Section 1.0

Summary

Section 1.0 Summary

NOTE TO THE READER:

The County of Riverside is recirculating Draft Environmental Impact Report No. 521 (DEIR No. 521) for public review from February 21, 2015 through April 6, 2015 in accordance with the California Environmental Quality Act, Section 15088.5. Correlative changes were made to Draft General Plan Amendment No. 960 (GPA No. 960) and the Draft Climate Action Plan. The revised GPA No. 960 and CAP documents are made available for public reference.

The documents were previously circulated from May 1, 2014, through June 30, 2014. The circulation garnered a substantial amount of comments from government and regulatory agencies, interest groups, and Riverside County citizens, which resulted in the aforementioned changes. Additionally, several changes to the documents occurred in order to more accurately reflect the existing conditions of the County, and to further analyze impacts associated with the GPA No. 960. The following is a summary of the changes that occurred to the documents:

Draft General Plan Amendment No. 960:

- *Data corrections to the Lakeview Nuevo Area Plan to reflect the removal of Specific Plan 342.*
- *Removal of the Lakeview Mountains Policy Area from the Lakeview Nuevo Area Plan.*
- *Addition of language clarifying the Wine Country Community Plan (GPA No. 1077) in relation to the Southwest Area Plan.*
- *Addition of language clarifying Airport Land Use consistency and Mixed Use Planning Areas.*
- *Addition of Policy S 1.4 requiring the County to implement the County of Riverside Multi-Jurisdictional Hazard Mitigation Plan.*
- *Addition of Policy OS 4.9 discouraging development within watercourses and areas within 100 feet of riparian vegetation.*
- *Minor modifications to text and policies as a result from comments received during the circulation of the draft document.*

Draft EIR No. 521:

- *The Draft EIR was updated to better reflect the existing conditions within the County.*
- *Several analysis sections of the Draft EIR were further refined in order to reflect changes associated with the updated background information. These sections included Air Quality, Greenhouse Gas, Biological Resources, Transportation and Circulation, Water Resources, and Cumulative Impacts.*
- *All analysis sections were updated where relevant to maintain consistency with any changes made in the Draft General Plan Update and Draft Climate Action Plan.*

Draft Climate Action Plan:

- *The Draft Climate Action Plan was updated with new implementation measures.*

The recirculated documents better account for the changing environment in Riverside County and more accurately address future conditions. Although comments submitted during the previous comment period do not require a written response, it should be noted that these comments are part of the administrative record and were taken into consideration while drafting the revised document. Any comments made during the May 2014 circulation of the documents will be included in the administrative record; however they will not be addressed in the Response to Comments. Per Section 15088.5(f)(1) of the CEQA Guidelines, only those comments submitted in response to the recirculated Environmental Impact Report will receive a formal written response in the Response to Comments as a part of the Final EIR.

In order to clearly display all of the changes that have been made during the General Plan Update Process, text has been formatted to show changes made in each step of the process. This includes:

- Black Text: General Plan text prior to GPA No. 960 is noted in black text.
- *Red Text: Textual changes proposed as part of the May 2014 previously circulated document are shown in red text.*
- *Blue Text: Textual changes made to the documents after the May 2014 circulation are shown in blue text.*

The color coding of the edits allows the reader to distinguish more clearly between the original General Plan text, the previously proposed May 2014 revisions (red) and the new February 2015 proposed revisions to GPA No. 960, EIR No. 521 and the Climate Action Plan.

1.1 Background on the General Plan Update Project

Starting in the late 1990s, the County of Riverside entered into a highly innovative and progressive planning effort known as the "Riverside County Integrated Plan" (RCIP) to create a comprehensive vision for anticipating and addressing the competing needs of growth and development, transportation and regional circulation, environmental protection and resource conservation within Riverside County over the next 20 to 50 years. The result of this landmark effort was the October 2003 adoption of an entirely new General Plan that replaced the aging plan that had become a pastiche of disjointed elements, policies and maps. The RCIP effort also encompassed creation of the Community Environmental and Transportation Acceptability Program (CETAP) for planning and coordinating provision of regional transportation systems and development of Multi-Species Habitat Conservation Plans (MSHCPs) to protect valued natural resources within Riverside County.

A key innovation of the 2003 RCIP General Plan was the introduction of "Foundation Components," a set of five broad, major land use categories that capture the overarching patterns of lifestyle within Riverside County's unincorporated communities: Open Space, Agriculture, Rural, Rural Community and Community Development. These Foundations are then supplemented at the local (Area Plan) level by a series of "land use designations" (LUDs) that describe specific types of land use with associated building density or intensity ranges, such as "Rural Residential," "Recreation," Commercial Retail" and so on. Chapter 1 of the 2003 RCIP General Plan describes the relationship thusly:

> *Land use mapping at the General Plan level, such as in the Land Use Element, depicts [five] "Foundation" Components, while Area Plans use a streamlined, consistent set of land use designations that fall under the umbrella of the Foundation Components.*

Accordingly, the countywide map of land use, Figure LU-1 in the Land Use Element (Chapter 3), delineates only the five Foundation Components. As detailed in the General Plan Certainty System (Administration Element, Chapter 10), the significance of these foundation components is that General Plan Amendments proposing a change of land use designation from one Foundation Component to another can only be entertained by the County at eight-year intervals, except in specific extraordinary circumstances and for Agriculture Foundation Amendments, which have slightly different standards. Changes that "downgrade" a land use, say from Commercial Retail to Open Space–Conservation, for example, are also allowed outside of the Certainty System cycle. For a full list of the General Plan's Foundations and LUDs, see Table 3.0-C in this EIR, or refer to the Glossary (Section 8.0).

In this way, the General Plan establishes its ground-breaking "Certainty System," which through the use of the proscribed Foundations and LUDs mentioned above, provides clarity regarding the interpretation and use of the General Plan in ongoing decision making and seeks to sustain the General Plan's policy direction over time. It does so while still recognizing that circumstances will change, imperfections in the General Plan will be discovered and events will occur that require changes. As outlined in General Plan Chapter 10 (Administration Element), the Certainty System takes State of California guidelines that limit (generally to four) the number of amendments to the General Plan each year and strengthens them further by identifying specific amendment categories and a time frame within which each can be considered for amendment to the General Plan. This to achieve, in the word of the General Plan (Chapter 1), "the absolute necessity to maintain a high level of confidence in the Plan and enable people affected by it to have reasonable expectations regarding how the [General] Plan will impact them. The Certainty System serves the needs of those who value a rural lifestyle, farmers who have invested in their operations and developers who want to ensure return on their investments. The System also ensures that open space is preserved in the County [of Riverside] for the benefit of all."

Another noteworthy feature of the 2003 RCIP General Plan is the formalization of 19 Area Plans which encompass virtually all of unincorporated western Riverside County, as well as the Coachella Valley, Desert Center and the Palo Verde Valley. (The two key remaining areas, March Air Reserve Base and the far eastern portion of the desert, are addressed directly in the Land Use Element (Chapter 3) of the General Plan, rather than any Area Plan.) Area Plans consist of a land use map and other illustrative materials relevant to the area, as well as specific policy direction required to provide guidance unique to each area. The Area Plans incorporate a streamlined land use designation (LUD) system representing a full spectrum of categories that relate to the natural or economic characteristics of the land in Riverside County. This system consolidates and replaces over 200 classifications in the previous General Plan. And, as noted above, these LUDs fall into the five basic Foundations, providing a measure of certainty for the future as envisioned by the RCIP General Plan and its Area Plans.

To ensure that the policies and plans of the General Plan remain adequate and appropriate for the continuing implementation of the Riverside County Vision, the Administration Element of the Plan includes provisions for methodically revisiting the document five years after its adoption in 2003 and every eight years thereafter. In 2008, this comprehensive review process was initiated for the first time. Through it, the County of Riverside has examined how implementation of the General Plan has proceeded and worked to determine what, if any, refinements are necessary or desirable to ensure the General Plan continues to reflect the Vision for Riverside County's future and remains a viable and efficient tool for implementing that Vision. The resultant areas identified for revision form the basis of this project, General Plan Amendment No. 960 (GPA No. 960). The proposed project covers updates on a variety of issues throughout the General Plan's Elements and Area Plans. Where necessary, a number of General Plan Appendices, such as Appendix E, "Socioeconomic Buildout Assumptions and Methodology," Appendix F, "Population and Employment Forecasts," and others have also been updated. The proposed changes are summarized briefly below. A full description of the proposed scope of the project is provided in Section 3.0 (Project Description).

1.2 Summary of the Proposed Project, GPA No. 960

The Riverside County General Plan serves as a blueprint for the future of Riverside County. It describes how the County of Riverside anticipates and plans for future growth, development and environmental management programs over the long term. It is intended to act as a "constitution" for public and private development, and to serve as the foundation for growth and land-use-related decision-making within unincorporated Riverside County. Most of unincorporated western Riverside County, the Coachella Valley region and parts of eastern Riverside County are divided into 19 Area Plans to provide more detailed land use and policy direction regarding local issues, such as land use, circulation and open space. The General Plan is meant to express the community's goals with respect to the man-made and natural environments, and to set forth the policies and implementation measures needed to achieve those goals for the welfare of those who live, work and do business in Riverside County. The following discretionary actions will be submitted to the Board of Supervisor as part of the proposed project:

- Adoption of General Plan Amendment No. 960 amending various General Plan maps, Elements, policies and appendices.

- Certification of Program Environmental Impact Report No. 521 pursuant to the California Environmental Quality Act (CEQA).

If GPA No. 960 is approved, it is expected to be used by a number of public agencies in connection with a variety of additional future discretionary decisions, as well as for other planning and long-range forecasting and coordination purposes. EIR No. 521 may also be used as a Program EIR for the review of any resultant implementing projects occurring under GPA No. 960. Such actions may include approval, initiation, funding or contribution to any policies, public facilities or other programs intended to implement the portions of the General Plan, as amended by GPA No. 960. Other actions would also include the eventual processing by the County of Riverside of development-level land use proposals (e.g., specific plans), as well as project-level review and approval of land use maps, such as tract and parcel maps, plot plans, conditional use permits, public use permits and other discretionary Riverside County actions related to land use implementation. Changes to zoning or other ordinances, as well as the proposal of new ordinances, may also result from the adoption of GPA No. 960.

The project, GPA No. 960, encompasses the General Plan components listed in Table 1.0-A (Proposed Components of GPA No. 960), below. For each item listed, existing policies were examined and assessed against current conditions. Where needed, policy or program changes were developed to provide the guidance necessary for the planned level of intensity and growth expected in Riverside County. As a result of this process, the following General Plan changes were included in GPA No. 960:

Table 1.0-A: Proposed Components of GPA No. 960

Proposed Project Component	Brief Description
I. GENERAL PLAN ELEMENTS	
1. Land Use Element	
Incidental Rural-Commercial Land Use Policy	New policy to allow incidental rural commercial use to occur in Rural and Rural Community Foundation Land Use Components. Proposed uses must adhere to the development standards of the Rural Commercial Zone.
Rural-Community Foundation Sphere of Influence Accommodation Policy	New policy to allow parcels within a city sphere of influence and the Rural Community Foundation Component to be moved into the Community Development Foundation (outside of normal cycle) if strict criteria and policies are met.

Proposed Project Component	Brief Description
Rural Village Overlays and Study Area Revisions	Revisions to existing RVOs and RVSAs to reflect outcomes of spatial analysis to determine appropriate land use patterns. (Including the Chiriaco, El Cariso, Meadowbrook, Good Hope, Sky Valley and Aguanga areas, as well as the San Jacinto Agriculture-Potential Development Study Area. See Area Plan list for specific sites and more details.)
Policy Area Revisions	Revisions to existing policy areas to reflect spatial analyses for determining appropriate land use patterns and other revisions to provide clearer direction. (Including the Anza Valley and Lakeland Village areas. See Area Plan list for specific sites and details.)
Airport Land Use and Airport Influence Area Compatibility Revisions	Amend policies on airports and land use compatibility to comply with California State statues. Update LUDs surrounding three airports (Blythe, Riverside Municipal and Flabob) to improve consistency with ALUC safety zones and plans.
Open Space Foundation Component Amendments	Exempt Foundation Component amendments into Open-Space Foundation from the Certainty Cycle to facilitate preservation of dedicated open space.
Expanded Day Care Facilities Policies	Expand intent of GPA No. 883 to address day care services for a wider spectrum of users, i.e., from child to senior care. Remove policies better suited to inclusion in as Riverside County Planning Dept. Standard Operating Procedures for day care facilities.
Chocolate Mountain Aerial Gunnery Range Military Policy	Add policy to address land use compatibility with the military base and the surrounding area; add corresponding policies to the Noise Element and the Eastern Coachella Valley Area Plan.
Update Land Use Element Figures, Tables, Policies and Text	Update these items to reflect current data. Includes Figure LU-1 (Land Use) changes to land use designations and deletion of Figure LU-7 (March Air Reserve Base Land Use Plan). Corresponding Area Plan items changed as needed.
2. Circulation Element	
Update County Circulation Plan and Text	Update General Plan circulation network (Figure C-1) to reflect results of Riverside County's newly developed transportation traffic model (RIVTAM) and improve consistency with proposed land uses across Riverside County. Also reflected in Area Plan level maps. Various text and polices revised accordingly.
Revised Traffic Level of Service Standards	Update Figure C-3 (Link/Volume Capacity/Levels of Service for Riverside County Roadways) to expand level of service (LOS) categories, as proposed by Transportation Department.
Revised Trails Map, Policies, Trails Sections and Text	Comprehensively update countywide bikeways and trails map (Figure C-7) to reflect current trails plans and provide policy direction to better facilitate trail construction and maintenance. Associated Area Plan items updated accordingly.
Update Circulation Element Figures, Tables, Policies and Text	Update these items to reflect current data. Includes revisions to Figure C-6 (Airport Influence Areas) and others. Corresponding Area Plan items changed as needed.
3. Safety Element	
Update Geological Data	Update Safety Element figures, tables, text and polices to reflect new available geological and seismic data, including Figure S-3 (Generalized Liquefaction) and Figure S-4 (Earthquake-Induced Slope Instability Map) which were revised per new information for the USGS Murrieta 7.5' quadrangle, as well as from other sources. Corresponding Area Plan items changed as needed.
Update Flood and Dam Inundation Data	Update Safety Element figures, tables, text and polices to reflect new available hydrological data from the U.S. Army Corps of Engineers and Riverside County Flood Control and Water Conservation District, including Figure S-9 (100-Year Flood Hazard Zones) and Figure S-10 (Dam Failure Inundation Zones), particularly in the Prado Basin, as well as from other sources. Corresponding Area Plan items changed as needed.
Update Fire Hazards Map and Policies	Update Safety Element figures, tables, text and polices to reflect new available fire hazard data from the California State and Riverside County Fire Department (CalFire), including Figure S-11 (Wildfire Susceptibility), as well as from other sources. Corresponding Area Plan items changed as needed.
Update Various Safety Element Figures, Tables, Policies and Text	Update these items to reflect current data. Includes Figure S-12 (Hospital Locations) through Figure S-22 (Rail Facilities and Pipeline Locations), among others. Corresponding Area Plan items changed as needed.
4. Multi-Purpose Open Space Element	
Energy Conservation Policies	Update to reflect current regulatory environment and policies regarding energy conservation and efficiency.
Water Conservation Policies	Revise/add policies to conserve water resources in Riverside County through new water-efficient landscaping practices (and Riverside County Ordinance No. 859).

Proposed Project Component	Brief Description
Watershed and Arroyo Policies	Revise/add policies to protect arroyos and watersheds. Includes corresponding changes to the Land Use, Safety and Circulation Elements as well.
Update Multi-Purpose Open Space Element Figures, Tables, Policies and Text	Update these items to reflect current data. Includes Figure OS-2 (Agricultural Resources) update per recent State of California farmland data, Figure OS-5 (Mineral Resources) to reflect latest mineral designations issued by the State of California, deletion of Figure OS-6 (Relative Archeological Sensitivity of Diverse Landscapes) and the addition of two new figures (OS-3a and OS-3b) depicting forestry resources. Corresponding Area Plan items changed as needed.
5. Air Quality Element	
Climate Action Plan and Greenhouse Gas Reduction	Add text and policies that address greenhouse gas reduction regulations and climate change in order to establish greenhouse gas reduction goals and provide coordination with the proposed Climate Action Plan (CAP).
Update Air Quality Element Figures, Tables, Policies and Text	Update these items to reflect current air data and regulations. Corresponding Area Plan items changed as needed.
6. Administration Element	
Revised Review Standards	Make revisions as necessary to reflect appropriate General Plan implementation.
7. General Plan Appendices	
Appendix A-1: Glossary of Terms and Acronyms	Update terms and acronyms.
Appendix B-1: General Planning Principals	Incorporate revisions to the General Planning Principals established by the 2003 General Plan update.
Appendix E-1: Buildout Assumptions & Methods	Revise and update land use build out assumptions used to develop build out data (population, housing, jobs, etc.) for the General Plan.
Appendix F-1: Population and Employment Forecasts	Revise population and employment forecast of Riverside County to reflect consistency with the SCAG model and provide data to make General Plan consistent.
Appendix I-1: Noise Element Data	Include technical noise data developed specifically for GPA No. 960.
Appendix K-1: Implementation Program	Update Implementation Program to reflect GPA No. 960 changes and additions.
Appendix L-1: Riverside County Airport Land Use Compatibility Plans	Include the current airport land use compatibility plans.
II. AREA PLANS	
Lake Elsinore Environs Policy Area (*aka* Lakeland Village) (Elsinore Area Plan)	Update mapped LUDs to reflect latest FEMA 100-year floodplain maps. Revise LUDs where necessary to eliminate split (two or more) LUDs on a single parcel.
El Cariso Rural Village Study Area (Elsinore Area Plan)	Delete existing study area as a result of the parcel-specific land use analysis made of the area. Region found not ripe for significant urbanization in near future.
Various Revisions to Land Use Plan, Policy Areas and Overlays within Area Plans	Revise mapped Land Use Designations, new city boundaries, policy area boundaries, overlays and make other land use changes within these Area Plans: Eastvale, Jurupa, Highgrove, Temescal Canyon, Elsinore, Lake Mathews/Woodcrest, Lakeview/Nuevo, Mead Valley, Southwest, Sun City/Menifee (mostly in City of Menifee now), Harvest Valley/Winchester, Reche Canyon /Badlands, San Jacinto Valley, Pass, REMAP, Western Coachella Valley, Eastern Coachella Valley, Desert Center, Palo Verde Valley and Figure LU-6 (Eastern Riverside County Desert Areas Land Use Plan).
Various Updates to Figures, Tables, Polices and Text (Various Area Plans)	Updates of various Area Plan figures (including hazard maps and resource maps), tables, policies and texts, as needed for consistency with changes made in the General Plan Elements (as described above).
III. PARCEL-SPECIFIC MAPPING (LUD) CHANGES	
Criteria 1 (R-M not warranted)	Correct technical mapping errors. Correctly designate mountainous areas and provide for missing land use designations.
Criteria 2 (OS-CH to other)	Open Space – Conservation Habitat designation applied to private properties
Criteria 3 (PF incorrect)	Public Facilities designation applied to non-public facility lands.
Criteria 4 (Remove OS-C)	Open Space – Conservation designation applied inaccurately.
Criteria 5 (Remove OS-R)	Open Space – Recreation designation applied inaccurately.
Criteria 6 (Private to OS or PF)	Parcels changed to Open Space or Public Facility designations to reflect uses.

Proposed Project Component	Brief Description
Criteria 7 (Adjust minimum parcel sizes)	Applications in process prior to 2003 General Plan Adoption and approved in the first year.
Criteria 8 (Executive directives)	Changes being made as a result of executive direction.
RCA-Acquired (Conserved) Lands	Apply OS-CH to lands acquired by the Western Riverside Regional Conservation Authority.
ALUC Compatibility Adjustments	Proposed LUD changes to reflect adopted updates to ALUC plans.

Footnotes:
1. "LUD" stands for Land Use Designation, the General Plan's method of denoting acceptable land uses for parcels.

Note: The Southwest Area Plan was amended through the adoption of GPA 1077: Wine County Community Plan, however the Wine County Community Plan and Temecula Wine County Policy Area are a separate project and as such are not included in GPA 960. Refer to Appendix Q of the General Plan for the Wine County Community Plan text.

Source: Riverside County Planning Department, project application materials, 2011.

1.3 Summary of the Public Review and Deliberation Process

As established by the Board of Supervisors, the comprehensive review process for the General Plan was organized and performed by the Planning Department of the Transportation and Land Management Agency in conjunction with public input at several levels. In addition to the various CEQA consultations conducted as part of this project, a new General Plan Advisory Committee was appointed by the Board to represent the various interests of the public and interested parties throughout Riverside County. Both the CEQA and GPAC processes were used to solicit public input and to identify areas of public controversy and the concerns of a variety of public agencies and interested parties. The CEQA process is described below. Additional information regarding the public hearings, GPAC activities and Tribal consultation performed pursuant to SB 18, and similar efforts, is provided in Section 3.0 (Project Description).

A. CEQA Notice of Preparation (NOP) Comments

Once the County of Riverside determined that the potential for significant impacts existed with the proposed project and that preparation of an Environmental Impact Report (EIR) was necessary, a Notice of Preparation (NOP) was prepared and distributed pursuant to requirements of CEQA. The NOP was issued for a 30-day comment period on April 13, 2009, to the State Clearinghouse, responsible agencies and other interested parties. The NOP and Initial Study were also posted (and remain) online at the Riverside County Planning Department's website at ***http://planning.rctlma.org/***.

The objective of distributing the NOP was to solicit public comment to aid in identifying the full range and scope of issues of concern so that these issues might be fully examined in the EIR. Thirty comments responding to the NOP were received during the comment period from the agencies/ entities listed below. Their comments are summarized in Section 2.2. The Initial Study, NOP, distribution list and NOP comments received by the County of Riverside are included in EIR Appendix A-1.

- Morongo Band of Mission Indians
- City of Chino Hills
- South Coast Air Quality Management District
- California Emergency Management Agency, Disaster Assistance Programs Branch

- City of Colton
- City of Loma Linda, Community Development Department, Planning Division
- Mojave Desert Air Quality Management District
- Coachella Valley Archaeological Society
- City of Riverside (2 letters)
- California Department of Transportation (CalTrans), Division of Aeronautics
- U.S. Dept. of Homeland Security, FEMA Region IX
- Riverside Transit Agency
- Southern California Association of Governments
- Friends of the Northern San Jacinto Valley
- Cathedral City
- California Public Utilities Commission, Rail Crossing Engineering Section,
- Imperial Irrigation District
- U.S. Marine Corps
- Orange County Transportation Authority
- Sierra Club
- California Public Utilities Commission
- Center for Biological Diversity
- Riverside County Airport Land Use Commission
- City of Colton
- Riverside County Flood Control and Water Conservation District
- Riverside County Waste Management Department
- California Regional Water Quality Control Board, Santa Ana Region
- California Department of Toxic Substances Control
- Metropolitan Water District of Southern California

B. Scoping Sessions

In compliance with State CEQA Guidelines, the County of Riverside has taken steps to optimize opportunities to participate in the environmental process. During the preparation of the Draft EIR, various federal, state, regional and local government agencies, as well as other interested parties were contacted to solicit comments and to disseminate information to them and the public regarding the proposed project. This effort also included two public scoping meetings held to solicit public comment on the project EIR. The first meeting was held on April 27, 2009, at Riverside County's Planning Department branch in Palm Desert. The second was held on May 4, 2009, at the County of Riverside Administrative Center in Riverside. Public comments, questions and statements made at these meetings have been considered and incorporated into the proposed project and this EIR where appropriate. A summary of the discussions held at the scoping meetings is provided in Section 2.2.3.

C. Public Hearings and Other Public Meetings

As part of the preparation of the project and its EIR, there have been a number of public hearings, workshops and meetings providing opportunities for public comment and participation. In particular, there were extensive public participation opportunities at the GPAC meetings. Through this forum the County of Riverside received over 70 letters discussing various issues concerning the General Plan and GPA No. 960. The list below summarizes the public meetings, workshops and hearings held to address the project. Detailed descriptions of each of these are provided in Section 3.0.

Board of Supervisors Hearings and Workshops:

- **April 8, 2008:** The Board approves creation and membership for the 2008 General Plan Advisory Committee.
- **October 21, 2008:** The Board formally initiates the proposed project as GPA No. 960.

Planning Commission Hearings and Workshops:

- **July 9, 2008:** A public workshop was conducted for the Riverside County Planning Commission to discuss the components being considered for updating the General Plan.
- **October 1, 2008:** The Planning Commission makes a recommendation to formally initiate GPA No. 960.
- **June 24 and August 19, 2009:** Planning Commission workshops were held to discuss various components of the project for which GPAC had concluded discussion and finalized recommendations. The Planning Commissioners provided feedback that further shaped the proposed project. Staff then incorporated these recommendations into the project description, the General Plan and its associated documents, and prepared Programmatic EIR No. 521 to analyze the project.
- **[Dates to TBD], ~~2014~~ *2015*:** Planning Commission hearings were held [details to be added here for Final EIR.]

General Plan Advisory Committee (GPAC) Meetings:

- **October 2008 to October 2009:** During this period, GPAC meetings were held roughly every six weeks. At these meetings, sections of the proposed project (generally proposed General Plan revisions, deletions or additions) were discussed and committee members voted on a group recommendation to go to the Planning Commission and BOS for consideration.

- **June 13 and August 1, 2013:** The remaining proposed draft GPA No. 960 updates (including the Air Quality, Safety and Circulation Elements) were presented to the GPAC. The draft Climate Action Plan (CAP) was also presented. The GPAC reviewed and discussed these documents, heard public comments and ultimately made recommendations to staff.

D. Public Review of the Draft Program EIR

The revised General Plan document prepared for GPA No. 960, the associated Draft Program EIR No. 521, including all of its appendices and technical studies, were distributed according to the distribution list included in Appendix EIR-1. It was also posted on the Riverside County Planning Department website at ***http://planning.rctlma.org/***. In addition, a CD-ROM of these documents was also made available for review at the following County of Riverside facilities and the library locations listed in Section 2.3.D.

County Administrative Center Riverside
4080 Lemon Street
Public Counter, 2nd Floor
Planning Department, 12th Floor
Riverside, California 92501-3634
Hours of Operation: 8:00 am to 5:00 pm
Monday through Friday

Desert Permit Assistance Center (Palm Desert)
77588 El Duna Court, Suite H
Palm Desert, California 92211
Hours of Operation: 8:00 am to 5:00 pm
Monday through Friday

During a 60-day Draft EIR public review period, this Program EIR was distributed to responsible and trustee agencies, other affected agencies and interested parties, as well as to parties who requested a copy of the Draft Program EIR in accordance with PRC Section 21092(b)(3). In addition, the Notice of Completion of the Draft EIR (NOC) has been distributed as required by CEQA and forwarded to those who formally requested notices concerning information pertaining to either the Draft EIR or the GPA No. 960. Written comments on this Draft Program EIR should be addressed to:

Ms. Kristi Lovelady, Principal Planner
County of Riverside,
Transportation Land Management Agency, Planning Department
4080 Lemon Street, 12th Floor, Riverside, California 92501-3634
Tel: (951) 955-0781 / Fax: (951) 955-1811
Email: klovelad@rctlma.org

1.4 Issues to Be Resolved and Areas of Potential Controversy

A. Areas of Potentially Significant Impacts

Pursuant to Section 15123(2) of the State CEQA Guidelines, a summary section must address areas of controversy known to the Lead Agency (the County of Riverside), including issues raised by agencies and the public. In addition, pursuant to Section 15123(3) of the State CEQA Guidelines, a summary section must also address issues to be resolved, including the choice among alternatives and whether or how to mitigate the significant effects identified. Accordingly, each of these issues is discussed, below. For impacts and mitigation, see Table 1.0-B (Summary of Proposed Project Impacts and Mitigation) at the end of this section.

The Initial Study (Environmental Assessment No. 41788) prepared for GPA No. 960, the General Plan Update Project, identified potential environmental impacts related to the following issues:

- Land Use and Planning
- Population and Housing
- Aesthetics and Visual Resources
- Agricultural and Forestry Resources*
- Air Quality*
- Greenhouse Gases (added subsequent to NOP)
- Biological Resources
- Cultural and Paleontological Resources
- Geology and Soils
- Hazardous Materials and Safety
- Hydrology and Flooding
- Mineral Resources
- Noise*
- Parks and Recreation
- Public Facilities (including Utilities and Service Systems)
- Transportation and Circulation*
- Water Resources*

- Cumulative Impacts*

Based on the Initial Study, it was determined that potential impacts associated with the aforementioned issues required further evaluation in the Program EIR for GPA No. 960. Greenhouse gas reduction, a topic newly added to the State CEQA Guidelines in 2010, was also identified to be addressed. The Initial Study also determined that an evaluation of potential cumulative impacts resulting from development accommodated by the General Plan changes resulting from GPA No. 960 would be included in the EIR. The topics marked with an asterisk ("*") include one or more impacts found to be significant and unavoidable in the EIR. See Section 4.0 and Section 5.0 (Additional Required CEQA Topics) of the EIR for full details.

B. Topics of Generating the Most Public Interest and Areas of Controversy

A number of comment letters were received during the NOP period, from both public agencies and concerned members of the public. Numerous public comments and testimony were also presented (or submitted) at the various workshops and meetings held prior to circulation of the Draft EIR (see list under Section 1.3 C, later in this section). For a summary of the NOP comment letters received by the County of Riverside, see Subsection 2.3 in Section 2.0 (Introduction). A brief summary of comments received at the two formal public scoping meetings is also presented under Section 2.3. In broad strokes, the various comments received indicated the following general areas of interest, concern or controversy.

1. Open Space Preservation

Many of the comments presented by members of the public, particularly at GPAC meetings in 2008-2009, as well as in 2013, focused on concern for preservation of open space areas, both generally and specifically (around the San Jacinto Wildlife Preserve, for example). These comments were considered by Riverside County Planning Department staff while preparing the revisions to the General Plan, in particular to the Land Use and Administration Elements. These comments also informed the discussion and analyses performed in EIR No. 521, in particular for Section 4.4 (Aesthetics and Visual Resources) and Section 4.8 (Biological Resources), among others.

2. Greenhouse Gas Emissions, Carbon Reduction and Global Climate Change

As a field of newly emerging science and regulation, particularly by the State of California, this topic brought comments from several public speakers and agencies. Concerns tended to focus on whether or not the County of Riverside would be able to reduce greenhouse gas emissions and how it would be accomplished. Comments also noted the need for a variety of "green" policies – that is, actions to institutionalize a conservation-based approach to energy and resource use, which includes reducing, reusing and recycling in a number of areas. Intense interest was also focused the preparation of a "Climate Action Plan," either as part of the General Plan or a separate stand-alone document, to fully establish Riverside County's plans for addressing greenhouse gases, carbon reduction and climate change. These comments were considered by Riverside County Planning Department staff while preparing the extensively revised Air Quality Element, as well as a proposed Climate Action Plan. These comments also informed the discussion and analyses performed in EIR No. 521, in particular for Section 4.7 (Greenhouse Gases), Section 4.6 (Air Quality) and Section 4.10 (Energy Resources), among others.

3. Local and Regional Traffic

A perennial concern for how any proposed changes to the General Plan would affect local and regional traffic levels and circulation patterns was expressed by several speakers and comments. Members of the public tended to focus on traffic and circulation issues closest to their home communities; public agencies, particularly municipalities in and adjacent to Riverside County, tended to focus on the potential traffic effects to their jurisdictions and on interagency coordination. These comments were considered by Riverside County Transportation Department staff while conducting the extensive countywide traffic modeling, as well as while preparing proposed roadway network revisions and General Plan Circulation Element changes. These comments also informed the discussion and analyses performed in EIR No. 521, such as for Section 4.8 (Transportation and Circulation) and Section 4.7 (Greenhouse Gases), among others.

4. Development Capacity of the County

An issue raised and discussed intensely at the GPAC meetings in 2008-2009 was how to plan for the appropriate level of build out (future development) for the County of Riverside. That is, determining how unincorporated Riverside County should look in 50-plus years when the developable land in the county has been "built out." The amount of houses, businesses and industry permitted within Riverside County in the future will directly affect the welfare and quality of life of those living, working and visiting in Riverside County. It also dictates that infrastructure and facility needs for those residents and workers – things like roads and highways, schools (and teachers), water supplies, parks and even landfills and sewer treatment plants to handle the inevitable wastes that arise from human habitation. It also directly affects the economic success of Riverside County residents and workers, as well as the commercial and industrial ventures themselves.

As part of the General Plan update process, Riverside County Planning Department staff developed a number of new development scenarios for areas slated for "additional study" under the 2003 RCIP General Plan. These were predominantly rural or other undeveloped areas in which future intensification was envisioned in 2003, but could not be planned explicitly due to time constraints. The various "Rural Village Overlay Study Areas" that result are an example. Each "study area" was examined to determine the future development level (if any) reasonable for the locale based on accessibility (roads), infrastructure (availability of water, sewer, etc.) and, in particular, its suitability relative to the surrounding area (existing neighboring uses and development patterns, habitat and environmental constraints, etc.).

Once formulated, Planning staff presented a number of possible regional development scenarios to the GPAC for discussion, refinement and direction. Consensus amongst the GPAC membership was used to direct the development scenarios ultimately incorporated into the proposed General Plan as part of GPA No. 960 (and analyzed in EIR No. 521). Accordingly, the General Plan Land Use Element, as well as details in the applicable Area Plans, was updated to reflect these results. These development proposals (or reductions) were also incorporated into the build out development scenarios analyzed and discussed in EIR No. 521, in particular for Section 4.2 (Land Use), Section 4.3 (Population and Housing) and Section 4.17 (Public Facilities), among others.

1.5 Summary of Alternatives, Environmental Impacts and Mitigation

One of the cornerstone functions of CEQA is that it "establishes a duty for public agencies to avoid or minimize environmental damage where feasible" (California Code of Regulations [CCR] Section 15021(a)). Accordingly the

CEQA State Guidelines (CCR Section 15021(a)(2)) specify that, "A public agency should not approve a project as proposed if there are feasible alternatives or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment."

The second part of this directive is met by Sections 4.2 through 4.19 of this EIR, which address a wide variety of environmental issues and include mitigation measures where feasible to lessen identified significant impacts. The first part of this directive, to identify "feasible alternatives" to the project, is addressed in Sections 6.2 through 6.4. Lastly, Section 6.5 provides a summary of the "environmentally superior alternative" and conclusions as to each alternative's ultimate feasibility compared to that of the proposed project, GPA No. 960, and the "preferred alternative" is selected.

A. Alternatives

Pursuant to CEQA, a range of possible alternatives was developed to reflect the stated project objectives and project significant impacts. The selection process is summarized in Table 6.0-A of Section 6.0 for the following basic alternative proposals.

Added Community Centers Alternative: This alternative addresses the effects of growth and development pressure by proposing to transfer development intensity planned for lands identified for future open space conservation into a series of additional community centers along transportation corridors. The overall number of residential units projected for unincorporated Riverside County would remain the same, but their locations, and possibly their densities, would change.

Agricultural Emphasis Alternative: This alternative addresses the effects of development pressure on agricultural resources by proposing a scenario in which removal of land from the Agricultural Foundation would only be allowed every eight years. Within the Eastern Coachella Valley Area Plan, future conversions would be limited to 50% of the proposed site; the remainder of the site would be required to be placed into permanent agricultural easements.

Reduced Rural Villages Alternative: This alternative would be similar to the changes to Rural Village Overlays (RVOs) proposed under GPA No. 960 in terms of eliminating RVO study areas (RVOSAs). However, it would also include additional reductions in development potential through the deletion of the two new RVOs proposed as part of GPA No. 960. Specifically, both the existing "Study Area" designations and the proposed new RVOs for the Good Hope and Meadowbrook areas would be deleted. Land uses would remain in their existing LUDs, with no alternative development potential added through the RVO overlay function. Unlike GPA No. 960, it would also omit several Policy Areas (either existing or proposed under GPA No. 960) that provide for future urbanization within specific areas, including in Anza in the hills of southern Riverside County and the Vista Santa Rosa region in the Coachella Valley, among others.

Green Economy Alternative: This alternative would entail revisions to the General Plan to encourage the development and utilization of the green (renewable) energy resources available in unincorporated Riverside County (e.g., wind, solar and geothermal). It would allow the transfer of development density/intensity from lands of high fire hazard into areas with alternative energy availability. The overall number of residential units and business uses (commercial and industrial) projected for unincorporated Riverside County would remain the same, but their locations, and possibly their densities, would change.

No Build/No Growth Alternative: This alternative is one type of "no project" scenario addressed by CEQA for comparison purposes. It would entail no growth occurring at all within unincorporated Riverside County (i.e., the County of Riverside would not approve any additional development applications). The only growth occurring

in Riverside County would be within its cities, which are assumed to build out according to their General Plans. As a result, the environmental baseline of Riverside County would be preserved in many areas, except where adversely affected by the growing demands of the cities within Riverside County (e.g., water use, traffic generation, land annexations, etc.).

No Project/Status Quo Alternative: This alternative is the key CEQA-mandated "no project" alternative called out in CCR Section 15126.6(e). For this EIR, the scenario assumes that GPA No. 960 is not adopted and that the existing RCIP General Plan (adopted in October 2003, and as amended through 2010), remains the guiding document dictating future growth within unincorporated Riverside County. Accordingly, this alternative can also be said to represent the "status quo."

B. Alternatives, Reduction of Significant Environmental Impacts and Environmentally Superior Alternatives

Build out of the General Plan, as it would be if updated pursuant to the proposed project, GPA No. 960, would have significant, unavoidable adverse impacts on: agriculture, air quality, noise, transportation and traffic, water supplies and growth inducement. There would also be a variety of other cumulatively considerable effects. As indicated in Table 6.0-A of Section 6.0, only one of the alternatives (Reduced Rural Villages Alternative) was found to address nearly all of the areas of significant project impacts and not result in any new (substantially greater) environmental impacts within unincorporated Riverside County. All of the other alternatives ha~~s~~*ve* substantial new and/or greater impacts, though most also had areas of substantially fewer impacts as well. The end results of each alternative's analysis are summarized below.

No Build/No Growth Alternative: This alternative, one of the "no project" scenarios addressed by CEQA for comparison purposes, would entail no growth occurring at all within unincorporated Riverside County (i.e., the County of Riverside would not approve any additional development applications). The only growth occurring in Riverside County would be within its cities, which are assumed to build out according to their General Plans. Although the No Build/No Growth Alternative does include some artificial assumptions in order to "preserve the physical environment," it is nonetheless included among the alternatives considered because of its utility in providing a clear examination of the effects of future growth in the cities within Riverside County, as well as the surrounding cities and counties. Though an admittedly extreme example, it specifically serves to paint a clear picture of how these areas' growth will themselves affect the unincorporated portions of Riverside County, even in the absence of any other unincorporated growth. Under this alternative, the environmental baseline of Riverside County would be preserved in many areas, except where adversely affected by the growing demands of the cities within Riverside County (e.g., water use, traffic generation, land annexations, etc.).

As noted in Table 6.0-A, this alternative would substantially lessen many of the significant environmental impacts associated with the project-updated General Plan. However, it would also result in significant impacts in relation to transportation system effectiveness (e.g., provide inadequate Levels of Service for roadways) and water resources (particularly due to increased demand on groundwater basins). It would also generate two new significant impacts within Riverside County in relation to inconsistencies with greenhouse gas reduction plans (particularly AB 32) and energy efficiency plans (particularly Title 24). Lastly, it would also escalate growth pressures within adjacent cities and counties; some of which could cause significant new (or worsened) impacts in these jurisdictions, for example increased strain on existing community services and facilities. See Section 6.4.A for full details.

Taken together, the substantial reduction in significant impacts associated with this alternative would make it appear to be the environmentally superior alternative addressed under CEQA. However, Section 15126.6(e)(2) of

the State CEQA Guidelines notes, "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives."

No Project/Status Quo Alternative: As noted above, CEQA specifies analysis of a no-project alternative that would be "reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with the available infrastructure and community services." (See State CEQA Guidelines, Section 15126.6(e).) Accordingly, the No Project/Status Quo Alternative examines the environmental effects associated with abandoning the proposed project, GPA No. 960, and 'doing nothing,' that is, allowing unincorporated Riverside County to continue to develop as planned under the existing Riverside County General Plan. Again, as with the first alternative, analysis of this alternative provides a look at the environmental cost of maintaining the status quo. As such, this alternative serves as a lens for highlighting the environmental implications for approving (or denying) the proposed project.

As noted in Table 6.0-A, this alternative would not substantially lessen any of the significant environmental impacts associated with the project-updated General Plan, mainly because this alternative, which represents build out of the existing General Plan, would result in more people, houses, jobs, economic land uses, vehicle miles traveled and related effects. Specifically, General Plan build out with implementation of project (GPA No. 960) changes would result in ~~a reduction of~~ roughly 2-6% fewer people, homes, jobs and economic land uses as compared to the existing General Plan. Accordingly, analysis predicts significant impacts largely in line with those forecast for the project-updated General Plan, except with a number of new significant impacts, including some substantially greater than those of the project. These new substantial impacts include: changes to existing visual character, increased greenhouse gas emissions, effects to biological resources outside of areas under an adopted MSHCP and inefficient use of energy. See Section 6.4.B for full details.

Because this alternative would have substantial environment effects in several key areas, including four new significant impacts, it is not deemed the environmentally superior alternative.

Agricultural Emphasis Alternative: Between 2000 and 2006, Riverside County loss roughly 30% of its existing agricultural lands to conversions made in the face of increasing development pressure. Although agriculture is Riverside County's largest industry in terms of dollars, agricultural decline continues as urban uses encroach upon agriculture operations and economic pressures (including the price of water supplies) make conditions ever more tenuous for Riverside County's farmers and ranchers. Not surprisingly, one of the significant impacts of build out of either the existing or updated General Plans is loss of agricultural lands to non-agricultural uses and encroachment of non-agricultural uses into agricultural areas. This alternative is proposed as a means for addressing (lessening) this significant impact by preserving existing farmlands and increasing overall agricultural uses within unincorporated Riverside County by roughly 250,000 acres. In addition, it also addresses cumulatively significant wildfire hazards by shifting roughly 25,000 future homes in remote, wildfire-prone rural areas to more accessible urban/suburban regions.

Overall, as indicated in Table 6.4-E, the Agricultural Emphasis Alternative would cause slightly more significant environmental impacts in the growing urban and suburban portions of unincorporated Riverside County, while substantially reducing many (but not all) impacts associated with spatial effects in the rural portions of Riverside County. In several key areas, this alternative would avoid, minimize or reduce impacts found significant under the proposed project to less-than-significant levels. These include: conversion of state-designated farmlands and encroachment or conflicts with existing agricultural uses; exposure of people or structures to wildland fire risks; and, facilitation of environmental effects due to the encroachment of development into isolated or remote areas.

With its greatly reduced rural development footprint, it would also avoid cumulatively significant cumulative impacts to archeological and paleontological resources, hazards (particularly in interface and wildland areas),

demand for fire protection services and effects on water resources and groundwater basins. The smaller development footprint means cumulative effects on existing hydrology and stormwater drainage systems would also be less than significant. This alternative would also avoid significant growth-inducing effects resulting from facilitating encroachment into isolated or remote areas. However, because this alternative restricts agricultural conversion, it would hinder (reduce) significant growth-inducing effects by creating (rather than removing) obstacles to population growth within Riverside County.

Lastly, this alternative would also result in several substantially greater (worse) environmental impacts, including: greatly increased demand for water, both imported and local (groundwater); increased demand for energy (electricity and natural gas) due mainly to increased agricultural uses (particularly water pumping) and ag-related economic uses (dairies, commercial, industrial, etc.); and, increased energy use and increased off-road equipment and vehicle operations associated with agricultural uses, contributing to substantial cumulative greenhouse gas emissions. And, lastly, environmental impacts associated with the need for new or expanded water infrastructure. Except for the greenhouse gas emissions, however, none of these cumulatively significant impacts are new as compared to those of the project-updated General Plan.

Taken together, this alternative adequately addresses four of the seven areas of significant effects associated with the proposed project, including having substantial improvements over the project in terms of both agricultural impacts and on-road vehicle traffic levels. It would also, however, be associated with three areas of more severe environmental impacts, including increased water demand and increased cumulative impacts in several areas. Although an improvement over the project in some ways, this alternative would not be the environmentally superior alternative due to the severe limitations and significant environmental impacts that would result in conjunction with the greatly increased water demand under this alternative. For these reasons, this alternative was not deemed the environmentally superior alternative.

Added Community Centers Alternative: Sprawling patterns of suburban growth in car-centric Southern California tend to result in increased traffic, noise and air pollution as vehicle travel increases within the far-flung new communities. Even with the advanced planning called for under the existing or project-updated Riverside County General Plans, impacts due to traffic and circulation, as well as attendant air quality and noise impacts, will be significant and unavoidable. This alternative is proposed as a means for addressing (lessening) this significant impact through the incorporation of an increased number of Community Centers. As defined under the existing General Plan, community centers are purposefully designed to provide land uses and activities designed in an "integrated fashion to create a dynamic urban environment that acts as the center of activity for the surrounding area." To accomplish this, community centers are designed to accommodate "a variety of residential densities, non-residential intensities and public spaces...integrated in a manner that promotes pedestrian activity and minimizes the dominance of the automobile."

Rather than increasing the overall build out of unincorporated areas, this alternative would represent (as compared to the existing and proposed GPA No. 960) a more concentrated pattern of development intensity. To accommodate these increases, development intensity within reserve areas for the two MSHCPs would be redistributed into community centers throughout Riverside County. Thus, under this alternative the overall size of the development footprint within unincorporated Riverside County would decrease, but the overall residential density would nearly double because of increases in lands designated as community center (CC) or mixed use planning area (MUPA) through overlays.

In total, roughly 1,200 acres of additional CC/MUPA were assumed for western Riverside County along the I-15 and Interstate 215 in the Perris Valley, in particular. In addition, 2,400 acres of CC/MUPA were placed out in eastern Riverside County, which has traditionally seen lower growth overall than to the west due to its more remote location relative to the job centers of Greater Los Angeles and Orange County. In total, roughly 21,600

new high- to very high-density dwelling units plus 10,500 medium-high to high-density units would be added throughout Riverside County, accommodating an increase of 12,600 people. With an equal amount of retail-commercial and associated commercial services added as well, over 90,000 additional jobs would be created.

Overall, as indicated in Table 6.4-H, the Added Community Centers Alternative would enable increased growth in urban cores while lessening some the significant effects associated with the proposed project. It addresses nearly all of the significant environmental impacts identified for the project and greatly reduces a number of effects, particularly spatial impacts, as a result of the reduced development footprint.

Some, but not all, of the project's significant cumulative impacts would be lessened under this alternative, however these effects are offset by the localized increases that would result within the urbanized Community Centers proposed. Specifically, due to the increase in housing, population, jobs, traffic and associated economic activity, this alternative would result in substantial individual and/or cumulative impacts in a number of areas, including greenhouse gas emissions and traffic congestion. Also, because of the disproportionate effects of growth in urban areas, this alternative would also have substantially greater impacts on existing parks and recreational facilities and cause growth effects triggering the need for additional facilities. It would also have growth-inducing effects on Riverside County, its cities and the surrounding communities, cities and counties. In all other areas, significant impacts either individually or cumulatively would be generally similar to those associated with build out of the General Plan pursuant to the project, GPA No. 960.

Taken together, this alternative addresses six of the seven areas of significant effects associated with the proposed project. However, it only substantially lessens or avoids significant impacts for one of the seven (agriculture); for air quality, noise and growth inducement, this alternative's impacts are generally similar to those of the project, although an improvement in many ways over the project, because of the absolute limiting effect of the finite water supply availability, as well as the increase in greenhouse gas emissions and traffic congestion. For these reasons, this alternative was not deemed the environmentally superior alternative.

Green Economy Alternative: In the past decade, modern society has become increasingly focused on the need to use the planet's resources wisely and efficiently. In particular, in conjunction with AB 32, California's Global Warming Solutions Act of 2006, the State of California has initiated a number of plans to reduce greenhouse gas emissions, including an initiative directing California to be obtaining a third of its electricity through alternative "green" methods by 2020. This legislative mandate has helped fuel the impetus for the growing green energy industry in the state. With its expansive open desert noted for 360 days of sunshine a year (in Blythe), bracketed by the famously windy San Gorgonio Pass to the north and the geothermal hot springs around the Salton Sea to the south, Riverside County offers unparalleled opportunities for green alternative energy generation.

Accordingly, this alternative aims to capitalize on Riverside County's renewable energy opportunities for wind, solar and geothermal by creating green economy jobs and improving the jobs-housing balance within Riverside County. It would accomplish this by proposing density transfers in which half the remaining rural residential (OS-RUR) lands are reallocated to Public Facilities (PF) to accommodate green energy generating land uses, such as commercial wind and solar energy generation, as well as geothermal or biomass, as opportunities arise. A portion (10%) of the remainder would also be allocated to additional light industrial (LI) land uses to provide additional related and ancillary services, manufacturing and other complimentary uses. Lastly, another 50% would be shifted to open space-conservation (OS-C) to provide buffers around energy uses and also to reduce the number of residences in remote, fire-prone areas (i.e., OS-RUR designated properties in interface/wildlands).

The result of this shift would greatly increase the jobs available within Riverside County, ideally allowing more residents to work in closer proximity to their homes, rather than commute to distant cities or counties. This would improve traffic on the region's freeways and main arteries, as well as greatly reducing the air pollution and

traffic noise generated in our communities. In addition to reducing energy generated from non-petroleum sources, this alternative would also aid in reducing greenhouse gas emissions by reducing commuter travel. (Vehicle trips are the number one source of greenhouse gas emissions in California.) Through these means, the Green Economy Alternative addresses a number of significant, unavoidable impacts associated with the project, in particular those resulting related to air pollution, noise, traffic and energy consumption within unincorporated Riverside County.

Overall, as indicated in Table 6.4-J, the Green Economy Alternative seeks to provide the planning needed to help California, and the country, transition from the existing, petroleum-based economy to a new, cleaner green economy based on alternative energy generation and related industries. Despite the decreased reliance on fossil fuels, however, the analysis herein finds that this alternative would have environmental impacts of similar severity to those forecast for build out of the General Plan as updated per GPA No. 960. In certain areas, in fact, as summarized in Table 6.0-A, this alternative would have substantially greater significant impacts driven mostly by the large increase in jobs created in Riverside County.

While it would reduce certain *regional* impacts (such as greenhouse gases and, possibly, traffic congestion), it would do so at the expense of substantial increases in cumulative environmental impacts within Riverside County itself. In particular, key areas adversely affected are those associated with the increased number of commuters heading into Riverside County for work: increased traffic and congestion (due to increased vehicle miles traveled within Riverside County), higher ambient noise levels (increased due to roadway traffic noise), increased localized and regional air pollution and greenhouse gas emissions. This alternative would also result in specific new significant impacts to viewsheds and aesthetics (including scenic highways) and to roadways and intersections where additional traffic volumes would cause LOS ranges to be exceeded above and beyond those already identified by either the existing General Plan or for this proposed project (i.e., those addressed in Section 4.18). Lastly, even though not new significant impacts, water-related impacts to domestic and groundwater supplies would also be substantially greater under this alternative.

Taken together, this alternative only addresses four of the seven areas of significant effects associated with the proposed project. Although an improvement in many ways over the project, because of the increase in jobs and the improved jobs-to-housing balance, there are substantially greater adverse effects associated with greenhouse gases, traffic and aesthetics. Even though this alternative meets all of the project objectives, it does so at the expense of greater environmental effects. For all of these reasons, this alternative would not be deemed the environmentally superior alternative.

Reduced Rural Villages Alternative: This alternative was conceived to address the significant effects of continued urbanization by limiting the plans designed to accommodate it in the General Plan. Accordingly, this alternative proposes to address environmental effects stemming from population growth by limiting the planned RVOs, and other overlays and policy areas to be incorporated into the General Plan as a result of GPA No. 960. Specifically, this alternative proposes to eliminate the two RVOs proposed under this project (Good Hope and Meadowbrook), leaving the areas with only their existing underlying rural LUDs. To counter urbanizing effects beyond the RVOSAs, this proposal also includes deleting other proposed urbanization changes from GPA No. 960, such as the Northeast Business Park Overlay, most of the Lake Elsinore Environs Policy Area (i.e., Lakeland Village) changes and also existing and proposed policies for the Anza and Aguanga areas in southern Riverside County. In addition, areas of potential future urbanization or intensification in association with the Coachella Valley, specifically Chiriaco Summit and Vista Santa Rosa, would also be eliminated under this alternative.

Overall, as indicated in Table 6.4-L, the Reduced Rural Villages Alternative would likely cause slightly fewer significant environmental impacts within the unincorporated portions of Riverside County as a result of the small (1-4%) decrease in the number of houses, people, jobs and economic uses proposed. These slight reductions

mean that impacts associated with this alternative would be largely the same or substantially similar to those forecast for build out of the General Plan as amended pursuant to the project, GPA No. 960.

Particularly as a result of fewer vehicle miles traveled in Riverside County, impacts associated with traffic, noise and air quality would be lower under this alternative. A lower population at build out would also mean that risks to people, such as from seismic, flood, air travel and hazardous material use, for example, would be slightly lower. Impacts resulting from the presence of people, such as demand for parks, schools, landfills, hospitals and other public services, as well as for water, wastewater treatment, electricity, roads and other infrastructure, would also be correspondingly reduced. In most cases, however, incremental impacts in these areas would still be cumulatively substantial.

Lastly, this alternative does not adequately address significant adverse effects to agriculture because the reduced potential for urbanizing development in key locations would contribute to an increase in development within areas that would otherwise remain rural and undeveloped, particularly within wildland and interface portions of Riverside County. Nor does it provide adequate plans for handling future urbanizing growth pressures and, as a result, would tend to lead to sprawling growth within the rural portions of Riverside County, particularly within the Rural Community Foundation.

In terms of environmental impacts, this alternative was found to substantially lessen traffic impacts because of the reduced urban areas allowed. It was also found to successfully address, though not substantially lessen, impacts in six areas of significant effects associated with the proposed project. It was not found to cause any new significant impacts or substantially increase any already expected to be significant pursuant to project analyses. Although a slight improvement over the project, because of the reduced urban development accommodated under this alternative, it would induce significant growth within cities and adjacent counties as a result of the unmet growth pressures within the unincorporated areas.

Nevertheless, notwithstanding these impacts outside unincorporated Riverside County, this alternative does reduce, either slightly or substantially, a majority of the significant adverse impacts associated with the project (i.e., build out of the General Plan pursuant to GPA No. 960). For this reason, this alternative is considered the environmentally superior alternative.

