrease. Thus, water users with prior water rights are assigned top priority for water in DWR's modeling of the SWP's water delivery reliability, even ahead of SWP Table A water deliveries.

6. Regulatory Restrictions on SWP Delta Exports

Multiple needs converge in the Delta: the need to protect a fragile ecosystem, to support Delta recreation and farming, and to provide water for agricultural and urban needs throughout much of California. Various regulatory requirements are placed on the SWP's Delta operations to protect special-status species, such as delta smelt and spring- and winter-run Chinook salmon. As a result, as described below, restrictions on SWP operations imposed by State and federal agencies contribute substantially to the challenge of accurately determining the SWP's water delivery reliability in any given year.

a. Biological Opinions on Effects of SWP Operations

Several fish species listed under the federal Endangered Species Act (ESA) as endangered or threatened are found in the Delta. The continued viability of populations of these species in the Delta depends in part on Delta flow levels. For this reason, the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) have issued several BOs since the 1990s on the effects of coordinated SWP/CVP operations on several species. [See Appendix EIR-8 for additional details on these legal matters.]

These BOs affect the SWP's water delivery reliability for two reasons. Most obviously, they include terms that specifically restrict SWP pumping levels in the Delta at certain times under certain conditions. In addition, the BOs' requirements are based on physical and biological phenomena that occur daily while DWR's water supply models are based on monthly data.

The first BOs on the effects of SWP (and CVP) operations [*note:* the Central Valley Project, CVP, is a separate federal water system that also used Delta water] were issued in February 1993 (NMFS BO on effects of project operations on winter-run Chinook salmon) and March 1995 (USFWS BO on project effects on delta smelt and splittail). Among other things, the BOs contained requirements for Delta inflow, Delta outflow and reduced export pumping to meet specified incidental take limits. These fish protection requirements imposed substantial constraints on Delta water supply operations. Many were incorporated into the 1995 Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta (1995 WQCP), as described under "Water Quality Objectives."

The terms of the USFWS and NMFS BOs have become increasingly restrictive in recent years. In December 2008, USFWS issued a new BO covering effects of the SWP and CVP on delta smelt, and in June 2009, NMFS issued a BO covering effects on winter-run and spring-run Chinook salmon, steelhead, green sturgeon and killer whales. These BOs replaced BOs issued earlier by the federal agencies.

The USFWS BO includes additional requirements in all but two months of the year. The BO calls for 'adaptively managed' (adjusted as necessary based on the results of monitoring) flow restrictions in the Delta intended to protect delta smelt at various life stages. USFWS determines the required target flow, with the reductions accomplished primarily by reducing SWP and CVP exports. Because this flow restriction is determined based on fish location and decisions by USFWS staff, predicting the flow restriction and corresponding effects on export pumping with any great certainty poses a challenge. The USFWS BO also includes an additional salinity requirement in the Delta for September and October in wet and above-normal water years, calling for increased releases from SWP and CVP reservoirs to reduce salinity. Among other provisions included in the NMFS BO, limits on total Delta exports have been established for the months of April and May. These limits are mandated for all but extremely wet years.

The 2008 and 2009 BOs were issued shortly before and shortly after the Governor proclaimed a statewide water shortage state of emergency in February 2009, amid the threat of a third consecutive dry year. NMFS calculated that implementing its BO would reduce SWP and CVP Delta exports by a combined 5% to 7%, but DWR's initial estimates showed an impact on exports closer to 10% in average years, combined with the effects of pumping restrictions imposed by BOs to protect delta smelt and other species.

The 2008 USFWS and 2009 NMFS BOs have been subject to considerable litigation. Recent decisions by U.S. District Judge Oliver Wanger changed specific operational rules for the fall/ winter of 2011–2012, and both the USFWS BO and NMFS BO have been remanded to the agencies for further review and analysis. However, the operational rules specified in the 2008 and 2009 BOs continue to be legally required and are the rules used in the analyses presented in [Chapters 5, 6 and 7 of the 2011 Final Delivery Reliability Report]. Chapter 5 [of the

Report] presents a comparison of monthly Delta exports as estimated for this 2011 Report with those estimated for the 2005 Report, illustrating how the 2008 and 2009 BOs have affected export levels from the Delta. [Note: Chapters 6 and 7 of the Report present existing (2011) and future (2031) SWP water delivery reliability information, respectively. Copies of chapters 5, 6 and 7 all are provided in Appendix EIR-8.]

The California Department of Fish and Wildlife (DFW) issued consistency determinations for both BOs under Section 2080.1 of the California Fish and Game Code. The consistency determinations stated that the USFWS BO and the NMFS BO would be consistent with the California Endangered Species Act (CESA). Thus, DFW allowed incidental take of species listed under both the federal ESA and CESA to occur during SWP and CVP operations without requiring DWR or the U.S. Bureau of Reclamation to obtain a separate State-issued permit.

Specific restrictions on Delta exports associated with the USFWS and NMFS BOs and their effects on SWP pumping levels are described further in Chapter 5 ('SWP Exports') of [the 2011 Final Delivery Reliability Report; as included in Appendix EIR-8.]

b. Water Quality Objectives

Because the Delta is an estuary, salinity is a particular concern. In the 1995 WQCP, the State Water Board set water quality objectives to protect beneficial uses of water in the Delta and Suisun Bay. The objectives must be met by the SWP (and federal CVP), as specified in the water right permits issued to DWR and the U.S. Bureau of Reclamation. Those objectives – minimum Delta outflows, limits on SWP and CVP Delta exports, and maximum allowable salinity levels – are enforced through the provisions of the State Water Board's Water Right Decision 1641 (D-1641), issued in December 1999 and updated in March 2000. DWR and Reclamation must monitor the effects of diversions and SWP and CVP operations to ensure compliance with existing water quality standards.

Among the objectives established in the 1995 WQCP and D-1641 are the 'X2' objectives. D-1641 mandates the X2 objectives so that the State Water Board can regulate the locations of the Delta estuary's salinity gradient during the months of February-June. X2 is the position in the Delta where the electrical conductivity (EC) level, or salinity, of Delta water is 2 parts per thousand. The location of X2 is used as a surrogate measure of Delta ecosystem health. For the X2 objective to be achieved, the X2 position must remain downstream of Collinsville in the Delta for the entire 5-month period, and downstream of other specific locations in the Delta on a certain number of days each month from February through June. This means that Delta outflow must be at certain specified levels at certain times – which can limit the amount of water the SWP may pump at those times at its Harvey O. Banks Pumping Plant in the Delta. Because of the relationship between seawater intrusion and interior-Delta water quality, meeting the X2 objective also improves water quality at Delta drinking-water intakes; however, meeting the X2 objectives can require a relatively large volume of water for outflow during dry months that follow months with large storms.

The 1995 WQCP and D-1641 also established an export/inflow (E/I) ratio. The E/I ratio, presented in Table 3 of the 1995 WQCP (SWRCB 1995:18–22), is designed to provide protection for the fish and wildlife beneficial uses in the Bay-Delta estuary (SWRCB 1995:15). The E/I ratio limits the fraction of Delta inflows that are exported. When other restrictions are not controlling, Delta exports are limited to 35% of total Delta inflow from February through June and 65% of inflow from July through January.

7. Climate Change

The California Water Plan Update 2009 identified climate change as a key consideration in planning for the state's water management. California's reservoirs and water delivery systems were developed based on historical

hydrology; future weather patterns have long been assumed to be similar to those in the past. However, as climate change continues to affect California, past hydrology is no longer a reliable guide to future conditions. This [sub]section discusses effects on the SWP that could result from specific aspects of climate change. [See also Appendix EIR-8.]

a. Decreased Water Availability with Reduced Snowpack

As the effects of climate change continue, mean temperatures are predicted to increase, both globally and regionally. Climate projections used to assess the reliability of California's future water supply forecast average air temperature increases for the Sacramento region of 1.3 to 4.0 degrees Fahrenheit by the middle of the 21st century and 2.7 to 8.1 degrees by the end of the century (California Climate Change Center 2009a:8). Climate change is anticipated to bring warmer storms that result in less snowfall at lower elevations, reducing total snowpack. Loss of snowpack is projected to be greater in the northern Sierra Nevada – and thus closer to the Feather River watershed, the origin of SWP water – than in the southern Sierra Nevada because of the relative proportions of land at low and middle elevations.

Snowmelt provides an average of 15 million AF of water for California per year, slowly released from about April to July each year (DWR 2006:2-22). Much of the state's water infrastructure, including the SWP, was designed to capture slow spring runoff and deliver it during the drier summer and fall months. However, during the 20th century, the average early-spring snowpack in the Sierra Nevada decreased by about 10%, resulting in the loss of 1.5 million AF of snowpack storage (DWR 2008:3). Using historical data and modeling, DWR projects that by 2050 the Sierra snowpack will be reduced from its historical average by 25% to 40% (DWR 2008:4). Increased precipitation falling as rain instead of snow during winter could result in a larger number of 'rain-on-snow' events. This would cause the snow to melt earlier in the year and over fewer days than historically, thus adversely affecting availability of water for pumping by the SWP during summer.

Such reductions in snowpack could have dire consequences. Under climate change and in some years, water levels in Lake Oroville, the SWP's main supply reservoir, could fall below the lowest release outlets, making the system vulnerable to operational interruption. DWR expects that a water shortage worse than the one during the 1977 drought could occur in 1 out of every 6-8 years by the middle of the 21st century and in one out of every three to four years at the end of the century (California Climate Change Center 2009a:46). In those years, it is estimated that an additional 575,000–850,000 AF per year of water would be needed to meet current regulatory requirements and to maintain minimum system operations. This could preclude the SWP from pumping as much water as it would otherwise.

Climate change is also expected to reduce the SWP's median reservoir carryover storage. Carryover water is like a water savings account for water managers to use during shortage periods. Thus, a climate change–generated reduction in the amount of carryover water available to SWP contractors would reduce the system's flexibility during dry and critical water years.

b. Increased SWP Water Demands

Even as water shortages may result from reduced snowpack, climate change may also cause water demand by SWP contractors to increase. Warmer temperatures may increase rates of evapotranspiration (loss of water from soil by evaporation and plant transpiration) and may extend growing seasons. A larger amount of water may be needed for irrigation of certain crops, urban landscaping, and environmental needs. Warmer temperatures will also increase evaporation from surface reservoirs. Reduced soil moisture and surface flow will disproportionately

affect the environment and other water users that rely heavily on annual rainfall such as rain-fed [i.e., non-irrigated] agriculture, livestock grazing on non-irrigated rangeland, and recreation.

c. Sea Level Rise

During the last century, sea level rose 7 inches along California's coast. Estimates of future sea level rise range from 4 to 16 inches by the middle of the 21st century and 7-55 inches by 2100 (DWR 2009b:4-37). The increases in sea level that are expected to continue could affect SWP water delivery reliability in several ways:

- Most of the land in the Delta is below sea level – by as much as 20 feet – as a consequence of ongoing subsidence. Increases in sea level could place more pressure on the Delta's already fragile levee system and, as a consequence, cause levee breaches that could threaten SWP Delta exports.

- As salty water from the Pacific Ocean moves farther upstream into the Delta, DWR could be required to increase the amounts of freshwater released from Lake Oroville to maintain compliance with Delta water quality standards.

- Sea level rise is expected to cause salt water to flow farther inland. The resulting increase in saltwater intrusion into coastal aquifers would make increasing amounts of groundwater unsuitable for water supply or irrigation (California Climate Change Center 2009b:80–81). The reduced availability of groundwater would likely contribute to further increases in demands for surface water from the SWP, especially by the coastal SWP contractors.

d. Adapting to Climate Change Effects in Forecasting Water Delivery Reliability

Chapter 7, "Future SWP Water Delivery Reliability (2031)," [of the 2011 Final Delivery Reliability Report] estimates the SWP's delivery reliability for conditions 20 years in the future (2031), reflecting potential hydrologic changes that could result from climate change. Further details on these future projections are included in a technical addendum to this report (posted on the Internet and available upon request). [See Appendix EIR-8.]

For purposes of this report and the technical addendum, the 2031 delivery estimates are based on a single median-impact future climate projection. To identify this projection, DWR analyzed the twelve climate projections for midcentury that were used in "Using Future Climate Projections to Support Water Resources Decision Making in California" (California Climate Change Center 2009a). The resulting water supply effects were examined to determine which one most closely represented the central or 'median' projection. The analysis examined the following projected climate and hydrology variables and their effects on SWP exports: temperature, precipitation, total inflow to major reservoirs, shifts in timing of runoff and Delta exports.

8. Ongoing Environmental and Policy Planning Efforts

As discussed earlier, the Delta is an essential part of the conveyance system for the SWP. SWP pumping at the Banks Pumping Plant is regulated to protect the many uses of the Delta. However, today's uses in the Delta are not sustainable over the long term under current management practices and regulatory requirements. As discussed below, two large-scale plans for the Delta that are in development could affect SWP water delivery reliability: the Delta Plan and the Bay Delta Conservation Plan (BDCP).

a. Delta Plan

After years of concern about the Delta amid rising water demand and habitat degradation, the Delta Stewardship Council was created in legislation to achieve State-mandated coequal goals for the Delta. As specified in Section 85054 of the California Water Code:

> *'Coequal goals' means the two goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. The coequal goals shall be achieved in a manner that protects and enhances the unique cultural, recreational, natural resource, and agricultural values of the Delta as an evolving place.*

The draft Delta Plan seeks to reduce reliance on Delta water supplies. In a series of policies and recommendations, the draft plan aims to encourage farms and cities to increase conservation and become more self-sufficient, particularly in the event of a disaster in the Delta. It calls for agricultural water agencies to change pricing to encourage conservation. It also urges the State Water Board to set enforceable flow objectives for the Delta and its tributaries that take into account wildlife and habitat needs. In the future, government projects in the Delta must prove they are consistent with the Delta Plan.

The Delta Stewardship Council is preparing the draft Delta Plan and environmental impact report. Scheduled for adoption and implementation in 2012, the Delta Plan is intended to serve as California's guiding policy document for the Delta and Suisun Marsh for the next 88 years (that is, through the year 2099), with frequent updates.

b. Bay Delta Conservation Plan

The BDCP is being prepared by a group of local water agencies, environmental and conservation organizations, state and federal agencies, and other interest groups. An outgrowth of the CALFED Bay-Delta Plan's Ecosystem Restoration Program Conservation Strategy, the BDCP has been in development since 2006. The heart of the BDCP is a long-term conservation strategy that sets forth actions needed for a healthy Delta. The BDCP would do all of the following:

- Identify conservation strategies to improve the overall ecological health of the Delta;
- Identify ecologically friendly ways to move freshwater through and/or around the Delta;
- Address toxic pollutants, invasive species, and impairments to water quality; and
- Establish a framework and funding to implement the plan over time.

A draft environmental impact report is planned to be released for public review in mid-2012. The report is targeted to be final in 2013, after which a decision to proceed with the program would be made. Upon adoption, the BDCP would provide the basis for issuance of endangered species permits for the continued operation of the SWP and CVP. The plan would be implemented over a 50-year period.

9. Delta Levee Failure

The fragile Delta faces a multitude of risks that could affect millions of Californians. Foremost among those risks, as they could affect the SWP's water delivery reliability, are the potential for levee failure and the ensuing flooding and water quality issues.

The Delta Risk Management Strategy (DRMS) was initiated in response to Assembly Bill 1200 (2005), which directed DWR to use 50-, 100- and 200-year projections to evaluate the potential impacts on Delta water supplies associated with continued land subsidence, earthquakes, floods, and climate change. In DRMS Phase 1, risks are as assessed and DRMS Phase 2 evaluates various solutions. Also discussed are other efforts currently being undertaken by DWR and other agencies to reduce risks to the Delta, enhance emergency response capabilities and reduce the risk of interruption of Delta water exports by the SWP and CVP.

a. Effects of Emergencies on Water Supplies

Phase 1 of the DRMS, completed in 2008, assessed the performance of Delta and Suisun Marsh levees under various stressors and hazards and evaluated the consequences of levee failures to California as a whole. The Delta is protected by levees built about 150 years ago. The levees are vulnerable to failure because most original levees were simply built with soils dredged from nearby channels, and were never engineered. Most islands in the Delta have flooded at least once over the past 100 years. For example, on June 3, 2004, a huge dry-weather levee failure occurred without warning on Upper Jones Tract in the south Delta, inundating 12,000 acres of farmland with about 160,000 AF of water. Because many Delta islands are below sea level, deep and prolonged flooding could occur during a levee failure event, which could disrupt the quality and use of Delta water.

Levee failure can result from the combination of high river inflows, high tide, and high winds; however, levees can also fail in fair weather – even in the absence of a flood or seismic event – in a so-called 'sunny day event.' Damage caused by rodents, piping (in which a pipe-like opening develops below the base of the levee) or foundation movement could cause sunny-day levee breaches.

A breach of one or more levees and island flooding may affect Delta water quality and SWP operations. Depending on the hydrology and the size and locations of the breaches and flooded islands, a large amount of salt water may be pulled into the interior Delta from Suisun and San Pablo Bays. When islands are flooded, DWR may need to drastically decrease or even cease SWP Delta exports to evaluate the distribution of salinity in the Delta and avoid drawing saltier water toward the pumps.

An earthquake could also put Delta levees, and thus SWP water supplies, at risk. In 2008, the 2007 Working Group on California Earthquake Probabilities estimated a probability of 63% that a magnitude 6.7 or greater earthquake would strike the San Francisco Bay Area in the next 30 years (Working Group 2008:6). An earthquake could severely damage Delta levees, causing islands to flood with salty water. The locations most likely to be affected by an earthquake are the west and southwest portions of the Delta because these areas are closer to potential earthquake sources. Flooding of the west and southwest Delta is also more likely to interfere with conveyance of freshwater to export pumps (DWR 2007, page 17).

Modeling of the effects of earthquakes on Delta islands was conducted by DWR for the DRMS Phase 1 report. Described in the California Water Plan Update 2009, the assessment found a 40% probability that a major earthquake occurring between 2030 and 2050 would cause 27 or more islands to flood at the same time. If 20 islands were flooded as a result of a major earthquake, the export of freshwater from the Delta could be interrupted by about a year and a half (DWR 2009b:5-15). Water supply losses of up to 8 million AF would be incurred by SWP (and CVP) contractors and local water districts.

b. Managing and Reducing Risks

The Phase 2 report for the DRMS, issued in June 2011, evaluates alternatives to reduce the risk to the Delta and the state from adverse consequences of levee failure (DWR 2011b). 'Building blocks' (individual improvements

or projects, such as improving levees or raising highways) and trial scenarios (various combinations of building blocks) were developed for the DRMS Phase 2 report. The building blocks fall into three main categories: conveyance improvements/flood risk reduction and life safety; infrastructure risk reduction; and, environmental risk mitigation.

The first of these categories is most relevant to the SWP in terms of reducing the risk of disruption of SWP Delta exports, but the environmental risk mitigation category includes a building block (Building Block 3.6) calling for reduction of water exports from the Delta.

Four trial scenarios were developed to represent a range of possible risk reduction strategies [and state and various concerned agencies, including MWD, continue to study these levee issues.]

c. Delta Flood Emergency Preparedness and Multi-Hazard Coordination

In the last 5 years, DWR has worked to improve its ability to respond quickly and effectively to simultaneous levee failures on multiple islands within the Delta. The Delta Emergency Operations Plan Concept Paper released in April 2007 (DWR 2007) was the initial product of this effort. To enhance the state's ability to prepare for, respond to, and recover from a catastrophic Delta levee failure, DWR subsequently began development of the Delta Flood Emergency Preparedness, Response, and Recovery Program. This program is intended to supplement DWR's emergency operations plan. The goal is to protect lives, property, and critical infrastructure in the Delta while minimizing impacts on the ecosystem. The program consists of three components: develop DWR's Delta response and recovery plan; coordinate DWR's plan with other Delta flood emergency response agencies; and, design and implement flood emergency response facilities within the Delta.

The flood emergency response plan for the Delta will describe the actions DWR will take before, during, and after a levee-endangering event or levee failure in the Delta. The Delta Flood Emergency Preparedness, Response, and Recovery Program is conducting an extensive effort to model water quality implications of levee failure and salinity changes associated with different levee repair strategies. DWR is coordinating this effort with the U.S. Army Corps of Engineers and expects to reach out to the five Delta counties during plan development.

DWR is also a member of the Sacramento-San Joaquin Delta Multi-Hazard Coordination Task Force, which was created in 2008 in the wake of passage of the Sacramento-San Joaquin Delta Emergency Preparedness Act of 2008 [and is] led by the California Emergency Management Agency (CalEMA). [This] task force was created to make recommendations to CalEMA on creating a framework for an interagency unified command system, coordinate the development of a draft emergency preparedness and response strategy for the Delta region, and develop and conduct an all-hazards emergency response exercise in the Delta.

[End of excerpt from SWP Final Delivery Reliability Report 2011]

E. Factors Affecting Colorado River Water Supplies

1. Colorado River Supplies and the Quantification Settlement Agreement

The 2003 Quantification Settlement Agreement (QSA) executed by IID, CVWD and MWD is a critical component of the California Plan. It establishes the baseline Colorado River water use for each of the agencies and facilitates the transfer of water from agricultural agencies to urban uses. It also specifies that IID, CVWD and MWD would forebear use of water to permit the U.S. Secretary of the Interior to satisfy the uses of the water rights holders that had been newly identified in the 1980s. On November 5, 2003, IID filed a validation action in

Imperial County Superior Court, seeking a judicial determination that thirteen agreements associated with the IID - San Diego County Water Agency (SDCWA) water transfer and the QSA are valid, legal and binding. Other lawsuits also were filed challenging the execution, approval and subsequent implementation of the QSA on various grounds. All of the QSA cases were coordinated in Sacramento County Superior Court.

After a number of pleading challenges, appeal of rulings dismissing one Imperial County case and dismissing portions of another, and pretrial rulings, the first phase of the trial ran from November 9 to December 2, 2009. One of the key issues of contention was the constitutionality of the QSA Joint Powers Authority Agreement, pursuant to which IID, CVWD and SDCWA agreed to commit $133 million toward certain mitigation costs associated with implementation of the transfer of 300,000 AF of water conserved by IID pursuant to the QSA and the State of California agreed to be responsible for any mitigation costs exceeding this amount.