C. Preferred Alternative

Although the environmentally superior alternative was identified above, the ultimate suitability of the alternatives must still be weighed against their ability to successfully achieve the stated project objectives. While CEQA notes that not all of the objectives need be attained, per CCR Section 15126.6(a)), the alternative selected must still "feasibly attain most of the basic objectives of the project" while also avoiding or substantially lessening the significant effects of the project. Accordingly, each of the alternatives was examined relative to these standards and the stated project objectives to determine whether any among them is the preferred alternative (instead of the proposed project, GPA No. 960) for achieving build out of the General Plan. These conclusions are summarized below.

No Build/No Growth Alternative: In terms of the project's stated objectives, this alternative does not satisfy several (see Table 6.0-A). It would not provide a suitable plan for further progress within Riverside County since it posits no growth and no development. Nor would it address new needs, since it pushes all new growth into the cities where Riverside County's General Plan does not apply. It would provide updated technical data, simply by definition, but would not provide any updated land uses within Riverside County (since no further development would be permitted). And, most particularly, it does not further the Riverside County Vision in any way since it does not permit or promote any continued progress within Riverside County. Thus, in total, this alternative

meets only one of five of the objectives of the project and it, therefore, is not considered an acceptable means for achieving the stated project objectives. For all of these reasons, despite being found environmentally superior to the proposed project, the No Build/No Growth Alternative is not deemed the preferred alternative.

No Project /Status Quo Alternative: In terms of meeting project objectives, this alternative does not satisfy several. It would not provide a suitable plan for further progress within Riverside County since it does not update the study areas identified in 2003 for future planning specifications. It does not include any LUD updates and thus does not address the updated land use objective. It does not address the updated regulations (e.g., AB 32 and greenhouse gas reduction planning). Thus, this alternative does not address new-needs objective. It would provide updated technical data, simply by definition. Lastly, it does not further the Riverside County Vision in any way since it does not enhance or extend the continued progress within Riverside County. Since this alternative meets only one of five of the objectives of the project, it is not considered an acceptable means for achieving the stated project objectives. For all of these reasons, the No Project/Status Quo Alternative is not deemed the preferred alternative.

Agricultural Emphasis Alternative: In terms of the project's stated objectives, this alternative does not satisfy several. It would not provide a suitable plan for further progress within Riverside County since it does not update the study areas identified in 2003 for future planning specifications. It does not include any LUD updates and thus does not address the updated land use objective. It would provide updated technical data, simply by definition and would likewise address updated regulations, such as AB 32 and Title 24, for similar reasons. It would not, however, fully comply with AB 32 due to the substantial increase in greenhouse gas emissions associated with this alternative. Nevertheless, this alternative could be said to adequately meet the address new needs objective. It does not, however, further the Riverside County Vision in regards to growth since the restrictions on agricultural conversion would significantly hinder (not enhance or extend) continued progress within Riverside County. Overall, this alternative only meets two of five of the objectives of the project, thus it is not an acceptable means for achieving the stated project objectives. For all of these reasons, the Agricultural Emphasis Alternative is not deemed the preferred alternative.

Added Community Centers Alternative: In terms of the project's stated objectives, this alternative would satisfy all but one. It would provide a suitable plan for further progress within Riverside County, since it provides for additional urban development in Riverside County. It would provide updated technical data, simply by definition. It also would address the updated regulatory environment, even though it would require CAP revisions to reduce to the additional greenhouse gas emissions associated with this alternative. Nevertheless, it could still be said to adequately meet the new-needs objective. It also may further the Riverside County Vision by allowing higher growth in certain urban cores, extending or enhancing continued progress within Riverside County. The only objective not met is that it does not include any LUD updates, and thus does not address the updated land use objective. In total, although this alternative meets four of the five objectives of the project, it does so while increasing growth and localized urban impacts beyond that of the proposed project or existing General Plan. Thus, this alternative is not deemed the favored means for achieving the stated project objectives. For all of these reasons, the Added Community Centers Alternative is not deemed the preferred alternative.

Green Economy Alternative: In terms of the project's stated objectives, this alternative appears to satisfy all of them. It provides a suitable plan for further progress within Riverside County, particularly in terms of increasing jobs availability. Even though it does not update the RVO study areas identified in 2003 for future planning specifications, it provides an alternate plan for future development and would also provide LUD updates, thus it does addresses the updated land use objective. It would provide updated technical data, simply by definition. And, despite increased greenhouse gas emissions, it would address the updated regulatory environment that future development within Riverside County would need to comply with (e.g., AB 32 and greenhouse gas reduction planning). Thus, it would adequately meet the address-new-needs objective. Lastly, it would further the Riverside

County Vision, since it proposes to greatly increase jobs in the region, helping to balance a region that traditionally has more homes than jobs, while preserving open space and the quality of life for Riverside County residents. This new economy would serve to enhance and extend the continued progress within Riverside County. In total, although this alternative meets all of the five objectives of the project, it does so while increasing growth and localized urban impacts beyond that of the proposed project or existing General Plan. For all of these reasons, the Green Economy Alternative is not deemed the preferred alternative.

Reduced Rural Villages Alternative: In terms of the project's stated objectives, this alternative does adequately meet 60% of them. It would provide LUD updates and thus addresses the updated land use objective. It would also provide updated technical data, by definition, and would address the updated regulatory environment that future development within Riverside County would need to comply with (e.g., AB 32 and greenhouse gas reduction planning) for similar reasons. Thus, it would meet some of the objective for meeting new needs. It would not, however, provide future planning necessary to address and accommodate the new needs related to urbanizing growth pressures on rural areas located near urban fringes. As such, it also would not accommodate further progress within Riverside County. Rather than providing plans to handle future demand for urbanizing uses within unincorporated Riverside County, this alternative actually limits further progress in terms of future development necessary to meet population growth forecast for Riverside County. Similarly, it also would not further the Riverside County Vision, as its limits on urbanization in growing rural-fringe areas would limit, rather than enhance or extend, continued progress within Riverside County. However, because of the limitations on future urbanization inherent in this alternative, it only meets two of five of the project objectives (40%). For this reason, despite being environmentally superior, this alternative would not be an acceptable means for achieving the stated project objectives. For all of these reasons, the Reduced Rural Villages Alternative is not deemed the preferred alternative.

D. Conclusions

As the result of the data and analyses presented in Section 6.0, it was determined that two alternatives exist that would be environmentally superior to the proposed project in terms of providing a scenario for guiding ultimate build out of the Riverside County General Plan. One, however, was the No Build/No Growth Alternative, which met only a single project objective. The second environmentally superior alternative was the Reduced Rural Village Alternative. While not without significant adverse environmental impacts, this alternative addresses the widest gamut of project impacts with the fewest new significant impacts. It would not, however, meet more than two of the stated project objectives.

Thus, as a result of this alternatives analysis, it was determined that the proposed project, GPA No. 960, remained suitable as the preferred project. It would achieve all of the stated project objectives while minimizing, to the extent feasible, the significant, unavoidable environmental impacts. Further, certain beneficial aspects of the alternatives analyzed have been incorporated into the proposed project. Specifically, GPA No. 960 proposes to eliminate some of the Rural Village Study Areas in which future urbanization was found to be unsuitable, associated with too many adverse environmental effects and/or to be otherwise infeasible (for example, due to lack of water and infrastructure, topography, or seismic hazards). In this way, GPA No. 960 has incorporated impact-reducing aspects of the Reduced Rural Villages Alternative in order to ensure the most environmentally suitable project alternative goes forward for consideration by the decision-makers of Riverside County. For all of these reasons, the project, GPA No. 960, remains the preferred alternative for achieving build out of the Riverside County General Plan pursuant to the stated project objectives.

E. Impacts and Mitigation for GPA No. 960

For the proposed project, a summary of environmental impacts, mitigation measures and the level of significance after mitigation is provided in Table 1.0-B on the following pages. The information in this summary is presented in a matrix format and briefly summarizes each of the environmental impacts associated with future development accommodated by GPA No. 960, as well as the existing and proposed General Plan policies and any new CEQA-specific mitigation measures recommended to reduce or avoid each potentially significant environmental impact. Lastly, the levels to which the policies and mitigation measures are expected to reduce the potentially significant environmental impacts are also indicated. Specifics on each category of environmental concern can be found in the corresponding parts of Section 4.0 of the EIR. Further details on other CEQA issues, such as significant unavoidable and irreversible effects, cumulative effects and growth-inducing effects, among others, are addressed in EIR Section 5.0 (Additional Required CEQA Topics).

Table 1.0-B: Summary of Proposed Project Impacts and Mitigation

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
4.2 Land Use		
Impact 4.2.A - Physically Divide an Established Community: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. None of the proposed changes, however, are in a location or of an extent that would physically divide an established community. Thus, this impact would be less than significant. Moreover, compliance with existing regulatory programs, Riverside County ordinances and existing General Plan policies would further reduce the already insignificant impact to communities.	**General Plan Policies:** LU 1.1, 1.3, 1.5, 1.6, 1.8, 2.1, 3.1, 5.4, 7.6, 9.1, 9.4, 15.2, 21.4, 25.2, 28.6, 28.9, 30.3, 30.4, 30.6, 31.1, 31.2, 31.3 and 36.1; C 1.1, 1.2, 1.3, 1.4, 1.7, 3.11, 3.12, 3.17, 3.21, 3.30, 3.31, 4.1, 4.3, 4.6, 4.8, 4.9, 6.1, 6.2, 6.3, 7.1, 7.2, 7.3, 7.4, 7.6, 7.8, 8.5, 8.7, 15.3, 15.4, 20.9 and 20.10; OS 8.1, 17.1, 17.2, 17.3 and 18.1	Less than significant.
Impact 4.2.B - Conflict With Environmental Land Use Policies Intended to Avoid or Mitigate an Environmental Effect: The proposed project contains new and revised policies, maps and data intended to clarify and enhance, not conflict, with the Riverside County General Plan, Riverside County ordinances and other regulatory programs, including those items adopted for the purpose of avoiding or mitigating an environmental effect. This impact would be less than significant. Moreover, compliance with existing regulatory programs and General Plan policies would further reduce the already insignificant impact.	**County Ord. No.s:** 448 and 576 **General Plan Policies:** LU 1.8, 5.4, 15.2, 15.8, 31.1 and 31.2; OS 17.1, 17.2, 17.3 and 18.1	Less than significant.
Impact 4.2.C - Conflict With Any Habitat Conservation Plan or Natural Community Conservation Plan: This impact is analyzed under Impact 4.8.6 of Section 4.8 (Biology). To summarize, this project does not include any General Plan changes that would preclude or hinder the Habitat Conservation Plans (HCPs) or Natural Community Conservation Plans (NCCPs) in effect within Riverside County. Additionally, future development accommodated by the proposed General Plan changes would be required to comply with all applicable HCP requirements and fully analyze, avoid and develop adequate mitigation for any significant biological effects prior to project approval or construction. As such, this project would not conflict with any applicable HCP or NCCP.	***See Impact 4.8.E.***	Less than significant.
4.3 Population and Housing		
Impact 4.3.A - Induce Direct or Indirect Population Growth: Future development consistent with the project would affect population growth both directly and indirectly. Overall, in terms of direct growth, the project's land use changes would serve to limit and slightly reduce the development capacity of Riverside County, yielding 1.4% less population growth than that projected for the existing General Plan. Projected reductions in dwelling units (- 2.0%) and, in particular, jobs, which would be reduced by 5.6%, would also indirectly limit population growth. Thus, overall growth rates associated with the project would not be increased over those proposed and planned for in the existing General Plan. Overall, the project represents a reduction in county capacity, yielding covers population growth forecasts, both compared to the existing General Plan and to current SCAG (2008 RTP) projections. Since the project's build out projections are for less population, housing and jobs than forecast under the existing General Plan and existing regional plans (SCAG RTP, etc.), project impacts on population growth, both direct and indirect, would be less than significant. Moreover, compliance with existing General Plan policies would further reduce the already insignificant impact associated with population growth.	**General Plan Policies:** LU 5.1, 5.2, 8.1 and 9.4; C 1.1, 1.4, 1.5, 2.4, 3.16 and 7.9	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Impact 4.3.B - Displace Residential Units: The project includes revisions to the existing General Plan that would affect the future development capacity of Riverside County. Future development pressure could result in redevelopment of existing uses, particularly in rural areas (e.g., agricultural lands and large-lot rural residential) and on under-utilized urban and suburban parcels. However, aerial analysis indicates that none of the areas proposed for land use changes under GPA No. 960 contain substantial numbers of existing houses whose loss would necessitate construction of replacement housing elsewhere. Thus, the project's effects on existing housing would be less than significant. Moreover, compliance with existing regulatory programs, including existing General Plan policies, would further reduce this already insignificant impact to housing inventory.	**General Plan Policies:** LU 8.1 and 9.4; C 2.4 and 7.9	Less than significant.
Impact 4.3.C - Displace People: The project includes revisions to the existing General Plan that would affect the future development capacity of Riverside County. In general, future development pressure could result in redevelopment of existing uses, particularly in rural areas (e.g., agricultural lands and large-lot rural residential) and on under-utilized urban and suburban parcels. However, none of the areas proposed for land use changes under GPA No. 960 contain substantial numbers of existing homes whose loss would displace substantial numbers of residents. Thus, the project's effects on residents would be less than significant. Moreover, compliance with existing General Plan policies would further reduce this already insignificant impact.	**General Plan Policies:** LU 8.1 and 9.4; C 2.4 and 7.9	Less than significant.
4.4 Aesthetics and Visual Resources		
Impact 4.4.A – Adversely Affect Scenic Vistas: Future development consistent with the changes proposed by GPA No. 960 would increase rural, suburban and urban uses in select portions of Riverside County, adversely affecting scenic vistas in some areas. Compliance with existing laws, regulatory programs, General Plan policies and existing Mitigation Measure 4.4.1A from EIR No. 441 help reduce potential impacts to scenic resources. Compliance with these, plus a new project-specific mitigation measure (4.4.A-N1) would ensure that future development accommodated by the project would have a less than significant impact on scenic vistas.	**Riverside County Ord. No.s:** 460 and 461 **Riverside County Policies:** Riverside County Design Guidelines **General Plan Policies:** LU 4.1, 14.3, 14.4, 14.5, 14.6, 14.7, 14.8, 16.4, 16.5, 16.12, 19.1, 28.6, 28.10, 29.9, 30.8 and 31.5; C 5.3 and 19.1 **Existing EIR No. 441 Mit. Measures:** 4.4.1A **New Mitigation Measure 4.4.A-N1:** No development shall be approved for parcels without adequate legal access and adequate physical access. Adequate and accessible circulation facilities must also exist to meet the demand of the proposed land use.	Less than significant with mitigation.
Impact 4.4.B – Adversely Affect Scenic Resources Within State Scenic Highways: Future activities consistent with GPA No. 960 would increase development of rural, suburban and urban uses, potentially substantially damaging scenic resources in some areas. Compliance with existing regulatory programs, General Plan policies and existing Mitigation Measure 4.4.1A from EIR No. 441 would reduce potential impacts to scenic resources to less than significant.	**Riverside County Ord. No.s:** 348, 460 and 461 **Riverside County Policies:** Oak Tree Design Guidelines; Riverside County Design Guidelines **General Plan Policies:** LU 4.5; C 20.1; OS 9.3 and 9.4 **Existing EIR No. 441 Mit. Measures:** 4.4.1A.	Less than significant.
Impact 4.4.C – Adversely Affect Existing Visual Character: The existing visual character or aesthetic quality of some sites affected by the proposed project may be altered by future activities consistent with proposed GPA No. 960 land use changes. Compliance with existing regulatory programs, existing General Plan policies, existing Mitigation Measure 4.4.1A from EIR No. 441 and new project-specific Mitigation Measure 4.4.A-N1 would ensure that potential adverse impacts to visual character resulting from GPA No. 960 are less than significant.	**Riverside County Ord. No.s:** 348, 457, 460 and 461 **Riverside County Policies:** Riverside County Design Guidelines **General Plan Policies:** LU 4.1 and 14.8 **Existing EIR No. 441 Mit. Measures:** 4.4.1A **New Mitigation Measure 4.4.A-N1:** *(See Impact 4.4.A for text)*	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Impact 4.4.D – Cause Adverse Light and Glare Effects: Future development consistent with GPA No. 960 would introduce new sources of light and glare which would adversely affect day and/or nighttime views in some areas. Compliance with a variety of existing regulatory programs, including General Plan policies and existing measures from EIR No. 441, would ensure that light and glare impacts to views are less than significant.	**Riverside County Ord. No.s:** 348, 461, 655 and 915 **Riverside County Policies:** Riverside County Design Guidelines **General Plan Policies:** LU 4.1. and 14.6 **Existing EIR No. 441 Mit. Measures:** 4.4.2A, 4.4.2B, 4.4.2C, 4.4.2D and 4.4.2E	Less than significant.
Impact 4.4.E – Interfere with Nighttime Use of the Palomar Astronomical Observatory: Future development accommodated by GPA No. 960 would introduce new sources of light within 15-45 miles of the Palomar Observatory, which requires dark skies to function. New sources of light resulting from GPA No. 960 would also contribute incrementally to the overall skyglow of the region, which interferes with nighttime operations at the Observatory. Compliance with a variety of existing regulatory programs, including General Plan policies, Riverside County ordinances, Ordinance No. 655 (Regulating Light Pollution) in particular, and existing measures from EIR No. 441, would ensure that light impacts on operations at Palomar Observatory are less than significant.	**Riverside County Ord. No.s:** 348, 461 and 655 **Riverside County Policies:** Riverside County Design Guidelines **General Plan Policies:** LU 4.1 **Existing EIR No. 441 Mit. Measures:** 4.4.2A, 4.4.2B, 4.4.2C, 4.4.2D and 4.4.2E	Less than significant.
4.5 Agricultural and Forestry Resources		
Impact 4.5.A – Cause the Conversion of Designated Farmlands: The specific land use and policy changes proposed by the project, GPA No. 960, would adversely affect (i.e., result in the conversion of) only minimal amounts of State-designated Prime Farmland, Farmland of Statewide Importance and Farmland of Local Importance ("Farmlands") to a variety of non-agricultural uses. No Unique Farmland would be affected. Due to the very small areas involved, these impacts would be less than significant. Indirectly, the growth accommodated and facilitated by the project would result in additional development and infrastructure demand that would further conversion of designated Farmlands to urban uses and result in other changes in the existing environment leading to additional Farmland conversion. This indirect impact would be significant and unavoidable.	**Riverside County Ord. No.s:** 509 and 625 **General Plan Policies:** OS 7.1, 7.3 and 7.5; LU 20.1, 20.2, 20.4, 20.5, 20.6, 20.9 and 20.11	Significant and unavoidable.
Impact 4.5.B – Encroach On or Conflict With Existing Agricultural Uses: Future development pursuant to land use and policy changes proposed by the project, GPA No. 960, has the potential to result in conflicts with existing zoning, agricultural uses, lands subject to a Williamson Act contract or within a Riverside County Agricultural Preserve. It may also result in introduction of new urban uses within 300 feet of agriculturally zoned property. Indirectly, the growth accommodated and facilitated by the project would result in additional development and infrastructure demand that would further conversion of agricultural lands to urban uses, encroach on existing agricultural activities and mapped Farmlands, and result in other changes in the existing environment leading to additional Farmland conversion. This indirect impact would be significant and unavoidable.	**Riverside County Ord. No.s:** 509 and 625 **Riverside County Policies:** Resolution 84-526 - Rules and Regulations Governing Agricultural Preserves **General Plan Policies:** OS 7.1, 7.3 and 7.5; LU 20.1, 20.2, 20.4, 20.5, 20.6, 20.7, 20.8 and 20.11	Significant and unavoidable.
Impact 4.5.C – Adversely Affect Forest Lands and Forestry Uses: In Southern California, including Riverside County, climate and topography limit the types and locations of forest lands and their potential for commercial or industrial timber utilization. Accordingly, there are no existing or currently proposed zoning of forest land, timberland or Timberland Production Zones within Riverside County; and the project would not conflict with any of these. Woody biomass removal, a type of forestry utilized by utility companies and forest management agencies for fire safety purposes, occurs	**Riverside County Ord. No.:** 559 **Riverside County Policies:** Resolution 84-526 - Rules and Regulations Governing Agricultural Preserves **General Plan Policies:** OS 8.1, 8.2 and 9.4; LU 7.6 and 7.10	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
with Riverside County, but not within fixed locations. Nevertheless, forest lands do occur in scattered locations within Riverside County. Hence, future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to result in loss or conversion of forest land to non-forest uses or result in other changes in the existing environment which, due to their location or nature, could result in forest land conversion as well. Further, growth accommodated and facilitated by the project would indirectly result in additional development and infrastructure demand that would create additional potential for forest land conversion or encroach on incompatible uses. Compliance with existing and proposed regulations and policies would ensure forestry impacts are less than significant.		
4.6 Air Quality		
Impact 4.6.A – Cause Inconsistency With Air Quality Plans: As outlined in Section 4.3 (Population and Housing), future development associated with GPA No. 960 represents a reduction in county capacity and yields lower population growth forecasts, both compared to the existing General Plan and to current SCAG (2008 RTP) projections. Since air quality management plans (AQMPs) are developed using growth forecasts issued by the applicable regional association of governments (SCAG, etc.), a project that is consistent with the applicable growth forecast would generally be consistent with the AQMP. This is the case for GPA No. 960. Further, it includes a number of new policies and programs related to greenhouse gas reductions that would also improve air quality for a variety of criteria pollutants addressed in AQMPs. Compliance with existing regulatory programs, Riverside County ordinances and General Plan policies, as well as new ones included in GPA No. 960, would further reduce this impact by reducing conflicts with or obstruction of the AQMP. However, while the existing General Plan policies and new ones included in GPA No. 960 may reduce conflicts and obstruction of any AQMP, the combined emissions from all proposed General Plan development would exceed the SCAQMD and MDAQMD significance thresholds for criteria pollutants. Exceeding these thresholds has the potential to hinder the region's compliance with each AQMP. Therefore, this impact is significant and unavoidable.	**Riverside County Ord. No.s:** 706 and 726 **General Plan Policies:** LU 1.5, 2.1, 8.12, 11.1-11.4 and 13.1-13.4; C 1.2, 1.7, 4.1, 4.8, 9.2, 11.2, 11.4, 11.5, 11.7, 12.2, 13.1, 17.4 and 20.14; AQ 1.1-1.9, 2.3, 2.4, 3.2-3.4, 4.2-4.7, 5.1-5.4, 7.1-7.4, 8.2, 8.4, 8.6-8.9, 9.1, 9.2, 10.1-10.4, 11.3, 11.4, 13.1-13.3, 14.1, 14.2, 14.4, 15.1, 16.1-16.4, 17.1-17.5, 17.8-17.11, 22.1, 23.1, 24.1, 25.1, 26.1, 27.1, 28.1 and 29.1-29.3 **New Mitigation Measure 4.7.A-N1:** *(See Impact 4.7.A for text.)* **New Mitigation Measure 4.7.A-N2:** *(See Impact 4.7.A for text.)*	Significant and unavoidable.
Impact 4.6.B(1) – Cause Significant Construction (Short-Term) Air Emissions: Future development accommodated by the proposed project, GPA No. 960, would result in construction activities generating air quality emissions that may be quantified based on the level of daily disturbance. However, since GPA No. 960 would be implemented through many (perhaps thousands) of individual projects occurring throughout Riverside County over next roughly 50 years, the level of daily disturbance for GPA No. 960 cannot be calculated and, therefore, the associated construction emissions cannot be quantified. Although implementing projects may be individually consistent with air quality standards, because of the cumulative nature of air emissions, such projects may nonetheless cumulatively exceed an air quality standard. Thus, even with implementation of the regulations, existing policies and mitigation measures outlined herein that reduce emissions, it cannot be guaranteed that they would be cumulatively reduced to below applicable thresholds. Thus, this impact would be significant and unavoidable with respect to violations of air quality standards for construction activities.	**General Plan Policies:** AQ 1.1-1.4, 1.10, 2.1, 4.1, 4.7-4.10, 5.1, 15.1, 16.1, 16.3, 17.1, 17.3, 17.4, 17.6, 17.8 and 17.11 **Existing EIR No. 441 Mit. Measures:** 4.5.1A, 4.5.1B and 4.5.1C **New Mitigation Measure 4.6.B-N1:** The construction contractor shall ensure that all disturbed areas and stock piles are watered at least three times per day or soil stabilizers are applied as necessary to prevent visible dust plumes from these areas. Stock piles not in use may be covered with a tarp to eliminate the need for watering or other stabilizers. **New Mitigation Measure 4.6.B-N2:** All construction equipment shall have EPA rated engines of Tier 3 or better. **New Mitigation Measure 4.6.B-N3:** As soon as electric utilities are available at construction sites, the construction site shall be supplied with elec-	Significant and unavoidable.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	tricity from the local utility and all equipment that can be electrically operated shall use the electric utility rather than portable generators.	
Impact 4.6.B(2) – Cause Significant Operational (Long-Term) Air Emissions: Stationary and mobile sources would emit criteria pollutants based on the level of daily operation. Modeling results indicate that such emissions would be large, both for individual future projects and cumulatively due to the countywide scale of GPA No. 960. Even with the implementation of regulations, ordinances and existing and proposed General Plan policies, in addition to new mitigation measures, criteria pollutant emissions would not be reduced below regulatory thresholds. Thus, this impact would remain significant and unavoidable with respect to violations of air quality standards for operational activities.	**General Plan Policies:** LU 1.5, 2.1, 4.1, 8.12, 11.1, 11.3, 11.4 and 13.1-13.4; C 1.2, 1.7, 4.1, 4.8, 9.2, 11.2, 11.4-11.7, 12.1-12.3, 13.1-13.3, 17.3, 17.4, 20.14 and 21.1; OS 12.1, 16.1-16.6, 16.8; AQ 1.1-1.11, 2.1, 2.3, 2.4, 3.1-3.4, 4.2-4.8, 5.1-5.4, 7.1-7.4, 8.2, 8.4, 8.6-8.9, 9.1, 9.2, 10.1-10.4, 11.3, 11.4, 13.1-13.3, 14.1, 14.2, 14.4, 15.1, 16.1-16.4, 17.1-17.5, 17.8-17.11, 19.1, 20.1, 22.1, 23.1, 24.1, 25.1, and 26.1 and 26.2 **New Mitigation Measure 4.7.A-N1:** *(See text in Impact 4.7.A.)* **New Mitigation Measure 4.7.A-N2:** *(See text in Impact 4.7.A.)* **New Mitigation Measure 4.6.B-N4:** All new development shall ensure that all interior and exterior architectural coatings used are low in reactive organic gases. **New Mitigation Measure 4.6.B-N5:** If hearths are included in new residential developments, they shall be energy-efficient natural gas appliances. No wood-burning hearths or stoves shall be permitted in new residential developments.	Significant and unavoidable.
Impact 4.6.C – Cause Cumulatively Significant Project Air Quality Impacts: Future development accommodated by GPA No. 960 would result in the emission of criteria pollutants for which the project is in non-attainment during both construction and operation of the new development. However, the exact location and level of activity for development projects under proposed GPA No. 960 is unknown and therefore cumulatively considerable increases to criteria pollutant levels cannot be quantified. Even with compliance with existing regulations and policies and the implementation of existing and new mitigation measures, the proposed project would result in significant and unavoidable cumulative impacts.	**Riverside County Ord. No.s:** 706, 726, 782 and 824 **General Plan Policies:** LU 1.5, 2.1, 4.1, 8.12, 11.1, 11.3, 11.4 and 13.1-13.4; C 1.2, 1.7, 4.1, 4.8, 9.2, 11.2, 11.4-11.7, 12.1-12.3, 13.1-13.3, 17.3, 17.4, 20.14 and 21.1; OS 12.1, 16.1-16.6, 16.8; AQ 1.1-1.11, 2.1, 2.3, 2.4, 3.1-3.4, 4.1-4.10, 5.1-5.4, 7.1-7.4, 8.2, 8.4, 8.6-8.9, 9.1, 9.2, 10.1-10.4, 11.3, 11.4, 13.1-13.3, 14.1, 14.2, 14.4, 15.1, 16.1-16.4, 17.1, 17.5, 17.6, 17.9-17.11, 19.1, 20.10, 22.1, 23.1, 24.1, 25.1, 26.1 and 26.2 **Existing EIR No. 441 Mit. Measures:** 4.5.1A, 4.5.1B and 4.5.1C **New Mitigation Measure 4.6.B-N1:** *(See text in Impact 4.6.B.)* **New Mitigation Measure 4.6.B-N2:** *(See text in Impact 4.6.B.)* **New Mitigation Measure 4.6.B-N3:** *(See text in Impact 4.6.B.)* **New Mitigation Measure 4.6.B-N4:** *(See text in Impact 4.6.B.)* **New Mitigation Measure 4.6.B-N5:** *(See text in Impact 4.6.B.)* **New Mitigation Measure 4.7.A-N1:** *(See text in Impact 4.6.A.)* **New Mitigation Measure 4.7.A-N2:** *(See text in Impact 4.7.A.)*	Significant and unavoidable.
Impact 4.6.D – Expose Sensitive Receptors to Air Pollutants: Future development accommodated by GPA No. 960 would expose sensitive receptors to pollutant emissions from both construction and operational activities. The degree of impact would depend on the type of operation, distance from sensitive receptors and the level of activity at each site. However, as the exact location, timing	**General Plan Policies:** AQ 1.1, 1.3, 1.4, 1.7, 1.10, 2.1-2.4, 4.1, 4.5-4.10, 5.1, 15.1, 16.1, 16.3, 17.1, 17.3, 17.4, 17.6 and 17.8-17.11 **Existing EIR No. 441 Mit. Measures:** 4.5.1A, 4.5.1B and 4.5.1C **New Mitigation Measure 4.6.D-N1:** New developments shall include the	Significant and unavoidable.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
and level of future development activities arising from GPA No. 960 is unforeseeable, specific impacts to sensitive receptors cannot be quantified. Thus, even after complying with regulations, existing policies and mitigation measures, as well as specific new mitigation measures, impacts cannot be guaranteed to be reduced to below applicable agency thresholds. Thus, this impact would be significant and unavoidable with respect to exposure of sensitive receptors.	following requirements to reduce emissions associated with toxic air contaminants (TACs): a. Electrical outlets shall be included in the building design of any loading docks to allow use by refrigerated delivery trucks. Signage shall also be installed, instructing commercial vehicles to limit idling times to five minutes or less. If loading and/or unloading of perishable goods would occur for more than five minutes and continual refrigeration is required, all refrigerated delivery trucks shall use the electrical outlets to continue powering the truck refrigeration units when the delivery truck engine is turned off. b. Electrical outlets shall be installed on the exterior of new structures for use with electrical landscaping equipment. Further, the property owner(s) shall ensure that the hired landscape companies use electric-powered equipment where available to a minimum of 20% of the equipment used. **New Mitigation Measure 4.6.D-N2:** The County of Riverside shall require minimum distances between potentially incompatible land uses, as described below, unless a project-specific evaluation of human health risks defines, quantifies and reduces the potential incremental health risks through site design or the implementation of additional reduction measures to levels below applicable standards (e.g., standards recommended or required by CARB, SCAQMD or MDAQMD). <u>SCAQMD Jurisdiction:</u> a. Proposed dry cleaners and film processing services that use perchloroethylene must be sited at least 500 feet from existing sensitive land uses including residential, schools, day care facilities, congergate care facilities, hospitals or other places of long-term residency for people. b. Proposed auto body repair services shall be sited at least 500 feet from existing sensitive land uses. c. Proposed gasoline dispensing stations with an annual throughput of less than 3.6 million gallons shall be sited at least 50 feet from existing sensitive land uses. Proposed gasoline dispensing stations with an annual throughput at or above 3.6 million gallons shall be sited at least 300 feet from existing sensitive land uses. d. Other proposed sources of TACs including furniture manufacturing and repair services that use methylene chloride or	

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	other solvents identified as a TAC shall be sited at least 300 feet from existing sensitive land uses. *e. Avoid siting distribution centers that accommodate more than 100 truck trips per day (or more than 40 truck trips operating transport refrigeration units per day, or where transportation refrigeration units operate more than 300 hours per week) within 1,000 feet of existing sensitive land uses.* f. Proposed sensitive land uses shall be sited at least 500 feet from existing freeways, major urban roadways with 100,000 vehicles per day or more and major rural roadways with 50,000 vehicles per day or more. g. Proposed sensitive land uses shall be sited at least 500 feet from existing dry cleaners and film processing services that use per-chloroethylene. h. Proposed sensitive land uses shall be sited at least 500 feet from existing auto body repair services. i. Proposed sensitive land uses shall be sited at least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons. j. Proposed sensitive land uses shall be sited at least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC. *k. Proposed sensitive land uses shall be sited at least 1,000 feet from existing distribution centers that accommodate more than 100 trucks per day, accommodate more than 40 trucks per day with transportation refrigeration units, or where transportation refrigeration units operate more than 300 hours per week.* <u>MDAQMD Jurisdiction:</u> a. Proposed industrial projects must be sited at least 1,000 feet from existing sensitive land uses. b. Proposed distribution centers with 40 or more truck per day shall be sited at least 1,000 feet from existing sensitive land uses. c. Proposed dry cleaner using perchloroethylene shall be sited at least 500 feet from existing sensitive land uses. d. Proposed gasoline dispensing facility shall be sited at least 300 feet from existing sensitive land uses.	

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	e. Proposed sensitive land uses shall be sited at least 500 feet from existing freeways, major urban roadways with 100,000 vehicles per day or more and major rural roadways with 50,000 vehicles per day or more. f. Proposed sensitive land uses shall be sited at least 1,000 feet from existing industrial facilities or distribution centers with more than 40 trucks per day. g. Proposed sensitive land uses shall be sited at least 500 feet from existing dry cleaners using perchloroethylene. h. Proposed sensitive land uses shall be sited at least 300 feet from existing gasoline dispensing stations. **New Mitigation Measure 4.6.B-N1:** *(See Impact 4.6.B(1).)* **New Mitigation Measure 4.6.B-N2:** *(See Impact 4.6.B(1).)* **New Mitigation Measure 4.6.B-N3:** *(See Impact 4.6.B(1).)*	
Impact 4.6.E – Cause or Expose People to Objectionable Odors: Future development accommodated by the proposed project would not create objectionable odors that would affect a substantial number of people. Additionally, compliance with existing regulatory programs and General Plan policies, as well as new Mitigation Measures 4.6.E-N1, 4.6.E-N2 and 4.6.E-N3 would further reduce objectionable odors. For these reasons odor impacts are less than significant.	**Regional Regulations:** SCAQMD Rules 402, 410 and 1179 **Riverside County Ord. No.s:** 706 **General Plan Policies:** AQ 1.5, 1.7, 2.1-2.4, 4.6, 5.1, 16.3 and 17.7-17.10 **New Mitigation Measure 4.6.E-N1:** Locate potential new odor sources predominantly down- or cross-wind from existing sensitive receptors and potential new sensitive receptors predominantly upwind from existing odor sources. As indicated by the "Right-to-Farm" ordinance, agricultural uses that have operated for more than three years cannot be re-classified as a public or private nuisance by new development. **New Mitigation Measure 4.6.E-N2:** Maintain an adequate buffer between potential new odor sources and receptors such that emitted odors are dissipated before reaching the receptors (minimum of 500 feet depending on odor source). As per the "right-to-farm" ordinance, agricultural uses that have been operated for more than three years cannot be re-classified as a public or private nuisance by new development. **New Mitigation Measure 4.6.E-N3:** Design odor-emitting facilities such that odor emitters are located as far from potential receptors as possible. Also, balance stack heights to provide the maximum dispersion of odor between the stack and the nearest sensitive receptor.	Less than significant with mitigation.
4.7 Greenhouse Gases		
Impact 4.7.A – Generation of Greenhouse Gas Emissions: Implementation of the Riverside County General Plan, as updated pursuant to the proposed project, (GPA No. 960), and associated Climate Action Plan (CAP) would result in future construction and operational activities that generate GHGs. Either individually or collectively, these activities have the potential to result in substantial	**Riverside County Ord. No.s:** 559, 655, 659, 695, 706, 726, 748, 782, 810, 824, 859 and 875 **Riverside County Policies and Regulations:** Riverside County Climate Action Plan (CAP); BOS Policies A-64, H-4, H-25 and H-29	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
emissions of GHGs; for example, exceeding the 3,000-10,000 MTY thresholds proposed by the SCAQMD in Tier 3 of its 2008 Interim CEQA Greenhouse Gas Significance Thresholds. However, implementation of the proposed General Plan policies and particularly, the Implementation Measures of the CAP, as well as existing EIR No. 441 and proposed mitigation measures would ensure GHG emissions within Riverside County would be less than significant.	**General Plan Policies:** LU 1.5, 2.1, 4.1, 8.12, 11.1, 11.3, 11.4 and 13.1-13.4; C 1.2, 1.7, 4.1, 4.8, 5.2, 9.2, 11.2, 11.4, 11.5, 11.6, 12.1, 12.2, 13.1-13.3, 17.3, 17.4, 21.1, and 21.7; OS 2.2, 2.5, 10.1, 11.1-11.3, and 12.1; AQ 1.1-1.4, 1.7, 3.2, 3.4, 4.1, 4.2, 4.4, 5.1, 5.2, 5.4, 8.4-8.9, 10.1-10.4, 13.1, 21.1-21.4, 22.1, 23.1, 23.2, 24.1, 24.2, 25.1-25.3, 26.1, 26.2, 27.1, 27.2, 28.1, 28.2, and 29.1-29.4 **Existing EIR No. 441 Mit. Measures:** 4.5.1C (sans item *g,* which is N/A) **New Mitigation Measure 4.7.A-N1:** To ensure GHG emissions resulting from new development are reduced to levels necessary to meet State of California targets, the County of Riverside shall require all new discretionary development to comply with the Implementation Measures of the Riverside County Climate Action Plan or provide comparable custom measures backed by a project GHG study (for example, using CalEEMod modeling) demonstrating achievement of the same target. The target to be met is a GHG emissions reduction of 25% below emissions for the adjusted BAU scenario for residential, commercial, industrial, institutional and mixed-use projects. The adjusted BAU is based upon the 2020 adjusted BAU found in the Final Supplement to the AB 32 Scoping Plan (CARB 2011). **New Mitigation Measure 4.7.A-N2:** In lieu of a project-specific analysis per Mitigation Measure 4.7.A-N1, a future discretionary project proposed pursuant to the Riverside County General Plan shall incorporate into the project design, operational features and/or Implementing Measures from the Riverside County Climate Action Plan, in such a manner as to garnish at least 100 points. The point values within the CAP's Screening Tables constitute GHG emission reductions. ***NEW Mitigation Measure 4.7.A-N3:*** *The County of Riverside will monitor implementation of the reduction measures and revise or amend the Climate Action Plan as needed based upon the results of monitoring to ensure achievement of the 2020 Reduction Target. In addition, the County of Riverside will start update process of the Climate Action Plan in 2017 to provide a post-2020 plan. The post-2020 Climate Action Plan update will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader state and federal reduction targets including Executive Order S-3-05 and with the scientific understanding of the needed reductions by 2050. The post-2020 Climate Action Plan update will include a set of updated reduction measures to achieve the 2035 and 2050 Reduction Targets and updated monitoring system to ensure that the updated targets are achieved. The County of Riverside will adopt the new*	