A final judgment was issued on February 11, 2010, holding that the State of California's commitment was unconditional in nature and, as such, violated the State of California's debt limitation under the California Constitution and that 11 other agreements, including the QSA, are also invalid because they are inextricably interrelated with the QSA Joint Powers Authority Agreement and the funding mechanism it established to cover such mitigation costs. The court also ruled that all other claims raised by the parties, including CEQA claims related to the QSA Programmatic EIR and the IID Transfer Project EIR, were moot. The court's decision was appealed and the ruling was stayed pending the outcome of the appeal. If the ruling stands, it could delay the implementation of programs authorized under the QSA or result in increased costs or other adverse impacts. The impact, if any, that the ruling might have on the availability of Colorado River supplies for urban water users simply cannot be known at this time, but may echo the days of uncertainty and litigation that previously had led to the creation of the QSA and related agreements (MWD RUWMP 2010).

In March 2010, MWD, IID, CVWD, SDCWA, the State of California and others filed notices of appeal challenging various aspects of the trial court's ruling. On December 7, 2011, the court of appeal issued its ruling reversing, in part, the trial court's ruling. In particular, the court of appeal held that while the State of California's commitment to fund mitigation costs in excess of $163 million was unconditional, actual payment of such costs was subject to a valid appropriation by the legislature, as required under the California Constitution. Moreover, the State of California's commitment did not create a present debt in excess of the State of California Constitution's $300,000 debt limit. Thus, the QSA Joint Powers Agreement was held to be constitutional. The court of appeal also rejected other challenges to the agreement. Lastly, in light of its ruling, the court of appeal remanded the matter back to the trial court for further proceedings on the claims that had been dismissed as moot. The impact, if any, which this litigation might have had on MWD's water supplies cannot be adequately determined at this time, according to MWD (Official Statement, page A-18, 2012).

2. Colorado River Water Rights and Conservation Programs

In addition to MWD's 2010 Regional Urban Water Management Plan (RUWMP), a great deal of further information and analyses regarding Colorado River water supplies are set forth in MWD's Appendix A to its "Official Statement," dated September 12, 2012, describing MWD's Water Revenue Refunding Bonds (2012 Series F). According to MWD, the Colorado River was MWD's original source of water after MWD's establishment in 1928. MWD has a legal entitlement to receive water from the Colorado River under a permanent service contract with the U.S. Secretary of the Interior. Water from the Colorado River or its tributaries is also available to other users in California, as well as users in the states of Arizona, Colorado, Nevada, New Mexico, Utah and Wyoming, collectively with California, the 'Colorado River Basin States,' resulting in both competition and the need for cooperation among these holders of Colorado River entitlements.

In addition, under a 1944 treaty, Mexico has an allotment of 1.5 million AF of Colorado River water annually except in the event of extraordinary drought, or serious accident to the delivery system in the United States, when the water allotted to Mexico would be curtailed. Mexico also can schedule delivery of an additional 200,000 AF of Colorado River water per year if water is available in excess of the requirements in the United States and the 1.5 million AF allotted to Mexico. The Colorado River Aqueduct, which is owned and operated by MWD, transports water from the Colorado River approximately 242 miles to its terminus at Lake Mathews in Riverside County. After deducting for conveyance losses and maintenance requirements, up to 1.2 million AF of water a year may be conveyed through the Colorado River Aqueduct to MWD's member agencies, subject to availability of Colorado River water for delivery to MWD as described below.

The long-term availability and reliability of Colorado River supplies delivered to California to help meet the state's agricultural, farming and development needs was extensively addressed as part of MWD's regional water supply analyses. As described above, California is apportioned the use of 4.4 million AF of water from the Colorado River each year plus one-half of any surplus that may be available for use collectively in Arizona, California and Nevada. In addition, California has historically been allowed to use Colorado River water apportioned to but not used by Arizona and Nevada when such supplies have been requested for use in California. Under the 1931 priority system that has formed the basis for the distribution of Colorado River water made available to California, MWD holds the fourth priority right to 550,000 AF per year. This is the last priority within California's basic apportionment of 4.4 million AF. In addition, MWD holds the fifth priority right to 662,000 AF of water, which is in excess of California's basic apportionment.

Until 2003, MWD had been able to take full advantage of its fifth priority right as a result of the availability of surplus water and apportioned but unused water. However, Arizona and Nevada increased their use of water from the Colorado River, leaving no unused apportionment available for California since the late 1990s. In addition, a severe drought in the Colorado River basin has reduced storage in system reservoirs, resulting in no surplus water being available since 2003. Prior to 2003, MWD could divert over 1.2 million AF in any year, but since that time, MWD's deliveries of Colorado River water have varied from a low of 633,000 AF in 2006 to a high of 1.105 million AF in 2009. In 2007, MWD received approximately 713,500 AF of Colorado River water. Average annual net deliveries for 2003 through 2011 were approximately 830,300 AF, with annual volumes dependent primarily on programs to augment supplies, including transfers of conserved water from agriculture. MWD's Colorado River supply was about 855,000 AF in 2011, of which approximately 699,000 AF was delivered through the Colorado River Aqueduct and about 186,000 AF of intentionally created surplus water was stored in Lake Mead.

MWD has taken steps to augment its share of Colorado River water through agreements with other agencies that have rights to use such water. Under a 1988 water conservation agreement between MWD and IID, IID constructed and operates a number of conservation projects that are currently conserving 105,000 AF of water per year. In 2007, the conserved water augmented the amount of water available to MWD by 85,000 AF and by prior agreement to the Coachella Valley Water District (CVWD) by 20,000 AF.

In 1992, MWD entered into an agreement with the Central Arizona Water Conservation District (CAWCD) to demonstrate the feasibility of CAWCD storing Colorado River water in central Arizona for the benefit of an entity outside the State of Arizona. Pursuant to this agreement CAWCD created 80,909 AF of long-term storage credits that may be recovered by CAWCD for MWD. MWD, the Arizona Water Banking Authority and CAWCD executed an amended agreement for recovery of these storage credits in December 2007. All 80,909 AF were recovered and delivered to MWD between 2007 and 2010 (Official Statement, page A-15, 2012).

Water recovered by CAWCD under the terms of the 1992 agreement allows CAWCD to reduce its use of Colorado River water, leaving Arizona with an unused apportionment. The U.S. Secretary of the Interior is

making this unused apportionment available to MWD under its Colorado River water delivery contract. In April 2008, MWD's Board authorized the expenditure of $28.7 million to join the CAWCD and the Southern Nevada Water Authority (SNWA) in funding the construction of a new 8,000 AF off-stream regulating reservoir near Drop 2 of the All-American Canal in Imperial County. The reservoir, constructed by the U.S. Bureau of Reclamation, was completed in October 2010. Newly named the Warren H. Brock Reservoir, it is expected to save up to 70,000 AF of water per year by capturing and storing water that would otherwise be lost. In return for its funding, MWD received 100,000 AF of water that is stored in Lake Mead until recovered, with annual delivery of up to 34,000 AF of water through 2010 and up to 25,000 AF between 2011 and 2036. Besides the additional water supply, the new reservoir adds flexibility to Colorado River operations.

MWD and the Palo Verde Irrigation District (PVID) signed a program agreement for a "Land Management, Crop Rotation and Water Supply Program" in August 2004. Per the MWD (Official Statement, page A-15, 2012), this program provides up to 133,000 AF of water to MWD in certain years through 2040. Under this program, fallowing of approximately 20,000 acres of land began January 1, 2005, and resulted in water savings of approximately 108,700 AF in 2005, 122,200 AF in 2011 and an estimated high of 144,300 AF in 2009 (including water from the supplemental fallowing program). With both Arizona and Nevada increasing use of their water apportionments and the variability and unpredictability of continued Colorado River surpluses, in 1997 the Colorado River Board of California, in consultation with MWD, IID, PVID, CVWD, SDCWA and the Los Angeles Department of Water and Power embarked on the development of an interagency plan for reducing California's use of Colorado River water to its basic apportionment of 4.4 million AF when use of that basic allotment is necessary.

In 1999, IID, CVWD, MWD and the State of California agreed to a set of 'Key Terms' aimed at managing California's Colorado River supply. These key terms were incorporated into the Colorado River Board's May 2000 California Plan that proposed to optimize the use of the available Colorado River supply through water conservation, transfers from higher priority agricultural users to MWD's service area and storage programs. In 2000, California voters approved Proposition 13, which authorized the State of California to issue $1.97 billion of its general obligation bonds for water projects. Additionally, California voters approved Proposition 50 in 2002 and Proposition 84 in 2006, which authorized the issuance by the State of California of $3.4 billion and $5.4 billion, respectively, of its general obligation bonds for water projects. Types of water projects eligible for funding under Propositions 13, 50 and 84 include water conservation, groundwater storage, water treatment, water quality, water security and Colorado River water management projects, many of which are within the scope of the California Plan. As a result of all these actions, since 2003 California's use of Colorado River water has been limited to its basic apportionment of 4.4 million AF per year.

In all, many of the core elements of the California Plan have been put into effect under the October 2003 QSA executed by CVWD, IID and MWD. The QSA establishes Colorado River water use limits for IID, CVWD and MWD, provides for specific acquisitions of conserved water and water supply arrangements for up to 75 years and restores the opportunity for MWD to receive any 'special surplus water' under a set of Interim Surplus Guidelines. The QSA also allows MWD to enter into other cooperative Colorado River supply programs. Related agreements modify existing conservation and cooperative water supply agreements consistent with the QSA and set aside several disputes among California's Colorado River water agencies. Specific programs authorized under the QSA include: lining portions of the All-American and Coachella Canals, which is projected to conserve 96,200 AF annually, with 80,200 AF of conserved water to be delivered to SDCWA by exchange with MWD and 16,000 AF to be delivered to the San Luis Rey Indian tribes by exchange under a water rights settlement; an amendment to the 1988 Conservation Agreement and the associated 1989 Approval Agreement extending the term of the 1988 Conservation Agreement and providing for the transfer of up to 105,000 AF of water conserved by IID to MWD less the amount (up to 20,000 AF of the conserved water) used by CVWD; and the transfer of 200,000 AF of water conserved annually by IID to SDCWA.

With full implementation of the programs identified in the QSA, at times when California is limited to its basic apportionment of 4.4 million AF per year, MWD expects to be able to annually divert to its service area 852,000 AF of Colorado River water plus any unused agricultural water that may be available, as was the case in 2004 and 2005. This is further augmented by the PVID program, which provides up to 118,000 AF of water per year. Challenges filed against the QSA are addressed above and any potential effects of those matters on the availability or reliability of MWD's Colorado River supplies remain speculative at this time.

In 2001, the U.S. Secretary of the Interior adopted guidelines (the "Interim Surplus Guidelines") for use through 2016 in determining if there is surplus Colorado River water available for use in California, Arizona and Nevada. The purpose of the Interim Surplus Guidelines is to provide a greater degree of predictability with respect to the availability and quantity of surplus water through 2016. The Interim Surplus Guidelines were later extended through 2026. The Interim Surplus Guidelines contain a series of benchmarks for reductions in agricultural use of Colorado River water within California by set dates.