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	post-2020 Climate Action Plan update by January 1, 2020.	
Impact 4.7.B – Conflict with GHG Reduction Plans, Policies or Regulations: Implementation of the Riverside County General Plan, as updated pursuant to the proposed project (GPA No. 960), would result in future construction and operational activities that generate GHGs. This generation of GHGs would potentially conflict with the implementation of AB 32 and SB 375, California policies for reducing GHG emissions. However, implementation of the proposed General Plan policies and particularly the Implementation Measures of the Riverside County CAP, plus proposed new Mitigation Measures 4.7.A-N1 and 4.7.A-N2, would ensure that build out of the General Plan, as amended by GPA No. 960, would be consistent with both AB 32 and SB 375 and have a less than significant impact on their implementation.	**Riverside County Ord. No.s:** 559, 655, 659, 695, 706, 726, 748, 782, 810, 824, 859 and 875 **Riverside County Policies and Regulations:** CAP; BOS Policies A-64, H-4, H-25 and H-29 **General Plan Policies:** LU 1.5, 2.1, 4.1, 8.12, 11.1, 11.3, 11.4 and 13.1-13.4; C 1.2, 1.7, 4.1, 4.8, 5.2, 9.2, 11.2, 11.4, 11.5, 11.6, 12.1, 12.2, 13.1-13.3, 17.3, 17.4, 21.1, and 21.7; OS 2.2, 2.5, 10.1, 11.1-11.3, and 12.1; AQ 1.1-1.4, 1.7, 3.2, 3.4, 4.1, 4.2, 4.4, 5.1, 5.2, 5.4, 8.4-8.9, 10.1-10.4, 13.1, 21.1-21.4, 22.1, 23.1, 23.2, 24.1, 24.2, 25.1-25.3, 26.1, 26.2, 27.1, 27.2, 28.1, 28.2, and 29.1-29.4 **New Mitigation Measure 4.7.A-N1:** *(See text in Impact 4.7.A.)* **New Mitigation Measure 4.7.A-N2:** *(See text in Impact 4.7.A.)*	~~*Less than significant with mitigation*~~. *Significant and Unavoidable*
4.8 Biological Resources		
Impact 4.8.A – Adversely Affect Riparian and Other Sensitive Habitats: Future development accommodated by the proposed project, GPA No. 960, would increase rural, suburban and urban uses in Riverside County, adversely affecting riparian or other sensitive habitats in various areas. Compliance with a variety of laws, including Sections 401, 402 and 404 of the federal Clean Water Act, Section 1600 et seq. of the California Fish and Game Code and the multi-species habitat conservation plans for western Riverside County and the Coachella Valley, as well as a variety of existing and proposed General Plan policies and project-specific new Mitigation Measure 4.8.A-N1, would ensure that this impact is reduced to less than significant.	**Regional Regulations:** Western Riverside County Multiple Species Habitat Conservation Plan (WRC-MSHCP) and Coachella Valley MSHCP (CV-MSHCP) **General Plan Policies:** LU 7.7, 9.1 and 9.2; C 20.9; OS 5.1, 5.2, 5.3, 5.5, 5.6, 6.1, 6.2, 9.3, 9.4, 17.1, 17.2, 18.1, 18.3, 18.4 and 20.2 **New Mitigation Measure 4.8.A-N1:** ~~*For sites not governed by an existing MSHCP,*~~ Where site conditions (for example, topography, soils, vegetation, etc.) indicate a project could adversely affect any riparian or riverine resources, then an appropriate assessment shall be prepared by a qualified professional. An assessment shall include, but not be limited to, identification and mapping of any riparian/riverine areas and evaluation of species composition, topography/hydrology and soil analysis, as applicable. An assessment shall be completed as part of the environmental review for the development proposal prior to its approval. Upon receipt of an assessment, the Riverside County Ecological Resources Specialist (ERS) shall review the document and make a finding that either: a. Riparian/riverine areas do not exist on site; b. Project-specific avoidance measures have been identified that would be sufficient to ensure avoidance of riparian/riverine areas; or c. Impacts to riparian/riverine areas are significant and unavoidable. If avoidance is not feasible, a practicable alternative that minimizes direct and indirect effects to riparian/riverine areas and vernal pools and associated functions and values to the greatest extent possible must be developed.	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	If impacts remain ~~*significant and*~~ unavoidable the then ~~*ERS will*~~ *projects shall be conditioned to* require the project applicant to obtain a Section 404 permit from the ACOE and/or a Fish and Game Code Section 1600 agreement from CDFW prior to the issuance of any grading permit or other action by the County of Riverside that would lead to the disturbance of the riparian resource. **New Mitigation Measure 4.8.A-N2:** ~~*For sites not governed by an MSHCP,*~~ A general biological resources assessment (BRA) shall be required as part of the discretionary project review process at the County of Riverside's discretion. For example, *a BRA would be required* if site inspection, aerial or other photos, resource agency data or any other information indicates potential for sensitive habitat to occur on, or be adversely affected by the proposed project. The BRA shall be prepared and reviewed as per the requirements outlined in Mitigation Measure 4.8.B-N1.	
Impact 4.8.B – Cause Direct and Indirect Impacts to Protected Species or Their Habitats: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting various sensitive species, including threatened, endangered and special status species protected under various local, state and federal laws. Compliance with the federal and California Endangered Species Acts (FESA & CESA), federal Clean Water Act (CWA) and California Fish and Game Code, as well as the two MSHCPs (WRC and CV) in Riverside County, plus existing and proposed General Plan Policies would avoid, reduce or minimize significant impacts to protected species and their habitats. In addition, a new project-specific mitigation measure, 4.8.B-N1, is proposed to ensure this impact would be less than significant.	**Regional Regulations:** Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP), WRC-MSHCP and CV-MSHCP **General Plan Policies:** C 20.9; OS 5.1, 5.3, 5.6, 6.2, 9.3, 9.4, 17.1, 17.2, 18.1, 18.3 and 20.2 **New Mitigation Measure 4.8.B-N1:** Prior to discretionary project approval for projects with potential to substantially adversely affect sensitive (listed, candidate or special status) species or habitats ~~*not covered by an existing MSHCP or HCP*~~, a general biological resource assessment (BRA) shall be performed. The following requirements shall apply: a. The BRA shall be performed by a Riverside County-approved biologist pursuant to a Memorandum of Understanding (MOU) executed between the biologist and the County of Riverside. b. The biology/environmental firm or biologist preparing the BRA must be on Riverside County's list of qualified consultants. c. Fieldwork must be performed by qualified biologists according to professional standards. d. If included in the BRA, presence/absence surveys for specific plants must be conducted during the applicable blooming season or other conditions as deemed scientifically appropriate and valid. e. Should affected species or habitat occur on the project site, then a "Focused Protocol Survey" must be prepared for those species using existing protocols established by the USFWS or CDFG. If no such protocols exist, the survey must be based on generally accepted biological survey protocols appropriate to the species.	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	The BRA requirement *may* be waived if any of the following conditions are documented to exist. a. The area affected by the proposed project ("footprint" herein) consists entirely of built environment (structures, pavement, etc.) and none of the biota or plant material present (i.e., landscaping) represent likely habitat used by a sensitive species. b. The Riverside County Environmental Resource Specialist (ERS) finds in writing that the proposed footprint does not have any biological resources expected to be used by a protected species or plant. c. The project or activity proposed is to be performed under an existing incidental take permit, habitat conservation plan or other governing permit, license or authorization (i.e. Section 7 consultation) and no new significant effect to the covered species or other protected species or resource is expected to occur. In addition to the items herein, the BRA shall also be prepared in accordance with the Riverside County "Guide to Preparing General Biological Resource Assessments," as well as any other requirements of the Riverside County Environmental Programs Department, Planning Department or other Riverside County agency. Upon receipt of the BRA, the Riverside County ERS shall review it and all supporting documentation. If the Riverside County ERS finds that the project does not have the potential to substantially affect sensitive species or habitat, no further mitigation is required. If the Riverside County ERS finds that the project has the potential to substantially adverse affect sensitive species or habitat, then additional mitigation will be developed and imposed to reduce such impacts to below a level of significance. Such mitigation may include but not be limited to obtaining an incidental take permits from the USFWS and/or CDFW, as applicable, and acquisition and conservation of replacement habitat at appropriate ratios.	
Impact 4.8.C – Adversely Affect Wetlands: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marshes, vernal pools, etc.) through direct removal, filling, hydrological interruption or other means. Compliance with the existing laws, regulatory programs and General Plan policies, as well as new project-specific Mitigation Measures 4.8.C-N1 and 4.8.C-N2, would ensure impacts to wetlands would be less than significant.	**Regional Regulations:** WRC-MSHCP **General Plan Policies:** LU 7.7, 9.1 and 9.2; OS 5.1, 5.2, 5.5, 5.6, 6.1, 6.2, 17.1, 17.2, 18.1, 18.3 and 18.4 **New Mitigation Measure 4.8.C-N1:** If site conditions (for example, topography, soils, vegetation, etc.) indicate that the proposed project could affect riparian/riverine areas or federally protected wetlands as defined by Section 404 of the CWA, then an appropriate assessment shall be prepared by a qualified professional as part of Riverside County's project review process.	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	An assessment shall include, but not be limited to, identification and mapping of any wetland(s) or riparian resources present; evaluation of plant species composition, topography and hydrology; a soils analysis (where appropriate) and conclusions stating the presence or absence of jurisdictional wetlands. An assessment shall be completed as part of the CEQA review for the development proposal. Should any grading or construction be proposed within or alongside the banks of the watercourse or wetland, the land divider/permit holder shall provide written notification to the Riverside County Planning Department that the alteration of any watercourse or wetland, located either on site or on any required offsite improvement areas, complies with the U.S. Army Corps of Engineers Nationwide Permit Conditions. Or, the land divider shall obtain a permit under Section 404 of the Clean Water Act. Copies of any agreements shall be submitted along with the notification. **New Mitigation Measure 4.8.C-N2:** If site conditions (for example, topography, soils, vegetation, etc.) indicate that the proposed project could affect riparian/riverine areas or federally protected wetlands as defined by CFGC Section 1600 *et seq*., then an appropriate assessment shall be prepared by a qualified professional as part of Riverside County's project review process. An assessment shall include, but not be limited to, identification and mapping of any wetland(s) or riparian resources present; evaluation of plant species composition, topography and hydrology; a soils analysis (where appropriate) and conclusions stating the presence or absence of jurisdictional wetlands. An assessment shall be completed as part of the CEQA review for the development proposal. Should any grading or construction be proposed within or along the banks of any natural watercourse or wetland located either on site or on any required offsite improvement areas, the land divider/permit holder shall provide written notification to the Riverside County Planning Department that the appropriate California Department of Fish and Wildlife notification pursuant to Sections 1601/1603 of the California Fish and Game Code has taken place. Or, the land divider shall obtain an "Agreement Regarding Proposed Stream or Lake Alteration" (Section 1601/1603 Permit). Copies of any agreements shall be submitted along with the notification.	
Impact 4.8.D – Impede Species Movement, Migration, Wildlife Corridors and Use of Wildlife Nursery Sites: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting movement, migration, wildlife corridors and the use of native wildlife nursery sites. Compliance with existing laws, regulatory programs and	**Regional Regulations:** WRC-MSHCP, CV-MSHCP and SKR HCP **General Plan Policies:** C 20.9; OS 5.1, 5.3, 5.6, 6.2, 9.3, 9.4, 17.1, 17.2, 18.1, 18.3 and 20.2 **New Mitigation Measures 4.8.B-N1:** *(See Impact 4.8.B.)*	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
General Plan policies, as well as new project-specific Mitigation Measures 4.8.B-N1 and 4.8.D-N1, would ensure that this impact is less than significant.	**New Mitigation Measure 4.8.D-N1:** Should a wildlife nursery site or native resident or migratory wildlife corridor be uncovered through a biological resources assessment (BRA), then a consultation with a Riverside County Ecological Resources Specialist (ERS) shall occur. The ERS shall make a determination if the site is essential for the long-term viability of the species. If such a determination is made, then the ERS shall work with the applicant to avoid the effects of development on the resource in question and condition the land use case accordingly. Should significant impacts to nursery site or corridor not be avoidable, project applicant shall be required to ensure the preservation of comparable nursery or corridor habitat off site.	
Impact 4.8.E – Conflict with Adopted Habitat Conservation Plans: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, including areas covered by adopted HCPs, in particular the WRC-MSHCP and the CV-MSHCP. Compliance with the provisions of these MSHCPs would ensure that future development accommodated by GPA No. 960 is consistent with the plans and that this impact is less than significant.	**Regional Regulations:** WRC-MSHCP, CV-MSHCP and SKR HCP **General Plan Policies:** C 20.9; OS 5.1, 5.3, 5.6, 6.2, 9.3, 9.4, 17.1, 17.2, 18.1, 18.3 and 20.2	Less than significant.
Impact 4.8.F – Conflict with Local Biological Resource Protections Policies or Ordinances: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in the county. In some locations, this could result in conflicts with local policies and ordinances protecting biological resources, such as Riverside County's Oak Tree Management Guidelines, for example. Compliance with existing laws, regulatory programs, Riverside County Ordinance No. 559 and General Plan policies would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 559 **Riverside County Policies:** Riverside County Oak Tree Management Guidelines **General Plan Policies:** OS 9.3 and 9.4	Less than significant.
4.9 Cultural and Paleontological Resources		
Impact 4.9.A – Adversely Change the Significance of Historical Resources: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting known and presently unknown historic resources. Compliance with existing laws, Riverside County Ordinance No. 578, General Plan policies and existing Mitigation Measure 4.7.1B from EIR No. 441 would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.:** 578 **General Plan Policies:** LU 4.5.; OS 19.2–19.5 **Riverside County Planning Dept. Procedures:** *(See EIR No. 521 Section 4.9.3, Subsections D.2 and D.3.)* **Standard Project Conditions of Approval:** *(See list in EIR No. 521 Section 4.9.3., Subsection D.4.)* **Existing EIR No. 441 Mit. Measures:** 4.7.1B	Less than significant.
Impact 4.9.B – Cause the Destruction of Known Archeological Resources: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting known or presently unknown archeological resources. Compliance with existing laws, General Plan policies, Planning Department procedures, project-level conditions of approval for cultural resources, existing Mitigation Measure 4.7.1B from EIR No. 441 and new Mitigation Measure 4.9.B-N1 would be sufficient to ensure that this impact is less than significant with mitigation.	**Riverside County Ord. No.s:** 578 **General Plan Policies:** OS 19.2-19.5 **Riverside County Planning Dept. Procedures:** *(See EIR No. 521 Section 4.9.3., Subsections D.2 and D.3, for text.)* **Standard Project Conditions of Approval:** *(See list in EIR No. 521 Section 4.9.3., Subsection D.4.)* **Existing EIR No. 441 Mit. Measures:** 4.7.1B **New Mitigation Measure 4.9.B-N1:** If avoidance or preservation in place of cultural resources is not feasible, the following mitigation measures shall be	Less than significant with mitigation.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
	initiated for each impacted site: a. Discoveries shall be discussed with the Native American tribal (or other appropriate ethnic/ cultural group representative) and the Riverside County Archeologist, and a decision shall be made with the concurrence of the Planning Director, as to the appropriate mitigation (documentation, recovery, avoidance, etc.) appropriate for the cultural resource. b. Further ground disturbance shall not resume within the area of the discovery until an agreement has been reached by all parties as to appropriate preservation or mitigation measures.	
Impact 4.9.C – Cause the Destruction of Unique Paleontological Resources or Sites: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County and could result directly or indirectly in destruction of unique paleontological resources or sites or unique geological features. Compliance with existing laws, General Plan policies, Planning Department procedures and project-level general conditions of approval for paleontological resources would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** OS 19.6–19.9	Less than significant.
Impact 4.9.D - Result in the Disturbance of Human Remains: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting human remains, including those interred outside formal cemeteries. Compliance with existing laws, General Plan policies, Planning Department procedures, project-level general conditions of approval for cultural resources, and existing Mitigation Measures 4.7.1A and 4.7.1B would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** OS 19.2-19.5 **Riverside County Planning Dept. Procedures:** *(See EIR No. 521 Section 4.9.3., Subsections D.2 and D.3, for text.)* **Standard Project Conditions of Approval:** *(See list in EIR No. 521 Section 4.9.3., Subsection D.4.)* **Existing EIR No. 441 Mit. Measures:** 4.7.1A. and 4.7.1B	Less than significant.
4.10 Energy Resources		
Impact 4.10.A – Increase Demand for Electricity: Future development accommodated by the proposed project, GPA No. 960, would be less intense than that currently planned in the existing General Plan. Thus, on a relative basis, the project would not increase demand for electricity over current plans. Site-specific foreseeable land use changes proposed under the project, however, do have the potential to introduce new development or intensify existing development on previously vacant or less-developed lands. Analysis of energy demands associated with these changes indicates project demands would be insignificant compared to existing baseline levels and forecast Riverside County growth rates. For these reasons, the proposed project would not have a significant impact on existing electricity supplies, production or transmission facilities. The project would not trigger the need for new or altered facilities nor result in substantial environmental impacts due to the construction of such facilities. Moreover, compliance with existing regulatory programs and General Plan policies, as well as new ones proposed as part of GPA No. 960, would further reduce the already insignificant impact associated with project-related electricity demand and service.	**General Plan Policies:** OS 10.1, 10.2, 11.2, 11.3, 11.4, 12.1-12.4 and 16.1-16.13; AQ 4.2-4.4, 5.2-5.4, 20.10-20.12, 20.18-20.21 and 20.28 **Existing EIR No. 441 Mit. Measures:** 4.8.1A and 4.8.1B	Less than significant.
Impact 4.10.B – Increase Demand for Natural Gas: Future development consistent with the proposed project, GPA No. 960, would be less intense than that currently planned in the existing	**General Plan Policies:** OS 12.1-12.4, 16.1, 16.2, 16.4-16.7, 16.10-16.12; AQ 4.2-4.4, 5.2-5.4, 18.3-18.5, 19.3, 20.11, 20.12, 20.21 and 20.28	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
General Plan. Thus, on a relative basis, the project would not increase demand for natural gas over current plans and would not trigger new additional environmental impacts. Site-specific land use changes proposed in GPA No. 960, however, do have the potential to introduce new development or intensify existing development on previously vacant or less-developed lands. Analysis of energy demands associated with these changes indicate project demands would be insignificant compared to existing baseline levels and are in line with expected growth rates. For these reasons, the proposed project would not have a significant impact on existing natural gas supplies, production or transmission facilities. The project would not trigger the need for new or altered facilities nor result in substantial environmental impacts due to the construction of such facilities. Moreover, compliance with existing regulatory programs and General Plan policies, as well as new ones proposed as part of GPA No. 960, would further reduce already insignificant impacts associated with project-related natural gas demand and service.	**Existing EIR No. 441 Mit. Measures:** 4.8.1A and 4.8.1B	
Impact 4.10.C – Cause the Inefficient Use of Energy: Future development consistent with the proposed project, GPA No. 960, would be less intense than that currently planned in the existing General Plan. Therefore, on a relative basis, the project would not increase demand for energy over current plans. The project also proposes to add a number of new policies and programs targeting energy efficiency and conservation directly in order to reduce greenhouse gas emissions by roughly 30% (see EIR Section 4.7, Greenhouse Gases). As a result of implementation of such measures, new development would be more energy efficient and less wasteful of energy than existing uses or proposed uses without GPA No. 960. For these reasons, the project would not result in inefficient, wasteful or unnecessary energy consumption and the project's impacts on use of energy would be less than significant. No project-specific mitigation is required. Moreover, compliance with existing regulatory programs and General Plan policies, as well as new ones proposed as part of GPA No. 960, would further reduce the already insignificant impacts associated with efficient use of energy.	**General Plan Policies:** OS 11.1-11.4, 12.1-12.4, 16.1-16.10 and 16.11-13.13; AQ 4.2-4.4, 5.2-5.4; 13.1, 18.3-18.5, 19.3, 20.10-20.12, 20.18, 20.19, 20.21, 20.27 and 20.28 **Existing EIR No. 441 Mit. Measures:** 4.8.1B	Less than significant.
4.11 Flooding and Dam Inundation Hazards		
Impact 4.11.A – Result in Housing Within Flood Hazard Areas: Future development accommodated by the project would result in encroachment into areas of mapped 100-year floods (including some alluvial fans) and other delineated flood hazards areas. Such development may increase the amount of people, structures and property at risk should a flooding event occur. These flood hazard areas are extensively regulated, however, and compliance with existing laws and regulatory programs, in particular Riverside County Ordinance No. 458, as well as General Plan policies and existing mitigation measures from EIR No. 441, would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 348, 457, 458 and 659 **General Plan Policies:** S 4.1-4.4, 4.8-4.10 and 4.18 **Existing EIR No. 441 Mit. Measures**: 4.9.2A, 4.9.2B, 4.9.2C and 4.9.2D	Less than significant.
Impact 4.11.B – Cause Impediment of Flows: Future development as a result of implementation of the proposed project may result in placement of structures within 100-year flood hazard areas, creating the potential for impeding or redirecting flood flows. As a result, people, structures and property, as well as those introduced by the new development, could be exposed to increased	**Riverside County Ord. No.s:** 458 and 461 **General Plan Policies:** S 4.2-4.5, 4.7-4.9 and 4.18 **Existing EIR No. 441 Mit. Measures**: 4.9.1A, 4.9.1B, 4.9.1C and 4.9.1D	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
flooding risks. Compliance with existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441, in particular Riverside County Ordinance No. 458, would be sufficient to ensure that this impact is less than significant.		
Impact 4.11.C – Expose People or Structures to Flooding Risks, Including Flooding Due to Dam or Levee Failure: Future development accommodated by the project may result in placement of structures, including habitable ones, within dam inundation zones, alluvial fan flooding zones and other areas of potential flood hazard. Such development would be at greater risk of flood hazards should a dam, levee debris basin or other critical flood control structure fail. As a result, existing people, structures and property, as well as those introduced as a result of GPA No. 960, could be exposed to increased flooding risks due to failure of flood control structures. Compliance with existing laws, regulatory programs and General Plan policies would be sufficient to ensure that this impact does not rise to the level of significance.	**Riverside County Ord. No.s:** 348, 457, 458, 461, 659 and 754 **General Plan Policies:** S 4.1-4.4, 4.6, 4.8, 4.9, 4.12 and 4.16-4.22	Less than significant.
Impact 4.11.D – Cause the Adverse Alteration of Drainage Patterns or Substantially Increase Surface Runoff: Development consistent with GPA No. 960 would alter drainage patterns, streams and river courses, in some cases substantially. It would also cause increases in surface runoff through the introduction of non-permeable surfaces (roofs, pavement, roads, etc.). If not properly managed, this would cause hydrological changes that could expose existing people, structures and property, as well as those introduced by the project, to increased flooding risks. Compliance with existing laws, regulatory programs and General Plan policies would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 348, 457, 458, 461, 659 and 754 **General Plan Policies:** S 4.4, 4.5 and 4.7-4.10	Less than significant.
Impact 4.11.E – Cause Inundation Risk Due to Seiche, Tsunami or Mudflow: Future development in areas subject to seiche have the potential to threaten people, structures and property. In terms of seiche hazards, there is no documented significant potential for any of the waterbodies within Riverside County. Based on morphology and hydrology, two waterbodies in Riverside County (Lake Perris and Lake Elsinore) may have the potential for seismically induced seiche. However, setbacks and flood hazard area regulations would be sufficient to protect against significant risks. Thus, for the proposed project, resultant future development along or near lakes and reservoirs is considered to be at minimal risk. Thus, overall, seiche impacts would be less than significant. Due to its inland location, by definition there are no tsunami risks in Riverside County. Mudflow or debris flow can occur in areas with steep slopes, particularly areas with loose soils and/or denuded of vegetation (e.g., fire burn areas) when exposed to large amounts of precipitation. Narrow canyons, arroyos and desert channels are also susceptible to flashfloods which can cause flooding damage directly or indirectly through mudflows. Human activity can also induce a slide, such as when soil becomes saturated from a broken water pipe or the improper diversion of runoff from a developed area. When addressed through proper soil engineering, site design and maintenance, these risks are less than significant.	**Riverside County Ord. No.s:** 348, 457, 458, 461, 659 and 754 **General Plan Policies:** S 4.1-4.10, 4.12 and 4.16-4.22 **Existing EIR No. 441 Mit. Measures**: 4.9.1A, 4.9.1B, 4.9.1C, 4.9.1D; 4.9.2A, 4.9.2B, 4.9.2C and 4.9.2D	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
4.12 Geology and Soils		
Impact 4.12.A – Expose People or Structures to Substantial Adverse Effects Due to Rupture of a Known Earthquake Faults: Future development accommodated by the proposed project would increase rural, suburban and urban uses in Riverside County. This may increase the potential for property loss, injury or death resulting from development where it occurs on or adjacent to known or as of yet undetected earthquake fault zones. Compliance with existing laws, regulatory programs, General Plan policies and existing (EIR No. 441) Mitigation Measure 4.10.1A would be sufficient to ensure that fault rupture impacts to future development accommodated by GPA No. 960's proposed General Plan changes would be less than significant.	**Riverside County Ord. No.s:** 547 **General Plan Policies:** S 2.1-2.6, 3.1, 3.3, 3.4, 3.8, 7.7, 7.8 and 7.11 **Existing EIR No. 441 Mit. Measures**: 4.10.1A	Less than significant.
Impact 4.12.B – Expose People or Structures to Substantial Strong Seismic Groundshaking: Like all of Southern California, Riverside County has experienced and will continue to face groundshaking resulting from activity on local and regional faults. Future development consistent with GPA No. 960 may increase the potential for property loss, injury or death resulting from this groundshaking hazard. Compliance with existing laws, regulatory programs, General Plan policies and existing EIR No. 441 mitigation measures would be sufficient to ensure that this impact is less than significant.	**Riverside County Regulations:** Riverside County Municipal Code, Chapter 15.60 - Earthquake Fault Area Construction Regulations **General Plan Policies:** S 2.2-2.6, 3.1, 3.3, 3.4, 3.8, 7.8, 7.7 and 7.11 **Existing EIR No. 441 Mit. Measures:** 4.10.2A, 4.10.2B and 4.10.2C	Less than significant.
Impact 4.12.C – Expose People or Structures to Substantial Adverse Effects Due to Seismic-Related Ground Failure, Including Liquefaction: Portions of unincorporated Riverside County are susceptible to liquefaction, a destructive secondary effect of strong seismic shaking. Future development associated with GPA No. 960 within Riverside County would increase the potential for the placement of structures and facilities in or near areas susceptible to liquefaction. Impacts associated with seismic-related ground failure and liquefaction would be reduced through compliance with existing laws, General Plan policies and existing EIR No. 441 mitigation measures. Compliance with the regulations described below would ensure that seismic-related ground failure and liquefaction risks to future development accommodated by the project would be less than significant.	**Riverside County Ord. No.s:** 547 **General Plan Policies:** S 2.2-2.7, 3.1, 3.3, 3.4, 3.8, 7.7, 7.8 and 7.11 **Existing EIR No. 441 Mit. Measures:** 4.10.3A and 4.10.3B	Less than significant.
Impact 4.12.D – Expose People or Structures to Substantial Adverse Effects Due to Landslides: Landslides and rockfall can occur throughout Riverside County as a result of seismic activity and other natural processes, as well as resulting from human activity. Future development within Riverside County accommodated by GPA No. 960 would increase the potential for structures and facilities in areas susceptible to landslides or rockfall. Compliance with existing laws and General Plan policies would reduce potential landslide and rockfall impacts to less than significant levels.	**General Plan Policies:** S 2.2-2.8, 3.1-3.8, 7.7, 7.8 and 7.11	Less than significant.
Impact 4.12.E – Result in Substantial Soil Erosion or Topsoil Loss: Areas exposed during future development activities accommodated by GPA No. 960 revisions to the General Plan would be prone to erosion and loss of topsoil. Wind and water are the two biggest factors in soil erosion. Human activities that remove vegetation or disturb soil are the biggest contributor to erosion potential.	**Riverside County Ord. No.s:** 484 **General Plan Policies:** S 3.5, 3.6, 3.11 and 3.12-3.14 **Existing EIR No. 441 Mit. Measures:** 4.10.8A, 4.10.9A, 4.10.9B and 4.10.9C	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Compliance with existing laws, General Plan policies and existing EIR No. 441 mitigation measures help reduce potential soil erosion impacts and ensure that future development would have a less than significant impact on soils.		
Impact 4.12.F – Result in Development on Unstable Geological Units or Soils: Unstable geological units and soils occur throughout Riverside County. Additionally, both natural and human activities have the potential to cause geologic instability. If improperly engineered or constructed, some types of development, particularly those involving heavy loads (concrete dams, for example) or affecting subsurface water levels (e.g., groundwater pumping or replenishment facilities), have an increased potential to cause ground or soil failures. These types of failures are in addition to those triggered by seismic events, as described in earlier impacts above. Future development accommodated by GPA No. 960 would increase the potential for landslides, liquefaction, lateral spreading and subsidence as a result of placement on unstable geological units or soils. However, compliance with existing laws and General Plan policies discussed below would reduce potential impacts related to development on or affected by unstable geological units or soil. Compliance with these would ensure that future development accommodated by the project would have a less than significant impact.	**General Plan Policies:** S 2.1-2.7, 3.1-3.5, 3.7-3.10 and 7.7	Less than significant.
Impact 4.12.G – Result in Development on Expansive Soils: Expansive soils are widely distributed throughout Riverside County. Future development associated with GPA No. 960 would increase the potential for the placement of structures and facilities in areas susceptible to damage resulting from expansive soils. Compliance with existing laws and mitigation measures from EIR No. 441 help reduce potential impacts from expansive soils and ensure that they are less than significant.	**Existing EIR No. 441 Mit. Measures:** 4.10.7A	Less than significant.
Impact 4.12.H – Result in Development on Soils Incapable of Supporting Septic Tanks or Alternative Wastewater Disposal Systems: Future development accommodated by GPA No. 960, particularly in areas outside of existing water and sewer service providers, would increase the potential for placement of structures and facilities in areas where soils are incapable of adequately supporting septic tanks or alternative wastewater disposal systems. However, due to laws, regulations and Riverside County policies addressing sewer requirements, potential impacts associated with these types of soils would be avoided or reduced to less than significant levels.	**General Plan Policies:** S 3.3	Less than significant.
4.13 Hazardous Materials and Safety		
Impact 4.13.A – Create a Significant Hazard Through the Routine Transport, Use of Disposal of Hazardous Materials: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, which could result in some adverse effects from facilities that transport, use or dispose of hazardous materials. However, compliance with existing laws and regulatory programs would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 348, 615, 651 and 718 **General Plan Policies:** S 6.1, 7.1, 7.3 and 7.9	Less than significant.
Impact 4.13.B – Cause a Significant Hazard Through the Accidental Release of Hazardous Materials: Future development accommodated by the project would increase the number of people and properties potentially at risk for upsets or accidental hazmat releases. However, while the potential for accidental explosion or release of hazardous substances from existing and future industries, transportation or disposal within Riverside County exists, it is not, nor would it be, any	**Riverside County Ord. No.s:** 615, 617, 651, 718 and 348 **General Plan Policies:** S 6.1, 7.1-7.3 and 7.9	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
higher than is typical for any other region of Southern California. Within Riverside County, the highest probabilities for inadvertent releases of hazardous substances are through a vehicular accident on heavily traveled freeways, during remediation or grading of a contaminated site, or from an industrial accident at a facility that handles large amounts of hazardous materials. Compliance with existing regulatory programs and General Plan policies would be sufficient to ensure that this impact is less than significant.		
Impact 4.13.C – Result in Hazardous Emissions or Related Hazards Within One-Quarter Mile of a School: Within Riverside County, there are 25 separate school districts for primary grades (K-12), four Community College Districts and a number of public and private colleges and universities. While no schools would be planned or built under GPA No. 960, the eventual build out of the General Plan would require additional schools, one or more schools of which may be located in the vicinity of a major hazmat site (see Table 4.13-A and Figure 4.13.1). In addition, school sites themselves contain hazardous materials of various types (such as pesticides, paints, cleaners and other commonly used substances). The use of such materials is governed by the schools and various regulations. The General Plan contains policies designed to protect the public and properties against hazardous material risks. However, the siting of school facilities is determined by individual school districts, based on criteria established by the California Department of Education (CDOE). While Riverside County can regulate the location of industrial uses within unincorporated areas, it cannot control the actions of individual school districts within Riverside County, or the CDOE, in siting new schools. As a result, the potential exists for significant impacts on school facilities resulting from hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or wastes within a quarter-mile of a school, but not as a result of the proposed project. School siting is also subject to review and approval by the California Department of Toxic Substances Control to help ensure school sites are not located on or near identified hazmat sites. Implementation of regulations and General Plan policies would ensure that future development consistent with GPA No. 960 would have less than significant hazmat impacts on schools.	**Riverside County Ord. No.s:** 617 **General Plan Policies:** S 6.1 and S 7.1-7.3	Less than significant.
Impact 4.13.D – Result in a Significant Hazard Due to Development on a Cortese List Hazardous Materials Site: According to the California Department of Toxic Substances Control database, there are 19 sites within Riverside County that are on the Cortese list, as shown in Table 4.13-A. However, none of the proposed GPA No. 960 sites are adjacent to or in the immediate vicinity of any properties on the Cortese list. Compliance with applicable federal, state and county regulations would reduce the potential risks of public exposure to hazardous materials to less than significant levels.	**General Plan Policies:** S 6.1, 7.1, 7.3, 7.6 and 7.14	Less than significant.
Impact 4.13.E – Result in Safety Hazard for People Within Two Miles of a Public or Public Use Airport: Future development accommodated by the project has the potential to introduce additional people and property within two miles of public airports. However, GPA No. 960 proposes changes within three Airport Influence Areas to improve safety by ensuring consistency between the General	**Riverside County Ord. No.s:** 269, 448 and 576 **General Plan Policies:** LU 1.8, 15.1-15.9 and 31.2	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Plan and these airports' Airport Land Use Plans. Future proposed development in a Riverside County Airport Influence Area would be subject to review by the Riverside County Airport Land Use Commission (ALUC) to ensure safety and minimize risks both to people and property on the ground. This would also help ensure air travel safety and protect the functioning of the public air facilities. In addition, the General Plan includes provisions to minimize safety hazards for people living and working in proximity to these airports. However, due to the nature of air travel, potential safety hazards around airports, such as aircraft accidents, would remain. An unforeseeable air accident could result in substantial loss of life or property damage, even within the safety zones outlined in the General Plan and the Riverside County Airport Land Use Compatibility Plan (ALUCP). However, compliance with applicable Riverside County and ALUC regulations would ensure that air hazard risks to the areas affected by GPA No. 960, including any resultant future development, would be minimized to less than significant levels.		
Impact 4.13.F – Result in a Safety Hazard for People in the Vicinity of a Private Airstrip or Heliport: Future development resulting from implementation of GPA No. 960 has the potential to introduce additional people and property within the vicinity of private airports, airstrips and heliports. However, the General Plan includes provisions to minimize safety hazards for people living or working in proximity to these facilities. Due to the nature of air travel, however, potential safety hazards around these facilities, particularly due to aircraft accidents, would remain, although usage levels of these types of facilities tend to be very low. Nevertheless, an air accident could result in substantial loss of life or property damage, even when development conforms to the standards for acceptable levels of risk, as outlined in the General Plan, ALUC standards, this EIR and Riverside County's safety plans. However, compliance with existing regulations and General Plan policies would ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 448 and 576 **General Plan Policies:** LU 1.8, 15.2, 15.9 and 31.2	Less than significant.
Impact 4.13.G – Impair or Interfere With an Adopted Emergency Response Plan or Emergency Evacuation Plan: Future development accommodated by the project has the potential to interfere with safety or evacuation plans if not consistent with these existing emergency plans. However, the overall level of future development accommodated by the General Plan would be slightly less under the proposed revisions of GPA No. 960 than it would under the existing General Plan, slightly lowering the populations needing potential evacuation. In addition, the construction of the new roads and connecting road segments proposed under GPA No. 960 would actually improve access to and from some of the more remote portions of the county, facilitating evacuations and emergency responses. Thus, overall, the proposed improvements associated with GPA No. 960 would have beneficial impacts on, and help reduce potential hazards related to, future increased populations. Further, compliance with existing regulations and General Plan policies would ensure that this impact is less than significant.	**Riverside County Regulations:** Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan **Riverside County Ord. No.s:** 787 **General Plan Policies:** S 5.12 and 5.14	Less than significant.
Impact 4.13.H – Expose People or Structures to Significant Risk Due to Wildland Fires: Areas of high fire hazard exist within unincorporated portions of Riverside County, including rural, mountainous terrain, as well as areas adjacent to, or covered by, natural grasslands or brush. Future	**Riverside County Regulations:** Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan **Riverside County Ord. No.s:** 695 and 787	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and industrial development, as well as the associated population, expected to occur within Riverside County over the next 50 years. Nevertheless, GPA No. 960 would accommodate future development in previously undeveloped areas, including some with high or very-high fire hazards. This would increase both the number of people and amount of property potentially exposed to fire hazards. Additionally, there is the potential for an increase in the occurrence of fires, particularly in urban-wildland interface areas, due to increasing human encroachment. Compliance with existing regulations and General Plan policies would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** LU 5.1, 5.2, 7.8 and 10.1; S 5.1-5.8, 5.9 and 5.11-5.21	
4.14 Mineral Resources		
Impact 4.14.A – Result in the Loss of Availability of Delineated Locally Important Minerals: No. As shown in Figure 4.14.1, the Riverside County General Plan does not contain any "locally important mineral resource recovery sites." GPA No. 960 does not propose to change this. Therefore, the proposed project would not have an effect on this type of resource.		No effect.
Impact 4.14.B – Result in the Loss of Availability of Known Mineral Resources: Future development consistent with the land use and policy changes proposed by GPA No. 960 has the potential to result in the loss of availability of known mineral resources that would be of value to the region and the residents of the State of California. Compliance with existing laws, regulatory programs and General Plan policies, as well as proposed new or revised General Plan policies, would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.:** 555 **General Plan Policies:** LU 9.6, 9.7 and 27.1-27.5; OS 14.1-14.5	Less than significant.
4.15 Noise		
Impact 4.15.A – Generate Noise or Cause Noise Exposure in Excess of Standards: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. In some locations, this would result in the introduction of new noise-sensitive land uses into areas of existing excess noise or areas in which county growth would eventually lead to excess noise levels. In addition, future development accommodated by GPA No. 960 would contribute incrementally to increased traffic volumes on county roads, resulting in noise increases affecting sensitive land uses along existing and future roads. As a result, new development, particularly residential uses along and adjacent to major transit corridors, could be exposed to noise levels that exceed Riverside County's noise standards. Existing sensitive uses would also be subject to these higher noise levels. Compliance with existing noise standards, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441 would reduce the effects of noise on new development to less than significant levels. However, where noise generators would expose existing receptors (residences and other sensitive uses) to excessive noise, impacts would be significant and unavoidable, as mitigation of these incremental and wide-spread noise impacts is infeasible.	**Riverside County Ord. No.s:** 847 **General Plan Policies:** N 1.1-1.3, 1.7, 2.2, 3.2, 3.5, 4.1, 4.4, 6.4, 7.3, 9.3, 9.7, 11.5, 14.1, 14.2 and 14.9; LU 4.1, 15.1, 15.2, 16.9, 16.10, 29.6, 30.6, 31.3 and 32.10; OS 14.5 **Existing EIR No. 441 Mit. Measures:** 4.13.2A, 4.13.2B, 4.13.2C, 4.13.2D, 4.13.3A, 4.13.3B and 4.13.3C	Significant and unavoidable.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Impact 4.15.B – Generate or Cause Exposure to Excessive Groundborne Vibration: Future development accommodated by GPA No. 960, and its associated infrastructure and support uses, would require construction activities that could cause temporary, short-term vibrations. These vibrations would be disruptive if located near sensitive receptors. Also, future development of new vibration-sensitive land uses could occur within areas subject to existing sources of vibration (e.g., railroads). However, compliance with General Plan policies and existing mitigation measures, would ensure that new uses are not subject to excessive vibration impacts. For construction-related vibration, compliance with existing Riverside County ordinances and General Plan policies, as well as a new project-specific Mitigation Measure 4.15.B-N1, would help reduce the effects of groundborne vibration impacts on sensitive receptors. In some cases, for example when construction occurs within 150 feet of an existing sensitive receptor, effects may still be felt. However, due to the short-term, temporary nature of construction impacts these remaining effects would not be significant.	**General Plan Policies:** N 15.2, 16.1, 16.2 and 16.3 **New Mitigation Measure 4.15.B-N1:** Prior to the issuance of any grading permit for new development involving vibration-sensitive land uses (which shall include, but not be limited to: hospitals, residential areas, concert halls, libraries, sensitive research operations, schools and offices), the project proponent shall provide evidence to the County of Riverside that placement of such uses within the area would not exceed groundborne vibration or groundborne noise impact criteria identified by the FTA (for example, the standards shown in Table 4.15-I of this EIR) or as otherwise deemed appropriate for the situation by the County of Riverside.	Less than significant with mitigation.
Impact 4.15.C – Result in a Substantial Permanent Increase in Ambient Noise Levels: Future development associated with implementation of GPA No. 960 would contribute to an increase in traffic, resulting in a corresponding increase in traffic noise. In some cases, this would cause ambient noise levels to either exceed the threshold of acceptability (65 dBA CNEL, for example) or to become further unacceptable in areas already exceeding noise thresholds. Compliance with existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441, would reduce potential impacts due to increased noise levels. For new development, full mitigation would typically be feasible. For existing noise-sensitive land uses, however, due to the widespread and pervasive nature of the noise impacts, it is generally not feasible to mitigate the impact fully for all affected receptors. Thus, this impact would be significant and unavoidable, even with the implementation of all feasible mitigation.	**Riverside County Regulations:** Riverside County Airport Land Use Compatibility Plans **Riverside County Ord. No.s:** 847 **General Plan Policies:** N 1.1, 1.2, 1.7, 2.2, 3.2, 3.5, 4.4, 6.4, 7.3, 9.3, 9.7, 10.1, 10.3, 10.4, 11.2, 11.4, 11.5, 12.1, 12.2 and 15.2; LU 16.9 and 16.10; C 3.27-3.29, 6.7, 9.4, 9.5, 13.7, 14.3, 20.8, and 23.8 **Existing EIR No. 441 Mit. Measures:** 4.13.3A, 4.13.3B, 4.13.3C, 4.13.2A, 4.13.2B, 4.13.2C and 4.13.2D	Significant and unavoidable.
Impact 4.15.D – Result in a Substantial Temporary or Periodic Increase in Ambient Noise Levels: Future development accommodated by GPA No. 960 would necessitate construction activities which could temporarily exceed applicable Riverside County standards at nearby noise-sensitive receptors. In many cases, the peak sound levels would be extremely brief and overall ambient noise levels would remain within acceptable limits. In addition, compliance with existing laws, regulatory programs, General Plan policies and existing mitigation measures from EIR No. 441, would also help reduce potential short-term noise impacts. On occasion, however, construction requirements and/or the proximity of the sensitive land use (e.g., within 150 feet or less) would make significant noise impacts unavoidable, even though temporary. Because of the close distances involved for such significant impacts, mitigation of sound levels to less than significant is technologically impossible. Thus, no additional project-specific mitigation is feasible. Future development accommodated by GPA No. 960 may result in significant short-term noise impacts that would be significant and unavoidable.	**Riverside County Ord. No.s:** 847 **General Plan Policies:** N 13.1-13.4 **Existing EIR No. 441 Mit. Measures:** 4.13.1A and 4.13.1B	Significant and unavoidable.
Impact 4.15.E – Expose People to Excessive Airport-Related Noise Levels: Future development accommodated by the project, GPA No. 960, may result in the exposure of new noise-sensitive land	**Regional Regulations:** Riverside County Airport Land Use Compatibility Plans	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
uses to noise from operations at public and private airports, airstrips and helipads. Around larger public airports, noise levels can exceed acceptable standards (e.g., 60 dBA) in certain areas, as shown by noise-contour maps of existing, future and ultimate build out operational conditions for public airports. The Airport Land Use Compatibility Plan (ALUCP) adopted by the Riverside County Airport Land Use Commission (ALUC) addresses noise-related land use constraints for the various zones surrounding Riverside County's airports. All future development proposed would be required to comply with applicable ALUC policies, as well as state and county regulations and policies, regarding site design and building construction to achieve acceptable interior and exterior noise exposure levels for habitable structures. Compliance with these and other applicable standards, as well as existing mitigation measures from EIR No. 441, would ensure that airport-related noise impacts on future development pursuant to the project would be less than significant.	**General Plan Policies:** N 7.1-7.4; LU 1.8, 15.1 and 15.2 **Existing EIR No. 441 Mit. Measures:** 4.13.2A, 4.13.2B, 4.13.2C and 4.13.2D	
4.16 Parks and Recreation		
Impact 4.16.A – Increase the Use of Existing Parks of Other Recreational Facilities Resulting in Their Substantial Physical Deterioration: Future development accommodated by GPA No. 960 changes would result in population growth in certain areas within Riverside County, incrementally increasing the number of residents using existing neighborhood and regional parks, as well as other recreational facilities, including trails and bikeways, in localized areas. This use would contribute slightly, but not significantly, to the wear and tear on existing facilities. Moreover, compliance with existing state and county regulatory programs and General Plan policies would further ensure that project-related effects to existing parks or recreation facilities are less than significant.	**Riverside County Ord. No.s:** 328 and 460 **General Plan Policies:** OS 20.3, 20.5 and 20.6; LU 25.2	Less than significant.
Impact 4.16.B – Trigger Growth Effects Resulting in the Need for Additional Parks or Recreational Facilities: Future development accommodated by GPA No. 960 changes would result in population growth in certain areas within Riverside County, triggering the need for expansion of existing or development of new recreational facilities and opportunities. This need, however, would be incrementally small (less than 1%) of the overall growth expected in Riverside County over the next 50 years and would be spread throughout Riverside County for the most part. As such, impacts would be less than significant. In a few areas, population increases would be large enough locally to potentially trigger the need for a new park, trail or other recreational facility. For such locations, compliance with existing state and county regulatory programs (the Quimby Act, specifically), as well as existing General Plan policies, would ensure project-related affects to parks, trails and other recreation would be less than significant.	**Riverside County Ord. No.s:** 328 and 460 **General Plan Policies:** OS 20.3, 20.5 and 20.6; LU 25.2	Less than significant.
Impact 4.16.C – Result in Significant Adverse Environmental Effects Due to the Need for Additional Parks or Recreational Facilities: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, resulting in a small overall population increase that would contribute incrementally to the need for an additional parks and recreational uses (including trails and bikeways) within Riverside County. Where these needs are localized due to specific policy and land use changes, increased populations could result in the need for an additional park or other recreational use, the construction or expansion of which could have an	**Riverside County Ord. No.s:** 328 and 460 **General Plan Policies:** OS 20.5 and 20.6; LU 9.2, 25.1-25.4; C 4.9, 15.1-15.4, 16.1, 16.2, 16.7, 17.2, 17.3, 18.1 and 18.2	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
adverse physical effect on the environment. However, compliance with existing regulations, Riverside County ordinances, mitigation measures from EIR No. 441 and General Plan policies, as outlined throughout this EIR, would be sufficient to ensure resultant environmental impacts are less than significant.		
4.17 Public Facilities		
Impact 4.17.A – Cause Adverse Environmental Effects Due to the Need for Fire Protection Services: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and industrial development, as well as the associated population, expected to occur within Riverside County over the next 50 years. In terms of actual changes to existing levels of fire services, however, localized development increases would trigger the need for additional fire services in specific areas, such as the Elsinore Area Plan. Construction and operation of new or improved fire stations within these areas would be subject to a number of regulatory measures that would ensure no significant environmental impacts occur.	**Regional Regulations:** Riverside County Fire Department Fire Protection and Emergency Medical Services Strategic Master Plan **Riverside County Ord. No.s:** 659 and 787 **General Plan Policies:** LU 5.1, 5.2, 7.8 and 10.1; S 5.1-5.9, 5.11-5.21	Less than significant.
Impact 4.17.B – Cause Adverse Environmental Effects Due to the Need for Law Enforcement Services: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and industrial development, as well as the associated population, expected to occur within Riverside County over the next 50 years. In terms of changes to existing levels of service, however, localized development increases would incrementally create demand for additional law enforcement personnel and services in specific areas, such as the Elsinore and Palo Verde Valley Area Plans. None of these increases, however, would trigger the need for new or improved facilities in order to meet the additional demand. The additional personnel (officers, supervisors and support staff), equipment and vehicles necessary could readily be accommodated at existing facilities. Therefore, the project would not have a significant adverse effect on law enforcement services due to the need to construct new facilities. Moreover, compliance with a variety of existing regulatory programs and General Plan policies would further prevent or reduce any impacts to law enforcement service associated with the project.	**Riverside County Ord. No.s:** 469 and 556 **General Plan Policies:** LU 5.1, 5.2 and 10.1 **Existing EIR No. 441 Mit. Measures:** 4.15.2A, 4.15.2B, 4.15.2C and 4.15.2D	Less than significant.
Impact 4.17.C-1 – Adversely Affect or Exceed the Permitted Capacity of a Landfill: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses, both residential and non-residential in localized areas throughout unincorporated Riverside County. These increases, however, are to some extent offset by reductions anticipated from other proposed changes of GPA No. 960 (in particular decreases in future commercial-retail and light industrial uses). Overall, future development resulting from the project would increase the annual amount of solid waste requiring disposal in sanitary landfills by roughly 9,000 tons per year over the next 50 years (conservatively assuming only achievement of the current state-mandated 50% diversion rate, but not	**Riverside County Regulations:** Countywide Integrated Waste Management Plan **General Plan Policies:** LU 5.1, 5.2 and 31.2 **Existing EIR No. 441 Mit. Measures:** 4.15.3A, 4.15.3B 4.15.3.C, 4.15.3D, 4.15.3E and 4.15.3F	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
the 75% by 2020 reduction rate. See Table 4.17-O.). Compared to existing and projected capacities at Riverside County landfills, this amount would incrementally increase the county fill rate by roughly 0.6% overall (even conservatively assuming no additional diversion or recycling reductions). In terms of actual changes from baseline conditions, this 0.6% increase due to project-related waste generation would occur in small increments throughout Riverside County over a roughly 50-year period. For these reasons, these amounts represent insignificant incremental increases and it is projected that sufficient landfill capacity would exist to accommodate the project's future solid waste disposal needs. Accordingly, the project's impact on landfill capacity would be less than significant. Moreover, regulatory compliance, particularly mandatory recycling and diversion programs, as outlined below, would also further reduce the already insignificant impact.		
Impact 4.17.C-2 – Cause Inconsistencies With Applicable Statutes and Regulations Related to Solid Waste, Including the County Integrated Waste Management Plan: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses, both residential and non-residential in localized areas throughout unincorporated Riverside County. These increases, however, are to some extent offset by reductions in other parts of Riverside County. Project-related waste generation would increase incrementally throughout Riverside County over a roughly 50-year period. Any future development authorized pursuant to the project would be required to comply with all applicable state, federal and county requirements for solid waste disposal, including the County-wide Integrated Waste Management Plan. Accordingly, the project would not have a significant adverse impact on the implementation, attainment or compliance with any of these statutes or regulations. Moreover, regulatory compliance, as outlined in Section 4.17.4.B, would further reduce the already insignificant impact.	**Riverside County Regulations:** Countywide Integrated Waste Management Plan **General Plan Policies:** LU 5.1, 5.2 and 31.2 **Existing EIR No. 441 Mit. Measures:** 4.15.3A-4.15.3F	Less than significant.
Impact 4.17.D – Cause Adverse Environmental Effects Due to the Need for Schools: Future development consistent with GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County resulting in a comparable increase in population, including students requiring educational services. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and the associated population expected to occur within Riverside County over the next 50 years. In terms of actual changes to existing student populations and service levels, localized development increases would incrementally generate additional students creating demand for additional school facilities, services and personnel in specific areas, particularly within the Palm Springs School District, Palo Verde Unified School District and Perris Union High School District. Outside of these three districts, none of the project-related population increases would trigger the need for new or improved facilities. The additional students generated over the next 50 years could readily be accommodated at existing facilities and such districts would not have a significant impact. For the remaining three districts, however, compliance with existing laws (Senate Bill 50, in particular) and the policies of the Riverside County General Plan would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** LU 5.2	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Impact 4.17.E – Cause Adverse Environmental Effects Due to the Need for Library Services: Future development accommodated by GPA No. 960 would incrementally increase rural, suburban and urban uses in localized areas throughout unincorporated Riverside County. Compared to the existing General Plan, the overall net effect of the project is to reduce the amount of dwelling units and the associated population expected to occur within Riverside County over the next 50 years. In terms of actual changes relative to baseline environmental conditions, localized new development would incrementally increase populations creating demand for additional library services—as indicated by floor space and volumes. Because the increases are spread throughout Riverside County and would occur over roughly 50 or more years, the additional 6,500 square feet of library floor space and 35,500 additional volumes needed as a result of new development potential from the project would be met through current long-range library planning and existing development impact mitigation programs (such as Ordinance No. 659). For these reasons the project would not have a significant adverse effect on library services.	**Riverside County Ord. No.s:** 659 **General Plan Policies:** LU 5.1 **Existing EIR No. 441 Mit. Measures:** 4.15.6A	Less than significant.
Impact 4.17.F – Cause Adverse Environmental Effects Due to the Need for Medical Facilities: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, resulting in a small overall population increase that would contribute incrementally (by about 6.5%) to the need for an additional community clinic and generating roughly 13,500 medical encounters. However, since the population increase would be spread throughout unincorporated Riverside County and occur over 50 years, associated impacts to medical facilities and services would be negligible. In terms of overall General Plan build out, the project would result in a net decrease of roughly 143,700 Riverside County residents. Thus, for long-range provision of needed medical facilities and services, the project would slightly lower (by roughly 8%) the expected increase in demand for new or expanded medical facilities and services over time. In total, the project would not have a significant adverse effect on medical facilities or services, nor would it cause significant adverse environmental impacts by necessitating construction of new facilities.	**General Plan Policies:** LU 5.1 **Existing EIR No. 441 Mit. Measures:** 4.15.7A and 4.15.7B	Less than significant.
Transportation and ~~Traffic~~ Circulation		
Impact 4.18.A – Conflict with an Applicable Plan, Ordinance or Policy Establishing a Measure of Effectiveness for the Performance of the Circulation System, Taking into Account All Modes of Transportation, Including Mass Transit and Non-Motorized Travel and Relevant Components of the Circulation System, Including, but Not Limited to Intersections, Streets, Highways and Freeways, Pedestrian and Bicycle Paths and Mass Transit: GPA No. 960 proposes to revise the LOS threshold for determining adverse impacts to Riverside County roadways. At present, the countywide threshold for significance is LOS C, with LOS D and E allowed in certain instances. When a roadway facility is projected to operate at a deficient LOS, this situation is often remedied by upgrading the facility designation to a higher classification, thus providing more capacity. By lowering the LOS threshold, fewer facilities would need to be upgraded in order to meet the new	**General Plan Policies:** C 1.2, 1.3, 1.7, 2.4, 2.5, 2.7 and 4.1 **Existing EIR No. 441 Mit. Measures:** 4.16.1A, 4.16.1B, 4.16.C **New Mitigation Measure 4.18.1A-N1:** As part of its review of land development proposals, the County of Riverside shall require project proponents to make a "fair share" contribution to required intersection and/or roadway improvements. The required intersection and/or roadway improvements shall be based on maintaining the appropriate level of service (LOS D or better). The fair share contribution shall be based on the percentage of project-related traffic to the total future traffic. **New Mitigation Measure 4.18.1B-N1:** As part of its review of land	Significant and unavoidable.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
proposed LOS target. However, even with the lower LOS threshold and upgrades in roadway classifications, several roadways are still projected to operate at a deficient LOS. In addition, a number of roadways that would operate at an acceptable LOS if their classification were upgraded, cannot be upgraded due to physical or environmental constraints. Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County relative to existing conditions, and increase travel demand within Riverside County. Compliance with existing laws, rules, regulations and policies, both existing and proposed, together with revisions to the Circulation Element for Riverside County will reduce impacts to the maximum extent feasible and practical; however, even with these measures impacts to the Riverside County roadway system will be significant and unavoidable.	development proposals, the County of Riverside shall ensure sufficient right-of-way is reserved on critical roadways and at critical intersections to implement the approach lane geometrics necessary to provide the appropriate levels of services. **New Mitigation Measure 4.18.1C-N1:** Where needed and where appropriate, the County of Riverside shall seek ways and means to increase the capacity of Circulation Element roadways by such measures as adding through travel lanes or additional turning lanes without increasing the right-of-way width requirement for the classification of the facility **New Mitigation Measure 4.18.1D-N1:** Where needed and where appropriate, the County of Riverside shall collaborate with Caltrans and other appropriate agencies to add auxiliary and mainline lanes on the freeway system within available right of way. **New Mitigation Measure 4.18.1E-N1:** The County of Riverside shall collaborate with Caltrans and other appropriate agencies to develop direct connections between the HOV/HOT lanes at the following freeway interchanges: I-15 at SR-91, SR-60 at SR-91/I-215 West junction, SR-60 at I-215 East junction and at other locations as needed. To the extent that such improvements may be possible within existing rights-of-way, environmental impacts would be less than significant. **New Mitigation Measure 4.18.1F-N1:** Where appropriate, the County of Riverside shall collaborate with Caltrans and other appropriate agencies to develop HOV lanes along the entire length of I-215 within Riverside County and along I-10 between the San Bernardino County line and Indio.	
Impact 4.18.B - Conflict with an Applicable Congestion Management Program, Including, but Not Limited to Level of Service Targets and Travel Demand Measures, or Other Targets Established by the County Congestion Management Agency for Designated Roads or Highways: The local Congestion Management Program (CMP) is administered by the RCTC. The level of significance established in the CMP is LOS E. If a facility fails to operate at LOS D or better the local responsible agency is required to develop and implement a deficiency plan intended to bring the facility into compliance. The program also establishes criteria for the development of transportation models to evaluate future traffic conditions, as well as monitoring criteria to evaluate existing system operation and performance, and includes criteria for the analysis of development impacts on the CMP network of regionally significant roadways. Riverside County is in compliance with the applicable CMP and has policies to address impacts to regional roadways. GPA No. 960 will not adversely affect the local CMP and does, in fact, include policies to support the goals and objectives of the CMP. Therefore, the impact is considered less than significant.	**General Plan Policies:** C 7.3 and 7.4	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
Impact 4.18.C - Result in a Change in Air Traffic Patterns, Including Either an Increase in Traffic Levels or a Change in Location that Results in Substantial Safety Risks: Riverside County has 16 municipal airports located throughout the county. One of these facilities is the March Air Reserve Base, which not only serves military aircraft and missions, but also has a civilian component. In addition, the County of Riverside has developed a Land Use Compatibility Plan for the Chino Airport. Although Chino Airport is situated within the County of San Bernardino, it is included within the Riverside County Airport Land Use Compatibility Plan because its impacts extend into Riverside County. Palm Springs International Airport is the only airport in Riverside County that has regularly scheduled commercial passenger flights. Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. Compliance with existing laws, rules and regulations, including the Riverside County Airport Land Use Compatibility Plan would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** C 14.1 and 14.6	Less than significant.
Impact 4.18.D – Alter Waterborne or Rail Traffic: Riverside County does not have navigable waterways providing transport of people and goods. Therefore, the Circulation Element does not contain any policies related to waterborne travel. A number of intercontinental railway facilities do pass through Riverside County. These rail lines carry a substantial amount of produce and goods. In addition, many of these same rail lines service rail passengers within the region, accommodating such services as Amtrak and Metrolink. Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. Compliance with existing laws, rules and regulations would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** C 13.1, 13.4 and 13.7	Less than significant.
Impact 4.18.E - Substantially Increase Hazards Due to a Design Feature (e.g., Sharp Curves or Dangerous Intersections) or Incompatible Uses (e.g., Farm Equipment): Riverside County policies and design standards currently reflect state and federal rules, regulations and standards with respect to roadway design. Nothing proposed in GPA No. 960 would alter roadway design criteria. Several new policies will reinforce Riverside County's commitment to public safety in roadway design. Compliance with existing laws, rules and regulations would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** C 3.4, 3.23 and 6.5	Less than significant.
Impact 4.18.F - Cause an Effect Upon, or a Need for New or Altered Maintenance of Roads: Future development accommodated by GPA No. 960 would result in the construction of new roadways to service this growth. Compliance with existing laws, rules, regulations, policies and design standards would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** C 3.1, 3.2 and 8.4	Less than significant.
Impact 4.18.G - Cause an Effect Upon Circulation During the Project's Construction: No specific construction projects are proposed as a part of GPA No. 960. The amendment does, however, set the parameter for future construction of the General Plan network. Construction impacts will be evaluated and appropriate control measures enforced at the time of construction.	**General Plan Policies:** C 8.4, 20.6 and 20.15	Less than significant.
Impact 4.18.H - Result in Inadequate Emergency Access or Access to Nearby Uses: Current and proposed policies require provisions for adequate emergency access. Compliance with existing laws, rules, regulations, policies and design standards would be sufficient to ensure that this impact is	**General Plan Policies:** C 3.24	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
less than significant.		
Impact 4.18.I - Conflict with Adopted Policies, Plans or Programs Regarding Public Transit, Bikeways or Pedestrian Facilities, or Otherwise Substantially Decrease the Performance or Safety of Such Facilities: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, thus, increasing the demand for alternative modes of transportation. GPA No. 960 provides multiple policies which are intended to promote the provision of alternative transportation facilities. Compliance with existing and proposed policies would be sufficient to ensure that this impact is less than significant.	**General Plan Policies:** C 1.2, 1.3, 4.1, 4.2, 4.6, 16.1 and 17.1	Less than significant.
4.19 Water Resources		
Impact 4.19.A – Result in Insufficient Water Supply: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to result in demand for water supplies where such are insufficient or unavailable to serve the project from existing entitlements and resources, thus necessitating new or expanded entitlements in order to adequately serve future development, or result in development in locations in which water supply adequacy cannot be ascertained. Due to the unavailability of potable water in some areas, as well as the variability and unpredictability of supply adequacy in light of future growth, as well as environmental and regulatory constraints, adequate water supplies for all forecast future development cannot be assured. As a result, within certain areas of Riverside County where sufficient water supply is not available or cannot be assured into the future, impacts would be significant and unavoidable.	**Riverside County Ord. No.s:** 458, 592, 617, 650, 682, 856, 859 and 871 **General Plan Policies:** OS 1.1, 1.3, 1.4, 2.1-2.5 and 18.1-18.6; LU 5.3, 21.2, 22.2, 28.3, 29.7, 30.7, 31.4 and 32.6 **Existing EIR No. 441 Mit. Measures:** 4.17.1C, 4.17.1D, 4.17.1E	Significant and unavoidable.
Impact 4.19.B – Substantially Deplete Groundwater Supplies or Interfere Substantially With Groundwater Recharge: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, would increase population within Riverside County, triggering increased water demands on areas relying on groundwater supplies. This is particularly likely in areas of Riverside County without municipal water service or other access to imported water supplies or where new development would rely solely on groundwater for supply. Increased and new uses may also conflict with groundwater management plans, monitoring programs or lead to groundwater extractions that individually or cumulatively exceed the groundwater basins' safe yields or cause a net deficit in the aquifer volume or reduction in the local water table level. In addition, there is the potential for future development accommodated by the project to occur in vacant areas that are currently available for groundwater recharge. Development of such areas would reduce the area available for aquifer recharge and could substantially interfere with groundwater recharge. A number of regulatory policies and programs address groundwater impacts. However, where groundwater recharge is insufficient, such increased demand on aquifers would result in significant and unavoidable impacts.	**Riverside County Ord. No.s:** 682, 856 and 871 **General Plan Policies:** OS 1.1, 1.3, 1.4, 2.1 - 2.5, 3.4-3.7, 4.1-4.3, 4.4-4.6, 4.8 and 18.1-18.6; LU 5.3, 21.2, 22.2, 28.3, 29.7, 30.7, 31.4 and 32.6 **Existing EIR No. 441 Mit. Measures:** 4.17.1C, 4.17.1D, 4.17.1E, 4.17.2A and 4.17.3A	Significant and unavoidable.
Impact 4.19.C – Substantially Degrade Water Quality: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, would result in an increased reliance on lower-quality water sources either from the Colorado River or marginal groundwater	**Riverside County Ord. No.s:** 427, 457, 458, 592, 617, 629, 650, 682, 754, 830, 843, 856 and 871 **General Plan Policies:** OS 3.1-3.7, 6.1 and 6.3; LU 9.1, 9.2 and 9.4	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
sources and would contribute to increased levels of pollutants in local/regional groundwater reserves and local/regional surface waters. These conditions would contribute to the deterioration of the quality of drinking water in Riverside County. Compliance with existing laws, regulatory programs, ordinances, General Plan policies and existing mitigation measures from EIR No. 441, however, would be sufficient to ensure that this impact is less than significant.	**Existing EIR No. 441 Mit. Measures:** 4.17.5A, 4.17.5B, 4.17.5C, 4.17.5D and 4.17.5E	
Impact 4.19.D – Violate Water Quality Standards or Waste Discharge Requirements: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to result in alterations to existing hydrology, increases in impervious surfaces and increases in urban runoff. Such changes would increase the discharge of pollutants into receiving waters if not properly managed and controlled. Thus, compliance with existing laws, regulatory programs, ordinances, General Plan policies and existing mitigation measures from EIR No. 441 is necessary to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 457, 458, 592, 617, 629, 650, 682, 754, 843, 856 and 871 **General Plan Policies:** OS 3.1-3.7, 6.1, 6.3; LU 9.1, 9.2 and 9.4 **Existing EIR No. 441 Mit. Measures:** 4.10.9A, 4.17.5A, 4.17.5B, 4.17.5C, 4.17.5D and 4.17.5E	Less than significant.
Impact 4.19.E – Exceed Wastewater Treatment Requirements: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to increase the amount of people and structures generating wastewater. Wastewater requires proper treatment to ensure it does not adversely affect receiving waters, for example, by elevating pollutant levels or introducing pathogens. Receiving waters are protected through Riverside County's compliance with and enforcement of its NPDES MS4 permits, as well as other permits required for a wide variety of activities with potential to discharge wastes into Waters of the State or U.S. These include construction and operational activities, operation of MS4s (municipal separate storm sewer systems) and industries that produce wastewater. Compliance with the NPDES program and permits, as well as other laws, regulations, ordinances, General Plan policies and existing mitigation measures from EIR No. 441, would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 457, 458, 461, 592, 617, 650, 754, 843 and 856 and 871 **General Plan Policies:** OS 3.1-3.7; LU 5.3, 21.2, 22.2, 28.3, 29.7, 30.7, 31.4 and 32.6 **Existing EIR No. 441 Mit. Measures:** 4.10.9A, 4.15.4A, 4.17.5A and 4.17.5E **New Mitigation Measure 4.19.E-N1:** Conventional septic tanks/subsurface disposal systems shall be prohibited within any designated Zone A of an EPA wellhead protection area. Where a difference between Riverside County and EPA septic tank setback distance requirements exists, the more restrictive standard shall apply.	Less than significant.
Impact 4.19.F – Exceed Wastewater Treatment Capacity: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to contribute to increased generation of wastewater needing treatment, the provision of which could exceed the existing capacity of the treatment facility. In addition, where sanitary sewer connection and treatment are not available, septic systems would be necessary. The proliferation of septic systems in rural communities may potentially contaminate groundwater with nitrates, ammonia, salts, metals, organic solvents, grease and oil and other substances, impairing the beneficial uses of local water supplies. Compliance with existing laws, regulatory programs, ordinances, General Plan policies and existing mitigation measures from EIR No. 441 would be sufficient to ensure that impacts associated with wastewater treatment capacities are less than significant.	**Riverside County Ord. No.s:** 458, 592, 650, 754, 843, 856 and 871 **General Plan Policies:** OS 3.1-3.3; LU 5.3, 21.2, 22.2, 22.8, 28.3, 29.7, 30.7, 31.4 and 32.6 **Existing EIR No. 441 Mit. Measures:** 4.9.1C, 4.10.9A, 4.15.4A, 4.17.5D, and 4.17.5E	Less than significant.
Impact 4.19.G – Result in Significant Adverse Effects Due to the Construction of New or Expanded Water or Wastewater Facilities: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, would result in increased demand for water supply, wastewater treatment and infrastructure to supply these services. These increases would contribute incrementally to the need for new or expanded water and wastewater treatment	**Riverside County Ord. No.s:** 592, 650, 682 and 843 **General Plan Policies:** OS 1.1, 1.3, 1.4, 2.1-2.5, 3.1-3.3 and 18.1-18.6; LU 5.3, 21.2, 22.2, 28.3, 29.7, 30.7, 31.4 and 32.6 **Existing EIR No. 441 Mit. Measures:** 4.17.1C, 4.17.1D and 4.17.5A	Less than significant.

Issues / Impacts	Policies and/or Mitigation Measures[1]	Level of Significance After Mitigation[1]
facilities. Since the project would be implemented on a case-by-case basis across many individual sites spread across Riverside County over roughly 50 years, however, it would not result in significant impacts tied to specific, inalterable areas. Rather, the future locations of such facilities can be established (located) so as to minimize potential environmental effects. Further, compliance with existing laws, regulatory programs, ordinances, General Plan policies and existing mitigation measures from EIR No. 441, would be sufficient to ensure that this impact is less than significant.		
Impact 4.19.H – Substantially Alter Existing Drainage Patterns Resulting in Substantial Erosion or Siltation: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to increase water erosion, sedimentation and siltation of surface water. This includes short-term construction impacts, as well as long-term operational impacts. Future development also has the potential to threaten, damage or change hydrologic baseline conditions throughout Riverside County over time. However, compliance with existing laws, General Plan policies and existing EIR No. 441 mitigation measures, would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 457, 458, 461, 659, 754 and 859 **General Plan Policies:** OS 1.4, 2.1-2.5, 3.1-3.7, 4.4-4.6, 4.8, 6.1, 6.3 and 18.1-18.6; LU 9.1, 9.2 and 9.4 **Existing EIR No. 441 Mit. Measures:** 4.9.1C, 4.9.1D, 4.9.2C, 4.10.9A, 4.10.9B, 4.10.9C, 4.17.4A, 4.17.4B, 4.17.4C, 4.17.5B, 4.17.5D and 4.17.5E	Less than significant.
Impact 4.19.I – Cause Runoff Exceeding Stormwater Drainage System Capacity or Cause Substantial Water Pollution: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, would result in the development of vacant lands within Riverside County. The addition of impervious surfaces from this development would increase stormwater runoff throughout Riverside County. In some areas, existing drainage facilities may not be adequate to accommodate the increase. However, compliance with existing laws, regulatory programs, ordinances, General Plan policies and existing mitigation measures from EIR No. 441, would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 457, 461, 592, 650, 659, 754, 843 and 859 **General Plan Policies:** OS 1.4, 2.1-2.5, 3.1-3.7, 4.4-4.6, 4.8, 6.1, 6.3 and 18.1-18.6; LU 5.3, 9.1, 9.2, 9.4, 21.2, 22.2, 28.3, 29.7, 30.7, 31.4 and 32.6 **Existing EIR No. 441 Mit. Measures:** 4.9.1.D, 4.9.2C, 4.10.9A, 4.10.9B, 4.10.9C, 4.17.5B and 4.17.5E	Less than significant.
Impact 4.19.J – Cause Significant Adverse Effects Due to the Need for New or Expanded Stormwater Drainage Facilities: Future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, would result in the development of vacant lands within Riverside County. The addition of impervious surfaces would increase the potential stormwater runoff from areas throughout Riverside County. Existing drainage facilities may not be adequate to accommodate future potential increases in stormwater runoff. Additional storm drain capacity and facilities may be necessary. It is feasible, however, for such future facilities to be planned, sited and constructed in a manner that minimizes potential environmental effects. In addition, compliance with existing laws, regulatory programs, ordinances, General Plan policies and existing mitigation measures from EIR No. 441, would be sufficient to ensure that this impact is less than significant.	**Riverside County Ord. No.s:** 457, 458, 461, 592, 650, 659, 754 and 843 **General Plan Policies:** OS 2.1, 3.4-3.7, 6.1, 6.3 and 18.1-18.6; LU 9.1, 9.2 and 9.4 **Existing EIR No. 441 Mit. Measures:** 4.9.1.D, 4.10.9A, 4.10.9B, 4.10.9C, 4.17.4A, 4.17.4B, 4.17.4C, 4.17.5D and 4.17.5E	Less than significant.

Footnotes:

1. Compliance with existing laws, ordinances, regulations, etc., is assumed under CEQA, regulatory compliance, including measures such as enforcement of existing Riverside County ordinances and prior-adopted mitigation from EIR No. 441, as well as existing and proposed Riverside County General Plan policies is assumed under CEQA. Further, the State CEQA Guidelines (CCR Section 15126.4(a)(3)) states, "mitigation measures are not required for effects which are not found to be significant." Thus, only those measures identified as "New Mitigation Measures" herein are deemed mitigation for the purposes of avoiding, reducing or minimizing a significant impact. Impacts fully mitigated through the implementation of the listed new mitigation measures are deemed "Less Than Significant With Mitigation."

Source: Riverside County Planning Dept., EIR No. 521, Sections 4 and 5, 2013.

Cumulative Impacts

In addition to the impacts listed in Table 1.0-B, Summary of Proposed Project Impacts and Mitigation, the project would also result in a "Cumulatively Considerable" contribution toward various significant cumulative impacts as analyzed in Section 5.0, Additional Required CEQA Topics. The project would result in Cumulatively Substantial/Significant Impacts for Population and Housing, Aesthetic and Visual Resources, Agricultural and Forestry Resources, Air Quality, Greenhouse Gases, Cultural and Paleontological Resources, Energy Resources, Geology and Soils, Hazardous Materials and Safety, Noise, Parks and Recreation, Public Facilities, Transportation and Traffic, and Water Resources. The project would also result in Significant Growth Inducing Impacts, as well as Significant Irreversible Commitments. For an analysis of these cumulative Impacts, refer to Section 5.0, Additional Required CEQA Topics.

Section 2.0

Introduction

Section 2.0 Introduction

2.1 Purpose of the Program Environmental Impact Report

In compliance with the California Environmental Quality Act (CEQA), this Program Environmental Impact Report (EIR No. 521, State Clearinghouse No. 2009041065) describes the environmental consequences associated with implementation of the Riverside County General Plan as updated and revised by the 5-Year Comprehensive Update Project, General Plan Amendment No. 960 (GPA No. 960). 'Project' or 'proposed project,' herein. This EIR is intended to fully inform decision-makers in Riverside County, other responsible and trustee agencies, and the general public of the potential environmental consequences of approval and implementation of the proposed project. The EIR addresses the changes associated with the proposed project, their effects on the existing General Plan, including projected county build out and, in particular, potential effects on the existing physical environment expected from implementation of the changes. The EIR addresses project-related changes to General Plan land uses, policies and maps, as well as changes related to environmental resources. It analyzes the mitigation value of compliance with existing federal, state and local regulations, including existing and proposed General Plan policies. And, where necessary, it also includes specific CEQA mitigation measures to reduce or avoid significant impacts. Lastly, this EIR also examines growth-inducing impacts, cumulative impacts and various alternatives to the proposed project.

This Program EIR has been prepared in conformance with the California Environmental Quality Act of 1970 (CEQA), as amended (Public Resources Code [PRC], Section 21000, *et seq.*), and the State CEQA Guidelines (California Code of Regulations [CCR], Title 14, Chapter 3, Section 15000, *et seq.*). Pursuant to the provisions of CEQA and the State CEQA Guidelines, the County of Riverside is the Lead Agency for the proposed project described herein and is charged with the responsibility of deciding whether or not to approve the proposed project. According to Section 15002 of the State CEQA Guidelines, the basic purpose of CEQA is to:

- Inform government decision makers and the public about the potential significant environmental effects of proposed activities.
- Identify ways that environmental damage can be avoided or significantly reduced.
- Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governing agency finds the changes to be feasible.
- Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

Accordingly, this EIR will be used by Riverside County staff and the public in their review of the revisions to the General Plan proposed under GPA No. 960. It may also be used by other agencies, including responsible and trustee agencies, in their decision making.

This EIR is a 'Program EIR,' evaluating the broad-scale impacts of the proposed project, GPA No. 960. Program EIRs are typically prepared for an agency plan, program or series of actions that can be characterized as one large project, such as a general plan. A General Plan EIR, addressing the impacts of countywide and local policy decisions, can be thought of as a "first tier" document (State CEQA Guidelines, Section 15152). It evaluates the large-scale impacts on the environment that can be expected to result from revision of the General Plan pursuant to the proposed project, but does not necessarily address the site-specific impacts of each of the individual development projects that would follow in the future implementation of the updated General Plan. CEQA requires each of those subsequent development projects be evaluated for their particular site-specific impacts. Such site-specific analyses are typically encompassed in second-tier documents, such as Project EIRs, Focused EIRs or Negative Declarations for individual development projects subject to the General Plan. They typically evaluate the impacts of a single activity undertaken to implement the overall plan.

According to the State CEQA Guidelines, a Program EIR is one that may be prepared on a series of actions that can be characterized as one large project and that are related: (1) geographically; (2) as logical parts in the chain of contemplated actions; (3) in connection with the issuance of rules, regulations, plans or other general criteria to govern the conduct of a continuing program; or, (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar effects that can be mitigated in similar ways. The proposed project falls within all of these criteria. It addresses land use and development proposals and changes with effects across the expanse of unincorporated Riverside County, thus indicating a basic geographic relationship. The project includes maps, goals, policies and actions that would be logical parts of a chain of contemplated actions governing the orderly development of land uses in Riverside County over time. The proposed policies and actions either directly establish or would govern future plans that establish or revise rules, regulations, plans or other criteria governing implementation of the General Plan as revised per GPA No. 960. Future implementing actions associated with the project would be carried out under the authority and approval of Riverside County. Lastly, many of the specific future projects and actions subsequently carried out pursuant to the updated General Plan would have a similar range of environmental impacts to which similar programmatic means of mitigation would be warranted.

There are several advantages to a Program EIR. It provides a more thorough consideration of regional influences, secondary effects, cumulative impacts, land use and policy alternatives, global climate change mitigation and other factors that apply to the program as a whole. Program EIRs avoid duplicative reconsideration of basic policy considerations. They allow the lead agency to consider broad policy alternatives and program-wide mitigation measures at a time when the agency has greater flexibility to deal with fundamental issues and, in particular, cumulative effects.

Subsequent projects approved or undertaken pursuant to a program EIR may still require additional environmental review. This would be determined by the County of Riverside on a project-by-project basis, based on the details and specifics of the project and its site, and appropriate subsequent analysis. However, program EIRs also allow subsequent environmental reviews to focus on issues unique to the site that were not specifically addressed in the program EIR. This allows decision makers and interested parties to focus on the CEQA analysis of the subsequent project's new effects not previously considered. The parameters by which a lead agency can determine the need for additional environmental documentation are outlined in the State CEQA Guidelines, Sections 15160 to 15170.

Thus, EIR No. 521 addresses amendment of the existing General Plan pursuant to GPA No. 960, which is the proposed project. The EIR anticipates a series of actions needed to achieve the implementation of the proposed updated General Plan. Further actions or procedures expected to be associated with the proposed project include the processing of zoning plans, specific plans, subdivision maps, site design plans, building permits and grading permits.

To keep the analysis of impacts in this Program EIR in perspective, the County of Riverside covers a territory of nearly 7,300 square miles – nearly the size of the State of New Jersey. It includes well-established urban, suburban and rural communities, and has an extensive array of agricultural lands, mining uses and recreational areas. There are rugged mountains, flat valley areas, open desert and expansive natural open space areas. The variety of geographic zones has an influence on climate which, in turn, affects biodiversity, energy usage (such as for air conditioning and heating), water usage (for agriculture and landscaping), wildfire hazards, flood hazards, air quality (heat, wind patterns, topography), water quality (natural salinity and groundwater recharge) and soil types (prime farmland) within the county. In addition, Riverside County contains vast expanses of federal and Native American lands and 26 incorporated cities that are not under the land use control of the County of Riverside.

The analysis in a Program EIR for a county of this size is not intended to be site-specific (e.g., determining the level of service for specific road intersections within the county), but rather a broader analysis. For instance, the traffic analysis determines whether the roadway widths proposed in the General Plan Circulation Element would accommodate the planned land uses. The Program EIR does not, however, determine fair-share roadway improvements for individual future development projects. Such fair-share improvements associated with future development must be determined during subsequent environmental review on a case-by-case basis.

Furthermore, EIR No. 521 is the primary reference document for the formulation and implementation of a mitigation monitoring program for the proposed project. Environmental impacts cannot always be mitigated to a level that is considered less than significant. In accordance with Section 15093(b) of the State CEQA Guidelines, if a lead agency approves a project that has significant impacts that are not substantially mitigated (i.e., significant unavoidable impacts), the agency shall state in writing the specific reasons for approving the project based on the final CEQA documents and any other information in the public record for the project. This is defined in Section 15093 of the State CEQA Guidelines as a "statement of overriding considerations."

2.2 Program EIR Scope, Contents and Organization

Riverside County has determined, based on findings of the Initial Study, that an EIR is required to address potentially significant effects that may result from implementation of the proposed project. The scope of the EIR also includes environmental issues identified by agencies and the general public in response to the NOP and subsequent scoping sessions. Hence, the environmental topics listed in Table 2.0-A (CEQA Topics and Locations within EIR No. 521), below, are addressed in this EIR in the locations indicated. EIR No. 521 consists of two basic documents collected into several volumes: the first document contains the text of the Draft Program EIR No. 521, the second document encompasses the technical appendices that accompany and support the Draft EIR. To further assist the reader's review of the document, the following briefly describes the Program EIR's format.

Section 1.0 – Summary: This section contains a summary of the Draft EIR's findings and CEQA processes. It also includes a brief summary of the proposed project, areas of controversy, public review procedures and a summary table listing all project impacts and mitigation measures recommended to reduce significant impacts of

the project and the level of significance of each impact following mitigation. The section also provides a summary of the project alternatives analysis.

Section 2.0 – Introduction: This section describes the EIR's purpose, legal requirements and intended use. It also has an outline of the document and a list of the environmental issues discussed.

Section 3.0 – Project Description: This section details the specific items included in proposed GPA No. 960, including changes in text, policy and maps for a variety of locations within both the General Plan Elements and its 19 attendant Area Plans.

Section 4.0 – Environmental Impacts and Mitigation: This section forms the main body of the EIR and provides environmental analyses of the proposed project. It includes discussion of environmental conditions and existing setting for each resource, anticipated effects associated with the project action, analysis of the resultant impacts and discussion of the applicable means for mitigation of these impacts (via regulatory compliance, Riverside County ordinance and policies, CEQA-specific mitigation measures, etc.). Section 4.0 is organized by environmental topic (e.g., aesthetics, air quality, noise). Section 4.1 describes the methodology and assumptions generally used.

Section 5.0 – Additional Required CEQA Topics: This section contains the additional topics required by CEQA, including unavoidable effects of the proposed project, significant irreversible environmental changes, growth-inducing impacts, cumulative impacts and consistency with regional plans.

Section 6.0 – Alternatives: This section contains discussion of alternatives to the project. As allowed by CEQA, most of the impacts of these alternatives are evaluated at a more general level than the project analyses contained in Section 4.0. Among others, this section includes evaluation of the effects of the 'No Build' alternative (in which no development is assumed to occur) and the 'No Project' alternative (essentially the 'status quo' alternative, in which GPA No. 960 is assumed not to have occurred and the existing General Plan builds out unchanged). Lastly, the environmentally superior alternative is identified.

Sections 7.0 – References: This section contains a number of items related to the preparation of the EIR itself, including: a listing of the organizations and persons consulted in preparation of the EIR, the names of the EIR preparers and a bibliography of documents and sources referenced.

Section 8.0 – Glossary: This section presents a glossary and list of acronyms encountered within the EIR in order to help clarify the many technical terms used.

Technical Appendices: The Draft EIR contains a number of appendices to the EIR, which are encompassed in the second set of volumes comprising the Draft EIR. They include the following: Appendix EIR-1 encompasses the various CEQA–related items that contribute to the preparation of this EIR, including the Initial Study, Notice of Preparation and resultant comment letters, as well as any other relevant correspondence received during the course of EIR preparation. It also includes in Appendices EIR-2 through EIR-11 the technical reports, studies and supporting data used for the analyses within the EIR, when such studies are not appended directly to the General Plan.

Appendix EIR-1: Project CEQA Documentation (Initial Study, NOP, NOP Responses)

Appendix EIR-2: Land Use Tables

Appendix EIR-3: Aesthetics Inventory

Appendix EIR-4: Traffic Study

Appendix EIR-5: Air Quality Study

Appendix EIR-6: Greenhouse Gas Technical Report

Appendix EIR-7: Noise Study and Impacts Analysis

Appendix EIR-8: Background and Supplemental Water Data

Appendix EIR-9: Background and Supplemental Biological Data

Appendix EIR-10: Air Quality and Greenhouse Gas Addendum

Appendix EIR-11: Cumulative Data

Table 2.0-A: CEQA Topics and Locations within EIR No. 521

Population and Employment Forecasts	General Plan Appendix F-1
Significant Environmental Effects of the Proposed Project**	Section 5.1 (and summary in Table 1.0-B)

Topic	EIR Location
Significant Environmental Effects Which Cannot Be Avoided if the Proposed Project is Implemented**	Section 5.1 (and summary in Table 5.0-A)
Significant Irreversible Environmental Changes Which Would be Involved in the Proposed Project Should It be Implemented**	Section 5.2
Mitigation Measures Proposed to Minimize Significant Effects**	Sections 4.2-4.19, 5.1-5.5 (and Table 1.0-B)

* Identified as potentially significant in the Initial Study for this project.
** Topics mentioned in CCR Section 15126.

2.3 Initial Notices, Public Outreach and Community Involvement

To further the basic purposes of CEQA, the environmental review process requires the preparation and public circulation of several documents. These include, in addition to the Program EIR, a Notice of Preparation (NOP) and an Initial Study (IS).

Riverside County formally initiated the environmental process for this project with circulation of an NOP, which was sent to responsible and trustee agencies, as well as interested parties, for a 30-day review period from April 13 to May 13, 2009. An NOP is a brief notice that the Lead Agency plans to prepare an EIR for a project. The purpose of the NOP is to solicit guidance from agencies and individuals as to the scope and content of the environmental information to be included in the EIR. Within 30 days after receiving the NOP, responsible agencies are to provide the Lead Agency with specific detail about the scope and content of the environmental information related to the responsible agency's area of statutory responsibility. This information is to be included in the Draft Program EIR. A total of 29 comments were received by the County of Riverside and have been taken into account during the preparation of this EIR. The NOP and the responses to the NOP from agencies and individuals are included in Appendix EIR-1 of this EIR. The letters received in response to the NOP are also summarized below. Along with the NOP, an Initial Study for the proposed project was circulated on March 13, 2009. It is also included in Appendix EIR-1.

A. CEQA Notice of Preparation Comments

Once the County of Riverside determined that the potential for significant impacts existed with the proposed project and that preparation of an Environmental Impact Report (EIR) was necessary, a Notice of Preparation (NOP) was prepared and distributed pursuant to requirements of CEQA.

The NOP was issued for a 30-day comment period on April 13, 2009, to the State Clearinghouse, responsible agencies and other interested parties. The NOP and Initial Study were also posted (and remain) online at the Riverside County Planning Department's website at ***http://planning.rctlma.org***.

The objective of distributing the NOP was to solicit public comment to aid in identifying the full range and scope of issues of concern so that these issues might be fully examined in the EIR. Thirty comments responding to the NOP were received during the comment period. These comments are summarized below. The Initial Study, NOP, distribution list and all NOP comments received by the County of Riverside are included in EIR Appendix A-1. The following summarizes the NOP comments received:

Morongo Band of Mission Indians: Letter dated April 15, 2009, from Franklin A. Dancy, Project Manager. Commented that the project area is within territory that may be considered a traditional use area or one with cultural ties to the Tribe. Tribe requests the County impose standard conditions regarding cultural and archaeological resources, as well as buried cultural materials. The standard conditions are outlined in the letter.

City of Chino Hills: In a letter dated April 16, 2009, Christine Kelly, Community Development Director, requested a copy of the Draft EIR once it was released.

South Coast Air Quality Management District: In a letter dated April 17, 2009, Steve Smith, Program Supervisor of the CEQA Section, Planning, Rule Development and Area Sources, requested an electronic copy of the Draft EIR and all appendices and technical documents related to air quality and its analysis. The SCAQMD also provided information and resources on air quality analysis, recommended mitigation measures and data sources.

California Emergency Management Agency, Disaster Assistance Programs Branch: In a letter dated April 20, 2009, Environmental Officer Dennis Castillo outlined specific state planning law citations addressing identification and analysis of hazards. He also recommended the County of Riverside examine each of these requirements and determine if hazard issues exist. He also suggested including a table in the Draft EIR to identify specific issues and where they are addressed in the General Plan.

City of Colton: In a letter dated April 20, 2009, Duane Morita requested a larger scale map showing proposed General Plan land uses along Riverside County's northern boundary (where it abuts Colton) near Highgrove and Interstate 215, specifically detailing parcel-specific changes C8-4 and C6-6.

City of Loma Linda, Community Development Dept., Planning Division: In a letter dated April 21, 2009, Raul Colunga, Assistant Planner, wrote to say the city had no comments.

Mojave Desert Air Quality Management District: In a letter dated April 21, 2009, Alan J. De Salvio, Supervising Air Quality Engineer, stated the District concurs with the scope of activities to be evaluated in the EIR regarding air quality, transportation and traffic.

Coachella Valley Archaeological Society: In a letter dated April 21, 2009, Julia Weaver, Secretary and Environmental Coordinator, recommended all CEQA, County of Riverside, state and federal regulations for prehistoric and historic cultural resources be followed during the GPA process.

City of Riverside: In a letter dated April 30, 2009, Planning Director Ken Gutierrez noted that the City of Riverside had recently completed its comprehensive update of its own general plan. He explained that, by Riverside County request, the City of Riverside incorporated an implementation tool ('Tool 10') into its General Plan to address sphere of influence consistency with Riverside County's General Plan. Changes to both the City's and County's General Plans were needed to address consistency in this area; Mr. Gutierrez suggested Riverside County's General Plan update project as a possible opportunity to further these consistency efforts.

California Department of Transportation (CalTrans), Division of Aeronautics: In a letter dated May 4, 2009, Sandy Hesnard, Aviation Environmental Specialist, stated CalTrans had reviewed the NOP with respect to airport-related noise and safety impacts, as well as to regional aviation land use planning issues. The author noted that GPAs must be submitted to Riverside County Airport Land Use Commission in accordance with the California Public Utilities Code (PUC) Section 21676 *et. seq.* It was also noted that CEQA (PRC Section 21096) requires the California Airport Land Use Planning Handbook be used as a resource in preparation of environmental documents for projects within airport land use compatibility plan boundaries. The letter emphasized that a General Plan must demonstrate adherence with ALUC policies regarding compatibility criteria compliance and stated that protecting airports from incompatible land use encroachment is vital to California's economic future. Other comments in the letter addressed aircraft noise level thresholds, mitigation measures for cumulative noise impacts associated with roadways and railway lines, Federal Aviation Regulation Part 77 criteria,

buyer notification requirements for lands around airports, proposed school sites and restricting land use practices attracting or sustaining hazardous animals within the vicinity of the airport.

U.S. Dept. of Homeland Security, FEMA Region IX: In a letter dated May 4, 2009, Gregor Blackburn, Branch Chief, requested the County of Riverside review the current effective countywide Flood Insurance Rate Maps, revised August 28, 2008. The letter also provided a summary of the National Flood Insurance Program floodplain management building requirements and contact information.

Riverside Transit Agency: In a letter dated May 4, 2009, Planning Communications Specialist Mike McCoy summarized the RTA's comments from the scoping meeting held that same day. He suggested key points for the EIR to promote safe, convenient and reliable transit resources in communities (such as identifying current and proposed bus routes and other transit issues, green alternatives to current modes of transportation, best practices for transit planning, etc.). He also noted the need for ADA-compliant bus stops along existing bus routes.

Southern California Association of Government (SCAG): In a letter dated May 4, 2009, Jacob Lieb, Manager, briefly outlined SCAG's role as a CEQA reviewing agency. He noted that SCAG considers the proposed project regionally significant per State CEQA Guidelines. Lastly, the letter provided information on SCAG's Regional Transportation Plan and Compass Growth Vision, and also requested a minimum of 45 days for review of the Draft EIR.

Friends of the Northern San Jacinto Valley: In a letter dated May 4, 2009, Conservation Co-Chair Susan Nash noted that the maps provided with the NOP did not show the San Jacinto Wildlife Area, Mystic Lake or the San Jacinto River course. It outlined two concerns with the Lakeview Nuevo Area Plan. First, that the County of Riverside is processing a GPA for the Villages of Lakeview, but neither that project nor this proposed project acknowledges the other. Secondly, they are concerned that studies regarding the San Jacinto River be addressed as one study area (and not split amongst Area Plans, etc.). Ms. Nash also noted that all the proposed projects involving large areas of agriculture in the San Jacinto Valley should be addressed in one planning area (to properly account for cumulative effects). She noted that the San Jacinto Valley and the San Jacinto River should be identified as one planning area and clearly shown on maps, as should the various cities' spheres of influence. Lastly, Ms. Nash noted that the County's Climate Action Plan and policies addressing AB 32 and SB 375 must be prepared first, with all other planning actions following.

City of Riverside: In a letter dated May 5, 2009, Planning Director Ken Gutierrez, noted that the NOP URL links listed in the Public Courtesy Notice for NOP were incorrect, though the documents are available on Riverside County's website. Mr. Gutierrez requested the County of Riverside provide a complete analysis for each instance where a GPA within the city sphere of influence over the past five years did not meet the Certainty System guidelines. He then requested the proposed density and intensity changes be analyzed for Western Riverside County MSHCP 'rough step analysis' conformance. He noted that the proposed sphere of influence policy would be critical for giving cities greater control over land use decisions within their spheres of influence. He also wanted to see the policies contained within the MSHCP's implementing MOU be added to the General Plan, as well as policies requiring development impacts to cities be appropriately mitigated. He suggested 'Smart Growth Principles' and 'Sustainable Design Principles' be used to reduce vehicle miles traveled and foster green technology. He asked that the General Plan roadway network be analyzed against the Land Use Element to determine if the network would accommodate the proposed growth. And, he recommended policies ensure continuous street connections and paved roads. He also recommended the trails system be completely analyzed and that all roadways and trails in the city's sphere of influence be properly linked. He commented on the need to analyze potential environmental effects for design guidelines and sphere-of-influence consistency as well as for air quality and traffic. Lastly, he noted that all impacts to the City of Riverside in these areas should be mitigated.

Cathedral City: In a letter dated May 5, 2009, Rich Malacoff wrote to acknowledge receipt of the NOP and that the proposed project would not affect Cathedral City.

California Public Utilities Commission, Rail Crossing Engineering Section, Consumer Protection and Safety Division: In a letter dated May 5, 2009, Utilities Engineer Rosa Munoz confirmed receipt of NOP and recommended the General Plan address safety for rail corridors and provide relevant mitigation measures.

Imperial Irrigation District: In a letter dated May 6 2009, Cameron Bucher noted that Riverside County's General Plan should include reference to the existing and federally recognized electrical transmission facilities and energy corridors, the existing Bureau of Land Management corridor and the Imperial Irrigation District Desert Southwest Transmission Line project. The letter also provided additional web resources for the California Desert Conservation Act Plan and the Department of Energy's Corridor and Congestion Study and the Westside Energy Corridor.

U.S. Marine Corps: In a letter dated May 11, 2009, T. A. Manfredi, by direction of the Commanding Officer, commented that the General Plan does not show the Chocolate Mountain Aerial Gunnery Range (CMAGR) or its military training routes. It should be revised to do so and also should consider density limitations for parcels near CMAGR and generally within the Eastern Coachella Valley Area Plan. The Safety Element should also mention CMAGR's aircraft use and the associated military training routes. It was suggested that a new Criteria Element (i.e., LUD) be added to recognize any military-owned or managed property and protect such as a military reservation. The letter also noted that the existing Noise Element does not mention noise, vibrations or interference associated with CMAGR aviation activities. Policies and programs developed by Yuma County, Arizona, are cited throughout the letter as exemplars.

Orange County Transportation Authority: In a letter dated May 12, 2009, Transportation Planning Manager, Charles Larwood, requested a copy of Riverside County's updated General Plan once it is completed. He also requested the OCTA be informed if the project affects or alters any part of the Western Riverside County MSHCP.

Sierra Club: In a letter dated May 12, 2009, Laurel L. Impett notes that the Sierra Club is concerned by the lack of specifics in the NOP and Initial Study. Concerned that the planning process would not allow for adequate public participation, the Sierra Club recommended additional scoping sessions or workshops. She also made comments on the EIR's scope, including: that the public should be given the opportunity to review the significance criteria or threshold of significance in advance of the Draft EIR; that a clear and comprehensive project description should be included, including a breakdown of the project description by land use categories; that an alternative that alters allowable development patterns should be considered to reduce environmental impacts and promote sustainability. And, lastly the Sierra Club commented on environmental impacts related to land use planning, population and housing, biological resources and wetlands, water resources and hydrology, air quality, climate change, transportation and circulation, public services, utilities, wastewater, solid waste, parks and aesthetics.

California Public Utilities Commission: In a letter dated May 12, 2009, Jensen Uchida encouraged the County of Riverside to include provisions of the Renewable Energy Transmission Initiative in the General Plan and attached a copy of the Imperial County General Plan's Geothermal / Alternative Energy and Transmission Element.

Center for Biological Diversity: In a letter dated May 13, 2009, Staff Attorney Jonathan Evans submitted comments on the CEQA process, strategies, methods and mitigation measures to address climate change in the General Plan. He also requested biological impacts be fully analyzed and mitigated to the extent feasible. To

address the project's greenhouse gas impacts, he recommended the County develop a climate action plan that sets specific measures to reach specified emission reduction targets. The letter also provides guidance on addressing and analyzing global climate change in the EIR. This includes recognizing the role of land use patterns and policy GHG reduction, addressing the threat of greenhouse gas pollution and global warming, and inventorying and analyzing projected greenhouse emissions from the project in the EIR. The EIR also must address the impact of global warming on the project and establish a zero threshold for significance in regards to greenhouse gas emission from project. Lastly, the EIR must analyze and adopt all feasible mitigation measures to reduce the project's greenhouse gas emissions.

Riverside County Airport Land Use Commission: In a letter dated May 13, 2009, Director Edward Cooper notes that the General Plan update would be an opportunity to bring the Riverside County General Plan into consistency with various Airport Land Use Compatibility Plans within Riverside County. Consistency is required by the State Aeronautics Act, which requires local jurisdictions to bring their General Plans into consistency with an Airport Land Use Compatibility Plan within 180 days of adoption, and the Commission has directed its staff to work with Riverside County Planning staff towards this end. The letter also includes information on compatibility plans adopted by ALUC between 2004 and 2009. It notes that the existing General Plan is inconsistent with the allowed density and intensity criteria of the ALUCP Compatibility Zones; policy area maps and tables in the existing General Plan do not correctly reflect airport influence area boundaries and compatibility zones in some areas; the EIR provides a means for addressing consistency; and, lastly, the proposed General Plan update would need to be reviewed by ALUC.

City of Colton: In a letter dated May 13, 2009, Assistant City Manager Mark Nauimi requests that the project's cumulative impact analysis consider approved and future projects in neighboring City of Colton and lists specific plans in Colton that should be considered. It also states the analysis should also include cumulative traffic generation and impacts on Colton roadways serving cumulative projects. The EIR should also evaluate consistency with federal Endangered Species Act requirements for the Delhi sands flower-loving fly, summarize compliance with SB 18, explain Riverside County and city coordination on future projects, evaluate impacts to Colton's traffic and transportation plans, evaluate impacts to the city's capital improvement projects and also include the Bi-County Corridor analysis.

Riverside County Flood Control and Water Conservation District: In a letter dated May 14, 2009, Teresa Tung, Engineering Project Manager, provided the following list of issues to consider for the General Plan and the associated EIR: existing Flood Control District facilities are not consistently shown on the existing General Plan's land use maps; planned flood control infrastructure in County Master Drainage Plans (MDP) and Area Drainage Plans (ADP) are not shown in the General Plan; and, mapped LUDs need to allow for proper planning within and around proposed MDP flood control infrastructure. Further, the EIR should analyze potential impacts to the MDPs and floodplain management studies may be necessary in areas where floodplain and flood hazards have not been studied and mapped. The General Plan and EIR should also address potential direct and indirect floodplain impacts, and describe the flood control facilities and other measures needed to mitigate flood hazards. Lastly, both documents should address water quality and the County's Water Quality Management Plans for new development and for minimizing discharge of pollutants in storm water.

Riverside County Waste Management Department: In a letter dated May 15, 2009, County Planner Sungkey Ma commented on AB 32 and inquired about Riverside County's approach to compliance with that law relative to a future Climate Action Plan.

California Regional Water Quality Control Board, Santa Ana Region: In a letter dated May 19, 2009, Mark G. Adelson, Chief of the Regional Planning Programs Section, submitted comments addressing the Santa Ana River and San Jacinto River watersheds. He noted that federal and state anti-degradation policies should be factor

heavily in the 'alternatives analysis' section of the EIR. He also made a number of specific comments directed at ensuring the updated General Plan and the project's EIR ensure proper protection of water quality.

California Department of Toxic Substances Control: In a letter dated May 19, 2009, Project Manager, Al Shami, of the Brownfields and Environmental Restoration Program wrote requesting the project do a number of things, specifically: evaluate impacts to human health and the environment pursuant to the list of regulatory agency databases provided; provide a mechanism for the identification and remediation of contaminated sites; develop a work plan for hazardous substance cleanup; require hazardous material investigation prior to demolition activities and for performing any needed remediation in compliance to California environmental regulations and policies; address soil contamination and testing; protect human health and sensitive receptors during construction or demolition projects; manage hazardous waste appropriately per California hazardous waste control laws; and, for former agricultural sites require investigation and, where needed, remediation of contaminants prior to construction.

Metropolitan Water District of Southern California: In a letter dated June 8, 2009, Manager Delaine W. Shane of the Environmental Planning Team wrote noting that the project area includes a number of Metropolitan-owned or operated facilities, rights-of-ways and property holdings. As such, MWD is concerned with potential impacts to any of its existing or future facilities resulting from proposed land use changes. They also request analysis of water quality issues related to the effects of land use changes on MWD water storage or conveyance facilities. And, they note that any proposed modification should not impact or impose additional restrictions on MWD properties. They request participation in the project planning process to ensure compatibility with MWD intended uses of non-operational properties. Lastly, the letter included a map of Metropolitan's facilities and properties in Riverside County.

B. Scoping Process

In addition to distribution and publication of the NOP, two public scoping meetings were held to solicit input from interested agencies and the public on what analysis and issues should be included in the EIR. These scoping meetings were held on Monday, April 27, 2009, at the Indio Office of the County Planning Department and Monday, May 4, 2009, at the County Administrative Center in downtown Riverside. Both meetings were open for public comment. Attendees were given the option of providing oral or written comments. The time, place and intent of these public scoping meetings was advertised (in English and Spanish) in the following daily (except La Prensa) publications:

- The Press-Enterprise, published April 17, 2009
- The Desert Sun, published April 17, 2009
- The Californian, published April 17, 2009
- La Prensa (Spanish-language weekly), published week of April 17-23, 2009

The comments received at each public scoping meeting are summarized below. Copies of the public notices and documents related to the public scoping meetings are provided in EIR Appendix A-1.

Public Scoping Meeting on Monday, April 27, 2009: There were approximately 12 attendees, none identified themselves as being with a public agency. All were either concerned community members or developers and their consultants. Riverside County staff present included Planning Director Ron Goldman (presiding), Principal Planner Mitra Mehta-Cooper and Planner IVs Cindy Thielman-Braun and Josh Lee. Principal Planner Dave

Mares from the Indio Office and Mike Gialdini from Supervisor Wilson's office were also in attendance. The scoping meeting started with introductions all around. Then Riverside County Planning Department staff provided background information on the project and planned EIR. This was followed by general discussion of a variety of community concerns, including provision of equestrian trails and recreational opportunities, community plans for the region and protection of rural areas. A question was asked for clarification of the relationship between the privately initiated Foundation GPAs and GPA No. 960. The question and answer portion of the meeting took about 30 minutes. No new issues not previously considered were raised.

Public Scoping Meeting on Monday, May 4, 2009: This scoping meeting was attended by 15 guests, including representatives from several public agencies: Riverside County Airport Land Use Commission (Brenda Ramirez), the Riverside Transit Authority (Michael McCoy) and the Orange County Water District (Donald L. Jackson). Riverside County staff present included Assistant Planning Director Damian Meins (presiding), Principal Planner Mitra Mehta-Cooper and Planner IVs Cindy Thielman-Braun and Josh Lee, as well as Planner II, Phayvanh Nanthavongdouangsy. Principal Planner Dave Mares from the Indio Office and Mike Gialdini from Supervisor Wilson's office were also in attendance. The scoping meeting started with introductions all around and background information on the project and planned EIR from Riverside County Planning Department staff. The discussion portion of the meeting that followed lasted about 45 minutes and proceeded formally through the use of the speaker's slips and three minute time limits.

The first speaker, Sue Nash, commented on wanting to see greenhouse gas issues addressed "first" and not after the "General Plan is put together;" perceived errors in how various maps depict the San Jacinto area; concerns about the proposed Northeast Dairies Policy Area's potential effects on the San Jacinto Wildlife Preserve; and, concerns about the effects of potential agricultural conversion in the San Jacinto area in general.

The second speaker, Cindy Ferry, had technical questions about the proposed EIR, including how General Plan build out would be calculated, how any density transfer programs would be addressed in those calculations and how privately initiated GPAs would be reflected in GPA No. 960 and the EIR. She also had questions about the length of the public comment period for Draft EIRs and concerns about the adequacy of any future technical studies. Lastly, she reiterated her position on the need for protecting rural lifestyles within Riverside County.

The third speaker, Michael McCoy, from the Riverside Transit Authority, requested the County of Riverside consider public transit needs in the proposed Circulation Element update, including accommodating transit corridors, bus pullouts and transit center collecting points. He also asked that the County of Riverside coordinate directly with the RTA on future bus routes and design of Riverside County's circulation network to provide appropriate roadways and infrastructure for future transit corridors.

Lastly, Laurie Taylor spoke about her concerns over available water supplies and plans for a density bonus program. She also asked how much agricultural lands would be preserved and whether there was a set amount, either by acreage or percentage, targeted for protection.

C. Public Hearings and Other Public Meetings Timeline

To inform the public of the General Plan Advisory Committee, Planning Commission and Board of Supervisors workshop and hearings are advertised ten days in advance in the local newspaper. Meeting materials, including comments submitted by the public, are posted advanced to the public hearings on the Planning Department's website. The public hearings provide an opportunity for the public to learn about the project, and to express their concerns and opinions on the proposed project. There was active public participation at the GPAC meetings. From the GPAC meetings, the County of Riverside received over seventy letters discussing various issues

concerning GPA No. 960. The list below summarizes the other public meetings, workshops and hearings that were held for the project.

1. Board of Supervisors Hearings and Workshops

April 8, 2008: The Board approved creation of, and membership for, the 2008 General Plan Advisory Committee.

October 21, 2008: The Board formally initiated the proposed General Plan update as GPA No. 960.

2. Planning Commission Hearings and Workshops

July 9, 2008: A public workshop was conducted for the Riverside County Planning Commission to discuss the components being considered for updating the General Plan.

October 1, 2008: The Planning Commission recommends formally initiating GPA No. 960.

June 24 and August 19, 2009: Planning Commission workshops were held to discuss various components of the project for which the GPAC had concluded discussion and finalized recommendations (see below). Planning Commissioners provided feedback to further shape the proposed project.

3. General Plan Advisory Committee (GPAC) Meetings

October 2008 through October 2009 and June 2013 through August 2013: During this period, GPAC meetings were held roughly every six weeks. At these meetings, sections of the proposed project (generally proposed General Plan text revisions, deletions or additions) were discussed and committee members voted on group recommendations to be forwarded to the Planning Commission and BOS for consideration.

2.4 Document Availability

Draft EIR No. 521 for GPA No. 960, the General Plan Update Project, including all of its appendices and technical studies, was distributed according to CEQA requirements and NOP requests, as well as Riverside County procedures. See Appendix EIR-1 for distribution lists. For convenience, it was also posted on the Riverside County Planning Department website.

The proposed project, Programmatic EIR and technical appendices may be viewed online at:

http://www.rctlma.org/planning

The County has made hardcopies of the complete text and exhibits of GPA No. 960 and EIR No. 521, including its technical appendices, available at both Planning Department offices within Riverside County, which are at the following locations:

County Administrative Center Riverside
4080 Lemon Street
Public Counter, 2nd Floor or

Planning Department, 12th Floor
Riverside, California 92502
Hours of Operation: 8:00 am to 5:00 pm
Monday through Friday

County Administrative Center (Palm Desert)
77588 El Duna Ct.
Palm Desert, California 92211
Hours of Operation: 8:00 a.m. to 5:00 p.m.
Monday through Friday

In addition, a CD-ROM of the proposed draft updated General Plan and Draft EIR No. 521, including all the associated EIR appendices and technical studies, was made available for review at the following library locations:

Section 3.0

Project Description

Section 3.0 Project Description

3.1 Introduction

The General Plan Update Project, General Plan Amendment No. 960 ("Proposed Project" or GPA No. 960), comprises a comprehensive review of, and necessary updates to, the Riverside County General Plan's policies, maps and implementing directions. The result of the effort is an amended County General Plan that continues to provide a clear and consistent set of directions for implementing the County Vision, Elements and Area Plans over the next five years and into the future. A detailed description of the proposed updates, revisions and changes encompassed by this project is provided in Section 3.5. Associated project-level information may also be found on the Planning Department's website at ***http://planning.rctlma.org/***.

The adoption of this amendment to the current General Plan and future implementation of the changes it encompasses is considered the "proposed project" as evaluated in this Program EIR. As stipulated by Section 15124 of the State CEQA Guidelines, the project description that follows provides details about the proposed components of GPA No. 960 to the extent needed for adequate evaluation of environmental impacts. This section also provides an overview of the project's regional location and general setting, project background, project objectives, a detailed description of the proposed changes to the General Plan, a brief discussion of the anticipated adoption and implementation of the updated Plan and an explanation of the intended uses of this Program EIR.

3.2 Regional Location and General Setting

Riverside County is large, encompassing 7,295 square miles that stretch across 200 miles of California - from the eastern edge of the Los Angeles metropolitan basin to the Colorado River. Bounded by Orange County on the west, San Bernardino County to the north, the State of Arizona to the east and San Diego and Imperial Counties to the south, Riverside County is the fourth largest county in California (Figure 3.1, Regional Location Map).

Riverside is one of the most diverse counties in California. It includes well-established urban, suburban and rural communities. It has an extensive array of agricultural lands, lands devoted to mineral extraction and recreational areas. There are rugged mountains, flat valley areas, open desert and expansive natural open spaces. The western portion of the county contains most of the county's non-desert areas, as well as most of its urbanized areas. To the east is the urbanizing hub of the Coachella Valley. Beyond Coachella is the northern half of the massive Salton Sea. Eastern Riverside County, which lies east of the crest of the San Jacinto Mountains, contains almost all the county's desert regions. Elevations in eastern Riverside County range from about 230 feet below mean sea level at the Salton Sea to 10,800 feet at the peak of Mount San Jacinto.

Of the roughly 4.6 million acres within Riverside County, approximately 10% falls within the 26 incorporated cities of the county, as shown below. The remaining portions include unincorporated county lands, as well as lands outside Riverside County's jurisdiction, such as military bases, National Forests, state lands and Indian Reservations. The western third of Riverside County is the most heavily populated region and contains roughly 85% of Riverside County's total population. The eastern two-thirds of the county contain the remaining 15%, with most of the population concentrated in the Coachella Valley region.

Temecula	
Wildomar	

* The City of Eastvale incorporated October 1, 2010, and the City of Jurupa Valley incorporated July 1, 2011. Since these both incorporated well *after* this EIR's NOP issuance date (April 13, 2009), Eastvale and Jurupa Valley are not addressed as separate cities within this EIR.

Source: Riverside County GIS, 2011.

Within Riverside County, major transportation corridors are associated with Interstate 10 and State Routes 91 and 60 for east-west connectivity. Interstates 15 and 215 provide the main north-south connectivity across Riverside County. Other regionally important highways include State Routes 62, 71, 74, 78, 79 and 111. Two major rail freight lines, Union Pacific and Burlington-Northern Santa Fe, cross Riverside County. Metrolink also provides commuter rail services connecting stops within Riverside County to San Bernardino County, as well as various locales in Orange and Los Angeles Counties. There are no waterways within Riverside County used for shipping.

Regionally, Ontario International Airport in San Bernardino County provides the largest number of passenger air flights within the Inland Empire region. Within Riverside County, commercial passenger service is also offered out of Palm Springs International Airport. This airport and March Air Reserve Base accommodate the largest aircraft within the region. Other public general aviation airports within Riverside County include Banning Municipal, Bermuda Dunes, Blythe, Corona Municipal, Chiriaco Summit, Flabob, French Valley, Hemet-Ryan, Jackie Cochran Regional, Palm Springs, Perris Valley and Riverside Municipal Airports.

Regionally, the County of Riverside is the fourth most populous county in California, behind only Los Angeles, San Diego and Orange Counties. Altogether, Riverside County represents roughly 5.5% of California's total population. Of the roughly 2.2 million people who reside in Riverside County, 72% (1.6 million) live within the incorporated cities. It is estimated that by 2035, Riverside County will be home to approximately 3.6 million people, who will occupy 1.3 million dwelling units (Riverside County Progress Report, 2009). This represents roughly a 65% increase over Riverside County's present population and housing stock.

3.3 Project Background

Starting in the late 1990s, the County of Riverside entered into a highly innovative and progressive planning effort known as the Riverside County Integrated Project (RCIP) to create a comprehensive vision for anticipating and addressing the competing needs of growth and development, transportation and regional circulation, environmental protection and resource conservation within Riverside County over the next 20 to 50 years. The result of this landmark effort was the October 2003 adoption of an entirely new General Plan that replaced the aging plan that had become a pastiche of disjointed elements, policies and maps. The RCIP effort also encompassed creation of the Community Environmental and Transportation Acceptability Program (CETAP) for planning and coordinating provision of regional transportation systems and development of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) to protect valued natural resources within the western third of Riverside County. (A second MSHCP for the Coachella Valley followed a few years later.)

To ensure that the policies and plans of the RCIP General Plan remain adequate and appropriate for the continuing implementation of the Riverside County Vision, the Administration Element of the General Plan included provisions for methodically revisiting the document every five years (later amended to every eight years). The year 2008 marked the first comprehensive review of the General Plan conducted by the Riverside County Planning Department.

Pursuant to Riverside County Ordinance No. 348, all proposed General Plan Amendments must be formally initiated by the Board of Supervisors. This process allows the Planning Commission and Board of Supervisors to provide feedback and determine if the proposed amendment is appropriate for the General Plan at this time. A preliminary project review is made by Planning Department staff and a recommendation from the Planning Director and from the Planning Commission is forwarded to the Board of Supervisors for an initiation decision. As part of this process for proposed GPA No. 960, a public workshop was conducted for the Riverside County Planning Commission on July 9, 2008, to discuss updates being considered for the General Plan. The project was formally initiated via a Planing Commission session on October 1, 2008, and at the Board of Supervisors on October 21, 2008.

To foster community input, a General Plan Advisory Committee (GPAC) was established by the Board of Supervisors to evaluate the various policy proposals and revisions being considered for inclusion in GPA No. 960. The thirteen GPAC members ultimately appointed by the Board of Supervisors represented a cross-section of Riverside County interests. The Committee included two members with extensive experience and knowledge of Riverside County Planning history, having participated in the creation of the original (2003) RCIP General Plan. The Committee also included representatives from the Building Industry Association, Nature Conservancy, Riverside County Planning Commission, an elected member from both the Western Riverside Council of Governments and the Coachella Valley Association of Governments, as well as a representative from each Riverside County Supervisorial District. The GPAC met every four to six weeks between October 2008 and October 2009 to evaluate Planning's staff-recommended proposals for GPA No. 960. Once the remaining draft sections of the General Plan were prepared, the GPAC reconvened on June 13, 2013 and August 1, 2013 to provide final comments. In addition, Planning Commission workshops were held on June 24 and August 19, 2009, to review and discuss various components of the project for which the GPAC had finalized recommendations. At these workshops, the Planning Commissioners provided feedback to further shape the revised General Plan.

Pursuant to CEQA, an Initial Study (Environmental Assessment No. 41788) was prepared for the project to define the parameters of the planned Program EIR. The Initial Study and a Notice of Preparation (NOP) were issued on April 13, 2009. By the close of the NOP comment period on May 12, 2009, the County of Riverside had received 29 comment letters. These comments are summarized in Section 2.3.A. Copies of all of the letters

received, along with the Initial Study and NOP documents, are included in Appendix EIR-1. During the NOP comment period, two public Scoping Sessions were held for interested agencies and the public. One was held April 27, 2009, at Riverside County's Planning Office in Palm Desert and a second was held May 4, 2009, in Riverside at the County of Riverside Administrative Center. A brief summary of the results of these sessions is also included in Section 2.3.

3.4 Project Objectives

The Riverside County General Plan is intended to be a blueprint for Riverside County's future. It describes the future growth and development within Riverside County over the long-term. As stated above, GPA No. 960 was designed to provide an update to the existing General Plan's policies, maps and implementing directions. Pursuant to the "Certainty System" established in the Administration Element of the General Plan, the following objectives are to be achieved by this periodic review and update. The General Plan was reviewed and the proposed changes in GPA No. 960 are designed to:

- Assess General Plan progress and issues related to its implementation.
- Perform necessary changes amongst Foundation Components within the General Plan.
- Develop policy, entitlement and technical amendments, as warranted.
- Extend planning projections another five to ten years into the future and adjust the General Plan to accommodate previously unanticipated needs.
- Enable the County of Riverside to reassess the Vision and Planning Principles of the General Plan and recommit to them.

Accordingly, GPA No. 960 also involved cataloging the amendments that have occurred since 2003 and examining the planned intensities and policies of the General Plan to determine if any revisions are needed. Figure 3.2 (Key Regions of Interest for GPA No. 960 (Western County)) and Figure 3.3 (Key Regions of Interest for GPA No. 960 (Eastern County)) show the general locations of land use-related proposals with spatial components under consideration as part of this project.

To achieve the update objectives established in the General Plan Administration Element, the General Plan was evaluated and proposals were developed by staff so that:

- The General Plan provides a clear and consistent set of directions for implementing the Riverside County Vision throughout the county over the next five to ten years and into the future (2035 and beyond). Where clarification or additional direction is needed, policies were added or modified. Where no longer relevant or appropriate, policies were deleted or revised.
- The General Plan's Elements, Area Plans and policies continue to provide clear, consistent direction for implementing Riverside County's Vision. A thorough evaluation was conducted to determine that the land use direction and planned intensities in these areas remain appropriate for their given locations. Mapping items found to be inconsistent or inappropriate were corrected.

- Policy Areas, Study Areas and Overlays throughout Riverside County continue to ensure coordinated development occurs at appropriate intensities in the manner envisioned in the General Plan. All such policy areas throughout Riverside County were evaluated towards this end to ensure their continued utility.

- Resource maps and other data-based information in the General Plan accurately reflect current data. Towards this end, these maps and other data-based information in the General Plan were examined and updated, as needed. Similarly, the General Plan policies and directives related to these resource maps were also revised where warranted by the updates.

- The references and discussions in the General Plan reflect and address the current statutes, regulations and policies of the County of Riverside and applicable outside agencies. Updates were made as needed to ensure this.

3.5 Project Components

This Program EIR addresses the potential environmental effects associated with implementation of proposed GPA No. 960. This amendment is designed to ensure that the County of Riverside maintains a focused and balanced pattern of growth that accommodates the demand for housing, employment opportunities and public facilities and services, while minimizing the potential adverse impacts that may result from increased urban development.

GPA No. 960 encompasses the proposals listed below. These proposals serve to address areas of the General Plan where changes are needed for a variety of reasons: to adjust to current County of Riverside conditions; to adhere to new laws passed or changed since the last update; to provide additional guidance for the planned level of intensity; to better coordinate where, and under what circumstances, intensity shall be accommodated; and, to ensure that any growth occurring in Riverside County is balanced and coordinated with appropriate public services, infrastructure and other basic necessities for a healthy and livable community.

As a result of the review process under GPA No. 960, a coordinated examination was made of all of the Elements and Area Plans of the General Plan to ensure their overall usefulness as the blueprint for Riverside County's growth is maintained. The minor technical changes include revisions to reflect newly incorporated cities and correcting general format issues to ensure flow and consistency. The discussion below describes the major changes identified and developed as a result of the review process.

The purpose of this project was to evaluate the Riverside County General Plan as a whole, making changes where found necessary. After staff conducted the Scoping Sessions, some proposals identified for review in GPA No. 960 at the Initial Study/NOP phase were subsequently found either to be premature for revision or simply not necessary for change. As a result, the scope of the proposed GPA No. 960 project has been narrowed as an outcome of the NOP process, as is permitted by Section 15083 of the State CEQA Guidelines.

The proposals that were identified for review in the Initial Study/NOP for this project, but were eliminated as part of the NOP process are outlined under Section 3.5.8.

A. Land Use Element Changes

The Land Use Element of the General Plan addresses the policies and programs for land use and development that apply countywide. All of the Land Use Element and general land use policy or designation changes proposed as part of GPA No. 960 are discussed here. The specific effects of these land use changes are assessed and discussed in further detail in Section 4.2 (Land Use).

In some cases, staff's review of the RCIP General Plan under GPA No. 960 yielded land use changes to policies and maps for specific Area Plans. In such cases, a generalized discussion is provided under Section 3.5.1.a. In other cases, the general review under GPA No. 960 yielded parcel-specific changes in land use designations. For those cases, a generalized discussion is provided under Section 3.5.1.b. The following changes to the General Plan Land Use Element are proposed in GPA No. 960:

1. Incidental Rural Commercial Policies

As described in the Land Use Element (for example, see Table LU-3), the existing General Plan only allows commercial activities to occur within the Community Development Foundation. While designed to prevent urban development in rural areas, it was found that such a limitation also prevented the development of neighborhood-serving incidental commercial uses and basic services in remote rural areas of Riverside County. Thus, policies are proposed in GPA No. 960 to allow small-scale commercial uses within the Rural and Rural Community Foundation Components. Proposed Policies LU 21.7 and 22.7 outline the manner in which rural-commercial land uses shall be permitted within these two Foundation Components and the specific conditions which apply to ensure that such uses are developed appropriately.

2. Sphere of Influence Policy

The General Plan Certainty System provides a great level of confidence in the future development patterns as Riverside County grows. However, because of the five-year review cycle initially associated with the Foundation Components (it has since changed to eight), it was discovered that such restrictions were limiting Riverside County's ability to appropriately plan and develop necessary infrastructure within the city sphere of influence areas. Thus, policies are proposed in GPA No. 960 to allow consideration of a quarterly General Plan Amendment from the Rural Community Foundation if the property is located within an established city sphere of influence area. Proposed Policy LU 22.8 and Administration Element-Required and Optional Findings 3.i were developed to provide the flexibility necessary to allow coordinated development and infrastructure provision within the city sphere of influence areas.