Under the Interim Surplus Guidelines, MWD initially expected to divert up to 1.25 million AF of Colorado River water annually under foreseeable runoff and reservoir storage scenarios from 2004 through 2016. An extended drought in the Colorado River basin initially reduced these expectations. From 2000 to 2004, snow pack and runoff in the Colorado River basin were below average. Although runoff was slightly above average in 2005, the runoff in 2006 and 2007 was again below average, making 2000 through 2007 the driest eight-year period on record. Above-average precipitation occurred in 2008, however, producing April through June inflows into Lake Powell that measured 144% of inflows for the same period in 2007. As of June 2008, storage in Lake Mead was at 49% of capacity and Lake Powell was at 53% of capacity. MWD's deliveries for 2007 were approximately 713,400 AF. MWD's 2008 Colorado River diversion approval from the U.S. Bureau of Reclamation totals 783,500 AF, including 4,777 AF for emergency delivery to Tijuana, Mexico.

In 2002, the Southern Nevada Water Authority (SNWA) and MWD entered into an "Agreement Relating to Implementation of Interim Colorado River Surplus Guidelines" in which SNWA and MWD agreed to the allocation of unused apportionment as provided in the Interim Surplus Guidelines and on the priority of SNWA for interstate banking of water in Arizona. SNWA and MWD entered into a storage and interstate release agreement on October 21, 2004. Under this program, Nevada can request MWD to store unused Nevada apportionment of Colorado River water in California. The amount of water stored through 2011 under this agreement was 70,000 AF. In subsequent years, Nevada may request recovery of this stored water. However, as part of a recently executed amendment, it is expected that Nevada will not request return of this water before 2022. The stored water provides flexibility to MWD for blending Colorado River water with less-saline SWP water and improves water quality.

In February 2007, the Bureau of Reclamation issued a Draft Environmental Impact Statement (EIS) regarding new federal guidelines concerning the operation of the Colorado River system reservoirs. These new guidelines establish water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage and surplus conditions in the Lower Basin, provide a mechanism for the storage and delivery of conserved system and non-system water in Lake Mead and extend the Interim Surplus Guidelines through 2026.

The Bureau of Reclamation released the Final EIS in November 2007 and the U.S. Secretary of the Interior issued the final guidelines through a Record of Decision signed in December 2007. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encourage agencies to develop conservation programs and allow the states to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions. The U.S. Secretary of the Interior issues the final guidelines through a Record of Decision signed in December 2007. The Record of Decision and accompanying agreement among

the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encourage agencies to develop conservation programs and allow the states to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from water shortages in all but the most extreme hydrologic conditions, according to the MWD (Official Statement, page A-20, 2012).

In addition, in May of 2006, MWD and the U.S. Bureau of Reclamation executed an agreement for a demonstration program that allows MWD to leave conserved water that MWD would otherwise use in Lake Mead. Only 'intentionally created surplus' water (water that has been conserved through an extraordinary conservation measure, such as land fallowing) was eligible for storage in Lake Mead under this program. MWD may store additional intentionally created surplus water in Lake Mead under the federal guidelines for operation of the Colorado River system reservoirs. The Secretary of the Interior delivers intentionally created surplus water to MWD in accordance with the terms of a December 2007 Delivery Agreement between the United States and MWD. As of January 2012, MWD had nearly 435,000 AF in its intentionally created surplus accounts, made up of water conserved by fallowing in the Palo Verde Valley and from the yield allocated to MWD from the Drop 2 Reservoir project and the Yuma Desalting Plant pilot run. MWD stored 193,350 AF of intentionally created surplus water in 2011, including 7,650 AF resulting from the Yuma Desalting Plant pilot run.

Federal and state environmental laws protecting fish species and other wildlife species could affect Colorado River operations, thus changing certain hydropower operations and the amount of water deliveries to the Colorado River Aqueduct. A number of species that are on either endangered or threatened lists under FESA are present in the area of the Lower Colorado River, including among others, bonytail chub, razorback sucker, southwestern willow flycatcher and Yuma clapper rail.

To address biological issues, a broad-based partnership of federal, state, tribal and private entities, including water, hydroelectric power and wildlife management agencies in Arizona, California and Nevada, have developed a multi-species conservation program for the main stem of the Lower Colorado River (the Lower Colorado River Multi-Species Conservation Program, LCR-MSCP). The LCR-MSCP allows MWD to obtain federal and state permits for any incidental take of protected species resulting from current and future water and power operations of its Colorado River facilities and to minimize any unpredictability from additional listings of endangered species. The MSCP also covers operation of federal dams and power plants on the river that deliver water and hydroelectric power for use by MWD and other agencies. The LCR-MSCP covers 27 species and habitat in the Lower Colorado River from Lake Mead to the Mexican border for a term of 50 years.

3. Colorado River Water Quality

As noted by the CWP (page 4-1), the primary water quality concern regarding Colorado River water is its high salinity. In addition, MWD and others have been engaged in efforts to protect their Colorado River water supplies from threats of uranium, perchlorate and Chromium VI. (See full discussion in Section 4.19.4.E.6.b). MWD has been active in efforts to protect these supplies from potential increases in nutrient loading due to urbanization, as well as investigating the sources and occurrence of constituents of emerging concern, such as N-nitrosodimethylamine (NDMA) and pharmaceuticals and personal care products (PPCPs). To date, MWD has not identified any water quality risks that cannot be mitigated (CWP, page 4-1). The only foreseeable water quality constraint to the use of Colorado River water would be the need to blend (mix) it with SWP supplies to dilute it to meet adopted salinity standards.

4. Quagga Mussel Threat

In January 2007, quagga mussels were discovered for the first time in Lake Mead. Quagga mussels can reproduce quickly and, if left unmanaged, can clog intake and raw water conveyance systems, alter or destroy fish habitats and affect lakes and beaches. Quagga mussels were first introduced in the Great Lakes in the late 1980s. These organisms infest much of the Great Lakes basin, the St. Lawrence Seaway and much of the Mississippi River drainage system. The most likely source of the quagga mussel infestation is recreational boats from water bodies around the Great Lakes, which were transported over 1,000 miles west to Lake Mead. In response to the Lake Mead finding, the CDFW created a multi-agency task force with MWD as one of its members. An initial survey of the Colorado River to ascertain the extent of the quagga mussel colonization detected low densities in Lake Mead, Lake Mohave and Lake Havasu, and in the intake of the Central Arizona Project. Quagga mussels were also detected at the Colorado River Aqueduct intake pumping plant, Gene Wash and Copper Basin reservoirs, in portions of the Colorado River Aqueduct and in Lake Skinner. A three-week shutdown of the Colorado River Aqueduct for rehabilitation and repairs in March 2007 also permitted inspection for quagga mussels. Desiccation of mussels from emptying the aqueduct during the shutdown followed by a week of chlorination to kill or limit spread of any remaining mussels after the aqueduct was placed back in service, helped control mussels found there. Shutdowns of the Colorado River Aqueduct in July 2007, October 2007 and March 2008 permitted additional quagga mussel inspection and facilitated some control measures.

MWD reports (Official Statement, page A-21, 2012) that it is working to enhance its ability to detect the mussels, studying mussel transport and settling in MWD conveyance systems, assessing additional, more cost-effective methods to control mussels and developing and implementing control strategies for mussels in MWD's lakes and reservoirs. Future quagga mussel control efforts are expected to include infrastructure upgrades and recommendations on boating practices or additional facilities to control the spread of mussels in the Colorado River Aqueduct system and additional long-term measures. In September 2007, MWD appropriated $5.91 million for design and construction of interim chlorination facilities at Copper Basin and Lake Mathews, design of permanent chlorination facilities at Copper Basin, Lake Mathews and Diamond Valley Lake, and related quagga mussel control measures. In February 2008, MWD appropriated $1.77 million for a new chlorine injection point at the Lake Skinner Outlet Conduit and for the procurement of liquid chlorine trailers and mobile chlorination units. In August 2008, MWD appropriated an additional $1.87 million to complete the chlorination facilities at Copper Basin and Lake Mathews, and in June 2009, MWD appropriated $1.13 million for design and construction of a chlorination system to control quagga mussel growth at the Skinner oxidation retrofit facilities. All told, MWD estimates that its costs for controlling quagga mussels could exceed $10 million per year.

F. Other Factors Affecting Water Supplies

1. Statewide Drought Conditions

Much of Riverside County can be subject to extreme weather events, including drought and the resulting impacts of such events. Drought, like other extreme events, may be localized or wide-spread, and hydrologic conditions constituting a drought for water users in one location may not constitute a drought for water users elsewhere or for water users having a different water supply. A determination of the existence of regional or statewide drought conditions is based on a combination of hydrologic and water supply factors. Because much of Southern California's water supply originates in Northern California in the Sacramento and San Joaquin River basins, DWR relies on hydrologic indices to define water year types for those areas. Snowpack is an important indicator of the water year type, since runoff from Sierra Nevada watersheds is the source of much of California's developed water supply. Based on snowpack and precipitation indices, DWR uses five water-year classifications: critical (being the driest), dry, below normal, above normal and wet.

While there is no accurate, long-term weather forecasting that allows the prediction of when droughts will occur or how long they will last, multi-year droughts are not an infrequent occurrence in California, happening at least once a decade, including the recent periods of 1987-1992, 2006-2009 *and 2013 to present*. Fortunately, droughts exceeding three years are *less likely to occur in* ~~relatively rare in~~ Northern California, the source of much of California's water supply. However, on average, the last decade has been one of the driest on record *across all of California.* According to DWR (Drought FAQs, 2011), parts of California experienced a series of consecutive dry years, water year 2000 set records for the single driest precipitation year on record for Los Angeles and San Diego, and Colorado River inflow into Lake Powell was below average for all but two years between 2000 and 2010.

California developed drought conditions beginning in 2012, and conditions are more extreme than found in previous drought years. In nearly 120 years of recorded history, 2013 was the driest year for California. Similar drought conditions have extended into 2014, with little rainfall and sparse snowpack. As mentioned above, much of Southern California relies on water supplies that originate in Northern California. Sparse snowpack in 2013 and 2014 in the Sierra Nevada Mountains has significantly decreased the amount of water typically provided to Southern California. This decrease in precipitation and snowpack statewide has affected water availability across the board for California, and the state's major reservoirs contain only half of their storage capacities. In January 2014, Governor Brown declared a drought State of Emergency, and directed state officials to take all necessary actions to prepare for water shortages. CAL FIRE hired additional firefighters, California Department of Public Health identified and offered assistance to communities at risk of drinking water shortages, and the California Department of Fish and Wildlife restricted finishing on waterways with low flows. The Water Year 2014 (October 1, 2013 to September 30, 2014) has been labeled California's third driest year, and the U.S. Drought Monitor classified 58% of California in "exceptional" drought and 80% of California in "extreme" drought. NOAA's National Climatic Data Center also reported above average statewide temperatures, which also affects water supply.

As noted by DWR's 2009 publication "Recent California Drought," impacts of drought are usually felt first by those who are directly reliant on annual rainfall, such as ranchers engaged in dryland grazing, rural residents reliant on wells in low-yield areas and small water systems lacking a reliable or alternate source. Drought impacts increase with the length of the drought, as supplies in reservoirs are depleted and groundwater levels decline. As drought conditions continue, other groups become more and more impacted, including individuals in or employed by the agricultural industry, local businesses related to agricultural activities, businesses or individuals dependent on agriculture and non-profit organizations serving the needs of those affected by the drought.