3. Rural Village Overlays and Study Areas

An examination was made of Riverside County's existing policies for rural areas that are designated for potential urbanization over time. Such areas were addressed in the existing General Plan via individual "Rural Village" overlays or study areas applied at the Area Plan level. As part of this project, both countywide and area-specific Rural Village policies and plans were evaluated to determine if they remain appropriate for future intensification and if they provide the necessary implementation guidance. The General Plan policy changes in GPA No. 960 that apply to all of Riverside County's Rural Village Overlays and Study Areas are described in proposed Policies LU 34.1 through 34.5. Changes proposed for specific Rural Villages are described under the applicable Area Plans, below.

4. Airport Land Use Compatibility Plan Consistency Changes

Since the adoption of the RCIP General Plan in 2003, the Riverside County Airport Land Use Commission (ALUC) has adopted revised Airport Land Use Compatibility Plans for various airports that affect Riverside County to address noise and safety-related concerns with airport operations. As such, the existing General Plan policies and land use designations within these Airport Influence Areas were examined to ensure they are consistent with, and appropriate for, the areas' air operations. As a result, various map, policy and parcel-specific land use changes were identified to establish consistency with some of these newly adopted plans. Due to issues beyond the scope of this EIR, the existing General Plan still has land use consistency issues within the Airport Influence Areas for the Jacqueline Cochran Regional Airport (formerly the Desert Resorts Regional Airport), French Valley Airport and Bermuda Dunes Airport. Land use changes included in GPA No. 960, however, ensure consistency for the Riverside Municipal, Flabob and Blythe Airports. See Section 4.13 for further details.

In addition to proposed updates to the Land Use Element airport policies (LU 15.1 through 15.9) and General Plan Table LU-3 (Relationship of ALUC Compatibility Plans to County Area Plans), Table 3-B (Summary of Airport Land Use Consistency Changes), below, summarizes Area Plan changes proposed in GPA No. 960 to establish consistency with the Airport Land Use Compatibility Plans. Corresponding changes under "mobile noise" in the General Plan Noise Element and under "aviation systems" in the Circulation Element were also revised to reflect these same airport-related changes.

Table 3.0-B: Summary of Airport Land Use Consistency Changes

Airport	Area Plan	Text Changes	Map Changes
Banning Municipal Airport	The Pass (PAP)	Update text, policies PAP 1.1-1.2 and Table PAP-4 for the Banning Municipal Airport Influence Area	Update Figure PAP- 4 (Policy Areas) and Figure PAP-5 (Banning Municipal Airport Influence Area [AIA]) to reflect current Banning AIA.
Bermuda Dunes Airport*	Western Coachella Valley (WCVAP)	Update text, policy WCVAP 5.1 & Table WCVAP-4 for Bermuda Dunes Airport Influence Area	Update Figure WCVAP-4 (Policy Areas) and Figure WCVAP-5 (Bermuda Dunes Airport Influence Area) to reflect current AIA.
Blythe Airport	Palo Verde Valley (PVVAP)	Update text, policy PVVAP 3.1 and Table PVVAP-4 for the Blythe Airport Influence Area	Update Fig. PVVAP-3 (Land Use Plan) to reflect parcel-specific land use changes; update LUDs in Fig. PVVAP-4 (Policy Areas) to reflect 2004 boundary for Blythe AIA; and, update Fig. PVVAP-5 (Blythe Airport Influence Area) to reflect updated airport compatibility zones.
Chino Airport	Eastvale (EAP)	Update text, policies 2.1-2.4, 3.1 and Table EAP-4 to reflect Chino Airport Influence Area	Update Figure EAP-5 (Chino Airport Influence Area) to reflect current Chino AIA boundaries.
Chiriaco Summit Airport	Eastern Coachella Valley (ECVAP)	Update text, policies ECVAP 3.1-3.2 and Table ECVAP-5 to reflect Chiriaco Airport Influence Area	Update Figure ECVAP-4 (Policy Areas) and Fig. ECVAP-5 (Chiriaco Summit Airport Influence Area) to reflect current Chiriaco Summit AIA.
Corona Municipal Airport	Temescal Canyon (TCAP)	Update text, policy TCAP 7.1 and Table TCAP-4 for Corona Municipal Airport Influence Area	Update Figure TCAP-4 (Policy Areas) and Figure TCAP-5 (Corona Municipal Airport Influence Area) to reflect current Corona Municipal AIA.
Desert Center Airport	Desert Center (DCAP)	Delete Desert Center Airport Influence Area section and Table DCAP-4 (Land Use Compatibility Guidelines) – no longer public.	Update Figure DCAP-4 (Policy Areas) to remove AIA and delete Figure DCAP-5 (Desert Center Airport Influence Policy Area) to reflect airport no longer being public.
Flabob Airport	Jurupa (JURAP)	Update text, policies JURAP 8.1-8.3 and Table JURAP-4 for the Flabob Airport Influence Area	Update Fig. JURAP-3 (Land Use Plan) to reflect parcel-specific LUD changes; Fig. JURAP-4 (Policy Areas) and Fig. JURAP-5 (Flabob Airport Influence Area) per current Flabob AIA bounds.
French Valley Airport*	Southwest (SWAP)	Update text, policy SWAP 11.1 and Table SWAP-4 for French Valley Airport Influence Area	Update Figure SWAP-4 (Policy Areas) and Figure SWAP-5 (French Valley Airport Influence Area) to reflect current French Valley AIA.

Airport	Area Plan	Text Changes	Map Changes
Hemet-Ryan Airport	Harvest Valley/ Winchester (HVWAP) and San Jacinto Valley (SJVAP)	Update text in HVWAP and SJVAP; policies HVWAP 1.1 and SJVAP 5.1; & Tables HVWAP-4 & SJVAP-4 to reflect the current Hemet-Ryan Airport AIA	Update Figure 4 (Policy Areas) and Figure 5 (Hemet-Ryan Airport Influence Area) in both HVWAP and SJVAP to reflect the current Hemet-Ryan Airport AIA boundaries.
Jacqueline Cochran Regional Airport*	Eastern Coachella Valley (ECVAP)	Update text, policy ECVAP 3.1 and Table ECVAP-4 for Jackie Cochran Regional Airport Influence Area	Update Figure ECVAP-4 (Policy Areas) and Figure ECVAP-5 (Jacqueline Cochran Regional Airport Influence Area) to reflect current AIA.
March Air Reserve Base (MARB)	HVWAP, Highgrove (HAP), Lake Mathews/ Woodcrest (LMWAP), Mead Vlly (MVAP), Lakeview/Nuevo (LNAP) and Reche Canyon/ Badlands (RCBAP)	Update text & policies re MARB for HVWAP (2.1), HAP (12.1), LMWAP (4.1), MVAP (2.1), LNAP (3.1) & RCBAP (1.1); update MARB Airport Land Use Compatibility Criteria in Tables HVWAP-5, HAP-4, LMWAP-3, LNAP-3, MVAP-3, and RCBAP-3	Update Figure 4 (Policy Areas) and Figure 5 (March Air Reserve Base Airport Influence Area) for Area Plans LMWAP, MVAP, LNAP & RCBAP, and Figure HVWAP-4 (Policy Areas) and Figure HVWAP-6 (March Air Reserve Base Influence Area), to reflect current boundaries and planning information for MARB.
Riverside Municipal Airport	Jurupa (JURAP)	Update text, policy JURAP 9.1 and Table JURPA-5 for Riverside Municipal Airport Influence Area	Update Fig. JURAP-3 (Land Use Plan) per parcel-specific LUD changes, Fig. JURPA-4 (Policy Areas) and Fig. JURAP-5 (Riverside Municipal Airport Influence Area) to reflect current AIA.
Skylark Airport	Elsinore (ELAP)	Remove Skylark Airport Influence Area text, policy ELAP 3.1 and Table ELAP-4	Update Figure ELAP-4 (Policy Areas) and delete Fig. ELAP-5 (Skylark Airport Influence Policy Area) to reflect Skylark Airport no longer public.

* Notwithstanding the changes proposed under GPA No. 960, the existing General Plan's land use designations may not be consistent with this airport's Airport Land Use Compatibility Plan.

Source: Riverside County Planning Dept., Project Application Materials, 2011.

5. Day Care Facilities

GPA No. 883, adopted in June 2009, amended the Vision and Land Use Element of the General Plan to include policies to encourage provision of child care facilities. GPA No. 960 includes changes to expand these policies to address care for all community members needing day care services (seniors, disabled adults, etc.). Furthermore, it was determined that a number of the specific policies for assessing the need for and location of child care facilities was better suited to Riverside County Planning Department Standard Operating Procedures (SOP) for use during project review. To reduce redundancies, GPA No. 960 also proposes to condense and eliminate certain day care policies in the General Plan and instead include various new implementation action items in proposed General Plan Appendix K-1 to further develop the day care SOP.

6. Open-Space Land Use Designations

For the purpose of preserving open space dedicated as a result of development, GPA No. 960 proposes Policy LU 23.1 to allow changes of land into Open Space Foundation Component as an entitlement/policy amendment, to be processed as defined in Section 2.4 of Ordinance No. 348. Thus, the policy would allow lands dedicated for Open Space by private land use entitlement or acquired by conservation agencies or other agencies to amend these lands' LUDs to conserved open space (OS-CH) under a quarterly GPA for the purpose of retaining lands as open space.

7. Chocolate Mountain Aerial Gunnery Range

A portion of the Chocolate Mountain Aerial Gunnery Range (CMAGR) is located in Riverside County. The CMAGR provides support training that is essential to the readiness of the nation's Marine Corps and Naval Air

Forces. Land use compatibility is essential for operation of the CMAGR while protecting the safety of surrounding communities. GPA No. 960 proposes Land Use Element Policy LU 36.2, as well as Eastern Coachella Valley Area Plan Policy ECVAP 11.1 and Noise Element Policy N 8.1, to address land use compatibility.

B. Area Plan Land Use Changes

A number of regional issues were examined at the local (Area Plan) level of the General Plan to determine if any revisions were needed. As a result, GPA No. 960 includes the following proposed changes:

1. Eastern Coachella Valley Area Plan

Chiriaco Summit: The existing Chiriaco Summit Rural Village Overlay (RVO) covers a small community of about 70 residents located along Interstate 10 about 30 miles east of Indio. The RVO spans roughly 660 acres. During review of this RVO, it was determined that discussion of this community's land uses was already provided in the existing Planned Communities Policy Area. Therefore, GPA No. 960 proposes to correct this discrepancy by leaving the policy area's land use discussion, while removing the Chiriaco Summit Rural Village Overlay from the map. Proposed policy ECVAP 2.2 and the update to Figure ECVAP-3 (Land Use Plan) would resolve this discrepancy.

2. Elsinore Area Plan

El Cariso Village: As part of GPA No. 960, several changes are proposed for the Elsinore Area Plan (ELAP). The ELAP's existing El Cariso Village RVO Study Area encompasses approximately 210 acres along Ortega Highway (State Highway 74) and is surrounded by the rugged Santa Ana Mountains. Following the adoption of the 2003 RCIP General Plan, the intent of this study area was to initiate a focused analysis (i.e., review of the existing land uses, lot sizes, topography and existing infrastructure) to determine appropriateness of this Study Area for possible land use intensities higher than the underlying existing LUDs. As part of the General Plan update and review process, such focused analysis was conducted and it was determined that due to limited access and infrastructure capacity, a Rural Village Overlay was inappropriate for El Cariso Village. Therefore, GPA No. 960 proposes to eliminate the Study Area and allow this community to continue to grow per its underlying LUDs as depicted on the existing Area Plan map (Figure ELAP-3). The deletion of existing Policy ELAP 6.2 pursuant to adopted GPA No. 1075 and subsequent updates to Figure ELAP-3 (Land Use Plan) and Figure ELAP-4 (Overlays and Policy Areas) proposed by GPA No. 960 would eliminate this overlay from the General Plan.

Meadowbrook: A Rural Village Overlay Study Area is also identified for the Meadowbrook community, which encompasses approximately 766 acres along Highway 74 and includes existing commercial and light industrial uses. The intent of this study area was to initiate a focused analysis to determine appropriateness of this study area and possible land use intensities above those of the underlying LUDs. As part of the General Plan update process, this focused analysis was conducted and it was determined that this community is surrounded by incorporated cities and has the infrastructure capacity to accommodate additional growth. As a result, GPA No. 960 proposes to revise the Meadowbrook Rural Village Study Area and map to create a full Land Use Overlay covering roughly 626 acres. Proposed Land Use Overlay Policies ELAP 5.1 and 5.2, new Figure ELAP-5 (Meadowbrook Rural Village Land Use Overlay) and updated Figure ELAP-3 (Land Use Plan) and Figure ELAP-4 (Overlays and Policy Areas) would provide an alternative land use development scenario for this area which would allow higher intensity uses than the underlying LUDs. These revisions would allow for better coordination and implementation of appropriate land use intensities in the Meadowbrook area.

Lakeland Village: The existing 234-acre Lake Elsinore Environs Policy Area was reviewed and revised to establish updated land use intensities to reflect revised flood mapping for Lake Elsinore. The land use changes proposed in GPA No. 960 apply to the unincorporated Riverside County territory along the southern edge of Lake Elsinore and bordered by the City of Lake Elsinore on both the east and west. The proposed changes encompass roughly 303 acres over 612 parcels within the Lakeland Village area. Because of the 100-year flood hazard zone, these properties have split designations; that is, two LUDs mapped on a single parcel. Proposed changes to these parcels modify their LUDs, identify parcels appropriate for commercial-retail, residential or open space designations and minimize the confusion caused by split designations. The proposed Lake Elsinore Environs Policies ELAP 6.1 and 6.2, plus update to Figure ELAP-3 (Land Use Plan) would encourage clustering and consolidated development as well as call for a development study to examine preserving the historic character of Lakeland Village.

3. Lakeview / Nuevo Area Plan

The Lakeview/Nuevo Area Plan (LNAP) of the General Plan has experienced tremendous development pressure over the last five years due to its central location in western Riverside County. The 2003 Riverside County General Plan LNAP included a Community Development Overlay along the Ramona Expressway in response to the growth occurring in this region. As part of GPA No. 960, General Plan land use designations and policies for this area were evaluated to determine if any changes were necessary. Accordingly, the following additions are proposed.

Northeast Business Park: Development patterns affecting agricultural and dairy lands north of the Ramona Expressway were examined to determine what level of intensification over time, if any, should be accommodated in the General Plan for landowners wishing to transition from the current predominantly agricultural uses to more urban uses. As a result, the nearly 260-acre Northeast Business Park Overlay is proposed in GPA No. 960 to ensure that adequate employment opportunities are available for the future residents of this area. The proposed overlay policies LNAP 5.1 through 5.3, as well as updates to Figure LNAP-3 (Land Use Plan) and Figure ELAP-4 (Overlays and Policy Areas), would provide an alternative land use development scenario for this area.

~~**Lakeview Mountains Policy Area:** Development patterns within the LNAP were evaluated and it was determined that an opportunity existed to guide future growth in such a way that would ensure cohesive development practices, preserve existing state-sanctioned hunting activities and provide for adequate buffers to safeguard wildlife values of the San Jacinto Wildlife Area to the north. To that end, GPA No. 960 includes the Lakeview Mountains Policy Area which would require that any master plan community incorporate the principals of "new urbanisim" which would facilitate internal transit, encourage pedestrian mobility through an interconnected trails network and provide for a transition from existing rural communities to proposed urban uses anticipated in the 2003 General Plan adoption of the LNAP Community Development Overlay. The new policy area would apply to approximately 350 acres of land straddling the Ramona Expressway and does not propose to change existing land use designations. The proposed Lakeview Mountains Policy Area is captured in LNAP 6.1 through 6.11, as well as updates to Figure ELAP-4 (Overlays and Policy Areas).~~

4. Mead Valley Area Plan

Good Hope: The existing Mead Valley Area Plan (MVAP) includes a Rural Village Overlay Study Area for the Good Hope Community. This study area encompasses approximately 265 acres located along State Highway 74 and includes existing commercial and light industrial uses. The "study area" designation indicated that following the 2003 adoption of the RCIP General Plan, a focused analysis would be needed to determine the area's appropriateness for possible land use intensities higher than the underlying land use designations. As part of the

General Plan update, such a focused analysis was conducted. It was determined that, since this community is surrounded by incorporated cities and has infrastructure capacity to accommodate additional growth, additional urbanization of the area would be appropriate in the future. Thus, GPA No. 960 proposes to revise the existing Good Hope Rural Village Study Area and map to provide a 217-acre Land Use Overlay. The proposed Land Use Overlay adds Policies MVAP 3.1 through 3.4 and Figure MVAP-6 (Good Hope Rural Village Land Use Overlay), as well as updates to Figure MVAP-3 (Land Use Plan) and Figure MVAP-4 (Overlays and Policy Areas) to provide an alternative land use development scenario for this area that would allow higher intensity uses than those of the underlying LUDs. This revision would allow for better coordination and implementation of an appropriate level of future land use intensities in the Good Hope community.

5. San Jacinto Valley Area Plan

Agriculture/Potential Development Special Study Area: The existing San Jacinto Valley Area Plan (SJVAP) includes an Agriculture/Potential Development Special Study Area to accommodate the conflicting visions of local residents and landowners for the future of this historically agricultural area. Following the 2003 adoption of the RCIP General Plan, the study area was to be subject to focused analysis to determine appropriate future land uses for the area. As part of the General Plan update, this focused study was conducted and it was determined that the study area's 7,664 acres should remain under the Agriculture Foundation Component and land use designation. Thus, GPA No. 960 proposes to eliminate the Agriculture/Potential Development Special Study Area and leave this region to remain agricultural. The proposed deletion of existing Policy SJVAP 6.1 and update of Figure SJVAP-4 (Overlays and Policy Areas) would eliminate this study area from the General Plan.

6. Riverside Extended Mountain Area Plan (RMEAP)

Aguanga: As part of GPA No. 960, several changes are proposed for the Riverside Extended Mountain Area Plan (REMAP). The Aguanga Rural Village Overlay Study Area occurs in REMAP and encompasses approximately 6,370 acres around the intersection of State Highways 79 and 371. Again, as part of the General Plan update, a focused analysis of the study area was conducted and it was determined that due to limited access and infrastructure capacity, intensification of the area via Rural Village Overlay was inappropriate for the Aguanga community. Thus, GPA No. 960 proposes to eliminate this study area. It would instead continue to grow according to the underlying LUDs depicted on the REMAP Area Plan map (Figure REMAP-3). The deletion of existing Policy REMAP 2.1 pursuant to adopted GPA No. 1075 and subsequent updates to Figure REMAP-3 (Land Use) and Figure REMAP-4 (Overlays and Policy Areas) proposed by GPA No. 960 would eliminate the overlay from the General Plan.

Anza Valley: Also in the southwestern portion of unincorporated Riverside County, the existing Anza Rural Village Overlay Study Area, encompassing roughly 1,470 acres along State Highway 371, was similarly examined to determine if it continues to remain appropriate for potential intensification. The Anza Valley Municipal Advisory Committee (MAC) had also developed a "Goals and Vision" statement outlining the desired future for this community. As part of the General Plan update, a focused analysis was conducted of the Anza Rural Village and the MAC's Goals and Vision. It was determined that due to limited infrastructure capacity, particularly lack of assured water supplies, a Rural Village Land Use Overlay was inappropriate for the Anza community. Instead, a policy area was proposed over the entire 74,500-acre region to promote and preserve the rural character of this community. Accordingly, GPA No. 960 proposes to eliminate the Anza Rural Village Study Area and instead includes a new Policy Area to dictate the urban design and character of this region. Deletion of existing Policy REMAP 2.1 pursuant to adopted GPA No. 1075 along with the proposed addition of new Policies REMAP 1.1 through 1.3 and updates to Figure REMAP-3 and Figure REMAP-4 would serve to convert the previously adopted Anza Rural Village Overlay Study Area into the proposed Anza Valley Policy Area.

7. Western Coachella Valley Area Plan

Sky Valley: Within this Area Plan, the existing roughly 100-acre Sky Valley Rural Village Overlay was examined to determine if it continues to plan for appropriate intensification for this community. Due to the very limited allowance of additional land use densities provided under this particular Rural Village Overlay, it was determined that no change was necessary for this Rural Village. Thus, although originally scheduled for updating, GPA No. 960 does not include any changes to the Sky Valley Rural Village Overlay.

C. Parcel-Specific Land Use Changes

The following GPA No. 960 items address revisions to General Plan land use designations (LUDs) necessary for specific locations in the categories outlined below. For a summary of all of the LUDs encompassed by the Riverside County General Plan and their relationship to the General Plan's Foundation Components (which serve to limit the pace at which urbanization can occur via the "Certainty System"), see Table 3-C (General Plan Land Use Designations and Foundation Components), below.

1. Conserved Land Mapping Changes

Since the adoption of the RCIP General Plan in 2003, lands have been acquired for permanent conservation of habitat under the implementation of two MSHCPs. As such, the General Plan land use designations for these acquired lands need to be updated to reflect current conditions. Although expected to have a net beneficial effect on environmental impacts throughout Riverside County, these land use changes are included within GPA No. 960 and this EIR because they do represent specific land use entitlement changes. In total, approximately 14,887 acres are being designated as Open Space – Conservation Habitat (OS-CH) as part of GPA No. 960. See Table 3-D (Lands Proposed for Open Space – Conservation Habitat Designation), below, for a summary of the LUDs changing as a result of this proposal.

2. Criteria-Based Parcel-Specific Land Use Changes

Since the 2003 adoption of the RCIP General Plan, a number of systematic mapping errors and inconsistencies were identified in how land use designations were applied. Such changes have been categorized according to eight basic criteria, as outlined below. It should be noted that these categories also include parcels previously included as part of adopted (but subsequently rescinded) GPA No. 716. The types of land use changes resulting from these systematic revisions are summarized here. The specific changes to land use designation occurring within a given local area are reflected in greater detail in Table 3.0-E, as outlined below. Land Use tables at the Area Plan level are also provided in Appendix EIR-2 of this document.

Criteria 1 - Technical Mapping Errors, Including Rural-Mountainous Designation Changes: This category addresses parcels that were erroneously designated as Rural Mountainous (RM), but do not meet the steep slope requirements. It also includes mechanical mapping errors, such as mapped land use designation colors not following parcel lines. This category affects a total of 78 acres of Riverside County.

Criteria 2 - Open Space-Conservation Habitat Designation Changes: This category addresses privately owned lands that were erroneously designated as "Open Space – Conservation Habitat," (OS-CH), which is normally used to designate publicly held lands being conserved for their habitat value. This category affects a total of 3,261 acres of Riverside County.

Table 3.0-C: General Plan Land Use Designations and Foundation Components

Foundation Component	Land Use Designation (LUD)	Building Intensity Range (du/ac or FAR)[1,2]	Selected Notes[3, 4]
AGRICULTURE (AG)	Agriculture (AG)	10 ac min.	One single-family residence allowed per 10 acres, except as otherwise specified.
RURAL (RUR)	Rural Residential (RR)	5 ac min.	Allows limited animal-keeping and agricultural, recreational and other uses.
	Rural Mountainous (RM)	10 ac min.	Also allows compatible resource development (including mining with SMP).
	Rural Desert (RD)	10 ac min.	Also allows renewable energy & utilities.
RURAL COMMUNITY (RC)	Estate Density Resi. (RC-EDR)	2 ac min.	Single-family detached residences. Limited agriculture, intensive equestrian and animal-keeping uses expected and encouraged.
	Very Low Density Resi. (RC-VLDR)	1 ac min.	
	Low Density Residential (RC-LDR)	0.5 ac min.	
COMMUNITY DEVELOPMENT (CD)	Estate Density Residential (EDR)	2 ac min.	Single-family detached residences. Limited agriculture and animal-keeping permitted, however, intensive animal-keeping discouraged.
	Very Low Density Resi. (VLDR)	1 ac min.	
	Low Density Residential (LDR)	0.5 ac min.	
	Medium Density Residential (MDR)	2 – 5 du/ac	Single-family attached and detached residences. Lot sizes range from 5,500 to 20,000 square feet, typical 7,200-sq. ft. lots allowed.
	Medium-High Density Residential (MHDR)	5 – 8 du/ac	Single-family attached and detached. Lot sizes range from 4,000 to 6,500 sq. feet.
	High Density Residential (HDR)	8 – 14 du/ac	Single-family attached and detached, including townhouses and patio homes.
	Very High Density Residential (VHDR)	14 – 20 du/ac	Single-family attached residences and multi-family dwellings.
	Highest Density Residential (HHDR)	20+ du/ac	Multi-family dwellings, including apartments and condos. 3-plus stories allowed.
	Commercial Retail (CR)	0.20 – 0.35 FAR	Local and regional retail uses. CR designated exceeds CR needed to serve population.[5]
	Commercial Tourist (CT)	0.20 – 0.35 FAR	Includes hotel, golf course, rec & amusement.
	Commercial Office (CO)	0.35 – 1.0 FAR	Includes financial, legal, insurance, etc.
	Light Industrial (LI)	0.25 – 0.60 FAR	E.g., warehouse/distribution, assembly, light manufacturing, repair facilities and supporting retail uses.
	Heavy Industrial (HI)	0.15 – 0.50 FAR	More intense industry generating significant effects, i.e., excessive noise, dust and other nuisances.
	Business Park (BP)	0.25 – 0.60 FAR	Employee-intensive uses, i.e. R&D, tech centers, corp. offices, "clean" industry & supporting retail.
	Public Facilities (PF)	≤ 0.60 FAR	Civic uses, such as Riverside County administrative buildings and schools.
	Community Center (CC)	5 – 40 du/ac 0.20 – 0.35 FAR	Includes combo of small-lot SFR, MFR, CR, office, BP & civic uses, transit facilities and rec open space in a planned development area. Including CCs in adopted Specific Plans.
	Mixed Use Planning Area (MUPA)	Varies	Applied to where a mix of uses is planned outside of Community Centers, where specific uses and ratios are not identified up front to provide flexibility.
OPEN SPACE (OS)	Conservation (OS-C)	N/A	Protection of open space for natural hazard avoidance, cultural preservation and natural and scenic resource preservation. Existing agri. permitted.
	Conservation Habitat (OS-CH)	N/A	Public and private lands conserved and managed in accordance with adopted MSHCPs or other conservation plans.
	Water (OS-W)	N/A	Includes bodies of water and natural or artificial drainage corridors. Mineral extraction allowed conditionally.

Foundation Component	Land Use Designation (LUD)	Building Intensity Range (du/ac or FAR)[1,2]	Selected Notes[3, 4]
OPEN SPACE (OS), *continued*	Recreation (OS-R)	N/A	Uses include parks, trails, athletic fields, golf courses and other such recreational uses.
	Rural (OS-RUR)	20 ac min.	One SFR allowed per 20 acres. Mineral extraction per Surface Mining Permit permitted in some cases.
	Mineral Resources (OS-M)	N/A	Mineral extraction and processing facilities; areas held in reserve for future mineral uses.

Footnotes:
1. FAR = Floor Area Ratio, the measurement of the amount of non-residential building square footage in relation to the size of the lot. DU/AC = Dwelling units per acre, the amount of residential units in a given area (acre).
2. The building intensity ranges are exclusive, e.g., the ranges are the minimum and maximum building intensities.
3. Clustering is encouraged in all residential designations. The allowable density of a particular land use designation (LUD) may be clustered in one portion of the site in smaller lots, as long as the ratio of dwelling units/area remains within the allowable density range associated with the designation. The rest of the site would then be preserved as open space or a use compatible with open space (e.g., agriculture, pasture or wildlife habitat). Within the Rural and Rural Community Foundations, as well as the Rural Designation of the Open Space Foundation, the allowable density may be clustered as long as no lot is smaller than 0.5 acre. However, for sites adjacent to Community Development Foundation areas, 10,000-square-foot minimum lots are allowed. The clustered areas would be a mix of 10,000-square-foot and 0.5-acre lots. In such cases, larger lots or open space would be required near the project boundary with Rural Community and/or Rural Foundation Component areas.
4. Selected notes roughly paraphrased from General Plan Table LU-3. See that table for specific standards and details.
5. Since the amount of land designated CR exceeds the amount anticipated to be necessary at build out, once CR becomes 40% built out in an Area Plan, additional studies will be required before additional CR will be permitted.

Source: Riverside County, RCIP General Plan, Table LU-3, 2008.

Criteria 3 - Public Facilities Designation Changes: This category addresses privately owned lands that were erroneously designated as "Public Facilities" (PF), which normally designates lands slated for public benefit uses, such as airports, sewage plants and other such infrastructure. This category affects a total of 192 acres of Riverside County.

Criteria 4 - Open Space-Conservation Designation Changes: This category addresses lands that were originally designated as "Open Space-Conservation" (OS-C), but have been determined to be unsuitable for such due to existing development, location or other constraints. This category affects a total of 28 acres of Riverside County.

Criteria 5 - Open Space-Recreation Designation Changes: This category addresses lands that were originally designated as "Open Space-Recreation" (OS-R), but have been determined to be inappropriate for such use. This category affects a total of 38 acres of Riverside County.

Criteria 6 - Appropriate Designation for Public Use Lands: This category addresses parcels in which public lands are designated for private development uses. Examples of this category include: correctly designating lands planned for public facilities (particularly around landfills) and open space uses. This category affects a total of 777 acres of Riverside County.

Table 3.0-D: Lands Proposed for Open Space - Conservation Habitat Designation

Foundation	LUDs of Lands Being Reassigned*	Acreage
RURAL COMMUNITY (RC)	RC-EDR	94.1
	RC sub-total	***94.1***
RURAL (RUR)	RR	8,986.2

	OS-RUR	5,963.6
	OS sub-total	***9,136.6***
Grand total of all acreages to OS-Conservation Habitat		**22,141.5 ac**

* LUD = "land use designations." See Table 3-C for LUD abbreviations and land use details.
Source: Riverside County Planning Dept., Project Application Materials, 2011.

Criteria 7 - Designations Appropriate for Existing Lot Sizes: This category applies land use designations that are more suitable to the existing lot sizes in certain areas of Riverside County. This category affects a total of 11 acres of Riverside County.

Criteria 8 - Other Land Use Changes, Including Those by Executive Direction: This category addresses land use designation changes that the Planning Director has identified over the last few years through the development review process and that do not fit into any of the other categories above. This includes preserving 782 acres of fish farming, aquaculture and related activities under the "Agriculture" (AG) land use designation. This category affects a total of 2,350 acres of Riverside County.

D. Circulation Element Changes

The existing Circulation Element (as well as the individual Area Plans) was examined to determine where changes were needed to ensure effective and efficient regional and local transportation systems to meet the traffic demands of both existing conditions and planned future intensities throughout Riverside County. As a result of this effort, the following changes are proposed to the Circulation Element as part of GPA No. 960:

1. Circulation Network Changes

The existing Countywide Planned Circulation System, as mapped in Figure C-1 of the General Plan (as well as detailed in the individual Area Plans) was examined to determine if regional and local transportation systems would be able to accommodate the traffic demands of the planned future intensities resulting upon General Plan build out, as well as those associated with proposed GPA No. 960 changes. As a result, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County. Updates were triggered by a number of factors: development occurring over the past five years, changes in local plans (such as city General Plans), changes in employment patterns and job centers and others. Also, the network and existing traffic patterns were studied and modeled extensively in the development of the new Countywide Transportation Model, RIVTAM, which was generally used to determine when and where roadway and intersection improvements are warranted on a case-by-case basis. The traffic study modeling and other data generated for this project are included in Appendix EIR-4.

Deletions to the existing Circulation Element are proposed due to factors such as: changes in incorporated areas, approved specific plans, findings of studies addressing specific areas that demonstrate that the roadway segment would not be needed, unavailability of right-of-way (ROW) and/or expectation of extreme difficulty in acquiring ROW and other constraints such as environmentally sensitive areas. Roadway re-alignments are proposed for purposes of avoiding steep grades, avoiding disruptions to adjacent communities, or taking advantage of available ROW. Changes in classification to either downgrade or upgrade roadways are proposed as a result of changes in

incorporated areas, in response to the findings of studies addressing specific areas and unavailability of ROW and/or expectation of extreme difficulty in acquiring additional ROW. Miscellaneous administrative changes are proposed for such matters as graphically marking the location of crossings of flood control channels, railroad grade separations, improving graphic representations, adding street names, etc. This miscellaneous category of changes is not expected to have any associated traffic impacts and therefore is not addressed further in this EIR.

As a result of the traffic modeling conducted for this GPA, it was also determined that revisions to a number of land use policies and/or designations were necessary to ensure the network's capacity and anticipated levels of service remain adequate. These land use-related changes are described either within the Land Use Element (where programmatic) or within the applicable Area Plan (where local).

2. Non-Motorized Transportation Plan Changes

Also for this project, the Countywide Non-Motorized Transportation Plan, as mapped in Figure C-7 of the General Plan (as well as detailed in the individual Area Plans) was examined for its adequacy in providing planning and coordination guidance for the provision of trails and other non-motorized transport needs within Riverside County. Where necessary, changes are proposed in GPA No. 960 to update standards for trail alignments, types, usage and functional classifications, as well as implementation policies for the development of trails.

GPA No. 960 also proposes to update the mapped locations of General Plan trails for all of Riverside County's Area Plans; eliminate or reclassify mapped trails that are no longer possible or practical to build due to environmental constraints; and identify opportunities for grade-separated trail crossings at over/underpasses, drainage culverts and along rivers for existing and planned freeways and other major roads, as well as floodways. In addition, Policies C 15.1 through C 18.3 were developed to provide the flexibility necessary to allow coordinated development and maintenance of non-motorized transportation system in Riverside County. The Countywide Non-Motorized Trail Network was mapped at the Area Plan level to allow customized solutions for local non-motorized networks. These proposed maps are included in the General Plan's Area Plans.

As of January 2011, pursuant to the California Complete Streets Act (AB 1358), Riverside County's update of the Circulation Element is required to plan for the development of multimodal transportation networks. In this regard, the existing General Plan already provides numerous policies to meet the needs of all "users of streets, roads and highways." Riverside County recognizes the benefits of a multimodal transportation network and encourages its establishment via the General Plan. As the Circulation Element provisions for the circulation system are implemented, the multimodal transportation network as characterized and intended by the Complete Streets Act will be realized. The changes proposed by GPA No. 960 would further enhance this effort.

E. Multipurpose Open Space Element Changes

The Multipurpose Open Space Element (MOSE) was examined to ensure that countywide policies addressing natural resources – their regulation, use and conservation – remain appropriate and adequate for current conditions and the planned future of Riverside County. Where appropriate, GPA No. 960 has proposed or revised policies to strengthen resource protection, energy conservation and infrastructure coordination. The various resource maps within the Element, as listed below, were also evaluated and updated, as necessary to reflect current information. Additional information on these specific updates is provided in the respective resource sections of the EIR.

Original MOSE Figures:

- Figure OS-1: Water Resources
- Figure OS-2: Agricultural Resources
- Figure OS-3: Parks, Forests and Recreation Areas
- Figure OS-4: Western Riverside County Vegetation
- Figure OS-5: Mineral Resource Areas
- Figure OS-6: Historical Resources
- Figure OS-7: Paleontological Sensitivity

Updated MOSE Figures:

- Figure OS-1: Rivers, Lakes, Reservoirs and Drainage Areas
- Figure OS-2: Agricultural Resources
- Figure OS-3: Parks, Forests and Recreation Areas
- Figure OS-3a: Forestry Resources Western County Parks, Forests and Recreational Areas
- Figure OS-3b: Forestry Resources Eastern County Parks, Forests and Recreational Areas
- Figure OS-4a: Western Riverside County Natural Communities Vegetation
- Figure OS-4b: Coachella Valley Natural Communities
- Figure OS-4c: Non-MSHCP Natural Communities
- Figure OS-5: Renewable Energy Resources
- Figure OS-6: Mineral Resource Zones
- Figure OS-7: Historical Resources
- Figure OS-8: Paleontological Sensitivity
- Former Figure OS-6: Relative Archaeological Sensitivity of Diverse Landscapes was deleted pursuant to adopted GPA No. 1083.

The following additional changes are proposed to the Multipurpose Open Space Element as part of GPA No. 960:

1. Water Conservation Policies

Riverside County's water supply is limited due to decreased state water supply as well as depletion of groundwater. Thus, policies regarding water supply, conveyance and conservation are revised and proposed in the Multipurpose Open Space Element as well as Land Use Element to reduce landscape water demand and to encourage the use of reclaimed water in the future developments. Updates to policies for water supply and conservation (Policies OS 1.3 through OS 1.4 and OS 2.1 through 2.5) and policies for water conservation and water-efficient landscaping resources (Policies LU 18.1 through 18.6) were developed for GPA No. 960 to encourage water-efficient practices as a proactive approach to addressing water-supply shortages in Riverside County.

2. Watershed and Watercourse Management Policies

In 2004, the Riverside County Board of Supervisors and the Riverside City Council appointed a joint County-City Arroyo-Watershed Advisory Committee to study the impacts of development and other human activities on the arroyos and watersheds that overlap the County of Riverside and the City of Riverside, and make recommendations for policies, technical tools such as mapping, and other measures that would be effective in reducing such impacts. The Advisory Committee presented its recommendations to the City Council and the Board of Supervisors on December 5, 2006. On June 5, 2007, the Board of Supervisors endorsed the recommendations, with some revisions, and directed that they be incorporated, as policies, into the General Plan.

Policies reflecting the Advisory Committee's recommendations are included in the Multipurpose Open Space, Land Use, Safety and Circulation Elements. Current standards and regulations for watersheds and watercourses call for sustaining watersheds at an acceptable level of quality, contributing to resource quality and maintaining groundwater supplies. These regulations were examined to ensure that County of Riverside policies and practices related to maintaining and preserving watersheds and watercourses remain adequate. Policies for project design (LU 4.1 u and v), land use compatibility (LU 7.6 through 7.9), open space preservation (LU 9.1 and 9.4), agricultural area plan designation (LU 18.8), water quality (OS 3.4 through 3.7), groundwater recharge (OS 4.5 through 4.7), floodplain and riparian area management (OS 5.3, 5.5 and 5.7), environmentally sensitive land (OS 18.3 and 18.4), code conformance and development regulations (S 1.3) and environmental consideration (C 20.4 and 20.5) are proposed in GPA No. 960 to provide efficient management of stormwater and urban runoff. A wide variety of site design policies are being proposed to improve permeability, water quality, water use efficiency and aesthetics according to the needs of a site or project vision.

F. Safety Element Changes

The Safety Element was examined to ensure that countywide policies addressing safety hazards, risks and preparedness remain appropriate and adequate for current conditions and the planned future of Riverside County. As a result, GPA No. 960 proposes new and revised policies to reduce hazard risks and improve safety, such as for updated geological, seismic and fire-hazard planning. The accompanying maps were similarly updated to reflect current information. Specific revisions include fire-hazard mapping and protection, 100-year flood zones and other hazard maps updated by the State of California and other agencies, as listed below. Safety Element policies for grading (S 1.3), fire hazards (S 5.1 through 5.8), long-range safety hazards (S 5.14 through 5.21) and updates to Safety Element figures (identified below) are also proposed as part of GPA No. 960.

- Figure S-18: Inventory of Highway Bridges
- Figure S-19: Inventory of Facilities Storing Hazardous Materials
- Figure S-20: Airport Locations
- Figure S-21: Major Highway Locations
- Figure S-22: Rail Locations

G. Air Quality Element Changes

The Air Quality Element was examined to determine if revisions or additions were needed to ensure adequate regulatory compliance and address emerging air quality issues. Where necessary, policies or programs were developed to address relevant air quality issues. Additionally, new information and policies related to California laws and policies related to greenhouse gas (GHG) emission reduction would also be incorporated into the chapter under GPA No. 960.

The revised Air Quality Element includes a new GHG emissions reduction strategy including GHG reduction targets based on a countywide carbon inventory prepared as part of GPA No. 960. From it, goals and policies were developed to achieve the reduction targets in coordination with the Climate Action Plan (CAP) that has also been developed for Riverside County (see Section J below).

The proposed revisions to the Air Quality Element include updates to the air quality standards in General Plan Table AQ-1, the addition of greenhouse gas reduction targets (Policies AQ 18.1 through 18.5), the establishment of greenhouse gas reduction objectives (AQ 19.1 through 29.4) and also policies establishing various CAP milestones (AQ 27.1 through 29.4). Additionally, GHG-related text was also added in other locations in the General Plan, in particular Chapter 2 (Vision), to reinforce Riverside County's position and commitment to improving air quality and combating greenhouse gases.

H. Administration Element Changes

The Administration Element of the General Plan was examined and updates are included in GPA No. 960 where needed to ensure its policies and programs continue to reflect current planning practices and provide a clear and concise set of directions for the implementation of the General Plan. In particular, it would permit amendment to an Open Space-Conservation land use designation as a technical amendment if flood maps are revised either by the Federal Emergency Management Agency (FEMA) or the Riverside County Flood Control and Water Conservation District. Additionally, a provision is included that requires land use conversions from the Rural Community to Community Development Foundation Component within the city sphere of influence area be consistent with the policies outlined in the Land Use Element of Chapter 3.

I. Updates to General Plan Appendices

Several of the technical appendices to the General Plan were updated, revised or reissued as necessary to ensure that the General Plan continues to reflect current conditions and growth forecasts for Riverside County. These appendices were developed as part of GPA No. 960 to ensure up-to-date data is provided to support the policy and program directives in the General Plan and to update planning, land use, socioeconomic, potential environmental constraints (such as ambient noise or air quality levels) and other projections and analyses.

Where a General Plan Technical Appendix is updated as a part of GPA No. 960, it is indicated with a "-1" label (as in "Appendix E-1," for example) to denote the newer version. Some General Plan appendices are unchanged: B, C, D, G, H, J and L. The General Plan appendices updated as part of GPA No. 960 are as follows:

- Appendix A-1: Glossary of Terms/Acronyms (updated terms and information, where needed)
- Appendix B-1: General Planning Principles
- Appendix E-1: Socioeconomic Build-out Assumptions and Methodology (updated planning, socioeconomic and demographic assumptions)
- Appendix F-1: Population and Employment Forecasts (updated demographic data and forecasts)
- Appendix I-1: Noise Element Data (updated ambient noise data and new traffic noise modeling, as developed for the noise study prepared for this EIR, see Appendix EIR-7)
- Appendix K-1: Implementation Program (updated as needed to reflect General Plan policy changes)

- Appendix L-1: Riverside County Airport Land Use Compatibility Plans

J. Climate Action Plan

In conjunction with GPA No. 960, Riverside County prepared a Climate Action Plan to ensure that Riverside County is consistent with the State of California's overall GHG reduction plans developed to implement AB 32, California's Global Warming Solutions Act of 2006. The CAP includes a program for enacting Implementation Measures to be used to ensure that future development within unincorporated Riverside County achieves Riverside County's greenhouse gas reduction goals. See EIR Section 4.7 (Greenhouse Gases) for more information.

K. Proposals Not Included in GPA No. 960

A number of proposals that were identified for potential review in the Initial Study/NOP for this EIR were subsequently eliminated from GPA No. 960 for various reasons. The following list identifies those elements that are no longer a part of GPA No. 960. In some cases, for example, where environmental issues were deemed negligible or where regulatory deadlines required earlier processing, the proposals were processed as separate General Plan Amendments. None of these items, however, were deemed to result in or contribute to any significant or incremental environmental impacts.

- Land Use Element – Fee Lands within Native American Tribal Jurisdiction Policies (adopted under GPA No. 1088)
- Housing Element Update (adopted under GPA No. 1097)
- Administration Element Update (adopted under GPA No. 1075)
- Healthy Communities Element (new Element; adopted under GPA No. 1096)
- Multipurpose Open Space Element – Cultural Resources Policies (adopted under GPA No. 1083)

3.6 Consultations and Discretionary Actions

The County of Riverside (represented by the Riverside County Planning Department) is the Lead Agency for CEQA review of GPA No. 960. CEQA defines the "Lead Agency" as the public agency with the principal responsibility for carrying out or approving a project. Thus, it is under the County of Riverside's authority that this General Plan Amendment and EIR have been prepared. The information presented in this EIR represents the review and analysis of the County of Riverside and reflects the independent judgment of the County of Riverside.

The contents of the General Plan Amendment, its Programmatic EIR and associated technical appendices may be used by a number of public agencies in connection with a variety of discretionary decisions. Such actions may include approval, initiation, funding or contribution to any policies, public facilities or other programs intended to implement the General Plan as updated by GPA No. 960. Such actions may also include the eventual processing of development-level land use proposals (e.g., specific plans), as well as project-level review and approval of land use maps, such as tract and parcel maps, plot plans, conditional use permits, public use permits and other

discretionary County of Riverside actions related to land use implementation. Changes to zoning or other ordinances, as well as the proposal of new ordinances, may also result.

Pursuant to PRC Section 21153, the County of Riverside as Lead Agency, has consulted with each responsible agency, trustee agency, any public agency that has jurisdiction by law with respect to the proposed project, any city or county that borders the County of Riverside and all cities within the County of Riverside.

A. Project Consultations

1. Tribal Consultations

Tribal consultation per California Government Code (CGC) Section 65352.3 (i.e., SB 18, the Traditional Tribal Places Law) requires the lead agency to provide meaningful consultation to tribal governments on proposed or amended general plans and specific plans, to aid in the protection of tribal traditional places and cultural resources through local land use planning.

California State's Native American Heritage Commission (NAHC) maintains a database of tribal governments recognized by the State of California and, when requested, provides lead agencies with contact information for appropriate tribal representatives. Of the fifteen tribal governments on the NAHC list for the proposed project, only five formally requested consultations within the 90 days response period (September 2009 through December 2009). A project overview presentation was given on February 23, 2010, to all interested tribal representatives. Individual tribal consultation occurred between March and August 2010.

During the initial individual consultation meetings, the project scope was reiterated and tribal representatives identified specific areas of the proposed project for further discussion. The requested sections were sent to each tribal group. Soon thereafter, a series of one to four consultation meetings were held with the individual groups. During these consultation meetings, Riverside County Planning Department staff provided specific policy updates and clarified the objectives and goals of each proposed component of GPA No. 960. Through this process, tribal representatives were able to express concerns with the proposed project in a confidential setting. Any requests for additional information were met.

Dependent upon the level of interest shown at this stage of consultation, in August 2010 letters were sent out to either conclude the consultation efforts and/or solicit summary of comments. As the project moved into the last stage of development, a letter to each tribal group, along with the draft General Plan, was sent to the tribal representatives between June and July of 2011 to update them on the status of GPA No. 960 and provide additional consultation opportunities, as well as identify other venues for comments.

As a result of the tribal consultations, several elements have been incorporated into GPA No. 960. These include recognition of tribal boundaries and an update to the Eastern Coachella Valley Area Plan to address tribal holdings and the Salton Sea. Cultural resource protection was also enhanced throughout the General Plan; though many of these issues were ultimately addressed in GPA No. 1083, as noted in the prior section.

2. Safety Element Consultations

Government Code Section 65302(g)(5) requires the County of Riverside to consult with the California Geological Survey and the State Office of Emergency Services prior to revision of the General Plan Safety Element to ensure the State of California's latest information and data are incorporated appropriately. Towards this end, Riverside

County Planning Department staff met with representatives from the Department of Conservation and the Office of Emergency Services. In a collaborative effort, the County of Riverside updated its fire hazard maps to reflect the most-recent State Responsibility Areas and Local Responsibility Areas. See General Plan Figure S-11. Corresponding fire-related policies were also updated.

3. Airport Land Use Commission (ALUC) Consultation

Public Utilities Code (PUC) Sections 21670-21679.5 call for counties and cities to ensure the orderly expansion of the airports located in, or affected by, their jurisdictions. This includes, in particular, the adoption of land use measures to minimize the public's exposure to excessive noise and safety hazards around public airports, as well as ensuring new incompatible uses are kept out of these areas. Accordingly, Riverside County's General Plan includes policies and maps intended to assure these protections.

For the ALUC consistency review of the General Plan, Riverside County Planning Department staff worked with ALUC staff to resolve planning issues within the General Plan's mapped "Airport Influence Areas." An initial presentation was made to ALUC on April 16, 2009, and a series of monthly technical meetings between ALUC and the Planning Department occurred through December 2009. An ALUC public workshop was held on March 11, 2010, and an additional technical meeting occurred on April 12, 2010. Meetings with the Second and Fourth Supervisorial District representatives were also held on May 5 and 25, 2010, specifically to discuss potential land use changes within the Airport Influence Areas within those Districts. Meetings with an ALUC subcommittee were held on December 10, 2009 and March 1, 2010. As a result of all of these meetings, a number of revisions were made to the General Plan in regards to airports and their respective Airport Influence Areas.

On July 10, 2014, ALUC reviewed the March 2014 edition of GPA No. 960 and found it consistent with all the applicable Airport Land Use Compatibility Plans provided that certain modifications were made including amendments to: Policy LU 6.1; a paragraph in the Circulation Element addressing Local Aviation Facilities; policies within the Mead Valley, Harvest Valley/Winchester and Reche Canyon/Badlands Area Plan to address compliance with the 1984 Riverside County Airport Land Use Plan; Appendix L-1 to include the 1984 Riverside County Airport Land Use Plan and the 1992 Hemet-Ryan Airport Comprehensive Land Use Plan. To complete the ALUC consistency review, modifications requested by the Commission are incorporated into the revised and recirculated GPA No. 960 document.

B. Discretionary Actions and Future Approvals

The following list specifies non-exhaustively and non-exclusively the approvals necessary for the project. The Riverside County Board of Supervisors will review GPA No. 960 and its EIR (No. 521, e.g., this document) and supporting documents to consider whether or not to take the following actions:

- Adoption of General Plan Amendment No. 960, encompassing updated texts and maps for the Riverside County General Plan, including its 19 Area Plans and its Appendices.
- Certification of Program Environmental Impact Report No. 521 prepared for GPA No. 960.
- Approval of EIR No. 521 Findings.
- Adoption of a Mitigation, Monitoring and Reporting Program in conjunction with EIR No. 521.

Subsequent to these actions, a number of future actions may be based (in whole or in part) upon the environmental evaluations undertaken as part of EIR No. 521 for the project. Subsequent development projects

may require review and approval by various Riverside County agencies or departments, including (but not limited to):

- Changes of zone, specific plans, tentative tract and parcel maps, conditional use permits, plot plans and other discretionary development approvals.

- Consistency analysis, review and approvals of activities subject to the Western Riverside County Multi-Species Habitat Conservation Plan or Coachella Valley Multi-Species Habitat Conservation Plan.

- A variety of county service and infrastructure providers are expected to use the Riverside County General Plan, as amended by GPA No. 960, as a long-range planning document for determining how to meet the specific needs served by the agency. For example, planning future service demands for landfills (Riverside County Waste Management Department), roads (Transportation Department), regional parks (Regional Parks and Open Space), detention facilities (Riverside County Sheriff's Department), among others, would need to identify and plan for the capacities needed to serve the County of Riverside's populace as it grows over the next 50 years.

Additionally, subsequent development projects may also require review and approval by various departments or agencies outside of the County of Riverside, including (but not limited to) those listed below. It should be noted that the following actions are associated with the future development of Riverside County as it builds out pursuant to the General Plan. That is, actions of the types listed here would occur whether or not the proposed project, GPA No. 960, was approved. And, as such, these actions are listed as general items and are not directly associated with GPA No. 960.

- Future development affecting a protected (threatened or endangered) species or its Critical Habitat occurring outside of areas covered by the two Multiple Species Habitat Conservation Plans or other HCPs within Riverside County, or for species or habitats not covered by such, would need an incidental take permit from the U.S. Fish and Wildlife Service issued pursuant to the federal Endangered Species Act.

- Future development affecting Waters of the U.S. or adjacent wetlands would need a fill permit from the U.S. Army Corps of Engineers issued pursuant to Section 404 of the federal Clean Water Act (CWA).

- Prior to obtaining a CWA Section 404 permit, a future use may also need to obtain water quality certification or waiver from the applicable Regional Water Quality Control Board pursuant to Section 401 of the federal Clean Water Act.

- Future development affecting native habitat within a streambed may need a Streambed/ Bank Alteration Agreement issued by the California Department of Fish and Wildlife pursuant to Section 1600 *et seq.* of the California Fish and Game Code.

- Future uses, such as industrial for example, may need air quality operating permits for boilers or other large combustion-based equipment from the Southern California Air Quality Management District or the Mojave Desert Air Quality Management District.

- Future uses within or altering a 100-year floodplain or other FEMA-mapped flood hazard area would need to obtain a Letter of Map Revision (LOMR), Conditional Letter of Map Revision (CLOMR) or Conditional Letter of Map Revision Based on Fill (CLOMR-F) that describes the effect that the proposed project or fill would have on the NFIP (National Flood Insurance Program) map.

- Future uses, such as industrial or medical, for example, may need hazardous material handling, use, storage and/or disposal permit(s) from the appropriate local, regional, state or federal agency. For example, a radioactive materials permit from the Nuclear Regulatory Commission or State Department of Toxic Substance Control.

Section 4.1

Environmental Assumptions and Methods

Section 4.1
Environmental Assumptions and Methods

4.1.1 Introduction

The Riverside County General Plan is intended to be a blueprint for Riverside County's future. It describes the future growth and development within the county over the long term. It acts as a constitution for public and private development, the foundation upon which County of Riverside authorities will make growth and land use-related decisions. The General Plan is meant to express the community's goals with respect to human-made and natural environments, and to set forth policies and implementation measures to achieve these goals for the welfare and betterment of those who live, work and do business in Riverside County. Accordingly, GPA No. 960 includes a variety of revisions and updates to the General Plan, proposed to ensure the General Plan remains an effective tool for planning and implementing Riverside County's future over time.

This Program EIR reviews the potential environmental effects of the proposed project, GPA No. 960, for each of the following areas:

- Agricultural and Forestry Resources
- Land Use
- Housing and Population
- Aesthetics and Visual Resources
- Air Quality
- Biological Resources
- Cultural and Paleo. Resources
- Energy Resources
- Flood and Dam Inundation Hazards
- Geology and Soils
- Greenhouse Gases and Climate Change
- Hazardous Materials and Safety
- Mineral Resources
- Noise
- Parks and Recreation
- Public Facilities
- Transportation and Traffic
- Water Resources

Section 4.0 of the EIR presents information on the existing setting, impacts, effectiveness of regulatory compliance, mitigation measures and level of significance after mitigation for each of the above environmental issues. Thresholds of significance are also listed for each issue and provide criteria for determining the

significance of any impacts associated with the proposed project. A discussion of the assumptions and methodology used to analyze the proposed project in this Program EIR, as well as those used to project the future scenarios against which impacts were analyzed, is provided below.