Unlike other extreme events such as earthquakes, fires or floods, drought onset is slow, which can often allow water suppliers sufficient time to implement preparedness programs, institute voluntary or mandatory conservation measures and mitigate reductions in normal supplies. Further, California has an extensive system of water supply infrastructure, including reservoirs, groundwater basins and inter-regional conveyance facilities. This infrastructure helps give water agencies the flexibility they need to respond to the demands of different types of water years and mitigate the effects of dry periods for most types of water users. ~~Thanks to this infrastructure, even after multiple consecutive dry years, one winter of heavy precipitation can often bring water supplies to normal levels.~~

As noted in previous sections, due to the current statewide drought, the SWP was only able to allocate about 5% of the total 4 million acre feet requested by public agencies. While drought onset is slower than other natural disasters, it is difficult to predict when the drought conditions will be reversed. Additional details regarding the relationship between recent drought conditions and SWP supplies and regional and local water supply reliability are discussed further in Section 4.19.4.

2. Climate Change

In addition to the legal and environmental constraints described above, it is also possible that future imported water deliveries could be affected by climate change due to the increased concentrations of carbon dioxide in the atmosphere. Climate change already appears to be altering the hydrologic conditions in the state, adding another layer of unpredictability to the water supply picture in Southern California. Further, climate change could exacerbate California's existing mismatch between where and when precipitation occurs and where and when water is needed.

As previously discussed for the SWP in Section 4.19.3.D, the DWR states that current research suggests global warming could significantly affect the hydrologic cycle, changing California's precipitation patterns and amounts from that of the historical record. There is evidence that suggests some changes have already begun to occur, such as Sierra snowmelt starting earlier, more runoff shifting from the spring to the winter, average air temperature increases of one degree Fahrenheit, rising sea levels and an increase in winter flooding frequency. *NOAA National Climatic Data Center reported that for the first nine months of 2014, California temperatures averaged 63.7º F, or 4.1º F above the 20th century average of 59.6º F. Temperatures from April to September averaged 70.0º F, breaking the old record for the period of 69.4º F set in 2013. In normal years, snowpack stores water during the winter months and releases is through melting during the spring and summer to replenish rivers and reservoirs. However, dry conditions have reduced the amount of snowpack in California's mountains, and warm weather caused early snowpack melting.*

These *climate* changes would significantly affect water supply planning and place more stress on the reliability of existing water supply infrastructure and flood management systems. Other important global climate change concerns include effects on local water supplies, including groundwater; changes in urban and agricultural demand levels and water consumption patterns due to higher temperatures; impacts to human health from water quality degradation and water-borne pathogens; declines in ecosystem health and function; and alterations to power generation and pumping regimes.

Because the potential impacts of climate change have been identified and incorporated into modeling efforts by DWR and individual water agencies, preparation for many of the possible impacts of global climate change are already being incorporated into water planning. For example, the Water Utility Climate Alliance, a group of ten nationwide water providers collaborating on climate change adaptation and greenhouse gas management issues, issued a white paper in January 2010 on methods for incorporating climate change variability into water planning. In addition, water agencies including MWD, CVWD, EMWD and others have already begun planning for possible scenarios resulting from climate change and incorporating responses to climate change in their UWMPs and other planning documents. (For example, see MWD 2010 RUWMP, pages 2-25 to 2-27; CVWD 2011 Management Plan Update, pages 5-15 to 5-17; EMWD 2010 UWMP page 75.)

a. Climate Change and the SWP

Climate change scenarios may further reduce the reliability of SWP water deliveries. As set forth above, DWR's 2011 SWP Final Delivery Reliability Report expressly accounts for and analyzes the potential impacts of climate change on SWP Table A and Article 21 deliveries, which indicates that climate change could decrease average SWP deliveries by as much as 5%. However, SWP- receiving wholesale water agencies that serve Riverside County, such as MWD, EMWD, WMWD and CVWD, have taken these reductions into account in their most recent UWMP updates and have developed elements to deal with the water delivery reductions and added unpredictability, including implementation of additional water conservation methods and development of alternative water supplies, including recycled and desalinated water.

b. Climate Change and the Colorado River

As discussed in MWD's 2010 RUWMP and CVWD's 2011 Management Plan Update, anticipated climate change scenarios may also impact availability of water from the Colorado River. While precise estimates of future impacts of climate change on runoff throughout the Colorado River basin are not currently available, some type of impact is expected. For example, increasing temperatures alone would likely increase losses due to evaporation and sublimation, resulting in reduced runoff. Other potential impacts include decreased annual flow, increased flow variability and more frequent and more severe droughts. Potential changes in the amount of precipitation received by the Colorado River basin could also affect basin yield, according to the CVWD 2011 Management Plan Update (page 5-15).

Potential climate change impacts were evaluated in the U.S. Bureau of Reclamation's 2007 Environmental Impact Study on the "Colorado River Interim Guidelines for East Basin Shortages and Coordinated Operations for Lakes Powell and Mead." These guidelines, which extend through 2026, were crafted to include operational elements to address potential impacts of climate change and increased hydrologic variability. Measures include coordinated operational elements and enhanced conservation opportunities. In addition, water agencies reliant on Colorado River water supplies, including CVWD and MWD, have incorporated elements in their most recent (2010) UWMP updates to deal with the increased unpredictability in Colorado River water supplies due to climate change to help prevent and ameliorate its effects. (For example, see CVWD 2011 Management Plan Update, pages 5-15 to 5-17; MWD 2010 RUWMP, pages 2-25 to 2-27.)

G. Regulations Affecting Water Demand

In concert with the many efforts described herein that are occurring statewide, regionally and throughout Riverside County to diversify, maximize and manage water supplies, California has officially shifted to a new paradigm with respect to managing water demands. The information below is an overview of several key factors affecting current and projected water demands. Additional information and analyses are provided below to illustrate the myriad approaches being implemented by regional wholesale and local retail water agencies throughout Riverside County to achieve extraordinary water conservation. See Appendix EIR-8 for additional details.

1. California's 20 X 2020 Law (SBX7-7)

The Water Conservation Act of 2009 (also referred to as 'SBX7-7' or the '20x2020' law) was enacted as part of the historic comprehensive water package passed during the 2009-2010 7th Extraordinary Session of the California Legislature. As described by MWD's 2010 Regional UWMP, SBX7-7 represents the culmination of efforts by water industry leaders, the environmental community and the legislature to enact legislation that would answer the Governor's call for the state to reduce per-capita water use 20% by the year 2020 as part of the larger effort to ensure reliable water supplies for future generations. The general declarations and policy of SBX7-7 (CWC Section 10608) recognize, among other things, that: Growing population, climate change and the need to protect and grow California's economy while protecting and restoring our fish and wildlife habitats make it essential that the state manage its water resources as efficiently as possible. Diverse regional water supply portfolios will increase water supply reliability and reduce dependence on the Delta.

Reduced water use through conservation provides significant energy and environmental benefits and can help protect water quality, improve stream flows and reduce greenhouse gas emissions. Improvements in technology and management practices offer the potential for increasing water efficiency in California over time, providing and essential water management tool to meet the need for water for urban, agricultural and environmental uses.

The factors used to formulate water use efficiency targets can vary significantly from location to location based on factors including weather, patters of urban and suburban development and past efforts to enhance water use efficiency. The new law includes provisions that apply to both urban and agricultural water conservation.

As applied to urban water conservation, SBX7-7 establishes the goal of achieving a 20% reduction in statewide urban per-capita water use by December 31, 2020, and the interim goal of achieving a 15% reduction by 2015. In an effort to achieve these goals, SBX7-7 requires urban retail water suppliers to develop technical information, such as baseline daily per-capita water use, water use targets and interim water use targets, and to report that information in their 2010 UWMPs.

Base daily per-capita (BDPC) water use is one of two of the primary calculations required by SBX7-7 and represents the average gallons per capita per day (GPCD) value for past water usage. The other key metric are the compliance water use targets, which represent the GPCD targets for 2015 and 2020. The BDPC water use calculation is based on gross water use by an agency in each year and can be from a ten-year average ending no earlier than 2004 and no later than 2010. Or, if 10% of an agency's 2008 municipal demand was met by recycled water, its BDPC may be based on a 15-year average. Using this BDPC water use figure, an urban retail water supplier must then determine its urban water use target for 2020 and its interim water use target for 2015, both in terms of GPCD. These are the 'compliance' water use targets.

CWC Section 10608.20(b) establishes four alternative methods for calculating the compliance water use targets. Generally, they must be determined via one of the following methods: (1) 80% of BDPC water use; (2) adherence to certain water use performance standards; (3) 95% of the applicable state hydrologic region target, as set forth in the State of California's Draft 20x2020 Water Conservation Plan; or (4) the provisional target method and procedures developed by DWR pursuant to SBX7-7. Per-capita reductions under SBX7-7 can be accomplished through any combination of increased water conservation, improved water use efficiency and increased use of recycled water to offset potable demands. Potable demand offsets can also occur through direct reuse of recycled water, such as for irrigation, or indirect potable water reuse through groundwater recharge and reservoir augmentation. SBX7-7 provides additional flexibility by allowing compliance on an individual agency basis or through collaboration with other agencies in a region. Based on MWD's analysis of population and demand, compliance with the 20x2020 goals on an individual agency basis throughout MWD's service area would result in reduced potable water demand by 380,000 AF in 2020.

To assist agencies in preparing the calculations required by SBX7-7, in March 2011, the DWR published a "Guidebook to Assist Urban Water Suppliers to Prepare a 2010 Urban Water Management Plan" and the "Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use (For the Consistent Implementation of the Water Conservation Act of 2009)." Agencies throughout Riverside County have utilized and relied upon DWR's guidance documents in preparing their 2010 UWMPs and complying with SBX7-7. Of particular note, an urban retail water supplier's failure to comply with the requirements of SB X7-7 may be render that agency ineligible for State of California water grant and loan funding opportunities.

As applied to agricultural water conservation, SBX7-7 requires all agricultural water suppliers (as defined by statute) to prepare and adopt an agricultural water management plan by December 31, 2012, and to update those plans by December 31, 2015, and every five years thereafter. As part of the agricultural water management planning process, agricultural water suppliers are required on or before July 31, 2012, to measure the volume of water delivered to their customers, a universal requirement being applied for the first time in California. Pursuant to SBX7-7, DWR must adopt regulations that provide for a range of options that agricultural water suppliers may use to comply with the measurement requirement. In addition, agricultural water suppliers will be required to adopt a pricing structure for water customers based at least in part on the quantity of water delivered and to implement efficient management practices as specified by SBX7-7. Effective 2013, agricultural water suppliers

that do not meet the water management planning requirements established by SBX7-7 will not eligible for State of California water grants or loans.

2. California Model Water Efficient Landscape Ordinance Law

California Assembly Bill 1881 (AB 1881), enacted in September 2008, modified and strengthened the Water Conservation in Landscaping Act (CGC Section 65591 *et seq.*) Among other things, AB 1881 required DWR to update the Model Water Efficient Landscape Ordinance in accordance with specified requirements to reflect the recommendations of the Landscape Task Force as documented in the report entitled Water Smart Landscapes for California. In addition, AB 1881 required local agencies to adopt the updated Model Ordinance or a local landscape ordinance that is at least as effective in conserving water for specified landscape applications, no later than January 1, 2010. If the local agency failed to adopt the Model Ordinance or its own local landscape ordinance, the Model Ordinance became applicable within that jurisdiction as a default measure. In addition, an updated Model Ordinance was approved September 10, 2009. A copy of the updated Model Ordinance may be viewed at: www.water.ca.gov/wateruseefficiency/docs/MWELO09-10-09.pdf.

The County of Riverside has an ordinance for the efficient use of water for landscaping. Ordinance No. 859, Water-Efficient Landscaping Ordinance, was adopted in 2006 and establishes provisions for water management practices and water waste prevention. See Section 4.19.5 for additional information.

3. Demand Management Measures and Best Management Practices

'Water conservation' is broadly defined to mean the use of less water for the same purpose of use allowed under the appropriative water right. The 2009 CWP identified urban water conservation as the water management strategy most effective for matching supply and demand. Water conservation is an attractive water management strategy because it can yield multiple benefits. Reducing demand can reduce or delay the capital cost of new infrastructure to treat and deliver water. Reduced use also reduces the demand for wastewater treatment, including capital costs and ongoing treatment costs. Water quality may also benefit.

In regard to water conservation, the UWMP Act identifies the following 14 Demand Management Measures (DMMs) that serve as a benchmark for all agencies. As recognized by DWR (CWC Section 10631(f)), these DMMs correspond with the 14 Best Management Practices (BMPs) set forth in the California Urban Water Conservation Council's Memorandum of Understanding Regarding Urban Water Conservation in California, as amended (June 9, 2010). They address the following areas or measures:

- Water survey programs for single-family residential and multifamily residential customers
- Residential plumbing retrofit programs
- System water audits, leak detection and repair
- Metering with commodity rates for all new connections and retrofit of existing connections
- Large landscape conservation programs and incentives
- High-efficiency washing machine rebate programs
- Public information programs

- School education programs
- Conservation programs for commercial, industrial and institutional accounts
- Wholesale agency programs
- Conservation pricing
- Use of a water conservation coordinator
- Water waste prohibitions
- Residential ultra-low flush toilet replacement programs

All of the state's urban water suppliers are pursuing and achieving extraordinary conservation pursuant to the UWMP Act, SBX7-7 and other local conservation requirements. Additional information on the conservation activities of Riverside County's water suppliers are summarized under their respective sections later in this chapter or provided in Appendix EIR-8.

4.19.4 Existing Environmental Setting – Local Water Supplies Serving Riverside County

A. Introduction

While imported water makes up a large portion of the region's supply of drinking water, local sources are an important part of the overall water resources for Riverside County. The prior section focused on the sources and issues affecting the region's supply of imported water from the Sacramento-San Joaquin Delta via the State Water Project and the Colorado River along the state's eastern border. In this section the various sources of local water supplies are examined. The chief source of local water supplies is groundwater. Thus, this section begins with an analysis of those groundwater basins most likely to be affected by the proposed project. Other local sources of water include surface water (rivers, streams, etc.) and recycled water (such as that reclaimed from wastewater treatment plants, among others), as well as desalination, graywater and other less-prominent sources. Each of these sources is discussed in turn below.

After discussing the various sources of local water, this section goes on to describe in detail the water supplies, services and resources associated with the numerous water agencies that serve Riverside County. In particular, a complete accounting is provided for the Metropolitan Water District of Southern California (MWD), since it is the major water importer and wholesale supplier serving most of Southern California, including most of western Riverside County. Following MWD, descriptions are provided for the other large wholesale water agencies serving Riverside County, first for western Riverside County and then for eastern. Accompanying these are brief descriptions of the individual retail water providers that rely on the wholesalers, with an emphasis on the water agencies expected to be affected by or serve the future development accommodated by GPA No. 960.

B. Local Groundwater Basins

Groundwater basins are defined by the California DWR pursuant to Bulletin 118 (2003), which describes each basin in California. As shown in Figure 4.19.14 (Groundwater Basins Within Riverside County), a number of groundwater basins underlie Riverside County. Where groundwater basins in Riverside County are expected to serve as water sources for future development accommodated by the project where no water district exists, information is provided herein. (These areas area discussed in greater detail at the end of this section as well). The intent of this section is ensure that in the absence of an UWMP or water service provider, sufficient information and analyses are provided to Riverside County decision-makers. This will enable them to make informed decisions regarding water resources and potential impacts. For the project's specific effects and impacts on water resources, see sections 4.19.4 and 4.19.5, later in this chapter.

1. Groundwater Rights and Regulations

California law recognizes several types of groundwater rights and also authorizes several ways to regulate and manage groundwater resources. Notably, however, no single statewide system exists in California for the allocation of groundwater rights, or for the use, regulation or management of the State of California's groundwater resources. The primary types of groundwater rights recognized in California are overlying, appropriative and adjudicated rights.

An *overlying right* is the right of a landowner to produce (e.g., pump up) percolating groundwater that exists beneath the property for reasonable and beneficial use on the overlying property, including but not limited to domestic, agricultural and related uses. Overlying rights are correlative, such that all holders of an overlying right to a particular source of groundwater have shared priority to the safe yield of a groundwater basin.

An *appropriative right* is the right to produce groundwater for non-overlying use, such as a use that is distant from the overlying land from which the groundwater is produced. Appropriative rights only apply to the amount of groundwater that is surplus to the reasonable and beneficial uses of overlying right holders.

An *adjudicated right* is obtained through legal proceedings brought to determine the rights of certain parties to divert or extract water from a particular source. Typically, a trial is conducted and the court issues a judgment or decree establishing the parties' respective water rights and specifying how those rights may be exercised and administered. Each adjudication is unique and the nature of an adjudicated right is determined by the express provisions of each judgment, decree, order or decision. Adjudicated rights are commonly determined when a groundwater basin is in overdraft.

Within Riverside County, a number of groundwater basins, as well as a few surface waters, have been subject to an adjudication process establishing various parties' rights to ensure the resource is used in a fair and sustainable way. Table 4.19-K (Adjudicated Waters in Riverside County) lists these waters, as identified by the State of California. Additional information on these resources and details on their adjudication can be found in the water agency descriptions (Section 4.19.4.D through F).

Among California's different types of groundwater rights, there are also different structures for regulating and managing groundwater. For example, the Regional Water Quality Control Boards carry out certain roles in regulating groundwater quality (as discussed in Section 4.19.2). Beyond those regulatory controls, the California Water Code authorizes the adoption of local groundwater management plans to address matters such as groundwater storage and recharge, well field contamination, monitoring programs and production assessments (commonly known as 'AB 3030' plans).

Thus, existing groundwater rights and management programs have usually been developed on an *ad hoc* basis in response to local conditions through local agencies, adjudication or districts formed by special legislation. See Section 4.19.5 for further information on local laws relating to groundwater.

2. Groundwater Basins in Riverside County

As shown in Figure 4.19.14, a number of groundwater basins are located within the two state-defined hydrologic regions covering Riverside County, the South Coast and Colorado River hydrologic regions. The information presented in this section is from DWR's California's Groundwater Bulletin 118, 2003 Update, unless noted otherwise. It should also be noted that, per the DWR, the water quality data reported here is intended as "an indicator of the types of activities that cause contamination in a given basin." It is only representative of the sample location site and "does not indicate the water quality delivered to the consumer."

Table 4.19-K: Adjudicated Waters in Riverside County

Water Body	Adjudication Information	Location
Surface Waters and Watersheds		
Santa Ana River	Decree Entered (state assisted). Private Watermaster	
Santa Margarita River Watershed	U.S. District Court- appointed Watermaster, final 1966.	Located in Riverside and San Diego Counties; For three GW Basins: 9-4, 9-5 and 9-6
Temecula Creek (Santa Margarita River)	Federal Decree; No Decree Entered	
Whitewater River	Statutory Adjudicated, Decree Entered (state assisted)	
Groundwater Basins		
Beaumont Basin	Watermaster by committee of various affected water agency heads. Final 2004.	Encompasses Groundwater Basins 8-2.08, 8-2, 7-21.04 and 7-21
Chino Basin	Court-appointed Watermaster. Final 1978.	Located in Riverside and San Bernardino Counties; NW part of Upper Santa Ana Valley Basin (8-2). (Cucamonga Basin, also part of Basin 8-2, was adjudicated sep.).
Upper San Jacinto Basin	Decree Entered (state assisted)	Adjudication "includes underground water"
San Bernardino Basin Area (SBBA)		Located in Riverside and San Bernardino Counties. Spans the NE part of Upper Santa Ana Valley Basin, GW Basin 8-2.

Source: DWR, Bulletin 118, 2003 Update, 2003. DWR Exhibit, "Water Rights Determination, California, 2002," 2002.

3. Colorado River Hydrologic Region – Groundwater Basins

DWR Bulletin 118 reports that the Colorado River Hydrologic Region covers approximately 13 million acres (20,000 square miles) in southeastern California. It is bounded on the east by Nevada and Arizona, the south by Mexico and to the west by the Laguna, San Jacinto and San Bernardino Mountains. The region spans all of Imperial County, most of Riverside County, much of San Bernardino County and part of San Diego County. About 533,000 people live in the region (as of 1998) and its largest population centers are Palm Springs, Palm Desert, Indio, Coachella and El Centro.

Many of the desert's alluvial valleys are underlain by groundwater aquifers. Roughly 26% of the region, (about 8.68 million acres) have underlying groundwater basins. A total of 64 basins and sub-basins have been delineated within the region. Due to the vast area and sparse settlement patterns throughout much of it, many of these local groundwater aquifers are the sole source of water for local communities.

According to the DWR, groundwater provides about 8% of the water supply in normal years for agricultural and urban uses within the region. In smaller basins, groundwater is found in unconfined alluvial aquifers. In some of the larger basins, particularly near dry lakes, aquifers may be separated by geological barriers that create confined groundwater conditions. Depths of basins range from tens or hundreds of feet in smaller basins and along arms of ephemeral rivers to thousands of feet in larger basins. The thickness of aquifers varies from tens to hundreds of feet. Well yields vary in this region depending on aquifer characteristics and well location, size and use. Some aquifers are capable of yielding thousands of gallons per minute to municipal wells.

Conjunctive use of surface water and groundwater is a long-standing practice in the region. Water is imported from the Colorado River for irrigation in Imperial, Coachella and Palo Verde valleys and from groundwater recharge in Coachella Valley. Water imported from Northern California via the State Water Project is used to replenish Warren and Joshua Tree groundwater basins. Many agencies have erected systems of barriers to allow more efficient percolation of ephemeral runoff from surrounding mountains. Some regional agencies are starting to investigate the concept of utilizing groundwater basins in this sparsely populated region for storing water that would then be pumped during drought years.

Table 4.19-L: Groundwater Basins in Riverside County

Basin/Subbasin # Name (Type[1])	Area (acres)	Well Yields[2]		Active Monitoring			TDS[6] (mg/L)	
		Max	Ave	No[3]	Qual[4]	Title 22[5]	Ave.	Range
South Coast Hydrologic Region

* Denotes groundwater basins located beneath known proposed project areas. See text for descriptions.