4.1.2 Assumptions and Methodology for Projections

A. Background

The environmental impacts that would result from future development accommodated by the proposed project would not occur at a single time, nor would they occur in a single location. Impacts to the environment resulting from the project would occur as the result of many individual private development and public works projects undertaken in compliance with applicable provisions of the General Plan, as amended by the proposed project, over an estimated 40-year period throughout unincorporated Riverside County. Thus, the project's EIR summarizes the impacts that could collectively (cumulatively) result from these individual actions and projects. The projections developed for the current existing General Plan, as well as those for the GPA No. 960 changes, form the basis for the impact analysis contained in this EIR. They represent estimates of the population, dwelling units and employment within unincorporated areas of Riverside County that could exist at build out of the current Riverside County General Plan and for the General Plan as it would be if amended by the proposed project, GPA No. 960. Where specific land use-related (spatial) changes would result from GPA No. 960, they are analyzed as a subset of General Plan build out.

A key concept in this EIR General Plan analysis is that projections reflect a theoretical build out of all unincorporated areas, which is estimated to occur around 2060. For regional coordination and infrastructure planning purposes, the Southern California Association of Governments (SCAG) develops 20- to 25-year projections. These shorter timeframes allow for close tracking of near-term infrastructure and improvement schedules, but are driven primarily by demographics, which are constantly changing. In contrast, the General Plan is primarily concerned with land use and spatial patterns that develop over much longer periods. Hence, the shorter timeframe would not be suitable for this EIR's purposes, as it would not capture the full extent of build out expected in the county. It should be remembered, however, that the actual rate of development is driven by the economy and is not under the control of government officials. The projections used in this EIR are theoretical and are used as the basis for environmental analysis and to compare various alternative scenarios.

B. Build Out Assumptions and Factors

The projections developed for the General Plan and proposed project estimate potential population, dwelling units and employment for unincorporated areas of the county, both generally (full county) and specifically for the subset of unincorporated county areas potentially affected by specific land use-related maps and policy changes proposed under GPA No. 960. This "spatial" subset represents changes that can be reasonably foreseen to occur in a specific location. During preparation of the initial (2003) RCIP General Plan, a number of statistical analyses were performed. In particular, a series of minimum, mid-range and maximum projections were prepared and studied to determine which would yield the most appropriate build out results for the purposes of environmental analysis. Through analysis, it was determined that the midrange projections for population, dwelling units and floor-area ratios (which affect employment calculations) would be most representative of a reasonably foreseeable future build out. The resultant midrange values are shown in Table 4.1-A (Dwelling Units per Acre Midpoint Assumptions). Mid-range projections are utilized because the installation of required infrastructure (e.g., roads and utilities), as well as the presence of environmental constraints (e.g., fault hazard zones, floodways, steep

slopes, high fire hazard areas, etc.), generally preclude maximum development of vacant lands. Midrange projections are a realistic approximation of the population, dwelling unit and employment growth that results from implementation of the General Plan, that also reflect a conservative approach that does not underestimate impacts.

As part of the preparation of GPA No. 960, the Riverside County Center for Demographics Research (RCCDR) undertook examination of all factors listed in Appendix E of the existing General Plan. They evaluated the existing factors in light of the most recent data available, including official Riverside County growth projections (RCP-07 and RCP-08), current SCAG data (2008 Regional Transportation Plan, etc.), current General Plans of cities within Riverside County, published data (U.S. Census, ULI Handbooks, etc.) and statistics issued by the California Department of Finance. The resultant statistical data was used to create proposed General Plan Appendix E-1 as part of GPA No. 960. As Appendix E-1 represents the most current and appropriate growth and demographic data, it was used for the statistical analyses performed for EIR No. 521. For full details on the methodology used for the generation of these projections and assumptions, see General Plan Appendix E-1.

In preparing GPA No. 960, two sets of key build out projections were developed. First, new build out projections were calculated for the General Plan to compile all of the changes that have occurred since its October 2003 adoption (through October 2009); particularly those General Plan Amendments that altered mapped Land Use Designations (LUDs). To ensure the accuracy and consistency of these projections, in some cases further development or clarification of assumptions were also made. Also, various socioeconomic factors, such as household occupancy, for example, were also updated through input from RCCDR.

The results of these updates are codified into the assumptions and methods reflected in General Plan Appendix E-1, which is proposed as part of GPA No. 960 as a replacement for the existing General Plan Appendix E. The basic components of Appendix E-1 were used to develop the land use and associated socioeconomic calculations for build out of both the existing General Plan and a "project" scenario for how the General Plan would build out if amended pursuant to GPA No. 960. These factors and calculations are used throughout this EIR and were derived according to the following methods.

1. Land Use Data

The County of Riverside maintains a geographic information system (GIS) database in which a variety of data is stored with links to geographical locations. The database encompasses a wide variety of data, including the locations of cities, Tribal lands, federal lands, freeways and highways, etc., boundaries for school districts, water districts, park districts and other public services. It also contains countywide information on a variety of environmental constraints, including soil types, seismic fault zones, floodplains, vegetation and mineral resources, to name just a few. As a result, GIS can provide a range of information and analyses for a given area – be it a parcel, block, city or region. It also provides summarized countywide data. This GIS database is known as RCLIS, the Riverside County Land Information System.

One of the levels of information, or layers, maintained through GIS is base Land Use Designations (LUDs), in which a General Plan LUD is assigned to each parcel of land within Riverside County under County of Riverside jurisdiction. (Thus, cities, Indian Reserves, National Forests, State Parks, etc., are not assigned LUDs.) These areas are organized into the 19 Area Plans of the General Plan, plus the remaining unincorporated (far east desert) areas addressed at the end of the General Plan Land Use Element. RCLIS was used to determine the total number of acres assigned to each of the General Plan LUDs for each Area Plan and for the other unincorporated areas. This "base acreage" was then adjusted as deemed appropriate based on any applicable planning assumptions, such as for Policy Areas, Community Centers and others. General Plan Appendix E-1 provides a complete description of these additional assumptions.

2. Dwelling Units

Dwelling units represent homes of all types, from the traditional stand-alone single-family home to multi-family residences, such as apartment complexes, condominiums or townhomes, as well as mobile homes, modular homes and any other type of unit. The General Plan includes 16 types of residential land use densities, ranging from Rural Residential (which calls for 5-acre minimum lots) to Highest Density Residential (which allows 20+ units per acre). Several LUDs, such as Agriculture, that are not primarily residential but allow a limited amount of residential development (e.g., Agriculture allows one unit per 10 acres), also contribute to Riverside County residential totals.

Each residential LUD is associated with a range of dwelling units, as shown in Table 4.1-A, below. As per the methods outlined earlier, for each LUD a midpoint was determined by RCCDR based on actual housing product types and associated acreage needed for roads and rights-of-way, drainage and other easements, water and sewer facilities, and other public facilities typically found in residential areas, such as local parks, elementary schools, etc. The listed midpoints are the values used for theoretical projection purposes throughout this EIR.

To determine the number of dwelling units expected within each residential LUD, the number of gross acres provided by RCLIS was multiplied by the LUD's respective du/ac factor. For example, 400 acres of Medium Density Residential, with a density range of 2.0 to 5.0 du/acre, has a midpoint of 3.5 du/acre. Thus, for planning projection purposes, a total of 1,400 dwelling units would be associated with these 400 acres (400 ac x 3.5 du/ac = 1,400 du).

3. Population

To reflect variations of household size associated with different regions of Riverside County, separate average household size figures developed by the RCCDR were used to determine projected population. These population projections, based on adopted 2010 Riverside County projections (RCP-10), are included in Table E-2 of proposed General Plan Appendix E-1 and are reproduced in Table 4.1-B (Area-Specific Population Factors).

Population is determined by multiplying the projected number of dwelling units (derived from LUD acreage per above) by the average persons per household. For example from above, a population projection for 400 acres of Medium Density Residential located in the Temescal Canyon Area Plan would result in a population estimate of 5,040 persons (1,400 dwelling units x 3.60 persons per du).

Table 4.1-A: Dwelling Units per Acre Midpoint Assumptions

General Plan Land Use Designation	Midpoint Factor (du/acre)	Range (Min. – Max.) (du/acre)
Agriculture (AG)	0.05	0 - 0.1
Rural Residential (RR)	0.15	0.1 - 0.2
Rural Mountains (RM)	0.05	0 - 0.1
Rural Desert (RD)	0.05	0 - 0.1
Open Space – Rural (OS-RUR)	0.025	0 - 0.05
Rural Community – Estate Density (EDR-RC)	0.35	0.2 - 0.5
Rural Community - Very Low Density (VLDR-RC)	0.75	0.5 - 1.0
Rural Community – Low Density (LDR-RC)	1.50	1.0 - 2.0
Estate Density (EDR) – Community Development	0.35	0.2 - 0.5
Very Low Density (VLDR) – Comm. Development	0.75	0.5 - 1.0
Low Density (LDR) – Comm. Development	1.50	1 - 2
Medium Density (MDR) – Community Development	3.5	2 - 5
Medium High Density (MHDR) – Comm. Development	6.5	5 - 8

General Plan Land Use Designation	Midpoint Factor (du/acre)	Range (Min. – Max.) (du/acre)
High Density (HDR) – Community Development	11.0	8 - 14
Very High Density (VHDR) – Comm. Development	17.0	14 - 20
Highest Density (HHDR) – Community Development	30.0	20 - 40

1. Not part of an Area Plan. See General Plan Land Use Element.
2. Value per RCP-10 for unincorporated Riverside County as a whole.

Source: Developed by RCCDR for Proposed (GPA No. 960) General Plan Appendix E-1, 2010.

4. Employment

There are two types of employment projections associated with the General Plan: one, the number of potential workers expected to be living in the projected number of homes for an area; and, two, the number of jobs expected to be associated with a given non-residential land use (such as commercial, industrial, agricultural, etc.)

To determine the number of potential workers resulting from residential land uses, the estimated population is multiplied by the "participation rate." The participation rate is the percent of the population that is expected to be working and that is either employed or not employed but actively seeking work. The participation rate for Riverside County, as defined by RCCDR in the latest Riverside County population and employment forecasts (Appendix F-1), is 44.86%. That is, of the total population of Riverside County, 44.86% are of employable age and availability for participating in the work force. Using this participation rate in the earlier example, the 5,040 residents would yield 2,261 workers.

In terms of calculating jobs associated with specific land uses, for example commercial-retail, several factors must be considered. Some LUDs, such as Agriculture, have direct factors for employees per acre, as shown in Table 4.1-D (Employment Factors), below. For most LUDs, such as commercial, industrial and other employment-generating land uses, determining the number of associated jobs is a multi-step process that requires the computation of net acreage, gross square footage and permitted square footage. These steps are outlined fully in Appendix E-1. To summarize:

Gross to Net Acreage: Gross acreage (based on mapped General Plan LUD values, as reported by RCLIS) is converted to a net acreage value to accommodate the developable areas that are needed for roads, easements and other such features. For commercial, heavy industrial and business park land uses, 25% of the gross acreage is assumed necessary for these features, leaving a net of 75% of the site developable. For light industrial land uses, 20% of the gross acreage is assumed necessary infrastructure and other features. Based on this process, 200 gross

acres of land with a Commercial Retail LUD would yield 150 net acres (200 acres x 0.75 net factor), while 200 gross acres of Light Industrial would yield 160 net acres (200 acres x 0.80 net factor).

Net Acreage to Square Footage: Net acreage is converted into a square footage value by multiplying the acreage by 43,560 (the number of square feet in one acre). Hence, the examples stated above would translate into totals of 6,534,000 square feet of Commercial Retail and 6,969,600 square feet of Light Industrial uses.

Building Square Footage: Because the County of Riverside does not allow land to be covered 100% by buildings, each non-residential LUD has an associated "Floor-to-Area Ratio" (FAR) assumption which specifies the amount of a site which may be covered with buildings. FARs were developed based on building size and lot coverage of existing inventory in Riverside County and the requirements of typical constraints encountered when gross acreage is engineered into a developed site plan. In particular, the need for parking, egress, grading and slopes, infrastructure easements, landscaping, etc., all affect the total amount of developable land and, thus, net lot size.

The FAR assumptions used for this EIR analysis are presented in Table 4.1-C (Floor-to-Area Ratio Midpoint Assumptions), below. Continuing with the earlier examples, the Commercial Retail site would have a built area of 1,502,820 square feet (6,534,000 square feet x 0.23 FAR) and the Light Industrial site would have 2,648,448 square feet (6,969,600 square feet x 0.38 FAR). Again, it should be noted that the FAR values in Table 4.1-C represent midpoint assumptions determined to be most appropriate for use in estimating future theoretical build out for planning purposes.

Table 4.1-C: Floor-to-Area Ratio Midpoint Assumptions

Land Use Designation	Floor-to-Area Ratio Midpoints
Commercial Retail (CR) *	0.23
Commercial Tourist (CT)	0.25
Commercial Office (CO)	0.35
Light Industrial (LI)	0.38
Heavy Industrial (HI)	0.40
Business Park (BP)	0.30

* Pursuant to General Plan Policy 23.2, it is assumed that Commercial Retail land uses will build out 40% as Commercial Retail, with the remaining 60% converting to Medium Density Residential (MDR) land use.
Source: Proposed (GPA No. 960) General Plan Appendix E-1, Table E-4, 2010.

Employees: Lastly, once building square footage has been determined, an estimate of the number of jobs (employees) expected to be generated as a result of the given LUD acreage can be made. Employment factors for individual land uses vary and are based on research performed by RCCDR in which actual employment figures were compared against the square footage of the business' buildings to develop job generation factors. These factors are presented in Table 4.1-D, below. Concluding the previous examples, the 1,502,820 square feet of Commercial Retail land use would generate an estimated 3,006 employees (1,502,820 square feet divided by 1 employee per every 500 square feet) and the Light Industrial land use would generate an estimated 2,571 employees (2,648,448 square feet divided by 1 employee per every 1,030 square feet).

Table 4.1-D: Employment Factors

Land Use Designation	Employment Factor
Commercial Retail (CR) *	1 employee / 500 square feet
Commercial Tourist (CT)	1 employee / 500 square feet
Commercial Office (CO)	1 employee / 300 square feet
Light Industrial (LI)	1 employee / 1,030 square feet
Heavy Industrial (HI)	1 employee / 1,500 square feet
Business Park (BP)	1 employee / 600 square feet
Agriculture (AG)	0.05 employee / acre

Land Use Designation	Employment Factor
Open Space – Mineral Resources (OS-MIN)	0.03 employee / acre
Open Space – Recreation (OS-REC)	0.15 employee / acre

* Pursuant to General Plan Policy 23.2, it is assumed that Commercial Retail land uses will build out 40% of the total acreage as Commercial Retail, with the remaining 60% converting to Medium Density Residential (MDR) land use.
Source: Proposed (GPA No. 960) General Plan Appendix E-1, Table E-5 2010.

4.1.3 Riverside County Build Out Projections

The projections developed for the General Plan estimate potential population, dwelling units and employment for unincorporated areas of the county. The mapped General Plan LUDs plus related policies serve as the basis for these projections. It must be remembered that these projections reflect theoretical build out estimates for the unincorporated areas, rather than what will actually be developed over the next 50 years. As stated previously, the actual rate of development is driven by the economy and is not under the control of government officials.

Table 4.1-E: Projections for Existing General Plan Build Out by Area Plan

Area Plan	Area (Acres)	Dwelling Units	Population	Workers[1]	Jobs[2]
Western Riverside County

Source: Proposed (GPA No. 960) General Plan Appendix E-1, Table E-5, 2010.

Based on the methodologies described above, a variety of socioeconomic projections (dwelling units, population and jobs) were developed for build out for each of the Riverside County Area Plans and other unincorporated areas. These projections are summarized by Area Plan in Table 4.1-E (Projections for Existing General Plan Build Out by Area Plan) with further detail provided for each Area Plan, including LUD tables, provided in Appendix EIR-2. For each area, two sets of projections are provided: The first codifies updated projections for the existing General Plan adjusted to reflect all of the General Plan Amendments adopted since October 2003; the second illustrates expected build out of the General Plan as it would exist if the proposed project, GPA No. 960, is adopted. The same baseline assumptions (as per Appendix E-1) have been used for both sets of projections to allow meaningful comparison between the two scenarios. These projections are utilized throughout this Program EIR where "plan-to-plan" discussions are presented to highlight the degree or scope of a proposed change. (See below for information on environmental baselines.)

4.1.4 Methodology for Environmental and Impact Analyses

The State CEQA Guidelines (CCR Section 15121) state that the purpose of an EIR is to serve as the informational document intended to "inform public agency decision-makers and the public generally of the significant environmental effect, identify possible ways to minimize the significant effects and describe reasonable alternatives to the project." In order to do this, the EIR provides information and analyses on a number of environ-

mental issues. Each environmental issue includes information on the environmental setting, environmental impacts and measure to mitigate significant effects. The scope and specifications generally used in the preparation of these areas for each environmental issue include the following.

A. Baseline Data Sources

Pursuant to CEQA, the descriptions of the physical environmental conditions provided in this EIR are as they exist at the time the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting will constitute the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant.

Because of the countywide scope and nature of this project and its programmatic EIR, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence is used instead and a discussion of how it is or is not expected to differ from the existing physical conditions is provided. It should be noted here that 'substantial evidence' refers to "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact," (PRC Section 21080(e)(1)). Further, 'substantial evidence' does not include "argument, speculation, unsubstantial opinion or narrative, evidence of social or economic impacts that do not contribute to, or are not cause by, physical impacts on the environment."

Each chapter in Section 4.0 of this EIR includes a description of the specific environmental baseline data presented and used, plus a discussion of how and why the sources used were determined to be the best-supported substantial evidence available.

B. Existing Environmental Conditions

As outlined in the State CEQA Guidelines, Section 15125, an EIR must include a "description of the physical environmental conditions in the vicinity of the project, as they exist at the time the Notice of Preparation is published." For this EIR, that date is April 13, 2009. The section also states that "this environmental setting will normally constitute the baseline physical conditions."

Thus, for each issue area analyzed in this EIR, a brief summary of the local and regional environmental conditions (both naturally-occurring and man-made) in existence at the time this Program EIR was prepared has been provided. This data provides the reader with the "baseline" from which future impacts are analyzed. The existing setting provides a "snap shot" of the environment at a particular point in time.

C. Existing Regulations

Each section also includes a description of the relevant existing federal, state and local statutes and regulations that apply to the given environmental area. It should be remembered that these regulations apply to all entities and situations, with or without the proposed project. That is, these regulations represent compliance measures that must be carried out when circumstances warrant, although in some cases the lead agency (Riverside County, in this case) has the ability to determine when or how the specific regulation applies to a given case. Generally, the regulations cited indicate the regulatory or programmatic directives under which the County of Riverside operates. In most cases, the regulations are implemented on a case-by-case basis as appropriate for the given project proposal before the County of Riverside. As part of the project approval process, contractual Conditions of Approval are developed by the County of Riverside that establish explicit requirements that must be satisfied.

Various Riverside County Departments, including Planning, Transportation, Fire, Building and Safety, Environmental Health, Waste Management and Flood Control, are responsible for monitoring implementation and verifying completion of the Conditions of Approval related to their areas of governance. Specifically, a project is not allowed to go forward with its next stage of development if specific conditions are not met. These conditions can include a variety of environmental requirements designed to ensure compliance with both CEQA and the various environmental protection laws. In this way, a set of standard Conditions of Approval are developed and approved for each discretionary project approved by the County of Riverside as a means for monitoring and ensuring compliance with applicable laws, regulations and policies.

As an example of how this system works, the Conditions of Approval for a four-lot residential subdivision might specify that "Prior to Grading" the proposed site must be subject to a biological assessment to verify that no sensitive species occur on the site. Thus, an applicant would not be able to obtain a grading permit for the project site until the Riverside County Planning Department reviews a biological study for the site and signs off on it. A variety of other development milestones, such as tract map recordation, building permit issuance, occupancy permit issuance and others, can thus serve as compliance points monitored and enforced by the County of Riverside.

D. Thresholds of Significance

Determinations of the significance of potential impacts resulting from implementation of the proposed project use the thresholds of significance from Appendix G of the State CEQA Guidelines. In addition, for some environmental issues, additional or modified thresholds are included to address special areas of concern unique to the County of Riverside, for example, the Palomar Observatory Special Lighting Zone. These thresholds represent the criteria used in this EIR to determine whether or not the impacts identified are significant.

E. Project Effects

This section provides a summary of how the proposed project, GPA No. 960, would change or affect the General Plan document and affect the anticipated future build out of the General Plan relative to the environmental issue being discussed. In some instances, the proposed project would only affect resources for specific, localized areas. This is particularly true of spatial impacts associated with proposed land use-related changes, such as the deletion of specific Rural Village Overlays, the alteration of mapped LUDs for specific parcels and so on. Where such areas are foreseeable in connection to the proposed project, they are analyzed and disclosed in this EIR. In other cases, proposed changes would result in future development in locations that cannot be reasonably foreseen at this time. For such cases, additional site-specific CEQA review and analysis would be necessary and project-specific mitigation developed, if necessary, to augment the programmatic approach outlined in this EIR.

Other proposed changes are countywide, for example the Air Quality Element revisions to address greenhouse gases, and do not have specific spatial components. As such, these types of impacts are analyzed and addressed on a countywide level. Future site-specific development proposals would implement or tier off the programmatic mitigation outlined in this EIR.

For both spatial and countywide analyses, to determine the scope of project effects, it was necessary to develop both a baseline scenario describing the existing environmental conditions and a project scenario describing the projected condition of Riverside County at General Plan build out with the adoption of the changes proposed in GPA No. 960.

These two scenarios were developed by the Riverside County Center for Demographic Research (RCCDR) for Riverside County as a whole based on Board of Supervisors-adopted demographic projections, existing demographic data and the land use mapping and assumptions called for in the General Plan (existing and proposed). The demographic data used was also consistent with that submitted by the County of Riverside to the two regional governmental coordination agencies, WRCOG (Western Riverside County Organization of Governments) and CVAG (Coachella Valley Association of Governments), as well as SCAG, the Southern California Association of Governments, responsible for wide-scale regional planning in Southern California. These scenarios also formed the basis for other demographic-based data modeled and used in this EIR: traffic generation, noise generation, air quality and greenhouse gas emissions, as well as population and housing issues.

In addition, two scenarios (baseline and project build out) were also developed for the portions of the project, GPA No. 960, with the potential for reasonably foreseeable spatial effects (that is, effects tied to *specific* locations). The baseline condition was derived from SCAG land use data updated through visual analysis of Riverside County's RCLIS aerial photo bank. The aerial inspections were used to determine actual uses present on the parcels of interest, including counts of actual number of dwelling units (homes) apparent. From the actual dwelling units, population numbers were calculated according to the methods and assumptions of proposed General Plan Appendix E-1. Non-residential uses (employment figures, etc.) were also calculated per Appendix E-1 assumptions.

For the project build out scenario, the proposed General Plan Land Use Designations (LUDs) with any overlay or policy area (whichever land use option resulted in the greatest development potential) were used to represent the future build out condition of the sites. Though unlikely to occur in the real-world, a build out of 100% of these lands was assumed to represent a "worst case" scenario environmentally. From the proposed LUDs, dwelling unit numbers, populations, business square footage and employment figures were calculated. Again, these values were developed as per the methods, assumptions and factors proposed in General Plan Appendix E-1. The results of both scenarios are presented in Section 4.2 (Land Use). See Tables 4.2-F and 4.2-G, in particular.

For various environmental impacts analyzed in this EIR, the land use and demographic results of the two scenarios (baseline and project build out) were then used as the basis for various theoretical resource usage projections. For example, existing and build out electricity demand values were calculated using the same set of energy factors for both scenarios. The control of variables in this way allows for a reasonable comparison between the two values, necessary to highlight how the project would affect the resource – electricity demand, in this example – between existing use and the future contemplated by this project. The resultant impacts and any necessary mitigation are then described in the two remaining sections of the EIR chapters.

F. Impacts Analysis and Mitigation

As required by CEQA, the potential impacts that may result from implementation of the proposed project were measured against the identified thresholds at the programmatic level. The Section 4.0 chapters discuss short-term and long-term, direct and indirect project impacts. Cumulative and growth-inducing impacts are discussed separately in Section 5.0 (Additional Required CEQA Topics).

Pursuant to CEQA (PRC Sections 21100(b)(3) and 21150), when an impact is analyzed and found to be "Less Than Significant," specific project mitigation is not required. Impacts identified as "Potentially Significant" require all feasible mitigation necessary to avoid, reduce or minimize the impact to a less-than-significant level, if feasible. Where implementation of, or compliance with, an existing federal, state or county regulation or General Plan policy would aid in reducing, minimizing or avoiding an impact, it is noted under "Regulatory Compliance." The same applies to compliance with any measures from EIR No. 441, since they are currently in effect as part of

the Mitigation and Monitoring Program adopted for the 2003 RCIP General Plan as part of EIR No. 441 and are imposed in this EIR, as appropriate.

Where an impact remains significant, despite compliance with applicable statutes, policies and regulations, specific measures are proposed to reduce the impact. Specifically, CEQA requires that the Lead Agency "mitigate or avoid the significant effect on the environment" of the project "whenever it is feasible to do so." Under CEQA (Section 21061.1), "feasible" means "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social and technological factors."

As stated by CEQA (PRC Section 15064(b)), "The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An iron clad definition of significant effect is not always possible because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area."

G. Significance After Mitigation

Each chapter is concluded with a statement as to whether implementation of the regulatory compliance and mitigation measures associated with the proposed project would reduce the project's impacts to a level that is less than significant. Pursuant to CEQA Section 21081, where a significant impact has been identified in the EIR, the County of Riverside shall not approve or carry out the project unless the County of Riverside makes one or more of the following findings with respect to each significant effect:

1. Changes or alterations have been required in, or incorporated into, the project which mitigate or avoid the significant effects on the environment.

2. Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency.

3. Specific economic, legal, social technological or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or alternatives identified in the environmental impact report.

In addition, with respect to significant effects that cannot be reduced to less-than-significant levels, the County of Riverside must find that specific overriding economic, legal, social, technological or other benefits of the project outweigh the significant effects on the environment. Pursuant to CEQA Section 21081.5, these findings must be based on substantial evidence in the record.

Section 4.2

Land Use

Section 4.2 Land Use

4.2.1 Introduction

The land use plan of the County of Riverside General Plan in many ways represents the culmination of the Vision and foundational values expressed throughout the document. The land use plan plays a large role in directly influencing the physical reality of Riverside County's future; it guides the ultimate pattern of development in Riverside County. It designates the general distribution, general location and extent of land uses, such as housing, business, industry, open space, agriculture, natural resources, recreation and public/quasi-public uses. The land use policies and maps are intended to capture and communicate Riverside County's long-term desires for the future use and development of its land. Accordingly, this section assesses the potential impacts on land use resources that could result from future development consistent with the changes to the plans and policies of the General Plan as proposed by the proposed project, GPA No. 960.

This section examines how the proposed project, GPA No. 960, would change or affect the existing baseline environmental conditions relative to land use and addresses related environmental effects. A number of the proposed GPA No. 960 land use-related changes are associated with specific, localized areas which can be evaluated spatially. This type of change includes the proposed deletion of specific Rural Village Overlays, the alteration of mapped LUDs for specific parcels and so on.

Other proposed changes, however, are not associated with specific locations. In some cases, project effects can only be assessed on a county-wide basis, such as for the new greenhouse gas reduction policies proposed for the General Plan Air Quality Element, which would apply to all new development and land uses wherever they occurred in unincorporated Riverside County. Others would affect only limited areas, but, as with the proposed incidental rural-commercial use policy, the locations in which the policy would be implemented cannot be foreseen at this time.

4.2.2 Existing Environmental Setting – Land Use

The County of Riverside covers roughly 7,300 square miles (4,670,000 acres), of which roughly 10% consist of incorporated cities. The General Plan is the master planning and policy document governing the unincorporated portions of Riverside County, approximately 6,500 square miles (approximately 4.2 million acres). See Figure 1.1 (Regional Location Map) in Section 1.0 (Summary).

Riverside County is surrounded by the counties of San Diego, Imperial, Orange and San Bernardino to the south, west and north, respectively. To the east, Riverside County abuts the County of La Paz, Arizona, where the Colorado River forms the border between the two states.

A. Jurisdictional Areas in Riverside County

Within Riverside County are 26 incorporated cities. These cities, as listed in Table 4.2-A (Cities Within Riverside County), below, have jurisdiction over their municipalities and are not included in the scope of the Riverside County General Plan, other than for planning and coordination purposes. Since the adoption of the 2003 General Plan, two new cities (Wildomar and Menifee) have been incorporated out of areas previously under Riverside County control. In 2008, the City of Wildomar incorporated in southwestern Riverside County, abutting the existing cities of Lake Elsinore and Canyon Lake. The new city encompasses roughly 8,500 acres that were previously part of Riverside County's Southwestern Area Plan. Also in 2008, the City of Menifee incorporated. This new city spans roughly a 50-square mile area encompassing nearly all of the Riverside County General Plan's existing Sun City/Menifee Area Plan. Together, these two cities encompass roughly 26,700 acres. Although the Sun City/Menifee Area Plan still exists in the Riverside County General Plan, as a result of the change, it now covers only the roughly 4,000 acres that remain under County of Riverside jurisdiction in the isolated pockets of land that were not included in the new city.

Both the existing General Plan and the proposed project's land use data have been updated to reflect the transfer of these two cities from Riverside County land use jurisdiction. The change does not, however, represent a discretionary action on the part of the County of Riverside. It should also be noted that two other new cities, Eastvale and Jurupa Valley, have been formed in the northwestern corner of the county. However, as the incorporation of these cities occurred in October 2010 and July 2011, respectively, well after the April 13, 2009, release of the NOP for this project, their incorporations are not reflected in the proposed project or this EIR. Their inclusion means that impacts to northwestern Riverside County are adequately addressed by this programmatic EIR. Even though they now represent impacts to cities (and are hence not subject to Riverside County jurisdiction), rather than the County of Riverside, such impacts are nevertheless still part of the region's impacts and their inclusion herein simply makes this EIR more conservative in that it may actually *over*estimate impacts to unincorporated Riverside County areas as a result.

Table 4.2-A: Cities Within Riverside County

Western Riverside County		Coachella Valley Region	Far Eastern Riverside County
Banning	Menifee	Cathedral City	Blythe
Beaumont	Moreno Valley	Coachella	
Calimesa	Murrieta	Desert Hot Springs	
Canyon Lake	Norco	Indian Wells	
Corona	Perris	Indio	
Eastvale*	Riverside	La Quinta	
Hemet	San Jacinto	Palm Desert	
Jurupa Valley*	Temecula	Palm Springs	
Lake Elsinore	Wildomar	Rancho Mirage	

* These cities incorporated after April 2009, thus are still included as Riverside County unincorporated areas herein.
Source: Riverside County Center for Demographic Research, Riverside County Progress Report, 2009.

Besides incorporated cities, there are a number of other governmental entities with jurisdictional areas within Riverside County, see Table 4.2-B (Other Jurisdictions with Lands in Riverside County). The federal government owns or controls large swaths of the county, for example, 1.26 million acres of National Forests and Monuments. Tribal lands span roughly 150,500 acres within the county. The Indian Tribes within the US are recognized as self-governing sovereign nations within their own tribal jurisdictions. The State of California also owns and controls nearly 40,000 acres of land within the county, including state parks, University of California campuses and research facilities, and various other uses.

Table 4.2-B: Other Jurisdictions with Lands in Riverside County

Tribes[1,2]	Federal Agencies[1]	State Agencies[1]
Agua Caliente Band of Cahuilla Indians	Army Corps of Engineers	Dept. of Fish and Wildlife
Augustine Band of Mission Indians	Bureau of Land Management	Department of Parks and Rec.
Cabazon Band of Mission Indians	Bureau of Reclamation	Dept. of Transportation
Colorado River Reservation	Department of Energy	Natural Resource Agency
Morongo Band of Mission Indians	Department of Defense	State Lands Commission
Pechanga Band of Luiseno Indians	Federal Highway Administration	University of California
Ramona Band of Mission Indians	Fish and Wildlife Service	
Santa Rosa Band of Mission Indians	National Forest Service	
Soboba Band of Luiseno Indians	National Park Service	
Torres-Martinez Desert Cahuilla Indians		
Twenty-Nine Palms Band of Mission Indians

B. Existing Use of Land Within Riverside County

Existing development and uses of land within Riverside County is a mosaic of varying types of uses, ownerships, character and intensity. Figure 4.2.3 (Generalized Existing Uses of Land Within Riverside County) identifies generalized existing (2008) land use throughout Riverside County based on raw data provided by SCAG and developed by the Riverside County Center for Demographic Research (RCCDR). This figure defines land uses into seven broad categories (Residential, Commercial, Industrial, Recreation and Open Space, Public Facilities, Vacant and Other), which are further divided in several underlying land use types.

The existing (2008) land use data (Table 4.2-C (Distribution of Existing Uses of Land within Riverside County), below) identifies land uses within Riverside County as a whole, as well as the distribution of land uses between cities and unincorporated areas. As shown in the table, the majority of land within Riverside County is not developed. Vacant and open lands are predominant in the eastern desert areas, particularly the easternmost third of the county. *In eastern Riverside County, the large majority of developed uses are located in the Coachella Valley region of the desert. Western Riverside County, west of the San Jacinto Mountains, contains a significant portion of urban and suburban development.* ~~The large majority of developed uses in eastern Riverside County are located in the Coachella Valley region of the desert. Much of Riverside County's urban and suburban development is also located in western Riverside County, roughly a third of the county located west of the San Jacinto Mountains.~~ Large tracts of federal lands, including National Forests, account for open space areas in southern Riverside County, much of the San Jacinto Mountains and parts of eastern desert as well.

Countywide, the overall built environment, including agricultural lands, encompasses approximately 1,300 square miles (832,000 acres), roughly 18% of the total area of Riverside County. Development is generally concentrated in the cities, with roughly 62% of the cities' territories developed, compared to only 12% of the unincorporated portion of Riverside County. The availability of vacant land also shows a similar trend, with roughly 6% located within cities and the majority, 94% located within the county. Normally cities grow outward as their edges develop and infrastructure becomes available, and typically do not annex large areas of open space or vacant lands.

Table 4.2-C: Distribution of Existing Uses of Land within Riverside County

Land Use Categories		Unincorporated (acres)	Within Cities (acres)	Countywide Total (acres)
Residential	***Subtotal***	***109,604***	***113,810***	***223,410***

Source: SCAG, 2008. Riverside County Center for Demographic Research, 2010.

All together a total of nearly 350 square miles (223,000 acres) of land is currently developed with residential uses in Riverside County, split nearly evenly between the County of Riverside and its incorporated cities. Commercial land uses account for 59,000 acres within the county. The majority is located within the western Riverside and Coachella Valley regions; clustered near major transportation routes, such as Interstates 15 and 215 and State Routes 91, 60, 74 and 111. A total of roughly 46,000 acres countywide are devoted to industrial uses, including heavy industry, warehousing and mineral extraction, as well as business parks. Unlike most of the other built uses, approximately 72% of industrial uses are located in unincorporated areas. Owing to Riverside County's collection of physical, biological and historical resources, a vast amount of land (1,081,000 acres, 23% of the county total) is in open space use and provides for recreation, agriculture, scientific opportunity and wild land preservation. This total also includes the hundreds of thousands of acres of National Forests, State Parks and other passive recreation areas outside of County of Riverside jurisdiction. Another 3.7% (173,000 acres) of the county is devoted to various public facilities, including landfills, military bases, public airports, schools and others.

C. Planned Land Use Under the Existing Riverside County General Plan

With the 2003 adoption of the completely revised RCIP General Plan, the County of Riverside planned for future growth in Riverside County by designating some existing vacant lands for future development to accommodate future demand in a manner compatible with existing patterns. Subsequent to its adoption, the RCIP General Plan has incorporated 22 General Plan Amendments; those GPAs adopted through approximately the first half of 2009 (i.e., prior to NOP issuance). Most of the changes were focused on site-specific Land Use Designation changes, mainly associated with new or revised Specific Plans. As part of the baseline for this update, Table 4.2-

D (Existing General Plan Mapped Land Uses (Countywide)) shows the land use planned under the existing General Plan.

1. Land Use Designations

Because of the size of Riverside County, most of the General Plan's land use designations are mapped within a series of 19 Area Plans. These Area Plans reflect locality-specific plans by which the countywide policies in the main body of the General Plan are implemented, with customizations where appropriate for the unique needs of each community. It is at the Area Plan level that the General Plan plans for future land development and utilization through the application of Land Use Designations (LUDs) tied spatially to the land covered by the Area Plan. LUDs and the General Plan Foundations in which they are categorized dictate the general types of land uses, densities and intensities that could be allowed. (It should be noted that LUDs are *not* synonymous with zoning; zoning is assigned via Riverside County ordinance, not the General Plan. Also, LUDs do not necessarily reflect the existing (actual) use of land. Rather, LUDs indicate the anticipated (future) development patterns and uses planned for within unincorporated Riverside County. Also, it should be remembered that none of the Riverside County General Plan applies to incorporated cities, sovereign tribal lands, or other non-County of Riverside jurisdictions.) As shown in Figure 4.2.2 (Cities Within Riverside County) and Figure 4.2.3 (Generalized Existing Uses of Land Within Riverside County), every part of Riverside County falls within one of these plans, except for the far easternmost portion of the county, which is covered directly in the Land Use Element of the General Plan. Full summaries of existing General Plan LUDs and the LUDs proposed under GPA No. 960, as well as the associated statistical summaries, are compiled by Area Plan in Appendix EIR-2.

* Existing General Plan includes all GPAs adopted through the end of 2009.
** Values rounded to nearest 10 acres and therefore may not sum precisely.
*** *The Southwest Area Plan was amended in 2014 by GPA 1077, which changed General Plan Land Use Designations; however GPA 1077 was completed as a separate project and thus impacts are not included in the analysis contained within this section. Refer to GPA 1077: Wine Country Community Plan and the Wine Country Community Plan Environmental Impact Report for further information on the impacts related to the project. Refer to GPA No. 960 Appendix Q for Wine Country Community Plan.*
Source: Riverside County Planning Department, Project Data, 2010.

~~Every part of Riverside County falls within one of these plans, except for the far easternmost portion of the county, which is covered directly in the Land Use Element of the General Plan. Full summaries of existing General Plan LUDs and the LUDs proposed under GPA No. 960, as well as the associated statistical summaries, are compiled by Area Plan in Appendix EIR-2.~~

The Riverside County General Plan provides land use designations for a total of approximately 4,010,500 acres (nearly 6,300 square miles) of unincorporated Riverside. Of these, nearly 82% are designated open space, while roughly 6% are designated for future urban and suburban development. Also, about 5% of Riverside County is designated agriculture, while rural and rural to urban transition areas (i.e., rural community), account for 9% of the total. Even with the significant growth of Riverside County in recent years, these LUD patterns indicate how most of Riverside County is still anticipated to remain undeveloped in near future, aside from certain pockets of targeted growth.

2. Specific Plans within the General Plan

A specific plan is a combined policy statement and implementation tool that is used to implement the General Plan and customized policies within a single project, such as infill development, larger multiple-use projects or a related series of projects. The specific plan serves to emphasize concrete standards and development criteria used for subsequent site plans. Since the development guidelines in a specific plan focus on the unique needs and characteristics of a specific area or community, specific plans allow for greater flexibility than is possible through conventional general plan land use designations and zoning alone.

As shown in Figure 4.2.5 (Adopted Specific Plans Within Riverside County), there are over 70 approved specific plans located throughout unincorporated Riverside County. These plans range in size from small, such as 25 acres for a commercial center, to very large, such as Specific Plan No. 327, Toscana (covering nearly 1,000 acres). Some Riverside County specific plans have subsequently been absorbed into cities through annexation. Table 4.2-E (Adopted Specific Plan Developments) provides a summary of Riverside County's specific plans.

As of 2009, specific plans encompassed nearly 65,500 acres (or 1.4%) of unincorporated Riverside County, primarily in the western and southwestern portions of the county. In total, approved specific plans within Riverside County are calculated to encompass approximately 92,000 planned housing units, approximately 37% (34,000 units) of which have been built through 2009.

3. Public Airports and Airport Land Use Plans

There are a total of 14 public airports located within or affecting Riverside County territory. Their locations are shown in Figure 4.2.6 (Public Airport Locations in Riverside County). These airports can be grouped into three categories:

a. Public Use General Aviation Airports Within Unincorporated Areas

Flabob Airport: Affects portions of the Jurupa Area Plan. (Now located within the newly incorporated City of Jurupa Valley, but treated as unincorporated since the City of Jurupa Valley's incorporation occurred after the April 2009 NOP issue date for this EIR.)

French Valley Airport: Affects portions of the Southwest Area Plan.

Hemet-Ryan Airport: Affects portions of the Southwest and Harvest Valley/Winchester Area Plans.

Bermuda Dunes Airport: Affects portions of the Western Coachella Valley Area Plan.

Jacqueline Cochran Regional Airport: Affects portions of the Eastern Coachella Valley Area Plan.

Chiriaco Summit Airport: This small facility affects portions of Eastern Coachella Valley Area Plan.

Blythe Airport: Affects portions of the Palo Verde Valley Area Plan. (Located outside City of Blythe.)

b. Public Use General Aviation Airports Located in Cities

These public, general aviation airports are located within cities, but also affect a portion of unincorporated Riverside County.

Corona Municipal Airport: Located in Corona; affects portions of the Temescal Canyon Area Plan.

Chino Airport: Located in Chino, San Bernardino County; affects portions of the Eastvale Area Plan.

Riverside Municipal Airport: Located in the City of Riverside; affects portions of the Eastvale and Jurupa Area Plans.

Perris Valley Airport: Located in Perris; does not affect any of unincorporated Riverside County.

Palm Springs International Airport: Located in Palm Springs; affects portions of the Western Coachella Valley Area Plan.

Banning Municipal Airport: Located in Banning; affects portions of (San Gorgonio) Pass Area Plan.

c. Military Facilities

March Air Reserve Base (MARB): *The March Air Force Base was established in 1918 and has operated almost continually since. In 1993, March Air Force Base transformed from an operational Air Force Base to an Active Duty Reserve Base, effective in 1996. Shortly afterward, the Air Force and March Joint Powers Authority (JPA) formally signed a "Joint Use Agreement," for the shared use of the airfield facilities. The JPA is comprised of the County, and the Cities of Moreno Valley, Perris, and Riverside. The March JPA regulates, manages and operates the March Inland Port, targeted for air cargo operations. Thus, March Air Reserve Base (MARB) now accommodates both military aircraft and civilian aircraft. The County of Riverside Airport Land Use Commission administers a comprehensive land use plan (CLUP) for operation of the aviation field, to ensure that land uses in and around the airport are compatible.*

MARB affects ~~a large swath of~~ western Riverside County, including portions of the Harvest Valley/Winchester, Highgrove, Lake Mathews/Woodcrest, Mead Valley, Lakeview/Nuevo and Reche Canyon/Badlands Area Plans. *MARB is located* on federal land amid the cities of Moreno Valley, Perris and Riverside. ~~MARB accommodates both military aircraft and civilian aircraft.~~ Most of the military flights at MARB are route-type flights by fixed wing aircraft.

Chocolate Mountain Aerial Gunnery Range (CMAGR): This naval training facility spans 460,000 acres of Riverside and Imperial counties east of the Salton Sea. Roughly 108,000 acres of the site's BLM and U.S. Department of Defense lands are within the county, mostly falling in the Eastern Coachella Valley Area Plan, with lesser amounts within the Far Eastern Desert area not covered under a stand-alone Area Plan. The CMAGR is actively used for military training exercises involving ground troops and, in particular, military aircraft. Both rotary wing and fixed wing aircraft frequent the site, including jets traveling occasionally at supersonic speeds. The CMAGR averages over 300 days of use annually, including 6,000-7,000 training sorties annually for fixed wing aircraft (one sortie represents one flight by one aircraft from takeoff to landing, but may include any number of bombing, strafing or other training runs). Sorties per day tend to average between five and roughly 20 for most CMAGR airspace areas. See Section 4.15 (Noise) for additional information on the CMAGR.

d. Airport Land Use Compatibility Plans and Airport Influence Areas

Airports in Riverside County provide an important travel function for passengers, as well as benefit the regional economy ~~for passengers as well as benefit and regional economies.~~ Future population growth in Riverside County would create additional demand for air transportation. At the same time, growth and urbanization can ~~also~~ threaten existing *and* ~~as well as~~ future airports by introducing incompatible land uses, people and property into airport~~s'~~ vicinities. To protect airports' future expansion needs from encroaching incompatible land uses, and to ensure the public is protected from excessive noise and air-related safety hazards, the State Aeronautics Act (Public Utilities Code Section 21670 *et seq.*) calls for the adoption of airport land use compatibility plans by the Riverside County Airport Land Use Commission (ALUC). *This will* ~~to~~ ensure that existing and future land uses planned around public use airports are compatible and safe~~ty~~.

As defined by the Riverside County Airport Land Use Commission, all of the public airports listed in Table 4.2-F (Air Facilities In and Around Riverside County), except Palm Springs International and Perris Valley, have influence areas that affect lands within unincorporated areas of Riverside County. These *influence areas* are mapped in the Riverside County General Plan. For more details, refer to the appropriate Area Plan's Airport Influence Area section for the airport in question.

Since 2004, the Riverside County ALUC has adopted new airport land use compatibility plans for all but three of the fourteen airports addressed in the General Plan (see Table 4.2-F). March Air Reserve Base/*March Inland Airport*, Hemet-Ryan *Airport* and Perris Valley Airport~~s~~ *use airport land use compatibility plans adopted before 2004* ~~do not yet have completed land use compatibility plans~~. *As required by state law, an airport land use compatibility plan has been adopted for all public use and military airports in the county. Preparation of compatibility plans for private use airports is at the discretion of the ALUC.* ~~either this plan or an earlier one has been adopted for all of the public use and military airports in the county, while preparation of compatibility plans for private use airports is at the option of ALUC.~~ Private air facilities are also included in the table; they are not required to have ACLUPs, but still must conform to FAA requirements regarding airspace and airport operations. The location of the public-serving airport facilities in the county are shown in Figure 4.2.6 (Public Airport Locations in Riverside County).

As developable land becomes increasingly scarce, growth pressures may lead to the encroachment of urban development adjacent to airports. Such encroachment can result in conflicts between the new uses and the goals and policies outlined in local airport's Airport Land Use Plan. Hence, one of the functions of Riverside County's General Plan is to ensure consistency with the purposes of the airport land use laws and ALUC compatibility plans via the land use plans and policies of the General Plan. Under the existing General Plan, future development has the potential to encroach on lands adjacent to public airports. The policies and land use designation changes proposed in GPA No. 960 would serve to improve coordination and compatibility between airport land use plans and the surrounding land uses.

The Public Resources Code (PRC) creates a connection between the Airport Land Use Planning Handbook (ALUPH) and CEQA documents, such as this EIR. Specifically, PRC Section 21096 requires that lead agencies must use it as "a technical resource" when assessing airport-related noise and safety impacts of projects located in the vicinity of airports. The most recent edition of the ALUPH was completed in January 2002 and is available from the Caltrans Division of Aeronautics website at (www.dot.ca.gov/hq/planning/aeronaut). Airport master plans primarily deal with onsite airport activities while an ACLUP mainly deals with offsite airport land use compatibility issues.

CPUC Section 21675(a) requires that ALUC plans be based on a long-range airport master plan. If such a plan does not exist for a particular airport, an airport layout plan may be used, subject to approval by the California Division of Aeronautics. Thus, the ACLUP for each airport within an ALUC's the jurisdiction is based on the

respective airport master plan or, as allowed by the statutes, a State-approved airport layout plan. State law also requires each local agency having jurisdiction over land uses within an ALUC planning area to modify its general plan and any affected specific plans to be consistent with the ACLUP. A local agency may only overrule ALUC by a two-thirds vote of its governing body after making findings that the agency's plans are consistent with the intent of State of California airport land use planning statutes. Additionally, the local agency must notify both ALUC and the California Division of Aeronautics at least 45 days in advance of its decision to overrule and must hold a public hearing on the proposed overruling (CPUC Section 21676(a) and (b)).

A general plan does not need to be identical with an ACLUP in order to be consistent with it. To meet the consistency test, a general plan must specifically address compatibility planning issues *(*either directly or through reference to a zoning ordinance or other policy document*),* and it must avoid direct conflicts with compatibility planning criteria. In general, GPA No. 960 includes LUD updates where necessary to ensure consistency with ACLUPs. However, in three cases this step is not included in GPA No. 960. Current General Plan LUDs reflecting an existing built community differ from the most recent ACLUP for the Bermuda Dunes Airport. Similar issues with the existing General Plan occur for the French Valley and Jackie Cochran airports due to prior approved specific plans.

Due to the processing complexities involved in resolving such issues, associated LUD changes for these areas are not proposed as part of GPA No. 960. Rather, GPA No. 960 does not change either the existing baseline conditions for these three ALUP areas, nor propose any future development changes. Further, the General Plan includes policies (LU 15.2-15.6) requiring land use proposals be consistent with both plans prior to application approval. Thus, for any proposed projects within the three unaddressed ACLUP areas, ALUC consistency reviews and findings (or Board of Supervisors overruling findings) are required*. This* ~~and~~ would address ~~these~~ compatibility issues at the level of individual future development proposals, should they occur (independent of GPA No. 960).

4.2.3 Policies and Regulations Addressing Land Use

A. State Regulations

1. California Planning and Zoning Law

The legal framework in which California cities and counties exercise local planning and land use functions is set forth in the California Planning and Zoning Law, Sections 65000 - 66499.58. Under State of California planning law, each city and county must adopt a comprehensive, long-term general plan. State law gives cities and counties wide latitude in how a jurisdiction may create a general plan, but there are fundamental requirements that must be met. These requirements include the inclusion of seven mandatory elements described in the Government Code, including a section on land use. Each of the elements must contain text and descriptions setting forth objectives, principles, standards, policies and plan proposals; diagrams and maps that incorporate data and analysis; and mitigation measures.

2. Subdivision Map Act

This Act (CGC Section 66410, et seq.) establishes statewide uniformity in local subdivision procedures, while giving the cities and counties the authority to regulate the design and improvement of subdivisions, require dedications of public improvements or related impacts fees and require compliance with the objectives and

policies of the general plan. This includes the authority to approve and design street alignments, grades and widths, drainage and sanitary facilities, lot size and configuration, traffic access and other measures, "as may be necessary or convenient to insure consistency with, or implementation of, the general plan or any applicable specific plan" (CGC Sections 66418 and 66419). Accordingly, these regulatory powers are the basis by which the County of Riverside promotes and implements the various policies and procedures outline in Riverside County's General Plan.

3. California Office of Planning and Research (OPR) General Plan Guidelines

To assist local governments in meeting general plan requirements, the OPR is required to adopt and periodically revise guidelines for the preparation and content of general plans (Government Code Section 65040.2). These are advisory guidelines, not mandated requirements, and serve as a reference tool for cities and counties in the preparation of local general plans. The guidelines include information on the required contents of a general plan, sustainable development and environmental justice, formatting, public participation and implementation.

4. State Aeronautics Act

This Act (Public Utilities Code [PUC] Section 21001 et seq.) requires that Airport Land Use Commission prepare airport land use compatibility plans (ALUCPs). ALUCPs promote compatibility between airports and the land uses that surround them to the extent that these uses are not already developed with incompatible land uses. They are intended to protect the safety of people, property and aircraft on the ground and in the air in the vicinity of the airport. They also address measures to ensure noise protection through land use planning and other measures.

B. Riverside County Regulations

1. Riverside County Ordinances

These existing Riverside County ordinances implement and guide various aspects of land use development, while protecting existing uses, people and property within Riverside County from conflict.

Ordinance No. 348 - Zoning and Land Use Ordinance: Establishes allowable uses of land and sets standards for what and how land may be developed. Protects the people and property of Riverside County from development of unsuitable land uses and ensures built areas are developed safely and with minimal conflict with surrounding lands.

Ordinance No. 448 - Airport Approaches Zoning: This ordinance was adopted pursuant to the Airport Approaches Zoning Law, (CGC Sections 50485-50485.14) and shall be liberally construed in support of the purposes and provisions within Section 50485-50485.14. Any proceedings for additions or amendments to the official plan of airports are required to conform to this ordinance.

Ordinance No. 460 - Subdivision Regulations: This ordinance regulates subdivisions pursuant to the Subdivision Map Act. All land divisions throughout unincorporated Riverside County are subject to all of the applicable provisions of the Subdivision Map Act and this ordinance.

Ordinance No. 461 - Road Improvement Standards and Specifications: This ordinance establishes proper standards, specifications and directions for the design and construction of any road or other land division improvements required to be constructed in the unincorporated territory of Riverside County.

Ordinance No. 509 - Agricultural Preserves: This ordinance establishes uniform rules for the agricultural and compatible uses allowed within an agricultural preserve. The ordinance ensures that incompatible uses are not allowed within established agricultural preserves and sets forth the powers of the County of Riverside in establishing and administering agricultural preserves pursuant to the California Land Conservation Act of 1965 (CGC Section 51200, et seq.), which are to be devoted to agricultural and compatible uses. Land uses not covered in the ordinance are prohibited within agricultural preserves.

Ordinance No. 576 - Regulating County Airports: The purpose of this ordinance is to provide minimum standards to safeguard life, limb, property and public welfare by regulating and controlling the various activities on airports, heliports or STOL (short takeoff and landing) ports owned or operated, or both, by the County of Riverside.

Ordinance No. 659 - Development Mitigation Fee for Residential Development: This ordinance establishes an impact mitigation fee to help mitigate the impacts caused by new developments on public facilities within Riverside County. The fees will be used to help establish new County of Riverside facilities that are necessary to meet the increased demand that will come about due to new development. These facilities include new fire and police stations, courts, libraries, regional parks and other facilities necessary to provide services to the residents of Riverside County.

Ordinance No. 671 - Consolidated Fees for Land Use and Related Functions: The purpose of this ordinance is to provide for the consolidation of certain schedules of fees related to the land use matters as provided for in the separate ordinances, resolutions and rules of the County of Riverside.

Ordinance No. 673 - Establishing the Coachella Valley Transportation Uniform Mitigation Fee: This ordinance establishes a mitigation fee program for funding the engineering, the purchase of right-of-way and construction of transportation improvements required of land developments within the Coachella Valley.

Ordinance No. 726 - Transportation Management Requirements - New Development Projects: This ordinance is intended to meet the requirements of the Riverside County Congestion Management Program and the Air Quality Management Plan as well as to promote consideration of transportation demand management objectives early in the development review process. Often, conventional land development promotes reliance on the single occupancy vehicle. This ordinance establishes policies and procedures to encourage and promote the use of alternative transportation modes through project design and facility planning.