Footnotes:

1. Groundwater Budget Type (per DWR, Bulletin 118, Box R):
   - A: Indicated that a groundwater budget (GWB) exists for the basin; enough information was available from varied sources to give a general indication of the basin's GWB; a groundwater model exists for the basin that can be used to calculate a GWB; or, actual groundwater extraction data exist for the basin.
   - B: Indicates that a use-based estimate of groundwater extraction was calculated for the basin.
   - C: Indicates that there is not enough data to provide either an estimate of the basin's GWB or groundwater extraction from the basin.
2. Well yields: Maximum and average well yields in gallons per minute (gpm) are reported for municipal supply and agricultural wells where available. Most of the values reported are from initial tests reported during well construction, which may not be an accurate indication of the long-term production capacity of the wells.
3. Number: the number of wells actively monitored without consideration of frequency.
4. Quality: the number of wells monitored for various constituents.
5. Title 22: the number of public water system wells that are actively sampled and monitored under the direction of the California Department of Health Services Title 22 program.
6. TDS: Total dissolved solids. Data from published reports.
7. Subdivided into two areas known as Riverside North and Riverside South for management purposes.

Source: DWA, Bulletin 118, "Hydrologic Regions of California," 2002. DWA, Bulletin 118 Update, Tables 24 and 41, 2003.

The chemical character of groundwater in the Colorado River region is variable. Minerals typically occurring in the region's water commonly include sodium and calcium, with magnesium appearing less often. Bicarbonate is usually the dominant anion, although sulfate and chloride waters are also common. In basins with closed drainages, water character often changes from calcium-sodium bicarbonate near the margins to sodium chloride or chloride-sulfate beneath a dry lake. It is not uncommon for concentrations of dissolved constituents to rise dramatically toward a dry lake where saturation of mineral salts is reached.

The TDS content of groundwater is high in many of the basins in this region; high fluoride content is also common. Sulfate content occasionally exceeds drinking water standards and high nitrate content is also common, especially in agricultural areas. Two of the primary challenges in the Colorado River region are overdraft in the Coachella Valley and leaking underground storage tanks. The EPA has not yet placed any contamination sites in this hydrologic region on the Superfund National Priorities List. However, one site is under consideration because of high pesticide levels.

From 1994 through 2000, a total of 314 public supply water wells were sampled in 23 of the 64 basins and subbasins of the Colorado River region. Analyzed samples indicate that 270 wells (86%) met the State of California primary MCLs for drinking water standards. Roughly 44 wells (14%) had constituents that exceeded one or more MCL.

The following basins and subbasins occur within the Colorado River Hydrologic Region and underlie areas potentially subject to future development as a result of the proposed project that are not already served by an existing public water agency or district. For a summary of all the region's groundwater basin data (i.e., Table 41 from DWR Bulletin 118, 2003 Update), see Appendix EIR-8.

Pinto Valley Groundwater Basin (No. 7-6): As shown in Figure 4.19.14, this fairly large basin underlies roughly 286 square miles of the Pinto Valley, located roughly east of the Upper Coachella Valley and southeast of

the Joshua Tree area. It drains eastward by the Fried Liver, Smoketree and Porcupine Washes. Annual average precipitation ranges to 6 inches.

Recharge to the basin is by percolation of runoff from the surrounding mountains, precipitation to the valley floor and by underflow. Groundwater moves eastward through the basin towards Chuckwalla Valley. Water levels have been generally noted as declining in the past 50 years, however, it has also risen at times. The total storage capacity of the basin is estimated at 230,000 AF. The amount currently in the basin is unknown, according to the DWR. Extractions are estimated at 319-320 AFY. This data, however, is from 1954 and more recent data is not available.

The chemical character of the groundwater ranges from sodium sulfate in the east to rich in sodium, calcium and their bicarbonates in the western portion of the basin. TDS ranges from 235-435 mg/L in the western part of the basin and 408-839 mg/L in the eastern part. The average TDS from a public supply well in the basin was 300 mg/L. At 298 mg/L, the eastern portion's sulfate concentrations locally exceed the MCL. In 1975, DWR also reported that the basin's fluoride concentrations are locally high for domestic use and the percent sodium is also high for irrigation use. There is only one public supply well reported for the basin. No water agencies, districts or management plans cover this basin.

Coachella Valley Basin (No. 7-21): The Coachella Valley Basin spans the entire Coachella Valley, roughly 525,000 acres, from the San Bernardino County line and San Gorgonio Pass in the north to the Imperial County line and Salton Sea to the south. The basin is subdivided into four subbasins, of which, the Indio Subbasin in the largest.

RIVERSIDE COUNTY PLANNING DEPARTMENT

GROUNDWATER BASINS IN RIVERSIDE COUNTY

This page intentionally left blank.

Indio Subbasin (No. 7-21.01): The Indio (Whitewater River) Subbasin itself spans roughly 336,000 acres (525 square miles) of Riverside County, as well as portions of San Bernardino and Imperial Counties. It extends southeast down Coachella Valley approximately 70 miles to the Salton Sea and is bounded by the Garnet Hill Fault in the north and the San Andreas Fault to the southeast. The Banning Fault bounds it to the north and the semi-permeable rocks of the Indio Hills marking the northeast boundary. The San Jacinto and Santa Rosa Mountains bound the subbasin on the south and bedrock of the San Gorgonio Pass bounds the subbasin to the northwest. The Salton Sea is the eastern boundary and the subbasin's primary discharge area. The subbasin underlies most of the valley's the cities. From about Indio southeasterly to the Salton Sea, the subbasin contains increasingly thick layers of silt and clay, especially in its shallower parts. These silt and clay layers, remnants of ancient lake beds, impede the percolation of water applied for irrigation and restrict groundwater recharge opportunities to the westerly and easterly fringes of the subbasin. The area receives an average of about 6 inches of precipitation a year.

The Indio Subbasin is drained by the Whitewater River and its tributaries. The Whitewater River rarely flows throughout the year and flow in its tributaries, such as the San Gorgonio River, is intermittent. Surface flow is southeastward to the Salton Sea. The Colorado River Aqueduct and the Coachella Branch of the All-American Canal convey imported surface water into the overlying Coachella Valley.

The groundwater supply of the Whitewater River Subbasin consists of a combination of natural runoff and returns from groundwater and imported water use. The supply is supplemented with artificial recharge with imported SWP and Colorado River water. Since the early 1980s, the water levels in this subbasin have been declining, at least partially due to increasing urbanization and groundwater usage. The long-term average of natural inflow is about 57,000 AFY and varies from about 8,000 AFY in very dry years to over 200,000 AFY in extremely wet years. From 2000 to 2009, natural inflows were below normal, averaging about 40,000 AFY. Returns from use vary with water demands. From 2000 to 2009, returns from use averaged about 240,000 AFY. During this same period, about 51,000 AFY of imported water was recharged in the basin while total inflows were about 331,000 AFY. Outflows from the basin were due to pumping, flows to the agricultural drainage system, evapotranspiration by native vegetation and subsurface flow to the Salton Sea. Between 2000 and 2009, groundwater pumping averaged about 389,000 AFY. Drain flows are estimated be about 48,000 AFY, while evapotranspiration and subsurface outflow averaged about 4,000 AFY. Total basin outflows for this period averaged 441,000 AFY.

Surface runoff and subsurface inflow are significant sources of recharge to the subbasin. In addition, the Whitewater River spreading grounds northwest of Palm Springs is recharged with imported Colorado River Aqueduct water and has a maximum capacity of 300,000 AFY. Colorado River water is conveyed into the subbasin via the Coachella Canal, which also supplies a pilot recharge project facility located in the southeastern part of the subbasin.

According to the CVWD, prior to 1949, pumping caused a steady decline in water levels. After 1949 and into the early 1980s, water levels rose as imported Colorado River water began to recharge parts of the subbasin. Elsewhere in the subbasin during this time, however, water levels continued to decline. And, since the 1980s, water levels in all parts of the subbasin have largely declined, even with the Colorado River imports. These declines are largely due to increasing urbanization and groundwater pumping.

Groundwater storage was estimated at 10,200,000 AF in the first 700 feet of saturated deposits, plus another 1,520,000 AF groundwater in storage for the Garnet Hill area. Between 1953 and 1967, the average annual decrease of groundwater storage was estimated at 33,000 AFY; though the DWR notes that population and development increases probably result in even larger average annual decreases now. CVWD (2000) estimates the

decrease in freshwater in storage in the Coachella Valley Groundwater Basin for 1999 to be 136,700 AF, of which the Indio Subbasin is the largest part.

According to the CVWD, total inflows for 1999 were 392,000 AFY and total outflows were 465,800 AFY, with a net annual change in freshwater storage of 136,000 AFY. The Whitewater River spreading grounds recharged 61,200 AFY in 1999. Average historical natural recharge is approximately 49,000 AFY, ranging from 187,000 AFY in extremely wet years to as low as 10,000 AFY in dry years. The average annual streamflow from streams in the subbasin is an estimated 31,000 AF.

Native groundwater in the Indio Subbasin is predominantly calcium bicarbonate in character, with an average TDS content of 300 mg/L. The Colorado River water is added to the subbasin at the Whitewater River spreading grounds and mixes within the subbasin, resulting in a net salt addition of approximately 265,000 tons per year. A plume of high nitrate-concentration groundwater (45 mg/L or greater) was noted extending southeasterly from near Cathedral City toward La Quinta. According to the DWR, the nitrate plume is a potential threat to deeper underlying groundwater via improperly constructed, sealed or abandoned wells. Groundwater near major faults, such as the Banning and San Andreas faults, contains elevated levels of fluoride.

Data reported by the DWR indicates that of 161-164 wells sampled under DHS Title 22 program requirements between 1994 and 2000, two showed concentrations above an MCL for primary inorganics and 13 for secondary inorganics, as well as seven for radiological constituents. None of the wells exceeded MCL for nitrates, pesticides, VOCs or SVOCs.

The subbasin has a reported 30 wells used by the CVWD for water level monitoring and 204 wells are used for public water supplies. The subbasin is utilized by both the CVWD and the DWA. The Coachella Valley Water Management Plan includes the Indio Subbasin amongst its management areas. As described previously, this CVWD-DWA joint plan is intended to outline and address the "current issues and management goals and practices pertaining to the area's groundwater system," including overdraft of the Indio Subbasin.

In 2003 the California DWR noted that the amount of usable supply in the overdrafted aquifer was decreasing. CVWD estimates basin overdraft annually and found the annual loss in storage (i.e., overdraft) for the Coachella Valley was approximately 72,000 in 2009. The 2009 loss in storage was lower than historical loss due to increased SWP Exchange water deliveries at Whitewater River Recharge Facility and increased Canal water recharge at the Thomas E. Levy Groundwater Replenishment Facility (Levy facility) that began in the east valley in 2009.

The overdraft condition of the Coachella Valley has caused groundwater levels to decline in many portions of the east valley from La Quinta to the Salton Sea and has raised concerns about water quality degradation and land subsidence. Water levels in the west valley from Palm Springs to La Quinta have also decreased substantially, except in areas adjacent to and down gradient of the Whitewater River Recharge Facility, where artificial recharge has successfully raised water levels. In 2009, the annual loss in storage in the Lower Whitewater River Subbasin was 23,900 AF and for the Upper Whitewater River Subbasin it was 48,100 AF. In all, between 2000 and 2009, an average of 110,000 AFY was removed from storage.

Mission Creek Subbasin (No. 7-21.02): Encompassing roughly 756 square miles (49,000 acres), the Mission Creek Subbasin is the third-largest of the four Coachella Valley subbasins. This subbasin occupies the northern part of the Coachella Valley, lying in a wedge-shape between the larger Indio Subbasin on the south and west, and Desert Hot Springs Subbasin on the north and east. See Figure 4.19.14.

Major surface water features in the area are the Whitewater River, Mission Creek, San Gorgonio River, Little and Big Morongo washes. These drainages flow intermittently during high precipitation events. The area averages about 6 inches of precipitation a year.

While sediment deposits may be as deep as 7,000 feet, the DWR notes that only the upper 2,000 feet may be considered water-bearing. The subbasin's water becomes more saline with depth. The coarse-grained and unconsolidated soils enable well yields as high as 3,000 gallons per minute. Groundwater movement is generally southward, although movement is relatively low due to the relative flatness of the basin. Runoff from the surrounding highlands drains into the subbasin from intermittent creeks and rivers supplying most of the recharge to the subbasin. Subsurface leakage occurs across the Mission Creek Fault approximately three miles southeast from Desert Hot Springs, allowing groundwater of different quality to enter the subbasin from the neighboring Desert Hot Springs Subbasin.

The DWR notes that water levels have been declining since the early 1950s, at a rate of 0.5-1.5 feet per year, due to scarce annual precipitation and groundwater extractions. MSWD reports that current water levels vary in domestic wells from 140 to 721 feet below ground surface with an average depth to water of 372 feet. The total storage capacity for the subbasin is an estimated 2,600,000 AF. This is the amount of groundwater the subbasin can theoretically contain based on 1935-1936 groundwater levels and using a maximum depth below surface of 1,000 feet. The 1935-1936 levels are considered to be steady state pre-development conditions. Groundwater in storage for the subbasin is estimated to be 1,400,000 AF. Groundwater extractions within the subbasin for 2000 were 8,923 AF by MSWD and 3,176 AF by CVWD. Estimated average seasonal tributary runoff to the subbasin is 6,000 AF.

Groundwater in the subbasin ranges in character from a calcium-magnesium bicarbonate in the northwest to sodium chloride sulfate type in the southeast. The average TDS content is generally below 500 mg/L. Data reported by the DWR indicates that of 14-15 wells sampled, two showed concentrations above MCL for radiological constituents and one for nitrates. None of the wells exceeded MCL for primary or secondary inorganics, pesticides, VOCs or SVOCs.

The subbasin has a reported five wells used by the MSWD for water level monitoring and 15 wells used for public water supplies. The subbasin is utilized by the MSWD, as well as CVWD and DWA. The subbasin is not adjudicated, but is managed under the Coachella Valley Water Management Plan. CVWD, DWA and MSWD jointly manage the Mission Creek Subbasin under the terms of the Mission Creek Settlement Agreement (December, 2004). This agreement and the 2003 Mission Creek Groundwater Replenishment Agreement between CVWD and DWA specify that the available SWP water will be allocated between the Mission Creek and Whitewater River subbasins in proportion to the amount of water produced or diverted from each subbasin during the preceding year. Groundwater recharge in the Mission Creek basin has taken place since 2002. In 2009, production from the Mission Creek Subbasin was about 7% of the combined production from these two subbasins. CVWD, MSWD and DWA are jointly developing a water management plan for this subbasin.

Desert Hot Springs Subbasin (No. 7-21.03): This subbasin is the second largest in the Coachella Valley and covers roughly 158 square miles (101,000 acres). It lies at the southern end of the valley, north of the Salton Sea and along the east and west sides of the Sea, down into Imperial County. The Little San Bernardino Mountains and the Indio Hills form the subbasin's boundaries to the southeast and southwest, respectively. It is divided from the Indio Subbasin by the Banning-Mission Creek Fault.

Thickness of the water bearing deposits is estimated to be in excess of 700 feet. Due to lack of development within the subbasin, however, groundwater data is sparse, except for the Miracle Hill area where development is greater due to the thermal waters that supply resorts. These hot thermal waters occur near active faults such as

the Mission Creek Fault. In the Miracle Hill area, the DWR notes that more than 130 water wells were drilled and approximately half of these were active in 1961 and pumped water for the hot water spas. Many of these wells or replacement wells are still active according to MSWD.

Seasonal runoff draining from the Little San Bernardino Mountains recharges the subbasin by percolating through the underlying water bearing coalescing alluvial fan deposits. Surface runoff, from high precipitation or snow-melt, is contained by intermittent creeks that discharge into the subbasin. The region is subject to low precipitation levels, an average of 5.7 inches per year.

In 1961, depth to water ranged from 12 feet below ground surface near the Mission Creek Fault to over 300 feet southeast of Miracle Hill. Water level data was sparse in most areas within the subbasin except the Miracle Hills, where the water table is declining because of use by resorts. Water level data in the other areas of the subbasin suggest that the water table has remained stable and that the 1964 synopsis of groundwater level trends is probably still relevant to current basin conditions. Presently, the subbasin is still underdeveloped due to high levels of TDS and most of the groundwater extraction is in the Miracle Hill Area where water levels are still in decline.

The DWR calculated the groundwater storage capacity for Desert Hot Springs at 4.1 million AF, based on specific yields determined from drillers' logs. DWR also calculated the groundwater in storage values for the saturated thickness 20 feet below the water table at 172,000 AF for the entire subbasin in 1961. This value may have declined slightly due to hot groundwater extraction in the Miracle Hill resort area.

Not enough data exist to compile a detailed groundwater budget for the subbasin. Little groundwater extraction data is reported or made public at this time. Due to the lack of groundwater management of this subbasin, DWR states that a water budget cannot be given. Also, groundwater extraction values of thermal waters for the resorts and spas are not available. Average seasonal tributary runoff to the subbasin was estimated to be 2,900 AF.

Sodium sulfate type groundwater exists throughout the subbasin with high TDS values ranging from 800-1,000 mg/L and chloride levels of 100-150 mg/L. The high TDS concentrations limit agricultural and domestic water resources limit the use of the subbasin's groundwater within the valley. Groundwater adjacent to the Mission Creek Fault and in the Miracle Hill area of the subbasin contains the largest amounts of sodium and sulfate and has abnormally high temperatures.

Hot water wells near the City of Desert Hot Springs, in the subbasin along the Mission Creek Fault, have groundwater temperatures that average 118°F. Gypsum, which is a significant source of sulfate, is present in the exposures of the Mission Creek Fault and in the semi-water bearing materials of the Indio and Mecca Hills, and may be a possible source of the sulfate ions in the subbasin's groundwater. A single well was tested for radiological constituents, nitrates, pesticides, VOCs and SVOCs. No MCL was exceeded for any of these.

The CVWD monitors 10-15 wells for water levels, two wells are monitored for water quality pursuant to Title 22 and an unspecified number of hot water wells (supplying non-potable water for resort use) are monitored for bacteria by the Riverside County Department of Health Services. CVWD, DWA and MSWD all use water from this subbasin, which is also addressed in the Coachella Valley Water Management Plan.

San Gorgonio Pass Subbasin (No. 7-21.04): This last subbasin has an area of approximately 60 square miles (38,650 acres) and is the smallest of the four subbasins comprising the Coachella Valley Basin. It is located at the upper northwestern edge of the valley and lies entirely within San Gorgonio Pass. The San Bernardino Mountains and San Jacinto Mountains bound this subbasin to the north and south, respectively. A surface drainage divide

between the Colorado River and South Coastal hydrologic regions bounds the subbasin to the west. The eastern boundary is formed by a bedrock constriction that creates a groundwater cascade into the Indio Subbasin.

Average annual rainfall within the subbasin ranges from 15 to 18 inches. The San Gorgonio River flows intermittently over the subbasin and is its main surface drainage feature. Precipitation in the northern San Bernardino Mountains contributes its runoff to the San Gorgonio River. The alluvial sand and gravel deposits overlaying the subbasin readily allow water recharge. Overall, however, the subbasin has a complex geologic and hydrogeologic history with scarce historical data available. A steep groundwater gradient is present in most of the subbasin because of construction of the San Jacinto Tunnel in the 1930s; the intense de-watering necessary for its construction increased the groundwater gradient and changed groundwater movement from westward to southeastward (diverting into the Indio Subbasin).

Little subsurface inflow occurs for the subbasin, but about 9,000 AFY outflows into the Indio subbasin. Groundwater extraction from the subbasin in 1999 was an estimated 7,500 AF according to the SGPWA. Average precipitation over the subbasin is approximately 18,000 AFY and average stream flow is 5,000 AFY. About 9% (2,100 AF) of this precipitation and stream flow is estimated to provide recharge to the subbasin annually. Between 1967 and 1987, DWR reported groundwater levels in the eastern part of the subbasin as rising or staying the same. Initially estimated at around 2,700,000 AF, DWR now estimates the total storage capacity of the subbasin to be about 2, 200,000 AF with roughly 1,400,000 AF of groundwater in storage for the entire saturated thickness of the subbasin.

The DWR characterizes groundwater in the subbasin as predominantly calcium-sodium bicarbonate type, with the TDS content from municipal wells ranging from 106 to 205 mg/L. The SGPWA monitors the subbasin's water levels from 17 wells and its water quality from eight wells. Five wells are monitored for drinking water quality pursuant to Title 22. In addition to the SGPWA, the subbasin is utilized by the City of Banning Water District, the Beaumont-Cherry Valley Water District and the Morongo Indian Tribe.

Terwilliger Valley Groundwater Basin (No. 7-26): This small basin covers approximately 12.5 square miles (8,030 acres) underlying the Terwilliger Valley, in the heart of the Anza area, roughly between the junction of Highways 371 and 74, and the San Diego County line. The valley lies at high elevation, roughly 3,000-6,000 feet above sea level, along the southwestern edge of the Colorado Desert and is drained by Coyote Creek. Most of the basin lies within the Cahuilla Indian Reservation. The basin is bounded on the west and east by impermeable basement rocks of the Peninsular Ranges, on the north by a surface water divide and on the south by impermeable rocks at Coyote Canyon. Average annual rainfall ranges from 14-18 inches.

Well logs have indicated that the water-bearing formations within the basin range in thickness from a few feet to 550 feet, possibly reaching 800 feet thick near the San Jacinto Fault, which lies immediately to the east. The basin is recharged by runoff that percolates through the valley's alluvium. It has been posited that groundwater levels have declined in some parts of the basin because of pumping. A water budget for the basin, however, is not available.

Several wells in the basin yield water of sodium-calcium bicarbonate character, with TDS content ranging from 147-500 mg/L, according to DWR. Nitrate concentrations greater than 44 mg/L are found in some wells drilled into thin alluvial deposits overlying bedrock. As the water levels are shallow, DWR notes that the nitrate probably comes from chemical fertilizers, animal wastes, septic tanks and decomposition of native plants. Only one well is monitored for Title 22 water quality in the basin. Most of the basin lies within the Cahuilla Indian Reservation and details of basin management are not available.