Ordinance No. 748 - Traffic Signal Mitigation Program: This ordinance establishes a means of equitably assessing the costs of Traffic Signal installations needed to mitigate the cumulative environmental impacts resulting from the additional traffic generated by new development projects.

Ordinance No. 824 - Western Riverside County Transportation Uniform Mitigation Fee (TUMF) Program: This ordinance establishes fees to fund the mitigation of cumulative regional transportation impacts resulting from future development. The mitigation fees collected through the TUMF program will be utilized to complete transportation system capital improvements necessary to meet the increased travel demand and to sustain current levels of traffic.

Ordinance No. 875 - Establishing a Local Development Mitigation Fee for Funding the Preservation of Natural Ecosystem Accordance with the Coachella Valley Multiple Species Habitat Conservation Plan: This ordinance is to establish a Local Development Mitigation Fee to aid in maintaining biological diversity and their supporting natural ecosystem processes; the protection of vegetation communities and natural areas within the county, Coachella Valley and surrounding mountains located in central Riverside County which are known to support threatened, endangered or key sensitive populations of plant and wildlife species; the maintenance of economic development within the unincorporated area of Riverside County by providing a streamlined regulatory process from which development can proceed in an orderly process; and the protection of the existing character of Riverside County and the region through the implementation of a system of reserves to provide permanent open space, community edges and habitat conservation for species covered by the MSHCP.

2. Multiple Species Habitat Conservation Plans (MSHCPs)

A Multiple Species Habitat Conservation Plan (MSHCP) is a comprehensive, multi-jurisdictional Habitat Conservation Plan (HCP) focusing on conservation of species and their associated habitats in Riverside County. Several such plans affect lands within Riverside County. The two preeminent plans affecting the largest portions of the county are the Western Riverside County MSHCP and the Coachella Valley MSHCP. Each of these plans coordinates multi-jurisdictional habitat-planning and conservation efforts in Southern California with the overall goal of maintaining biological and ecological diversity while accommodating appropriate development and infrastructure needs. The MSHCPs allow Riverside County and participating cities to maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts. Towards these ends, Riverside County maintains and tracks all of the acquisitions and conservation of lands and periodically updates the General Plan Land Use maps accordingly.

C. Existing Riverside County General Plan Policies

The following existing General Plan polices address various facets of land use planning and regulation within the County of Riverside.

1. Land Use (LU) Element Policies

Policy LU 1.1: Allow for the continued occupancy, operation and maintenance of legal uses and structures that exist at the time of the adoption of the General Plan and become non-conforming due to use, density and/or development requirements.

Policy LU 1.3: Notify city planning departments of any discretionary projects within their respective spheres-of-influence in time to allow for coordination and to comment at public hearings.

Policy LU 1.6: Coordinate with local agencies, such as LAFCO, service providers and utilities, to ensure adequate service provision for new development.

Policy LU 1.8: As required by the Airport Land Use Law, submit certain proposed actions to the Riverside County Airport Land Use Commission for review. Such actions include proposed amendments to the general plan, area plans, or specific plans, as well as proposed revisions to the zoning ordinance and building codes.

Policy LU 2.1: Accommodate land use development in accordance with the patterns and distribution of use and density depicted on the General Plan Land Use Map (Figure LU-1) and the Area Plan Land Use Maps, in accordance with the following:

a. Provide a land use mix at the countywide and area plan levels based on projected need and supported by evaluation of impacts to the environment, economy, infrastructure, and services.

b. Accommodate a range of community types and character, from agricultural and rural enclaves to urban and suburban communities.

c. Provide for a broad range of land uses, intensities, and densities, including a range of residential, commercial, business, industry, open space, recreation, and public facilities uses.

d. Concentrate growth near community centers that provide a mixture of commercial, employment, entertainment, recreation, civic, and cultural uses to the greatest extent possible.

e. Concentrate growth near or within existing urban and suburban areas to maintain the rural and open space character of Riverside County to the greatest extent possible.

f. Site development to capitalize upon multi-modal transportation opportunities and promote compatible land use arrangements that reduce reliance on the automobile.

g. Prevent inappropriate development in areas that are environmentally sensitive or subject to severe natural hazards.

Policy LU *8.8* (Previously LU 7.8): Stimulate industrial/business-type clusters that facilitate competitive advantage in the marketplace, provide attractive and well landscaped work environments, and fit with the character of our varied communities.

Policy LU *9.2* (Previously LU 8.2): Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the General Plan and federal and state regulations such as CEQA, NEPA, the Clean Air Act and the Clean Water Act.

Policy LU *9.3* (Previously LU 8.3): Incorporate open space, community greenbelt separators, and recreational amenities into Community Development areas in order to enhance recreational opportunities and community aesthetics, and improve the quality of life. (AI 9, 28)

Policy LU *15.2* (Previously LU 14.2): Review all proposed projects and require consistency with any applicable airport land use compatibility plan as set forth in [General Plan] Appendix L*-1* and as summarized in the Area Plan's Airport Influence Area section for the airport in question.

Policy LU *15.8* (Previously LU 14.6): In accordance with FAA [Federal Aviation Administration] criteria, avoid locating sanitary landfills and other land uses that are artificial attractors of birds within 10,000 feet of any runway used by turbine-powered aircraft and within 5,000 feet of other runways. Also avoid locating attractors of other wildlife that can be hazardous to aircraft operations in locations adjacent to airports. (AI 3)

Policy LU *21.2* (Previously LU 17.2): Require that adequate and available circulation facilities, water resources, sewer facilities and/or septic capacity exist to meet the demands of the proposed land use.

Policy LU *21.3* (Previously LU 17.3): Ensure that development does not adversely impact the open space and rural character of the surrounding area.

Policy LU *28.2* (Previously LU 22.2): Accommodate higher-density residential development near community centers, transportation centers, employment and services areas.

Policy LU *28.6* (Previously LU 22.6): Require setbacks and other design elements to buffer residential units to the extent possible from the impacts of abutting agricultural, roadway, commercial and industrial uses.

Policy LU *28.9* (Previously LU 22.9): Require residential projects to be designed to maximize integration with and connectivity to nearby community centers, rural villages and neighborhood centers.

Policy LU *30.3* (Previously LU 24.3): Protect industrial lands from encroachment of incompatible or sensitive uses, such as residential or schools, that could be impacted by industrial activity.

Policy LU *30.4* (Previously LU 24.4): Concentrate industrial and business park uses in proximity to transportation facilities and utilities, and along transit corridors.

Policy LU *30.6* (Previously LU 24.6): Control the development of industrial uses that use, store, produce or transport toxins, generate unacceptable levels of noise or air pollution, or result in other impacts.

Policy LU *31.1* (Previously LU 25.1): Accommodate the development of public facilities in areas appropriately designated by the General Plan and area plan land use maps.

Policy LU *31.3* (Previously LU 25.3): Require that new public facilities protect sensitive uses, such as schools and residences, from the impacts of noise, light, fumes, odors, vehicular traffic, parking and operational hazards.

Policy LU *32.12* (Previously LU 26.12): Since it is a land use designation within the Community Development Foundation Component, the Community Center designation may be enlarged, reduced, added, or eliminated for any site within a Community Development area through quarterly General Plan amendments (GPAs). However, the area of any one Community Center (whether included in the General Plan at the time of its initial adoption or subsequently added through a general plan amendment) shall not be permitted to be enlarged by a cumulative total (through one or more GPAs) of more than 10% during any eight-year certainty period.

Policy LU *36.1* (Previously LU 31.1): Preserve the character of Eastern Riverside County Desert Areas through application of those land use designations reflected on [General Plan] Figure LU-6, Eastern Riverside County Desert Areas Land Use Plan.

2. Circulation (C) Element Policies

Policy C 1.1: Design the transportation system to respond to concentrations of population and employment activities, as designated by the Land Use Element and in accordance with the [General Plan] Circulation Plan, Figure C-1.

Policy C 1.2: Support development of a variety of transportation options for major employment and activity centers, including direct access to transit routes, primary arterial highways, bikeways, park-n-ride facilities and pedestrian facilities.

Policy C 1.4: Utilize existing infrastructure and utilities to the maximum extent practicable and provide for the logical, timely and economically efficient extension of infrastructure and services.

Policy C 1.5: Evaluate the planned circulation system as needed to enhance the arterial highway network to respond to anticipated growth and mobility needs.

Policy C 1.7: Encourage and support the development of projects that facilitate and enhance the use of alternative modes of transportation, including pedestrian-oriented retail and activity centers, dedicated bicycle lanes and paths, and mixed-use community centers.

Policy C 3.11: Generally locate commercial and industrial land uses so that they take driveway access from General Plan roadways with a classification of Secondary Highway or greater, consistent with design criteria limiting the number of such commercial access points and encouraging shared access. Exceptions to the requirement for access to a Secondary Highway or greater would be considered for isolated convenience commercial uses, such as stand-alone convenience stores or gas stations at an isolated off-ramp in a remote area. Industrial park type developments may be provided individual parcel access via an internal network of Industrial Collector streets.

Policy C 3.12: Improve highways serving as arterials through mountainous and rural areas to adequately meet travel demands and safety requirements while minimizing need for excessive cut and fill.

Policy C 3.16: Dedicate necessary rights-of-way as part of the land division and land use review processes.

Policy C 3.21: Consider granting a reduction in improvement requirements for land divisions involving parcels greater than 20 acres in size and designated as agriculture on the General Plan Land Use map.

Policy C 3.30: Design roadways to accommodate wildlife crossings whenever feasible and necessary.

Policy C 3.31: Through the development review process, identify existing dirt roads serving residential areas which may be impacted by traffic from new developments and design new developments such that new traffic is discouraged from using existing dirt roads. When this is unavoidable, require that new developments participate in the improvement of the affected dirt roads.

Policy C 4.1: Provide facilities for the safe movement of pedestrians within developments, as specified in the County ordinances regulating the division of land of the County of Riverside.

Policy C 4.6: Consult the County Transportation Department as part of the development review process regarding any development proposals where pedestrian facilities may be warranted. The County may require both the dedication and improvement of the pedestrian facilities as a condition of development approval.

Policy C 6.1: Provide dedicated and recorded public access to all parcels of land, except as provided for under the statutes of the State of California.

Policy C 6.2: Require all-weather access to all new development.

Policy C 7.2: Work with property owners to reserve right-of-way for potential CETAP corridors through site design, dedication and land acquisition, as appropriate.

Policy C 7.4: Coordinate with transportation planning, programming and implementation agencies such as Caltrans, Riverside County Transportation Commission, Western Riverside Council of Governments, Coachella Valley Association of Governments, and the cities of Riverside County on various studies relating to freeway, high occupancy vehicle/high occupancy toll lanes, and transportation corridor planning, construction, and improvement in order to facilitate the planning and implementation of an integrated circulation system.

Policy C 7.8: Collaborate with all incorporated cities and all adjacent counties to implement and integrate right-of-way requirements and improvement standards for General Plan roads that cross jurisdictional boundaries. Detailed procedures have been developed and include the following:

a. For development under County jurisdiction but within the sphere of influence (SOI) of a city having roadway standards different from the County, city and County staff will cooperate and agree on a reasonable choice of design standards for the particular circumstances involved, and negotiate logical transitions from city to County standards.

b. In general, for such development under County jurisdiction but within the SOI of an incorporated jurisdiction, city standards should apply if the staffs concur that annexation to the city will logically occur in the short to intermediate range future. Where annexation seems doubtful into the long term future, County standards should apply.

c. Transition areas at meeting points of roadways designed to differing city and County standards or differing functional classifications should be individually designed to facilitate satisfactory operational and safety performance. Further, the County should update the road standards to reflect the intent of this policy and standards agreed upon by the County and other local agencies.

Policy C 8.5: Participate in the establishment of regional traffic mitigation fees and/or road and bridge benefits districts to be assessed on new development. The fees shall cover a reasonable share of the costs of providing local and subregional transportation improvements needed for serving new development in the unincorporated area.

Policy C *20.9* (Previously C 20.7): Incorporate specific requirements of the Western Riverside County Multiple Species Habitat Conservation Plan and the Coachella Valley Multiple Species Habitat Conservation Plan into transportation plans and development proposals.

Policy C *20.10* (Previously C 20.8): Avoid, where practicable, disturbance of existing communities and biotic resource areas when identifying alignments for new roadways or for improvements to existing roadways and other transportation system improvements.

3. Multipurpose Open Space (OS) Element Policies

Policy OS 6.1: During the development review process, ensure compliance with the Clean Water Act's Section 404 in terms of wetlands mitigation policies and policies concerning fill material in jurisdictional wetlands.

Policy OS 8.1: Cooperate with federal and State agencies to achieve the sustainable conservation of forest land as a means of providing open space and protecting natural resources and habitat lands included in the MSHCPs.

D. Proposed New or Revised County General Plan Policies

The following proposed polices address issues related to land use planning and regulation.

1. Land Use (LU) Element Policies

Policy LU 1.5: The County shall participate in regional efforts to address issues of mobility, transportation, traffic congestion, economic development, air and water quality, ~~and~~ watershed and habitat management~~, child care~~ with cities, local and regional agencies, stakeholders, Indian nations and surrounding jurisdictions.

Policy LU 1.7: ~~Within five years of the adoption of this General Plan, r~~ *R*eview all Specific Plans that have been in effect for 20 or more years in order to determine whether the types and intensities of proposed development remain appropriate for undeveloped areas within the Specific Plan boundaries. In conjunction with each Foundation General Plan Amendment (eight-year) cycle, prepare a report on Specific Plan implementation addressing all Specific Plans, with particular attention to Specific Plans that have reached their twentieth anniversary during that eight-year period.

Policy LU 3.1: Accommodate land use development in accordance with the patterns and distribution of use and density depicted on the General Plan Land Use Maps (Figure LU-1) and the Area Plan Land Use Maps in accordance with the following concepts:

a. Accommodate communities that provide a balanced mix of land uses, including employment, recreation, shopping, *public facilities* ~~child care~~ and housing. ~~Encourage the siting of child care centers compatible with community needs, land use and character, and encourage such centers to be available, accessible and affordable for all economic levels.~~

b. Assist in and promote the development of infill and underutilized parcels which are located in Community Development areas, as identified on the General Plan Land Use Map.

c. Promote parcel consolidation or coordinated planning of adjacent parcels through incentive programs and planning assistance.

d. Create street and trail networks that directly connect local destinations, and that are friendly to pedestrians, equestrians, bicyclists, and others using non-motorized forms of transportation.

e. Re-plan existing urban cores and specific plans for higher density, compact development as appropriate to achieve the RCIP Vision.

f. In new towns, accommodate compact, transit adaptive infrastructure (based on modified standards that take into account transit system facilities or street network).

g. Provide the opportunity to link communities through access to multi-modal transportation systems.

Policy LU 5.4: Ensure that development and conservation land uses do not infringe upon existing *essential public facilities and* public utility corridors, ~~including~~ *which include County regional landfills,* fee-owned rights of-way and permanent easements, whose true land use is that of "public facilities." This policy will ensure that the "public facilities" designation governs over what otherwise may be inferred by the large scale general plan maps.

Policy LU *7.6* (Previously LU 6.7): *Require* ~~B~~*b*uffer*ing to the extent possible* and/or *the* maintain*ing of* a natural edge for proposed development directly adjacent to ~~n~~*N*ational ~~f~~*F*orests.

Policy LU *9.1* (Previously LU 8.1): Provide for permanent preservation of open space lands that contain important natural resources, *cultural resources,* hazards, water features, watercourses *including arroyos and canyons*, and scenic and recreational values.

Policy LU *9.4* (Previously LU 8.4): Allow development clustering and/or density transfers in order to preserve open space, natural resources, *cultural resources,* and/or biologically sensitive resources. *Wherever possible, development on parcels containing 100-year floodplains and blue line streams and other higher-order watercourses and areas of steep slopes adjacent to them shall be clustered so as to keep development out of the watercourse and adjacent steep slope areas, and to be compatible with other nearby land uses.*

Policy LU *15.3* (Previously LU 14.3): Review all subsequent amendments to any airport land use compatibility plan and either *amend the General Plan to be consistent with the compatibility plan* ~~adopt the plan as amended~~ or overrule the Airport Land Use Commission as provided by law (Government Code Section 65302.3).

Policy LU *21.4* (Previously LU 17.4): Encourage clustered development where appropriate on lots smaller than the underlying land use designation would allow. *The density yield of the underlying land use designation may be clustered on one-half acre lots; however, for sites located adjacent to the Community Development Foundation Component, 10,000 square foot minimum lots may be considered.* ~~While lot sizes may vary, the overall project density must not exceed that of the underlying land use designation unless associated with an incentive program.~~

Policy LU *25.2* (Previously LU 19.2): Provide for a balanced distribution of recreational amenities. ~~in Open Space, Rural and Community Development General Plan land uses.~~

Policy LU *28.5* (Previously LU 22.5): Integrate a continuous network of parks, plazas, public squares, bicycle trails, transit systems and pedestrian paths *into new communities and developments* to provide both connections within each community and linkages with surrounding features and communities.

***NEW* Policy LU 29.10:** *Floor to Area Ratio (FAR) is intended for planning purposes only. The Planning Director or his/her designee shall have the discretion to authorize use of a FAR that is less intense in order to encourage good project design and efficient site utilization.*

***NEW* Policy LU 30.9:** *Floor to Area Ratio (FAR) is intended for planning purposes only. The Planning Director or his/her designee shall have the discretion to authorize use of a FAR that is less intense in order to encourage good project design and efficient site utilization.*

Policy LU *31.2* (Previously LU 25.2): Protect major public facilities, such as landfill and solid waste *processing* ~~disposal~~ sites and airports, from the encroachment of incompatible uses.

2. Circulation (C) Element Policies

Policy C 1.3: Support the development of transit connections *between Riverside County and regional activity centers in other counties as well as transit connections* that link the Community Centers located throughout the county and as identified in the Land Use Element and in the individual Area Plans.

Policy C 3.17: Ensure dedications are made, where necessary, for additional rights-of-way or easements outside the road right*s*-of-way ~~that are~~ needed to establish slope stability, ~~or~~ drainage and *related* structures. These dedica-

tions shall be made by land dividers or developers to the responsible agency during the land division and land use review process.

Policy C 4.3: Assure *and facilitate* pedestrian access from developments to existing and future transit routes and terminal facilities through project design.

Policy C *4.8* (Previously C 4.9): Coordinate with all transit operators to ensure that *ADA compliant* pedestrian facilities are provided along and/or near all transit routes, whenever feasible. New land developments may be required to provide pedestrian facilities due to existing or future planned transit routes even if demand for pedestrian facility *may* ~~is~~ not *be* otherwise warranted.

Policy C *4.9* (Previously C 4.10): Review all existing roadways without pedestrian facilities when they are considered for improvements ~~(whether maintenance or upgrade)~~ to determine if new pedestrian facilities are warranted. New roadways should also be assessed for pedestrian facilities.

Policy C 6.3: Limit access points and intersections of streets and highways based upon the road's General Plan classification and function. *Require that* ~~A~~ *a*ccess points ~~must~~ be located ~~a sufficient distance away from major intersections to allow for safe, efficient operation~~ *so that they comply with Riverside County's minimum intersection spacing standards. Under special circumstances the Transportation Department may consider exceptions to this requirement*.

Policy C 7.1: Work with incorporated cities to mitigate the cumulative impacts of incorporated and unincorporated development on the countywide transportation system.

Policy C 7.3: Incorporate the Regional Transportation Plan *of the Southern California Association of Governments (SCAG) and*~~,~~ the Riverside County Congestion Management Program~~, and the Riverside County Short- and Long-Range Transit Plans~~ into the Circulation Element and ~~encourage~~ *with* the active participation of Caltrans*, work to expedite* the design *and implementation* of state highway capital improvement projects.

Policy C 7.6: Support ~~the development of a new internal East West CETAP Corridor in conjunction with a new Orange County CETAP connection. Such corridor(s) would be constructed simultaneously to avoid further congestion on Interstate 15. Or, in the alternative, the East-West Corridor, would be constructed simultaneously with~~ major capacity enhancements on ~~the~~State Route 91, between ~~Pierce Street~~ *the counties of Riverside* and ~~the~~ Orange ~~county line and the capacity improvement of Interstate 15 (north) to westbound State Route 91 overpass~~.

Policy C 7.9: Review development applications in cooperation with RCTC and as appropriate, to identify the precise location of CETAP corridors and act to preserve such areas from any permanent encroachments, pending dedication or acquisition. *Coordinate with RCTC to evaluate and update the CETAP corridors periodically as conditions warrant.*

Policy C 8.7: Review and update the County *of Riverside* Road and Bridge Benefit District fee structure ~~for~~*and* development impact fees ~~annually~~ *periodically* to ensure that capacity expansion projects are developed and constructed in a timely manner.

Policy C 15.3: Develop a trail system which connects *Riverside* County parks and recreation areas while providing links to open space areas, equestrian communities, local municipalities and regional recreational facilities (including other regional trail systems)*, and ensure that the system contains a variety of trail loops of varying classifications and degrees of difficulty and length*.

Policy C 15.4: *Periodically* ~~R~~ review and update the *Trails and Bikeways Plan ([General Plan] Figure C-7)* ~~Regional Trail Map~~ in accordance with the review procedures and schedule of the General Plan, in order to *ensure* ~~assure~~ *its* compatibility with the other ~~elements~~ *components* of the *Riverside* County General Plan, and with the similar plans of *agencies, such as* Western Riverside County Council of Governments *(WRCOG),* Coachella Valley Association of Governments *(CVAG)*, Riverside County Transportation Commission *(RCTC)*, *Regional Conservation Authority, Riverside County Habitat Conservation Authority* and all jurisdictions within and abutting Riverside County. *This shall include consistency with the WRCOG and CVAG non-motorized planning documents.*

3. Multipurpose Open Space (OS) Element Policies

Policy OS *17.1* (Previously OS 17.3): Enforce the provisions of applicable MSHCPs~~, if adopted,~~ when conducting review of possible *legislative actions, such as* general plan amendments*,* ~~and/or~~ zoning *ordinance amendments, etc.* ~~changes.~~

Policy OS *17.2* (Previously OS 17.1): Enforce the provisions of applicable MSHCPs~~, if adopted,~~ when conducting review of development applications.

Policy OS *17.3* (Previously OS 17.2): Enforce the provisions of applicable MSHCPs~~, if adopted,~~ when developing transportation or infrastructure projects that have been designated as covered activities in the applicable MSHCP.

Policy OS 18.1: Preserve multi-species habitat resources in the County of Riverside through the enforcement of the provisions of applicable MSHCPs~~, if adopted~~.

4.2.4 Thresholds of Significance for Land Use

The project would result in a significant impact on land use if it would:

A. Physically divide an established community.

B. Conflict with any applicable land use plan, policy or regulation or an agency with jurisdiction over the project (including, but not limited to, the general plan) adopted for the purpose of avoiding or mitigating an environmental affect.

C. Conflict with any applicable habitat conservation plan or natural community conservation plan.

4.2.5 Effect of GPA No. 960 on the General Plan and on Land Use

The proposed project, GPA No. 960, includes changes to a variety of General Plan policies, maps and implementing directions related to land use. A detailed description of the individual items encompassed by this project is provided in Section 3.0 (Project Description). Because the General Plan is concerned mainly with the physical build out of Riverside County, many of the changes associated with GPA No. 960 affect planned land usage. In particular, proposed changes affect land use overlays, land use designations and policies that affect the conversion of rural, semi-rural, agricultural and vacant lands to suburban or urban uses in various parts of the county.

Table 4.2-G (Land Uses Under Existing General Plan and Proposed Project), below, shows the acreage covered by each of the General Plan land use designations (LUDs) within unincorporated Riverside County under the existing General Plan and as it would be as a result of adoption of the proposed project for those components of the project with known or foreseeable spatial components. It should be noted that both scenarios in the table represent theoretical build out of Riverside County pursuant solely to the mapped LUDs and the mid-point values established in General Plan Appendix E-1 (as described in detail in Section 4.1 (Environmental Assumptions and Methods) of this EIR). It is not to be construed as representing official or actual build out entitlements for either the existing or proposed General Plan.

Among other things, the proposed project would update or add several land use overlays, land use designations and policies that would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in various locales throughout the county. As with the current General Plan, future development consistent with GPA No. 960 has the potential to introduce people, property and structures into previously undeveloped areas in some locations.

By definition, a general plan is most basically a blueprint for guiding a city or county's future growth and development. As such, the changes to Riverside County's General Plan proposed by GPA No. 960 have the potential to affect the future growth and development of the unincorporated portions of Riverside County in several ways. Some land use changes would serve to increase the development potential (density or intensity) for a given site or area, such as when an existing LUD is changed from Open Space-Water (OS-W), which does not permit development, to Open Space-Rural (OS-RUR), which allows low-density residential development (one home per 20 acres). In terms of environmental impact, if this change occurred on a 100-acre parcel of vacant (undeveloped) land, it could eventually result in the introduction of five new homes.

Similarly, some land use changes would decrease development potential; for example, when land designated in the existing General Plan as "Medium Density Residential" (MDR, 2-5 dwelling units per acre), is reduced to "Estate Density Residential" (EDR, one dwelling unit per 2 acres). Accordingly, a change of this sort on a 100-acre parcel of vacant land could result in the introduction of up to 50 new homes on the site. In this case, it should be noted that the environmental impact is based on the difference between the existing site condition (vacant), rather than the existing General Plan LUD (which would have allowed up to 500 homes on the same parcel). In the given example, the entire 100-acre site would be subject to physical environmental impacts (for example, going from native, undisturbed vegetation to fully graded). And, demographically, the site could be said to theoretically house around 153 new residents, based on Riverside County's average home occupancy rate of 3.06 people per unit.

Lastly, some land use-related project changes would be ascribed as neutral, in that they merely change development potential incrementally, rather than grossly increasing or decreasing it. An example of this would be changing a site's LUD from Medium Density Residential to Business Park. For the vacant 100-acre parcel example, in both cases the entire 100-acre site would be subject to ground-disturbing environmental impacts. The key difference here would be that the residential use would provide new homes and about 150 new residents. These new residents would need schools, medical facilities, libraries and so on. The business park, on the other hand, would provide office and retail jobs instead, and also increase commuter traffic.

Thus, this chapter mainly concerns itself with the two kinds of land use changes with the potential for adverse environmental effects: those resulting in development on land that would have otherwise remained undeveloped and those resulting in development of increased density or intensity compared to that accommodated under the existing General Plan. The other outcomes, which would not adversely affect existing land use, are not discussed further here. Thus, the following proposed GPA No. 960 components are not included: deletion of Rural Village Overlays from the communities of El Cariso, Aguanga and Anza (thus leaving the existing General Plan's base

This page intentionally left blank

LUDs unchanged and in effect); deletion of the San Jacinto Agriculture/Potential Development Study Area (also leaving existing General Plan base LUDs unchanged and in effect).

All of these changes involve elimination of future (unrealized) development potential, rather than changes to any of the existing land uses existing in these areas. Additionally, deletion of such areas does not change the base LUDs underlying the sites; development of which was analyzed previously in EIR No. 441 for the 2003 RCIP General Plan. Likewise, the two new policies affecting potential floor-area-ratios (FARs) for commercial or industrial building footprints (proposed policies LU 29.10 and 30.9) would enable smaller building footprints, rather than increased intensities, and thus would not trigger any additional adverse environmental effects. For further information on the details of the various components of GPA No. 960, see Section 3.0 (Project Description). In terms of overall land use effects, the items proposed under GPA No. 960 would result in the net changes indicated in Table 4.2-G (Land Uses Under Existing General Plan and Proposed Project).

It should be noted that the following projections are based on the assumption that all of the changes proposed under GPA No. 960 actually result in future development and fully build out. That is, it is a theoretical, worst-case scenario that likely over-states the actual development potential in the real-world. The actual future development of the individual parcels and areas affected by GPA No. 960 proposals are subject to the discretion of many hundreds to thousands of individual property owners, including both private individuals, business entities and even various public agencies and other entities. The County of Riverside has little to no control over the decision to propose development (new or redeveloped) on a given site. (Though the County of Riverside will have the discretion to review and approve or deny such development applications for most cases within unincorporated Riverside County). Demand for additional development is often a result of many interrelated factors, including population growth and economic demand, as well as location, local supply (i.e., existing home inventory) and even infrastructure availability (water supply, electricity, etc.)

Table 4.2-G: Land Uses Under Existing General Plan and Proposed Project

GENERAL PLAN LAND USE	Existing GP Acreage	Proposed* Acreage	Change in Acreage	Percent Change
AGRICULTURE FOUNDATION	**189,730**	**188,880**	**-850**	**-0.4%**

San Jacinto Ag/Potential Development Study Area					
Remove RVSA designation. Area to develop per underlying LUDs.	7,660 ac	agri, pf, rural res, sfr, vac; **<1%:** min, util, ranch, ag-res	320 du	AG, LDR-RC, MDR, OS-CH, RM, VLDR-RC; **<1%:** OS-W, VLDR	1,170 du
Sky Valley Rural Village Study Area					
After analysis, no revisions proposed. Development potential remains as per existing General Plan.	100 ac	ind, school, rural res, vac; **<1%:** sfr	10 du	RR	20 du
Habitat Conservation					
Parcels acquired by conservation agencies (RCA) for open space conservation (as OS-CH) under the WRC-MSHCP.	14,890 ac	vac	0 du	OS-CH	0 du
Totals	**111,440 acres**		**5,853 du**		**14,790 du (approx. 150% increase)**

Key:
agri = agriculture/crops
pf = public facilities
util = utilities/infrastructure
rural res = rural residential
Tribe = Indian lands (non-county)
comr = commercial
rec = recreation
sfr = single-family residences
mfr apt = multi-family apartments
du = dwelling units (residences)
ind = industrial
school = schools
mob park = mobile home park
vac = vacant
min = mineral/mining
ranch = animal-agri
ag-res = multiple sfr on lot

Footnotes:
1. Rounded to nearest 10 acres (or nearest 1 acre, if total less than 10 acres). Thus, totals may not sum precisely.
2. Uses and LUDs encompassing less than one-tenth of 1% of the total area of the project component omitted.
3. As determined through visual analysis. See Appendix EIR-3.
4. See General Plan, Table 3, for full Land Use Designation (LUD) descriptions. The "theoretical" values listed here are for comparison purposes and are not equivalent to the official build out projections included in either the existing or proposed General Plan.
5. Theoretical build out = number of dwelling units resulting if 100% of project area developed as per GPA No. 960-proposed LUDs. Includes 60% of Commercial-Retail (CR) acres developing as medium-density residential (MDR).
6. "/RC" indicates LUDs for both the Community Development and Rural Community (RC) Foundations included.
7. Within the areas incorporated as new cities (Eastvale and Jurupa Valley) subsequent to this project's inception.
8. "AG" LUD allows up to 1 du per 20 acres; no residences allowed under "BP" LUD.

Source: Riverside County Planning Department, Project Application, GIS analysis, 2010.

Note: Through the adoption of GPA 1077: Wine Country Community Plan, the Temecula Valley Wine Country Policy Area was created in the Southwest Area Plan. However, the amendment was adopted after the date of the NOP for GPA 960 and as such it is not included within the analysis contained in the Land Use Section of this document. Refer to GPA No. 960 Appendix Q.

4.2.6 Land Use - Impacts and Mitigation

The following land use-related impacts that could result from implementation of the proposed project, GPA No. 960, were evaluated for significance and the need for mitigation, as indicated.

A. Would the project physically divide an established community?

Impact 4.2.A - Physically Divide an Established Community: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. None of the proposed changes, however, are in a location or of an extent that would physically divide an established community. Thus, this impact would be less than significant. Moreover, compliance with existing regulatory programs, Riverside County ordinances and existing General Plan policies would further reduce the already insignificant impact to communities.

1. Analysis of Impact 4.2.A

The physical arrangement of the built environment within Riverside County would change as development is authorized pursuant to the General Plan, including those policies, plans and provisions amended as per the proposed project. In addition to Policy Areas, the General Plan also protects existing communities through a variety of policies, as well as the application of land use designation (LUD) mapping. All of the mapped LUDs in the General Plan fall within Foundation Components, which limit the types and intensities of development. See page LU-38 of the General Plan for additional details on the Foundations, their implementation and use.

In terms of the General Plan changes proposed by GPA No. 960, spatial analysis indicates they would not result in future development that would cause the physical division of an established community through placement of a freeway, railroad, airport, dam or large area of open space. Neither the revisions to the Land Use Element nor the Circulation Element would result in any new significant open space areas, roadway networks or other large-scale infrastructure (canals, freeways, etc.) that could physically divide an establish community. In terms of land use, there are no new large-scale changes to land use designations, especially to open space designations, that would physically divide a community. Areas being designated as Open Space-Conservation Habitat under GPA No. 960 have been selected specifically because of their location away from conflict with urban development. The proposed changes to policy areas and overlays, particularly the rural village study areas and overlays, also serve to further define and clarify expected land use for those areas. They provide guidance to enhance future development, rather than cause future disruptions or divisions. Also, as shown in Table 4.2-G, some of the land use changes proposed under GPA No. 960 would serve to *remove* barriers to development, such as with the Rural Village Overlays, which establish alternate LUDs for rural areas anticipated to urbanize in the future as the County of Riverside grows.

In summary, the General Plan and its Area Plans are able to guide where and how future development will occur through the various means described above. The changes proposed by GPA No. 960 further enhance these means and, as outlined above and in Section 4.2.4 (Thresholds of Significance for Land Use), would not result in the physical division or disruption of any existing community. Further, as outlined below, because the General Plan (in general) and the individual Area Plans (specifically) provide policies that reflect the unique combination of conditions throughout Riverside County, future development accommodated by the proposed project would not disrupt or divide the physical arrangement of any established communities.

2. Regulatory Compliance for Impact 4.2.A

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, programs, Riverside County ordinances and General Plan policies would further reduce or minimize this already insignificant impact.

a. Compliance with State and County Regulations

Compliance with the following State of California and County of Riverside regulations would further prevent already insignificant impacts to physical access to and through established communities in unincorporated Riverside County. As expressed by the California Supreme Court, Riverside County's General Plan serves as the "constitution for future development." Accordingly, it has been developed and implemented pursuant to California's planning and zoning codes, as outlined in Section 4.2.3 (Policies and Regulations Addressing Land Use), to ensure that it contains the necessary elements (including objectives, standards, policies and plans, as well as maps and mitigation measures) to ensure growth and development within the county occur in an organized and appropriate manner. Among others, the Subdivision Map Act (CGC Section 66410, *et seq.*) is one of the laws that underpin the County of Riverside's legal authority to regulate and exert discretionary authority over a variety of development activities. The County of Riverside's various ordinances, also outlined in Section 4.2.3, provide specific directives on how and where such development activities can and cannot occur. Compliance with these requirements would aid in protecting established communities within the county from disruption or division.

b. Compliance with Existing Riverside County General Plan Policies

The following existing policies of the Riverside County General Plan would further reduce the already insignificant land use impacts to established communities. See Section 4.2.3.C for full text of each of these policies.

Land Use Policies: LU 1.1, 1.3, 1.6, 1.8, 2.1, 15.2, 28.6, 28.9, 30.3, 30.4, 30.6, 31.1, 31.2, 31.3, 36.1

Circulation Policies: C 1.1, 1.2, 1.3, 1.4, 1.7, 3.11, 3.12, 3.21, 3.30, 3.31, 4.1, 4.3, 4.9, 6.1, 6.2, 7.1, 7.2, 7.4, 7.8, 8.5, 20.9 and 20.10

Multipurpose Open Space Policies: OS 8.1

c. Compliance with Proposed New or Revised Riverside County General Plan Policies

The following proposed revised policies of the Riverside County General Plan would further reduce the already insignificant land use impacts to established communities due to physical division. See Section 4.2.3.C for full text of each of these policies.

Land Use Policies: LU 1.5, 3.1, 5.4, 7.6, 9.1, 9.4, 21.4, 25.2

Circulation Policies: C 3.17, 4.6, 4.8, 6.3, 7.3, 7.6, 8.7, 15.3, 15.4

Multipurpose Open Space Policies: OS 17.1, 17.2, 17.3, 18.1

3. Significance of Impact 4.2.A After Mitigation

The analysis presented above indicates development accommodated by the project, GPA No. 960, would have less than significant impacts on established communities due to physical division. In addition, compliance with the above-listed existing regulatory programs, standards and General Plan policies would further reduce or avoid the insignificant impacts associated with the project.

B. Would the project conflict with any applicable land use plan, policy or regulation or agency with jurisdiction over the project (including, but not limited to, the general plan) adopted for the purpose of avoiding or mitigating an environmental effect?

Impact 4.2.B - Conflict With Land Use Policies Intended to Avoid or Mitigate an Environmental Effect: The proposed project contains new and revised policies, maps and data intended to clarify and enhance, not conflict, with the Riverside County General Plan, Riverside County ordinances and other regulatory programs, including those items adopted for the purpose of avoiding or mitigation an environmental effect. This impact would be less than significant. Moreover, compliance with existing regulatory programs and General Plan policies would further reduce the already insignificant impact.

1. Analysis of Impact 4.2.B

The changes proposed under GPA No. 960 are intended to clarify existing policies, correct errors and oversights and provide additional guidance where appropriate to further the physical growth and development of Riverside County. As such, the proposed changes in the general sense serve to enhance, rather than impede, the land use plans, policies and programs of the Riverside County General Plan, ordinances and other regulatory programs. Project impacts on Riverside County land use plans, policies and regulations would be less than significant. Consistency with various environmental regulations and programs are discussed by topic throughout this EIR. In addition, the project would also affect the following plans:

Airport Land Use Compatibility Plans (ALUCPs): The General Plan contains maps, policies and programs to preserve aviation ways, protect flight paths and minimize impacts to residents and workers in the airport vicinity and associated safety zones. Generally, countywide airport policies are provided in the General Plan Land Use Element. Map and policies particular to the specific public airports and facilities affecting Riverside County are provided in the applicable Area Plans.

Airports in Riverside County provide an important function for passengers as well as for local and regional economies. Future population increases projected for Riverside County would create an additional demand for air transportation. Since 2004, the Riverside County Airport Land Use Commission (ALUC) has adopted new land use compatibility plans for eleven of the fourteen public airports in Riverside County. Three airports, March Air Reserve Base, Hemet-Ryan Airport and Perris Valley Airport have not been completed to date. As land suitable for development becomes increasingly scarce, urban development may occur adjacent to airports. Such encroaching development may result in conflicts between new development and the goals and policies outlined in local Airport Land Use Plans (ALUPs). Thus, the General Plan is a tool for implementing and ensuring consistency with the purposes of these ALUPs.

Implementation of General Plan policies and land use designations related to airport land use plans reduces the effects of development encroachment of land adjacent to airports and protects the safety of residents and workers in the airport vicinity. The proposed policies and land use designation changes included in GPA No. 960, which

include improved land use mapping and LUD coordination for the Blythe, Flabob and Riverside Municipal Airports, would only serve to increase the level of compatibility between airport land use plans and the surrounding land uses. The proposed LUD changes within Riverside Municipal, Flabob and Blythe Airport Influence Areas facilitate parcel-level consistency that enhances the vision and goals of the Riverside County ALUC. GPA No. 960 does not propose changes for any other ALUPs within Riverside County and, thus, would not affect them. Overall, the project's effect on airport safety and ALUPs would be less than significant.

Other Plans: In terms of other agencies with jurisdiction over the project, project effects and impacts are discussed under the applicable environmental resource of this EIR. In particular, Section 4.8 (Biology) includes analysis of impacts to and consistency with the Western Riverside County and Coachella Valley Multi-species Habitat Conservation Plans, as well as others. The greenhouse gas chapter (Section 4.17) discusses the creation and implementation of a County Climate Action Plan to ensure implementation of and compliance with California's greenhouse gas reduction plans (e.g., AB 32). Section 4.14 (Mineral Resources) discusses County of Riverside compliance with SMARA, the State of California's Surface Mining and Reclamation Act. See these and other chapters in Section 4 of the EIR for additional information on these issues.

2. Regulatory Compliance for Impact 4.2.B

The analysis indicates this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, programs, policies and existing mitigation measures from prior EIR No. 441 would further reduce or minimize this already insignificant impact.

a. Compliance With Federal and State Regulations

Compliance with the following federal, state and county regulations would further prevent already insignificant impacts to land use plans, policies and regulations adopted to avoid or mitigate environmental effects.

State Aeronautics Act and Riverside County Airport Land Use Plans: All discretionary development proposals are reviewed against the applicable ALUPs. Pursuant to the State Aeronautics Act, the County of Riverside requires consistency between the two and makes findings for projects considered appropriate within airport safety zones. The proposed project is consistent with and would, in fact, enhance coordination of land use planning between the Riverside County General Plan and the ALUPs for the Flabob, Blythe and Riverside Municipal Airports.

Ordinance No. 448 - Airport Approaches Zoning: This ordinance supports of the purpose and provisions of CGC Section 50485. Any proceedings for additions or amendments to the official plan of an airport are required to conform to this ordinance.

Ordinance No. 576 – Regulating County Airports: As described in Section 4.2.3, this Riverside County ordinance provides regulations and standards that ensure airports are operated safely to protect residents, visitors, workers and property within the county.

b. Compliance With Existing Riverside County General Plan

The following existing Land Use Element policies (LU 1.8, 15.2, 15.8, 31.1 and 31.2) of the Riverside County General Plan would further reduce the already insignificant impact. See Section 4.2.3.C for full text of each of these policies.

c. Compliance With Proposed New or Revised General Plan Policies

The following new or revised policies of the Riverside County General Plan would further reduce the already insignificant impact to land use. See Section 4.2.3.C for full text of each of these policies.

Land Use Policy: LU 5.4

Multipurpose Open Space Policies: OS 17.1, 17.2, 17.3 and 18.1

3. Finding of Significance for Impact 4.2.B

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on land use policies, plans and regulations adopted for the purpose of avoiding or mitigation an environmental effect. In addition, compliance with the above-listed existing regulations, Riverside County ordinances and General Plan policies would further reduce or avoid the insignificant impacts associated with the project.

C. Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Impact 4.2.C - Conflict With Any Habitat Conservation Plan or Natural Community Conservation Plan: This impact is analyzed under Impact 4.8.6 of Section 4.8 (Biology). To summarize, this project does not include any General Plan changes that would preclude or hinder the Habitat Conservation Plans (HCPs) or Natural Community Conservation Plans (NCCPs) in effect within Riverside County. Additionally, future development accommodated by the proposed General Plan changes would be required to comply with all applicable HCP requirements and fully analyze, avoid and develop adequate mitigation for any significant biological effects prior to project approval or construction. As such, this project would not conflict with any applicable HCP or NCCP. See Section 4.8 for full discussion.

4.2.7 Significance After Mitigation for Land Use

The analysis presented above indicates that future development consistent with the proposed project, GPA No. 960, would have less than significant impacts on land use-related environmental issues, including physical division of an established community, consistency with land use plans, policies and regulations adopted to avoid or mitigate environmental effects, and conflicts with habitat conservation plans. Moreover, compliance with the above-listed existing regulatory programs, standards and General Plan policies would further prevent or reduce any impacts associated with the project.

Section 4.3

Population and Housing

Section 4.3 Population and Housing

4.3.1 Introduction

Population and housing are among the fastest changing statistical categories for Riverside County. The information provided in this section is intended to aid decision-makers in their consideration of the demographic and planning matters affecting the long-range future of Riverside County and the effect of the project, GPA No. 960, on these issues. To facilitate this, a variety of new data and information was developed as part of the project, as described below.

Related to these demographic issues, the project includes updates to two General Plan Appendices, which are labeled to indicate their relationship to prior General Plan Appendices. Appendix E-1, "County Socioeconomic Buildout Assumptions" provides an updated set of planning assumptions for predicting build out conditions. It is used for both the updated baseline (existing General Plan) land use-related build out projections used in this EIR, as well as those prepared to reflect the changes proposed by GPA No. 960. Appendix F-1, "County Population and Employment Forecast," prepared by the Riverside County Center for Demographics Research (RCCDR), updates Riverside County's socioeconomic data and forecasts. Together, these documents, plus project application data, provide the base data for the analysis presented in this chapter. Where other sources are used, they are noted accordingly. See Section 4.3.5 (Effect of GPA No. 960 on the General Plan and on Population and Housing) for additional details.

The current Regional Housing Needs Assessment (RHNA) "planning period," as established by SCAG and addressed in the General Plan Housing Element, is January 1, 2006, through June 30, 2014 *(4th cycle)*. The Riverside County General Plan's Housing Element was updated for this planning period and to comply with State of California housing law under General Plan Amendment No. 1097 adopted on June 25, 2013. *Riverside County is currently updating the Housing Element for the next RHNA "planning period" from October 2013 to October 2021 (5th cycle) in a separate process outside of General Plan Amendment No. 960. Thus, the data and analysis in this section is based on General Plan Amendment No. 1097, the most recently adopted General Plan Housing Element (4th cycle). The planning period of 2006-2014 for the 4th cycle more closely coincides with the baseline date adopted for GPA No. 960.*

4.3.2 Existing Environmental Setting - Population and Housing

The County of Riverside encompasses approximately 7,295 square miles (4,668,480 acres). Of this total, the majority (6,386 square miles, that is 4,087,300 acres) is unincorporated territory. The remaining approximately 12.5% encompasses 28 incorporated cities. Note, the cities of Eastvale and Jurupa Valley incorporated after the public circulation of the CEQA Notice of Preparation (NOP) for GPA No. 960 and thus post-date the baseline for this EIR (April 2009). Leaving the Eastvale and Jurupa Valley areas in this EIR ensures that the County of

Riverside unincorporated data represents a 'worst-case' scenario of greater extent than would occur if the cities were treated as separate municipalities.

With few exceptions, the County of Riverside's land use authority extends only to privately-held lands within the unincorporated portion of Riverside County. (Despite their inclusion in this EIR section, the County of Riverside has no jurisdictional authority over either the City of Eastvale or Jurupa Valley.) Other entities, such as the federal government, Indian Tribes and the State of California, control various lands within the boundaries of Riverside County. Some of these areas cover extensive portions of the county. For example, the Cleveland and San Bernardino National Forests, under the jurisdiction of the U.S. Forest Service, together encompass over 8% of unincorporated Riverside County territory. Sovereign lands controlled by Indian Nations within the county total another 2%. See Section 4.2 (Land Use) for further details on these land use issues. Although the County of Riverside has no jurisdiction over these lands, where applicable (for example, under 'Forestry,' in Section 4.5 (Agricultural and Forestry Resources)), this EIR analysis does nonetheless address potential impacts to these areas.

A. Baseline Data Sources

Pursuant to CEQA, the descriptions of the physical environmental conditions provided in this EIR are as they exist at the time of issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting constitutes the baseline physical conditions for which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant.

Because of the countywide scope and nature of this project and its programmatic EIR, much of the data presented herein does not represent a single point in time (i.e., April 13, 2009). Rather, the data set that is best supported by substantial evidence is used.

For the baseline population, employment and housing data presented and used herein, the following sources were determined to be the best-supported substantial evidence available and were used for the reasons stated. Land use data and other environmental data sets are described in their respective chapters elsewhere. For example, see Section 4.2 for additional land use details.

The population, jobs and housing data presented in this subsection were developed pursuant to proposed General Plan Appendices E-1 and F-1. The land use-based data and associated build out projections use these documents in conjunction with GIS-based acreage and land use data for the current General Plan, inclusive of all approved General Plan Amendments through 2009. Though extending past the April 2009 NOP date, this point in time is used to capture the full cycle of General Plan Amendments, which typically only occur quarterly. All land-use based data and projections made for GPA No. 960 reflect proposed changes to this same baseline data set.

As indicated in General Plan Appendix F-1, all demographic (as opposed to land use) based projections and modeling used herein are based on the Board of Supervisors-approved Riverside County Projections for 2010 (RCP-10), unless noted otherwise. This 2010 data set is used because it is a more accurate reflection of Riverside County conditions than the next-prior available data set, which was the 2007 RCP. (No official RCP was issued for 2008 or 2009). RCP-10 was also used because (unlike 2010 U.S. Census data), it is consistent with the baseline data used in other areas, for example the traffic modeling assumptions used in RIVTAM, Riverside County's new, completely revised and updated countywide traffic model. In cases where demographic data from before April 2009 is used, it generally represents a 'worst-case' scenario because it reflects conditions in which rapid near-term growth was still being predicted. In other cases, however, data developed after April 2009 is used to more accurately reflect current expected growth rates.

B. Population

Population growth in Riverside County as a whole has been quite rapid over the past two decades. As reported in proposed General Plan Appendix F-1, the population grew from approximately 1.2 million 1990 to nearly 2.1 million as of January 1, 2008. Riverside County's population is now larger than that of ten states in the nation and it is now the eleventh-most populous county in the United States. Population grew most markedly after the 2000 U.S. Census. Between 2000 and 2008, Riverside County's population increased by over a half million people, making it one of the fastest growing metropolitan areas in the United States for that period. The majority of the population growth has been from migration into Riverside County as people relocated from adjacent counties, such as Los Angeles, San Diego and Orange Counties. In 2007, the unincorporated portion of Riverside County had a population of 537,600 persons. As illustrated in Table 4.3-A (Population Growth Trends, 1997-2007), between 1997 and 2007, the population of unincorporated Riverside County increased by 26.7%.

Table 4.3-A: Population Growth Trends, 1997-2007

Region	1997 (people)	2007 (people)	Change	
			Total	Percent
Unincorporated Riverside County *	393,900	537,600	+143,700	+26.7 %
Riverside County (Total) **	1,420,600	2,034,800	+614,200	+30.2 %

* The Unincorporated Riverside County total includes the now incorporated population of the City of Eastvale (incorporated in 2010) and the City of Jurupa Valley (incorporated in 2011).

** Includes both unincorporated Riverside County and cities within the county (as of January 2008).
All values rounded to nearest 100.

Source: Riverside County Center for Demographic Research, 2008 Riverside County Progress Report, 2008.

C. Housing

Housing has been the major driver of growth in Riverside County between 2000 and 2009. As indicated in Table 2 of proposed Appendix F-1, during this period Riverside County's housing stock grew by more than 34% (roughly 199,700 units). Household (i.e., occupied housing unit) growth during this same period generally paralleled housing growth with approximately 171,400 new households. Average household size also increased steadily during that time, from 2.49 persons per household in 1990 to a peak of 3.09 persons per household in 2004. Since the 2004 peak, average household size has declined slightly and stood at 3.06 persons per household as of 2009.

The demand for housing in Riverside County is largely a demand for single-family homes in affordable price ranges. Accordingly, roughly 83% of the housing units added between 2000 and 2009 were single-family detached units. Only approximately 33,600 of the new units added during this period were other housing types, such as condominiums and townhomes (i.e., single-family attached units), apartment complexes (i.e., multiple-family units) and mobile homes.

Since 2006, however, housing demand and home values have been greatly affected by changes in the national and local economies, as well as mortgage and banking industry changes. As a result, since 2006, the vacancy rate of existing homes has increased, while the construction of new homes has dropped. This downturn in housing ~~starts~~ has also affected employment in the region, as many construction jobs were lost.

Table 4.3-B: Housing Growth Trends, 1990-2007

Region	1990 (units)	2007 (units)	Change	
			Total	Percent
Unincorporated Riverside County *	161,400	200,900	+39,500	+19.7
Riverside County **	483,800	753,800	+269,900	+35.8

* The Unincorporated Riverside County total includes housing units from the now incorporated City of Eastvale (incorporated in 2010) and the City of Jurupa Valley (incorporated in 2011).

** Includes both unincorporated Riverside County and cities within the county (as of January 2008).
All values rounded to nearest 100.

Based on an allocation process initiated by the California Department of Finance and further refined by the Southern California Association of Governments (SCAG), as well as the Western Riverside Council of Governments (WRCOG) and the Coachella Valley Association of Governments (CVAG), the County of Riverside was tasked with a "fair share" target for the provision of housing in the region. According to the State of California, the "fair share" of regional housing is the number of additional dwelling units that would be required to accommodate the anticipated growth in households, replace expected demolitions and conversion of housing units to non-housing uses and achieve a future vacancy rate that allows for the healthy functioning of the housing market. These RHNA targets were projected for the period ending July 2014 *(4th cycle)*. According to the RHNA, Riverside County is projected to need a total of 57,172 additional housing units by 2014, with roughly 75% of the units located in western Riverside County and the remaining 25% in the Coachella Valley region of the county. Housing needs broken down by income group are as shown in Table 4.3-D (Regional Housing Needs Assessment, 2006-2014).

Although Riverside County contains large amounts of vacant land, the suitability of such lands can vary greatly from one location to another and a variety of physical, environmental and economic constraints affect were new homes can actually be built. For example, some areas are already developed or "built out," while others must be set aside for roads, parks, water storage facilities and other infrastructure. Some areas contain sensitive biological

resources that must be protected; other areas are underlain by seismic faults that would be hazardous to build on. These types of constraints all affect the potential housing capacity achievable with Riverside County.

Table 4.3-D: Regional Housing Needs Assessment, 2006-2014

Region	Total Adjusted Need	Income Category			
		Very Low	Low	Moderate	Above Moderate
WRCOG Area* (Western Riverside County)	43,114	10,704	6,939	7,827	17,643
CVAG Area (Coachella Valley Region)	14,058	3,247	2,263	2,615	5,933
Unincorporated Riverside County - Total	57,172	13,952	9,202	10,442	23,576

* WRCOG data adjusted to equal Total Adjusted Need Adopted. SCAG data did not equal the sub-region total.
Data includes housing needs for the cities of Menifee and Wildomar, which incorporated in 2008.

D. Employment

Table 4.3-E (Annual Average Payroll Employment by Industry, Riverside County *2004-2013* ~~1999-2007~~ shows average annual employment by industry for Riverside County for *2004* ~~1999~~ through *2013* ~~2007~~ as reported by the California Employment Development Department (CEDD). These figures represent CEDD estimates of the number of jobs in Riverside County for which workers are receiving a wage or salary. These figures do not include self-employed people or military personnel. *According to the American Community Survey (2008-2012), approximately 71,000 workers are self-employed in Riverside County and approximately 4,500 in military service.* ~~According to the 2000 Census, there were approximately 53,000 self-employed people working in Riverside County and 2,400 people in military service.~~ In a small number of cases, more than one job is held by a single person. Based on statistical analysis of U.S. Census and CEDD data performed by the RCCDR, the number of multiple job holders is assumed to be minimal.

Employment in Riverside County rose by *32,300 jobs between 2004 and 2013* ~~196,500 between 1999 and 2007~~. Of this growth, roughly 85% was concentrated in *four* ~~five~~ industrial sectors: *Personal, Medical, and Other Services (+37,000); Local Government (+11,400); Transportation, Warehousing and Public Utilities (+10,400); and Retail Trade (+5,700)* ~~Business-Related Services (26,100); Construction (26,200); Retail Trade (30,200); Personal, Medial and Other Services (59,200); and Local Government (25,400~~). *The Construction sector had the largest decrease in jobs, at a loss of 28,000 employees.* A full breakdown of job growth by sector is present in Table 4.3-E, below.

For analysis purposes, the above industry groups are sorted into two broad categories: "Basic" and "Population Serving." Basic industries are those driven primarily by factors broader than local consumption demand. A common example of a basic industry is a manufacturing firm that provides goods that are consumed outside of the region. Basic industries create new income for an area and typically support spin-off industries. Population-serving industries, on the other hand, are those driven primarily by the demands of local population or consumers. Population-serving industries provide goods and services needed by the population of the region it serves. A retail store and a dentist office are examples of population-serving businesses. Since population-serving industries rarely grow significantly beyond the size of the resident population, the strength of a local economy is often measured by the size of its basic industries.

According to Table 4.3-E statistics, both basic and population-serving employment increased over the last decade; however, population-serving employment increased at a faster rate. Hence, as a share of total employment, basic employment in Riverside County has *declined slightly from 35.09% in 2004 to 34.16% in 2013, whereas population-serving jobs increased from 64.91% to 65.84%.* ~~37.2% in 1999 to 34.4% in 2007, whereas population-serving jobs increased from 62.8% to 65.6%.~~ Of the high-growth industries cited in the table, all but one of them were population-serving.

4.3.3 Policies and Regulations Addressing Population and Housing

A. State Regulations

California Government Code (CGC) Sections 65580-65589.8: These sections of the CGC require the preparation of a Housing Element as one of seven elements mandated for a jurisdiction's general plan. Specifically, the law requires that the element provide "an identification and analysis of existing and projected housing needs and a statement of goals, policies, quantified objectives and scheduled programs for the preservation, improvement and development of housing." CGC Section 65588 requires that housing elements be updated not less frequently than every five years. Each revision must describe the progress made on achieving the goals and objectives of the previous housing element.

State law requires that the Housing Element provide for the development of local housing programs designed to meet Riverside County's "fair share" of housing needs for all income groups, as assigned by SCAG, WRCOG and CVAG, based off the State Department of Finance's projections of statewide housing needs as apportioned by the State Department of Housing and Community Development. A jurisdiction's "fair share" of the regional housing need is the number of additional dwelling units that would be required to accommodate the anticipated growth in households, replace expected demolitions and conversion of housing units to non-housing uses and achieve a future vacancy rate that allows for the healthy functioning of the housing market.

The residential character of Riverside County is, to a large extent, determined by the variety of its housing, their locations and their maintenance levels. The General Plan Housing Element forms an official response to the need to provide housing for all economic segments of the population. It establishes policies that will guide County of Riverside government decision-making and sets forth an action plan to implement housing goals through 2014.

B. County Regulations

The following existing regulations and policies are intended to guide residential development within Riverside County to ensure that population and housing needs are met. These policies are not part of proposed GPA No. 960. Rather, they are policies that have been approved by the County of Riverside as separate prior discretionary actions.

Ordinance No. 588 - Home Mortgage Finance Program: This ordinance establishes a home mortgage finance program pursuant to Part 5 of Division 31 of the California Health and Safety Code. Under the program, the County of Riverside issues revenue bonds to provide funds to be used to provide "housing which is affordable by persons on the lower end of [the] purchasing spectrum."

Ordinance No. 760 – Mobile Home Park Rent Stabilization: This ordinance is aimed at facilitating and encouraging "fair bargaining between mobile home owners and park owners in order to achieve mutually satisfactory agreements regarding space rental rates." The goal is to preserve the value of these parks for their owners while also preserving the value of the mobile homes for their owners and preventing "unreasonable space rental adjustments." The ordinance applies to "all mobile home residential rental spaces located within the unincorporated area of Riverside County, except if otherwise exempt" for various reasons. Also, mobile home parks constructed after January 1, 1990, are exempt from the ordinance.

C. Existing Riverside County General Plan Policies

The following existing General Plan polices address various facets of planning and regulation related to population and housing within Riverside County.

1. Land Use Element (LU) Policies

Policy LU 5.2: Monitor the capacities of infrastructure and services in coordination with service providers, utilities, and outside agencies and jurisdictions to ensure that growth does not exceed acceptable levels of service.

Policy LU *8.1* (Previously LU 7.1): Accommodate the development of a balance of land uses that maintain and enhance the county's fiscal viability, economic diversity and environmental integrity.

2. Circulation Element (C) Policies

Policy C 1.1: Design the transportation system to respond to concentrations of population and employment activities, as designated by the Land Use Element and in accordance with the Circulation Plan, Figure C-1.

Policy C 1.4: Utilize existing infrastructure and utilities to the maximum extent practicable and provide for the logical, timely, and economically efficient extension of infrastructure and services.

Policy C 1.5: Evaluate the planned circulation system as needed to enhance the arterial highway network to respond to anticipated growth and mobility needs.

Policy C 3.16: Dedicate necessary rights-of-way as part of the land division and land use review processes.

D. Proposed New or Revised Riverside County General Plan Policies

The following proposed revisions to General Plan polices address various facets of population and housing planning and regulation within Riverside County.

1. Land Use Element (LU) Policies

Policy LU 5.1: Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and ~~child~~ day care centers ~~(i.e. infant, toddlers, preschool and school age children)~~, transportation systems and fire/police/medical services.

Policy LU *9.4* (Previously LU 8.4): Allow development clustering and/or density transfers in order to preserve open space, natural resources, *cultural resources,* and/or biologically sensitive resources. *Wherever possible, development on parcels containing 100-year floodplains and blue line streams and other higher-order watercourses and areas of steep slopes adjacent to them shall be clustered so as to keep development out of the watercourse and adjacent steep slope areas, and to be compatible with other nearby land uses.*

2. Circulation Element (C) Policies

Policy C 2.4: The direct project related traffic impacts of new development proposals shall be mitigated via conditions of approval requiring the construction of any improvements identified as necessary to meet level of service *targets* ~~standards~~.

Policy C 7.9: Review development applications in cooperation with RCTC and as appropriate, to identify the precise location of CETAP corridors and act to preserve such areas from any permanent encroachments, pending dedication or acquisition. *Coordinate with RCTC to evaluate and update the CETAP corridors periodically as conditions warrant.*

4.3.4 Thresholds of Significance for Population and Housing

The project would result in a significant impact on population or housing if it would:

A. Induce substantial population growth in an area, either directly (e.g. by proposing new homes and businesses) or indirectly (e.g. through extension of roads or other infrastructure).

B. Displace substantial numbers or existing housing, necessitating the construction of replacement housing elsewhere.

C. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

4.3.5 Effect of GPA No. 960 on the General Plan and on Population and Housing

The project, GPA No. 960, would have spatial effects where it involves a variety of specific General Plan Land Use Designation (LUD) corrections and changes, several Policy Area, Study Area and overlay changes, proposals for new trail and road alignments and standards and an incidental commercial policy for rural areas. In addition, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County. This section summarizes population and housing-related changes to the General Plan and discusses the effects of these proposed changes on population and housing. Specific impacts and mitigation are then evaluated according to identified significance thresholds in the subsequent section (4.3.6).

It should be noted that the General Plan's Housing Element is updated according to a separate cycle in conjunction with the Regional Housing Needs Analysis. As such, the most recent Housing Element revision was adopted June 25, 2013, pursuant to GPA No. 1097. For this reason, no changes to the current Housing Element are proposed as part of GPA No. 960.

A. Proposed Changes to the General Plan

The existing General Plan addresses population and housing issues in the Land Use (LU) Element, the Housing Element and within individual Area Plans. GPA No. 960 includes a num0ber of changes that affect land use within Riverside County and, indirectly, population and housing as well. As noted above, however, it does *not*

include any changes to the Housing Element itself. For text of the specific General Plan policy changes included as part of GPA No. 960, see Section 4.3.3.C, above.

1. General Plan Appendix E-1: Socioeconomic Buildout Assumptions and Methodology

This appendix to the General Plan outlines both the procedures used to turn land use designations and acreages into theoretical socioeconomic projections. These specifically include assumptions for residential land use (e.g., dwelling units per acre, persons per dwelling unit), commercial and industrial (e.g., gross to net acreage, floor-area-ratio, jobs per square foot, etc.) and other uses. The appendix also includes details on specific assumptions associated with policy areas, community centers, rural village overlays and other special planning areas. As part of GPA No. 960, all of the assumptions and data in this appendix was examined and, where necessary, updated or expanded. In addition, all of the build out projections included in the General Plan (Land Use Element and the Area Plans) were recalculated based on the methods, assumptions and factors updated in Appendix E-1 (see below). These changes directly affect the number of housing units assumed to result from various land use designations and policies.

2. General Plan Appendix F-1: Population and Employment Forecasts

This appendix was also updated as part of GPA No. 960. Appendix F-1 presents the socioeconomic forecasts developed for the County of Riverside by the Riverside County Center for Demographic Research (RCCDR) and also presents SCAG data for the region. While Appendix E-1 addresses developing theoretical build out projections based on *land use* specifically, the forecasts of Appendix F-1 are based on demographic data, socioeconomic and population trends (birth and death rates, immigration, emigration, etc.) and other factors independent of land use. Simply put, this demographics data indicates *how many* people will live and work in Riverside County in the future. The land use plans of the General Plan and its Area Plans indicate *where* these people will live and work. The demographic data presented in Appendix F-1 directly indicates the populations expected to occur in Riverside County.

3. Land Use and Socioeconomic Build Out Results

As noted above, as part of GPA No. 960 all of the land use-based and demographic data in the General Plan was updated to reflect RCCDR demographic forecasts for Riverside County (per Appendix F-1) and land use assumptions (per Appendix E-1). In particular, this includes all of the land use-related build out projections included in the General Plan. Both the Land Use Element and the individual Area Plans were recalculated based on the methods, assumptions and factors updated in Appendix E-1. These updates were necessary both to reflect updated Appendix E-1 assumptions and to address the various changes to land use proposed by GPA No. 960 (e.g., changes to land use designations, policy areas, rural village overlays and study areas, etc.). These changes enable the General Plan to more accurately reflect the theoretical populations, dwelling units and jobs anticipated from build out of the General Plan, as amended by GPA No. 960. The project includes updated General Plan Tables LU-1, LU-2, LU 4 and LU 5, as well as similar tables from the individual Area Plans. See the general summary presented in Table 4.3-F (Theoretical Build Out Projections (Land Use-Based Capacities)) of this EIR. These tables include dwelling units totals which indicate the specific area's total *capacity* for possible residences.

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies

and others as described in Section 3.0 (Project Description) of the EIR. As the specific effect of these policies on housing and population cannot be foreseen at this time, they are not analyzed further in this section.

B. Analysis of GPA No. 960 Effects on Population and Housing

In order to analyze project effects on population and housing, the Riverside County Planning Department worked with RCCDR to develop several socioeconomic scenarios for future growth within the county. These included build out projections for the existing (2008) General Plan, as well as for the General Plan as it would be if GPA No. 960 is adopted. These are referred to as the (existing) General Plan and "project" build out scenarios, respectively, throughout this EIR. As Riverside County build out is currently projected to be reached around 2060, a second set of project projections were also developed for the General Plan at horizon year (2035) to enable comparison with the current (2008) SCAG Regional Transportation Plan.

For existing conditions, values from the official "2010 Riverside County Projections" (RCP-10) were used, except jobs data was taken from 2008 (the most recent year available from the California Department of Finance). RCP-10 was used instead of the prior projections from 2007 (RCP-07) because it was determined that due to the economic slow-down since 2007, the RCP-07 projections over-estimated expected growth. Use of such inflated data would have caused the under-reporting of changes, and hence potential impacts, associated with the project. In this case, use of RCP-10 represents a more conservative, 'worst-case' scenario that is appropriate for a programmatic EIR.

Table 4.3-F, below, shows the acreage covered by each of the General Plan LUDs within unincorporated Riverside County under the existing General Plan and as it would be as a result of adoption of the project. From these land uses and acreages, socioeconomic projections were made for dwelling units, populations, jobs, etc. It should be noted that both scenarios in the table represent theoretical build out of Riverside County based on the mapped LUDs and mid-point values established in General Plan Appendix E-1. This data is a demonstration of planned county capacity, not necessarily the actual build out conditions that would exist in 2060. Since *the location* in which a given population settles is, in part, affected by this available land use capacity, the data nevertheless provides an important perspective on the demographic changes expected in Riverside County over time, both with and without the project.

As shown in Table 4.3-F, the existing General Plan's mapped Land Use Designations (LUDs) for the roughly 4,010,000 acres of land in unincorporated Riverside County would yield approximately 520,900 dwelling units at build out. Through the use of population growth factors developed for each individual Area Plan by the RCCDR, as well as employment and other factors, at build out the existing (2008) General Plan would yield roughly an additional 1,702,700 people and add 561,500 jobs. For the General Plan as amended per GPA No. 960, future development projections indicate its build out would yield approximately 520,900 dwelling units, 1,702,700 people and 561,800 jobs.

In analyzing the resultant data, several key trends were noted. First, a comparison between the build out projections for the existing General Plan and project scenarios indicates the net result of the project would be to slightly *decrease* the planned capacity of Riverside County, i.e., the number of people, homes and jobs expected in Riverside County at full build out (2060). Specifically, housing would be decreased by 2.0%, population by 1.4% and employment by 5.6%. These decreases are due primarily to GPA No. 960's proposed revisions to existing overlays, policy areas and study areas in the General Plan. As detailed in Section 3.0 and Section 4.2, a number of these overlays and policy areas where found to have planned for more urban development than could be supported for a given area due to various factors (e.g., distance from existing urban centers or infrastructure, lack of potable water, presence of sensitive habitat, etc.) GPA No. 960 proposals would correct this issue with the resultant decreases as seen in Table 4.3-G (Comparison of Regional Projections), particularly for employment.

Second, as with the existing General Plan, the amended General Plan would accommodate a substantial amount of growth within unincorporated Riverside County between now and build out. The housing supply would more than double under both scenarios. Population would grow even more, by roughly 269% and 264%, respectively, and employment would more than quadruple for both scenarios. The existing General Plan shows jobs increasing to nearly 500,000. Under the project scenario, jobs would increase slightly less, to roughly 462,000. This is still, however, a 463% increase over existing levels.

Third, it is important to note the results of the interim Year 2035 analysis (see Table 4.3-G) which can be compared to SCAG forecasts. The data developed by RCCDR indicates that despite recent economic conditions, growth is nonetheless anticipated for all three sectors – jobs, housing and population.

Table 4.3-F: Theoretical Build Out Projections (Land Use-Based Capacities)

Source: Riverside County Center for Demographic Research, 2010, and sources noted in footnotes, above.

When compared to current SCAG forecasts, however, county growth under the project scenario would be less than that forecast by SCAG in the current (2008) Regional Transportation Plan (RTP). This indicates that future county growth accommodated by the project would not exceed that planned for regionally, nor would it cause excessive indirect growth-related effects to infrastructure, regional utilities or public services. See Section 5.0 (Mandatory CEQA Items) for further details and analysis of regional consistency, as well as growth-inducing effects.

At the Area Plan level, the proposed project would have very little effect on acreage. Three Area plans would slightly lose acreage (-4.1% for Eastvale, -5.7% for Highgrove and -3.3% for Lake Mathews/ Woodcrest Area Plan); four others would change by 0.5% or less and the rest would essentially have no change. In terms of dwelling units, the Pass Area Plan would lose roughly 15.6%, including nearly 2,800 Very Low Density Residential (VLDR) dwelling units (du). REMAP (the Riverside Environs Mountainous Area Plan) would show the greatest change, losing 26.1% of its dwelling unit capacity, nearly 5,600 du of Medium-Density Residential (MDR), 2,400 du of Medium-High Density Residential (MHDR) and 1,000 du of Estate Density Residential (Rural Community Foundation) (RC-EDR). These losses are mainly due to the elimination of the Aguanga and Anza Rural Village Study Areas, which were planned for higher intensities under the existing General Plan.

Similarly, trends for population changes are similar to those for residential build out. The Pass Area Plan would see roughly 7,600 fewer people than projected under the existing General Plan's build out. With roughly 23,400 fewer people, REMAP would see the largest reduction in population at build out.

For employment projections, REMAP in particular would also see significant capacity reductions; 87.1% fewer jobs than originally planned. This results from reductions in the overall amount of Commercial-Retail (CR) and Light Industrial (LI) land uses in the Area Plan, yielding a decrease in jobs of roughly 12,800 and 19,900, respectively. Two other Area Plans would also see lesser adjustments to employment projections. The Reche Canyon/Badlands Area Plan would see a 6.8% reduction in potential jobs, mainly due to reductions in acreage designated for Business Parks (BP). The Elsinore Area Plan would have roughly 1,100 fewer jobs due to reductions in CR acreage, yielding an 8.6% decrease, due mainly to the deletion of the excess capacity originally proposed for the El Cariso Rural Village Study Area.

4.3.6 Population and Housing - Impacts and Mitigation

A. Would the project induce substantial population growth in an area, either directly (e.g. by proposing new homes and businesses) or indirectly (e.g. through extension of roads or other infrastructure)?

Impact 4.3.A - Induce Direct or Indirect Population Growth: Future development consistent with the project would affect population growth both directly and indirectly. Overall, in terms of direct growth, the project's land use changes would serve to limit and slightly reduce the development capacity of Riverside County, yielding 1.4% less population growth than that projected for the existing General Plan. Projected reductions in dwelling units (- 2.0%) and, in particular, jobs, which would be reduced by 5.6%, would also indirectly limit population growth. Thus, overall growth rates associated with the project would not be increased over those proposed and planned for in the existing General Plan. Overall, the project represents a reduction in county capacity, yielding covers population growth forecasts, both compared to the existing General Plan and to current SCAG (2008 RTP) projections. Since the project's build out projections are for less population, housing and jobs than forecast under the existing General Plan and existing regional plans (SCAG RTP, etc.), project impacts on population growth, both direct and indirect, would be less than significant. Moreover, compliance with existing General Plan policies would further reduce the already insignificant impact associated with population growth.

1. Analysis of Impact 4.3.A

The General Plan is intended to serve as a guide to the future development occurring within Riverside County, outlining the uses considered appropriate for various regions and coordinating the provision of infrastructure with the protection of natural resources. Thus, as a plan, it is expected to deal with population growth. This is also true of the General Plan as it would exist as amended by GPA No. 960. Accordingly, since population growth is an intrinsic part of a general plan, the proposed project would be considered to cause "substantial" population growth: if any of its LUD changes, plans or policies would result in an increase in population beyond that already planned for and accommodated by the existing General Plan; if it would cause a growth rate in excess of that forecast in the existing General Plan; or, if it would do either of these relative to existing regional plans, such as the SCAG Regional Transportation Plan (RTP), etc.

As shown in Table 4.3-F, the project would not result in an increase in population directly at the countywide level. Rather, it plans for 1.4% fewer people than that of the existing General Plan. Nor would it do so indirectly; it also calls for 2.0% fewer dwelling units and 5.6% fewer employment uses. Thus, overall, population growth and its associated environmental effects would be similar to (or slightly less than) that already projected and analyzed for the existing General Plan (via EIR No. 441). In addition, population forecasts for the General Plan, as amended per GPA No. 960, would be less than that originally forecast for various regional plans, as shown in Table 4.3-G. Thus, the population growth associated with future development accommodated by the project also would not be substantial on this basis. (Also see Section 5.5 (Cumulative Impacts) for more on regional consistency).

An analysis was also made of actual population changes; that is the difference between existing (2008) and General Plan build out (2060) populations with and without the project. In terms of actual population growth, that data in Table 4.3-G indicates that that the project-amended General Plan would yield a population increase of roughly 1,149,200 people over approximately 52 years. This amounts to an annual growth rate of 3.99%. This annual rate of population increase is not considered substantial as it is in line with (actually, slightly less than) that currently projected under the existing General Plan (a 1,174,000 increase yielding an annual growth rate of

4.08%). For this reason, the increase in population over baseline conditions as a result of future development accommodated by the project is not considered "substantial."

In terms of direct population growth, on a local level no Area Plan would see a "substantial" population increase as a result of the project's changes. Only five Area Plans are forecast to see any population growth beyond that already planned in the General Plan. The Temescal Canyon and Western Coachella Valley Area Plans would add less than 0.5% each (177 and 125 additional people, respectively). The Southwest Area Plan (SWAP) would add roughly 1.4% (1,570) more people and Eastern Coachella Valley Area Plan (ECVAP) would add the most additional people: 8,090. This total, however, is still only 2.0% more than that already planned for ECVAP. Thus, this increase is not "substantial."

In terms of indirect population growth, as noted in Table 4.3-F, the project would result in an overall decrease in the number of dwelling units and employment uses (jobs) developed at General Plan build out in roughly 2060. At the local level, one Area Plan (ECVAP) would gain roughly 1,730 more dwelling units than originally planned. But, as already notes, this is only a 2% increase is not substantial growth. Two other Area Plans gaining dwelling units would see even smaller increases; 230 dwelling units for the Palo Verde Area Plan (a 1.6% increase) and 520 dwelling units for SWAP (a 1.4% increase). Similarly, three Area Plans would see small gains in terms of jobs; Lake Mathews/ Woodcrest Area Plan would gain 90 jobs (1.8% increase), the San Jacinto Valley Area Plan would gain roughly 100 jobs (0.5% increase) and SWAP would gain roughly 270 jobs (1.0% increase). Again, none of these increases would be considered "substantial."

One area, the Lakeview/Nuevo Area Plan (LVNAP), would gain nearly 3,800 additional jobs; an increase of 25.6%. This amount, however, is not expected to indirectly cause populations in the region to increase above or beyond those already forecast and accommodated by the revised General Plan, as the plan already provides sufficient housing capacity to readily house these workers in and around this Area Plan should they choose to move near their workplaces. For this reason, the project is not anticipated to result in a substantial indirect population growth in this area.

Lastly, as described in Section 3.0, the project includes several components that address large-scale development patterns, intensities and densities. These include the Good Hope and Meadowbrook Rural Village Land Use Overlays (RVOs) and the Lakeland Village and Northeast Business Park Policy Areas as well. Although these areas are being planned generally for increased urbanization, the data in Table 4.3-F (in which these new proposals are included in their respective Area Plans) shows that they do not contribute to any substantial population increases over those already planned under the existing General Plan for the reasons discussed above.

Thus, for all of these reasons, GPA No. 960 would not substantially increase population growth either locally or at the countywide level. And, overall, future development accommodated by the project would result in less than significant direct and indirect population growth impacts.

2. Regulatory Compliance for Impact 4.3.A

In addition to Housing Element requirements, under the existing General Plan the County of Riverside has implemented a number of policies and programs in regards to the population and housing. Given the broad scope of factors that affect population, housing and employment, many of the policies in the General Plan directly or indirectly address aspects of these issues. The Vision chapter of the General Plan summarizes the intricate impacts related to population growth the best. It points out that the General Plan was envisioned and crafted with the basic notion that Riverside County would see significant growth in its population over time. Thus, the focus of the discussion and policies in the General Plan is on the management and quality of this growth, rather than preventing growth within Riverside County all together. Additionally, the above analysis indicates that this

impact would be less than significant and hence no project-specific mitigation is needed. Thus, the following policies would further reduce or minimize this already insignificant impact. See Section 4.3.3.C for full text of each of these policies.

Policies LU 5.1, 5.2, 8.1 and 9.4: Policies LU 5.1 and 5.2 require development approval not exceed infrastructure support. Policy LU 8.1 ensures that growth does not infringe on necessary land uses, including rights-of-way and open space and Policy LU 9.4 allows clustering to facilitate growth without adversely affecting sensitive resources.

Policies C 1.1, 1.4, 1.5, 2.4, 3.16 and 7.9: Policies C 1.1, 1.4 and 1.5 require circulation infrastructure respond to growth needs. Policy C 2.4 requires new development to provide necessary circulation improvements to ensure adequate levels of service and Policies C 3.16 and 7.9 ensure that growth does not impinge upon lands needed for future circulation infrastructure.

3. Significance of Impact 4.3.A After Mitigation

For the reasons outlined above, future development accommodated by GPA No. 960 would have less than significant impacts on both direct and indirect population growth. In addition, compliance with the above-listed General Plan policies would further reduce or avoid the insignificant impacts associated with the project.

B. Would the project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

Impact 4.3.B - Displace Residential Units: The project includes revisions to the existing General Plan that would affect the future development capacity of Riverside County. Future development pressure could result in redevelopment of existing uses, particularly in rural areas (e.g., agricultural lands and large-lot rural residential) and on under-utilized urban and suburban parcels. However, aerial analysis indicates that none of the areas proposed for land use changes under GPA No. 960 contain substantial numbers of existing houses whose loss would necessitate construction of replacement housing elsewhere. Thus, the project's effects on existing housing would be less than significant. Moreover, compliance with existing regulatory programs, including existing General Plan policies, would further reduce this already insignificant impact to housing inventory.

1. Analysis of Impact 4.3.B

The project includes revisions to the existing General Plan that would alter capacity and may affect future development. Future development pressure could result in redevelopment of existing uses, particularly in rural and agricultural areas, as well as on underutilized urban and suburban parcels. On a countywide level, the data presented in Section 4.3.5 shows that the build out capacity of the General Plan, even with the changes proposed by GPA No. 960 (see Table 4.3-F), would accommodate more dwelling units than needed on a demographic level (as per projections, see Table 4.3-G). In total, the analysis demonstrates that the project would neither displace substantial numbers of existing housing nor necessitate construction of replacement housing elsewhere.

As with all future development accommodated by the General Plan, it is expected that existing built land uses, including residences, would generally remain and that new development would occur predominantly on vacant or sparsely developed land because Riverside County's inventory of vacant land makes this type of new development generally more economical than redevelopment, particularly for the type of large-scale projects with the greatest potential for displacing substantial numbers of people or residences. Where occurring on vacant land, future development consistent with GPA No. 960 would not displace any existing residential units. A significant impact

would only occur where residences were displaced by development or redevelopment. As capacity (available homes) exceeds demand, it is not expected to cause displacement necessitating replacement construction elsewhere.

Additionally, since as demonstrated in Table 4.3-F, there would be sufficient space available within unincorporated Riverside County for the development of replacement housing without further displacement effects, it can reasonably be surmised that any potentially significant impacts associated with the construction of any replacement housing would be mitigated through the means proscribed in the original General Plan EIR No. 441 (and/or herein) for any other future residential development and as outlined for future development within this EIR as well (in particular as discussed under Section 4.2 of this EIR). The end result would be less than significant impacts to housing inventory and the people that occupy them.

2. Regulatory Compliance for Impact 4.3.B

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Thus, the following existing policies of the Riverside County General Plan would further reduce the already insignificant housing impacts. See Section 4.3.3.C for full text of each of these policies.

Policies LU 8.1 and 9.4: Policy LU 8.1 ensures that future development be developed in a balanced manner. Policy LU 9.4 allows clustering to facilitate growth without adversely affecting sensitive resources.

Policies C 2.4 and 7.9: Policy C 2.4 requires new development, which includes residential, to provide necessary circulation improvements to ensure adequate levels of service. Policy C 7.9 ensures that future development, which includes residential, does not impinge upon lands needed for future circulation infrastructure.

3. Significance of Impact 4.3.B After Mitigation

The above analysis indicates that future development accommodated by GPA No. 960 would have less than significant impacts on housing. It would not displace substation numbers of existing housing nor necessitate construction of replacement housing elsewhere. In addition, compliance with the above-listed existing General Plan policies would further reduce or avoid the insignificant impacts associated with the project.

C. Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

Impact 4.3.C - Displace People: The project includes revisions to the existing General Plan that would affect the future development capacity of Riverside County. In general, future development pressure could result in redevelopment of existing uses, particularly in rural areas (e.g., agricultural lands and large-lot rural residential) and on under-utilized urban and suburban parcels. However, none of the areas proposed for land use changes under GPA No. 960 contain substantial numbers of existing homes whose loss would displace substantial numbers of residents. Thus, the project's effects on residents would be less than significant. Moreover, compliance with including existing General Plan policies would further reduce this already insignificant impact.

1. Analysis of Impact 4.3.C

As outlined in Impact 4.3.B, the project includes revisions to the existing General Plan that alters the capacity of Riverside County and thus may affect future development. In general, future development pressure could result

in redevelopment of existing uses, particularly in rural and agricultural areas, as well as on underutilized urban and suburban parcels. On the countywide level, the data presented in Section 4.3.5 shows that the build out capacity of the General Plan, even with the changes proposed by GPA No. 960 (see Table 4.3-F), would accommodate more dwelling units than needed on a demographic level (as per projections, see Table 4.3-G). Thus, the analysis demonstrates that the project would neither displace substantial numbers of people nor necessitate construction of replacement housing elsewhere to house them.

As with all future development accommodated by the General Plan, it is expected that existing built land uses, including residences, would generally remain and that new development would occur predominantly on vacant or sparsely developed land, because Riverside County's inventory of vacant land makes this type of new development generally more economical than redevelopment, particularly for the type of large-scale projects with the greatest potential for displacing substantial numbers of people or residences. Where occurring on vacant land, future development consistent with GPA No. 960 would not displace any existing residents. A significant impact would only occur where existing residences were displaced by development or redevelopment. However, as capacity (available homes) exceeds demand, it is not expected to cause displacement necessitating replacement construction elsewhere.

Additionally, since as demonstrated in Table 4.3-F, there would be sufficient space available within unincorporated Riverside County for the development of replacement housing without further displacement effects, it can reasonably be surmised that any potentially significant impacts associated with the construction of any replacement housing would be mitigated through the means proscribed in the original General Plan EIR No. 441 (and/or herein) for any other future residential development and as outlined for future development within this EIR as well (in particular as discussed under Section 4.2). The end result would be less than significant impacts to housing inventory and the people occupying them.

2. Regulatory Compliance for Impact 4.3.C

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. The following policies would serve further reduce or minimize this already insignificant housing-related impact. See Section 4.3.3.C for full text of each of these policies.

Policies LU 8.1 and 9.4: Policy LU 8.1 ensures that future development not infringe on necessary land uses, including rights-of-way and open space. Policy LU 9.4 allows clustering to facilitate growth without adversely affecting sensitive resources.

Policies C 2.4 and 7.9: Policy C 2.4 requires new development, which includes residential, to provide necessary circulation improvements to ensure adequate levels of service. Policy C 7.9 ensures that future development does not impinge upon lands needed for future circulation infrastructure.

3. Significance of Impact 4.3.C After Mitigation

The above analysis indicates that future development accommodated by the project, GPA No. 960, would have less than significant impacts on people and their housing needs. It would not displace substantial numbers of people nor necessitate construction of replacement housing elsewhere. In addition, compliance with the above-listed existing General Plan policies would further reduce or avoid the insignificant impacts associated with the project.

4.3.7 Population and Housing - Level of Significance After Mitigation

The analysis presented above indicates that future development accommodated by the project, GPA No. 960, would have less than significant impacts on housing and population-related environmental issues, including inducement of substantial population growth, either directly or indirectly, displacement of substantial numbers of people or existing homes or triggering the need for construction of replacement housing. Moreover, compliance with the above-listed General Plan policies would further prevent or reduce the insignificant impacts associated with the project.

Section 4.4

Aesthetics and Visual Resources

Section 4.4
Aesthetics and Visual Resources

4.4.1 Introduction

This chapter reviews and analyzes aesthetic and visual resources associated with the proposed project, General Plan Amendment No. 960 (GPA No. 960). These resources include scenic vistas and viewsheds, scenic highways and scenic/visual resources, such as trees, rock outcroppings and elements of the built environment like historic buildings. This chapter also includes light and glare, which can adversely affect visual resources, ecosystems and the nighttime use of the Palomar Astronomical Observatory (which relies on dark skies for scientific purposes).

4.4.2 Existing Environmental Setting – Aesthetic and Visual Resources

Riverside County encompasses over 7,200 square miles extending roughly 200 miles in width from the Colorado River (Arizona border) to within 14 miles of the Pacific Ocean. Riverside County shares borders with Orange, San Diego, Imperial and San Bernardino Counties. Within Riverside County, there are 26 incorporated cities with individual identities set among a mixture of rural communities, small towns, deserts and open space areas. (For the purposes of GPA No. 960, the cities of Eastvale and Jurupa Valley have been treated as part of unincorporated Riverside County, as the cities did not incorporate until October 1, 2010, and July 1, 2011, respectively, after the date of this project's CEQA Notice of Preparation. The two other new cities, Wildomar and Menifee, which both incorporated in 2008, are included as municipalities in this EIR.) The various communities within unincorporated areas are defined by the built environment and the surrounding topography, which includes river valleys, lakes, low desert, mountains, foothills and rolling plains.

Since elements of GPA No. 960 occur throughout Riverside County, for visual assessment purposes, Riverside County is divided into eastern and western regions by the San Jacinto Mountains. A deep valley known as the San Gorgonio Pass, formed by the San Jacinto and San Gorgonio Mountains, serves as a natural link between these two areas. The San Bernardino, Little San Bernardino and Pinto Mountains form a portion of Riverside County's northern boundary while numerous mountain ranges, including those in the Santa Rosa Wilderness and Cleveland National Forest, serve as boundaries along the southern and western edges of Riverside County.

A. Baseline Data Sources

Pursuant to CEQA, the descriptions of the physical environmental conditions provided in this EIR are as they exist at the time the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental

setting constitutes the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact is significant.

Because of the countywide scope and nature of this project and its programmatic EIR, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence is used and a discussion of how it is or is not expected to differ from the existing physical conditions would be provided. It should be noted here that 'substantial evidence' typically refers to "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact," (PRC Section 21080(e)(1)). Further, 'substantial evidence' does not include "argument, speculation, unsubstantial opinion or narrative, evidence of social or economic impacts that do not contribute to, or are not cause by, physical impacts on the environment."

For the scenic and aesthetic resource baseline data presented and used herein, the following sources were determined to be the best-supported substantial evidence available and were used for the reasons stated. Land use data and other environmental data sets are described in their respective chapters elsewhere.

The data sources used herein for this section include: The 2004, 2006 and 2008 Field Reports issued by the California Department of Conservation, Farmland Mapping and Monitoring Program, in addition to the 2007 aerial photographs of the Riverside County Land Information System. The field reports, which map farmland and describe those previously mapped farmlands that have been converted to more urban uses, are the most recent data available from the State of California, which performs biennial farmland mapping updates as directed by state law. The latest aerial photographs depicted in the Riverside County Land Information System were flown in 2007 and show activity and uses for parcels within Riverside County. Riverside County highways, including scenic highways and roadways are also visible from the photographs. Together the data sources provide the information needed to establish the baseline used in determining potential impacts to aesthetic and visual resources pursuant to the proposed GPA No. 960.

B. Visual Character

A scenic vista is a view of an area that is visually and aesthetically pleasing and is generally associated with rural open spaces. This includes viewsheds of water bodies, ridgelines, mountain tops, skylines and other natural features. A viewshed is simply an area of land, water or other environmental element that is visible to the human eye from a fixed vantage point. Scenic and visual resources are generally defined to include the smaller-scale features within a viewshed, such as individual trees or boulders, as well as components of the built environment, such as windmills in rural areas and so on. They can also include, though are not limited to, land formations (natural or cultural modification), rock outcroppings, undisturbed natural areas (e.g., riparian areas, oak woodlands, etc.), open space, view corridors associated with designated scenic routes, points of historic or cultural significance, agricultural areas (e.g., vineyards, citrus groves) and other human-made features.

The following information summarizes the primary aesthetic resources and visual character within Riverside County. Since the project has the potential to affect areas throughout the county, the visual character of Riverside County is depicted and described in a general manner to provide a basic understanding of the major physical features, landmarks and characteristics of Riverside County. Specifics on localized areas expected to be affected by the project are addressed under Section 4.4.5 (Effect of GPA No. 960 on the General Plan and on Aesthetic and Visual Resources), later in this chapter. Additional details may also be found in each of the region-specific Area Plans of the General Plan and also in the 1999 Riverside County Integrated Plan Existing Setting Report.

Based on the descriptions in the 1999 Existing Setting Report, 15 visual analysis areas were identified to facilitate a greater understanding of the unique aspects, features and visual characteristics common in the various regions

of Riverside County. The boundaries of the regions are selected to capture areas of common physical characteristics and similar development patterns. Table 4.4-A (Summary of Visual Character and General Changes) provides a brief summary of the visual characteristics of these 15 areas. A more detailed, though dated, examination of Riverside County aesthetic resources for each region or area is included in Section 4.8 of the 1999 Existing Setting Report, which also includes a detailed photo essay.

Since 1999, when the Existing Setting Report was prepared, Riverside County's visual character has undergone substantial changes in the urban/suburban fringe areas as growth fueled the urbanization of existing suburban areas and the conversion of open, vacant lands to developed uses. According to the State of California, Riverside County, including its cities, accounted for roughly 23% of all new urban areas within California between 2006 and 2008. Between 2000 and 2008, the California Department of Conservation estimates that "developed or built-up land" in Riverside County increased by 60,862 acres. Much of this build up has been concentrated around existing city centers and other urban centers. Areas that have had considerable amount of visual changes associated with growth are noted in Table 4.4-A, below.

1. Western Riverside County

Western Riverside County is loosely bounded by the Santa Ana Mountains and Cleveland National Forest on the west and the San Jacinto Mountains and the San Bernardino National Forest on the east. Topography varies dramatically in this region, ranging from low-lying valleys to rolling hillsides and steep mountainous terrain with large rock outcroppings. Major features of this area include the Santa Ana River basin, Lake Mathews, Lake Perris, Lake Elsinore, Lake Skinner, Vail Lake, Hemet Lake, the San Jacinto River, Murrieta Creek, the Santa Rosa Plateau, the Santa Margarita River and the vineyard/citrus region near Temecula. The Diamond Valley Reservoir south of Hemet is the largest reservoir in Southern California. Western Riverside County includes numerous unincorporated communities as well as the cities of Corona, Riverside, Beaumont, Banning, Norco, Lake Elsinore, Perris, Hemet, San Jacinto, Moreno Valley, Calimesa, Canyon Lake, Murrieta, Wildomar, Menifee and Temecula.

2. Eastern Riverside County

Eastern Riverside County is loosely bounded by the Colorado River on the east and the Santa Rosa and San Jacinto Mountains on the west. The area includes the San Gorgonio Pass, part of Joshua Tree National Park, Whitewater River the Palo Verde Mesa and the northern end of the Salton Sea. The most urbanized areas in this portion of the county are contained in the Coachella Valley. The valley includes the incorporated cities of Desert Hot Springs, Palm Springs, Cathedral City, Rancho Mirage, Indian Wells, Palm Desert, La Quinta, Indio and Coachella. The City of Blythe near the Arizona border is the eastern-most city in Riverside County. The area around Palm Springs is noted for its golf resorts nestled among the Santa Rosa Mountains. The Coachella Valley is also a major source of date palm groves in the U.S. The San Gorgonio Pass, noted for its high winds, is a key source of wind power for Southern California. The vast mountainous terrain of Joshua Tree National Park and desert topography of the Chuckwalla Valley lie between the Coachella Valley, Blythe and the Colorado River.

Table 4.4-A: Summary of Visual Character and General Changes

Visual Analysis Area	General Visual Character
1. Jurupa Valley-Eastvale	Large-lot and low-density single-family residences among rolling hills, as well as medium density residential tracts in Eastvale; increasing industrial uses in Mira Loma, concentrated commercial along Mission Boulevard and Limonite Avenue, commercial uses otherwise scattered; agricultural uses (e.g., dairies and grazing lands); the Santa Ana River flows along the southern boundary of the area. **Since 2000:** The area has seen extensive urbanization with the addition of a number of new housing developments, as well as a number of new commercial developments as well. An elementary school was also established in the area. The City of Eastvale incorporated on October 1, 2010 and the City of Jurupa Valley incorporated on July 1, 2011.
2. Temescal Valley	Framed by the Santa Ana Mountains and the Gavilan Hills, predominantly rural land and suburban single-family residences set among open space; mountainous areas are filled with rock outcroppings, scattered oak trees and riparian areas. Some light industrial and commercial along the I-15. **Since 2000:** The area has been subject to new urbanization due to various new home developments and a major commercial retail center (the "Shops at Dos Lagos"). The active portion of El Sobrante Landfill was expanded by approximately 70 acres.
3. Greater Elsinore	The Santa Ana Mountains form the western boundary of this area marked by oak and scrubby pine forests, scattered residences and campgrounds; large-lot residences in the rolling hills east of I-15; lakeside resorts and campgrounds; semi-urbanized in Sedeco Hills and Wildomar; large-scale Specific Plans (e.g., Horsethief Canyon, Trilogy at Glen Ivy, the Retreat, etc.); mineral extraction north of Lake Elsinore. Scattered commercial uses along Grand Ave within Lakeland Village, predominately residential and vacant lots. **Since 2000:** The area experienced growth and urbanization due to new home developments, major commercial retail centers and the addition of schools in the area. Also, the City of Wildomar incorporated July 1, 2008.
4. Southwestern Riverside County Area	Framed by the Santa Ana Mountains, Santa Margarita and Agua Tibia ranges and the Black Hills; consists of a series of valleys separated by rolling hills; eastern slopes of the Santa Ana Mountains characterized by steep slopes and valleys, citrus and avocado orchards and the Santa Rosa Plateau Ecological Preserve; large residential lots; rural communities east of Temecula; Vail Lake; equestrian uses on rolling hills; agricultural uses. **Since 2000:** The area saw rapid urbanization as multiple new home and commercial retail developments were added to the Temecula/Murrieta area along with multiple new schools and business park developments. The Wine Country in Temecula has also seen extensive growth during this time period.
5. Lake Mathews Area	Region consists primarily of rolling hills, large-lot residential, citrus and vineyards uses; Lake Mathews, significant amounts of natural open space, natural rock outcroppings and Mockingbird Canyon Archeological Site. **Since 2000:** The area saw extensive urbanization due to new home developments.
6. Highways 74-79	Large-lot residential uses, agricultural and equestrian uses among low-lying flatlands and rocky peaks; includes Diamond Valley Lake, some scattered single-family residences on smaller lots/mobile homes; some commercial-industrial and community serving uses. **Since 2000:** Both Highways 74 and 79 have seen extensive growth along their routes due to new home developments within the cities of Hemet, Murrieta and Temecula.
7. Menifee Valley	A valley ringed by ridges; rugged rock outcroppings; pockets of residential uses on edges of the valley; estate development in surrounding hillsides; some commercial and industrial development; golf courses, residential and some agriculture uses. **Since 2000:** This area has seen extensive urbanization along the I-215 corridor and suburbanization of former agricultural fields beyond. Much of this area is now part of the City of Menifee, which incorporated October 1, 2008.
8. Perris Valley	Flatlands and adjacent foothills; rural residential and agricultural uses. **Since 2000:** Perris Valley saw extensive urbanization with the addition of multiple new home developments and the Perris Crossing retail shopping center and associated infrastructure. An elementary school and a middle school were also added to the area.

Visual Analysis Area	General Visual Character
9. Lakeview and Nuevo	Wide variety of geographical features, low-lying valleys, rolling hills and rock mountainous terrain; primarily large-lot rural residential; some public facilities; the San Jacinto River runs through the northern portion of the area. **Since 2000:** The area has not experienced a tremendous amount of urbanization; however, a number of residential developments have occurred in the area.
10. San Jacinto Valley	Encompasses San Jacinto Valley and adjacent foothills and mountains; urban development within cities, otherwise medium-density residential development, scattered commercial uses; predominantly agricultural and dairies; the San Jacinto River traverses the area in a northwest-southeast direction; riparian areas along the river; views of mountains, rock outcroppings and sparse, low-lying vegetation. **Since 2000:** A number of new housing developments and associated services and infrastructure, including a school, have arisen, along with some commercial development also.
11. Reche Canyon and Lake Perris	Reche Canyon consists primarily of mountainous terrain with low-lying vegetation, rock outcroppings and large-lot rural residential uses; rural, agricultural and suburbanizing uses in Highgrove, Badlands and San Timoteo Creek along eastern boundary. **Since 2000:** The area has experienced some growth due to urbanization trends, particularly in the Oak Valley area.
12. San Gorgonio Pass	Bordered by the San Bernardino and San Jacinto Mountains; small town urban uses; San Gorgonio River; Morongo Band of Mission Indians Reservation lands, wind energy facilities, large-lot rural residential and agricultural uses; desert and hillside vegetation. **Since 2000:** The Cherry Valley area, as well as areas in and around the cities of Banning and Beaumont, has continued to urbanize with the addition of residential and commercial developments and educational facilities. Additional wind turbines have also been introduced in the Pass, near Whitewater River. "The Morongo Casino, Resort and Spa" was developed in the Cabazon area.
13. Riverside Extended Mountain Area Plan (REMAP)	Encompasses the San Jacinto and Santa Rosa Mountains; mountain peaks, rock outcroppings; numerous springs and streams; vegetation ranging from desert scrub to alkaline forests; rural residential enclaves; scattered community and tourist-related commercial uses; public recreation areas; wilderness areas; panoramic views of the Coachella Valley to the east and low-lying areas of Riverside County to the west. **Since 2000:** The area has not experienced a tremendous amount of urbanization, but some residential growth has occurred.
14. Coachella Valley	East of the San Jacinto and Santa Rosa Mountains; wind turbines, golf-oriented and tourist resort communities; date groves and agricultural uses; desert oasis areas; cove-like communities at base of Santa Rosa Mountains; Whitewater River; Salton Sea State Recreation Area; desert and mountain vistas. **Since 2000:** The Coachella Valley region, particularly within and spreading out from the cities, has expanded greatly. Mainly with housing and resort-style residential communities, associated golf courses, businesses and infrastructure. Aquaculture (fish farms) has flourished west of the Salton Sea. Also, the necessary approvals and permits were completely obtained for the Coachella Valley Multiple Species Habitat Conservation Plan (CVMSHCP) in October of 2008. The CVMSHCP was adopted to ensure the preservation of sensitive biological resources and open space in the Coachella Valley region of eastern Riverside County.
15. Eastern Riverside County (East of Coachella Valley to the Arizona Border)	Vast expanses of desert scrub; portion of Joshua Tree National Monument; desert mountain ranges; desert wilderness areas; agricultural uses in the Palo Verde Valley; Colorado River; residential and commercial in Blythe. **Since 2000:** Some development has occurred in the Blythe and Palo Verde areas, principally residential. A new power plant also occurs in Blythe.

C. Nighttime Light and Glare

Light pollution may most simply be described as the alteration of natural light levels in the outdoor environment due to artificial light sources. More commonly, it is taken to mean excessive or obtrusive artificial light. The International Dark-Sky Association defines light pollution as, "any adverse effect of artificial light including sky glow, glare, light trespass, light clutter, decreased visibility at night and energy waste." Some sources, such as the

U.S. National Park Service, delineate it as artificial illumination of the night sky decreasing the visibility of stars and other natural sky phenomena. The term also includes the incidental or obtrusive aspects of outdoor lighting, such as glare (visual impairment), trespass into areas not needing lighting, use in locations or at times when lighting is not needed and disturbance of the natural nighttime landscape. Night lighting and glare can affect human vision, navigation and other activities. In particular, excessive night lighting can lead to skyglow, which interferes with the operation of astronomical observatories. Light pollution can also interfere with nocturnal wildlife, particularly night-hunting or foraging animals, such as owls, rodents and others.

Since the early 1980s, a global dark-sky movement has emerged as part of a campaign to reduce the amount of light pollution. With the renewed focus on energy conservation and greenhouse gas emission reduction, attention is again being turned to the reduction of excessive lighting, which also wastes electricity as surely as a dripping faucet wastes water. U.S. Department of Energy data has demonstrated that approximately 30-60% of energy consumed in lighting is unneeded or excessive and wastes the energy equivalent of over two million barrels of oil each day.

Nighttime lights can create a form of light pollution that adversely affects the natural environment, such as inhibiting nocturnal species' ability to hunt at night, and the human environment, such as interfering with the functionality of astronomical observatories or causing glare that endangers driving or airplane navigation. A major scientific resource, the Palomar Observatory, is located in San Diego County approximately 5.5 miles south of the Riverside County border. In general, astronomic observatories need to be sited at least 30 to 40 miles away from large, brightly lit areas, such as cities and other urban concentrations, in order to ensure adequate nighttime darkness of the sky. Back when established, over a century ago in 1908, the Palomar Observatory was located in a remote, undeveloped region. However, in the last century, growth and urban development have spread tremendously throughout Southern California, particularly in western Riverside County and the cities of Temecula, Murrieta, as well as within the Coachella Valley.

It is to be expected that the minimization of nighttime light pollution within the region surrounding the observatory is essential to its operation. To aid in accomplishing this, the County of Riverside enforces Ordinance No. 655 (Regulating Light Pollution). This ordinance establishes two zones for specific lighting controls based on distance from the Observatory. As shown in Figure 4.4.1(Countywide Palomar Restriction Zones A and B), Zone A encompasses a sphere with a 15-mile radius; Zone B encompasses a 45-mile radius from the Observatory. The intent of the ordinance is to restrict the permitted use of certain light fixtures that emit into the night sky undesirable light rays which have a detrimental effect on astronomical observation and research.

D. Scenic Highways and Roadways

Scenic vistas and natural features, including low-lying valleys, mountain ranges, ridgelines, rock formations, rivers and lakes are often enjoyed via Riverside County's many roadways. Due to the visual significance of many of these areas, certain roadways within Riverside County have been officially recognized as either 'eligible' or 'designated' State or County scenic highways. Table 4.4-B (Summary of State and County Eligible and Designated Scenic Highways), below, outlines these highways; they are shown graphically in Figure 4.4.2 (Riverside County Scenic Highways). Development along the designated scenic highways and roadways is managed to preserve the areas' scenic qualities.

Since 2000, the State of California has not designated any new State scenic highways nor has the State of California added any roadways within Riverside County to the State-Eligible Highways list. *Additionally, Interstate 10 (San Gorgonio Pass and Western Coachella Valley: San Bernardino County line to Calimesa, through to Indian Wells) was removed from the State Eligible Scenic Highways list.* While a number of roadways within Riverside County remain as County-eligible scenic highways, no new roadways have been officially designated as County scenic highways.

RIVERSIDE COUNTY PLANNING DEPARTMENT

SCENIC HIGHWAYS

This page intentionally left blank

4.4.3 Policies and Regulations Addressing Aesthetic and Visual Resources

A. State and Federal Regulations

The California Department of Transportation (Caltrans) State Scenic Highway Program provides for the designation of scenic or eligible scenic highways, as well as scenic corridors. Scenic corridors are evaluated based on existing scenic areas adjacent to and visible from (but not within) the highway right-of-way and featuring primarily scenic and natural features. Topography, vegetation, viewing distance and jurisdictional lines determine corridor boundaries. Caltrans scenic highway considerations are based upon "how much of the natural landscape a traveler sees and the extent to which visual intrusions impact the scenic corridor." As part of the designation process, the local governing body must develop and implement a corridor protection program containing the following five legislatively-required elements:

1. Regulation of land use and density of development (i.e., density classifications and types of allowable land uses).

2. Detailed land and site planning (i.e., permit or design review authority and regulations for the review of proposed developments).

3. Control of outdoor advertising (i.e., prohibition of off-premise advertising signs and control of on-premise advertising signs).

4. Careful attention to and control of earthmoving and landscaping (i.e., grading ordinances, grading permits, design review authority, landscaping and vegetation requirements).

5. The design and appearance of structures and equipment (i.e., design review authority and regulations for the placement of utility structures, microwave receptors, wireless communication towers, etc.).

B. Riverside County Regulations

As discussed above, the following existing regulations and policies are intended to protect existing aesthetic and visual resources within Riverside County. These policies are not part of the proposed GPA No. 960; rather, they are policies that have been previously approved by the County of Riverside as separate discretionary actions.

Ordinance No. 655 - Regulating Light Pollution: The intent of this ordinance is to restrict the permitted use of certain light fixtures emitting into the night sky undesirable light rays which have a detrimental effect on astronomical observation and research. Ordinance No. 655 defines lighting sources, establishes the type and manner of installation and operation of lighting and details lighting prohibitions. Ordinance No. 655 applies to restriction zones Zone A and Zone B. These radius zones are based on distance from the Palomar Observatory. Zone A encompasses a 15 miles radius and Zone B encompasses a 45-mile radius around the observatory. See Figure 4.4.1.

Table 4.4-B: Summary of State and County Eligible and Designated Scenic Highways

Designation	Hwy/State Route	Region / Areas Affected
State Designated	State Route 243 and State Route 74	San Gorgonio Pass, Western Coachella Valley and San Jacinto Mountains: Banning City limit to SR-74, SR-74 from San Bernardino National Forrest to SR-111 in Palm Desert
State Designated	State Route 62	Western Coachella Valley: Interstate 10 to San Bernardino County line
State Eligible	State Route 74	From San Jacinto Mountains, through San Jacinto Valley, Harvest Valley/Winchester, Sun City, Menifee and Elsinore Valleys: Orange County line to El Cariso and continuing east towards the City of Hemet
State Eligible	Interstate 15, State Route 91 and State Route 71	Temescal Valley, Lake Elsinore and Southwestern Riverside Co. South from north of Corona to the San Diego County Line
~~State Eligible~~	~~Interstate 10~~	~~San Gorgonio Pass and Western Coachella Valley: San Bernardino County line to Calimesa, through to Indian Wells~~
State Eligible	State Route 111	Eastern Coachella Valley: Salton Sea (Bombay Beach) to SR-195 near Mecca
State Eligible	State Route 79	San Jacinto Mountains: From the SR-371 intersection in the Aguanga area, south to the San Diego County line
County Eligible	US Highway 95	Palo Verde: From I-10 to the San Bernardino County line
County Eligible	Interstate 10	Palo Verde, Desert Center, Eastern Desert Area and Eastern and Western Coachella Valley: From the Arizona border at the Colorado River to the SR-62 junction
County Eligible	Dillon Road	Western Coachella Valley: North from I-10
County Eligible	Oak Glen Rd/ Beaumont Ave	San Gorgonio Pass: San Bernardino County line to Beaumont Ave. to the Beaumont city limit
County Eligible	San Timoteo Cyn Rd / Redlands Blvd	San Gorgonio Pass and Reche Canyon/Badlands: From the Beaumont city limit to the Moreno Valley city limit to SR-60
County Eligible	Gilman Springs Road/ State Route 79	Reche Canyon/Badlands and San Jacinto Valley: Moreno Valley city limit to Lamb Canyon Road (SR-79), south of the Beaumont city limit to the Gilman Springs Rd intersection; and continuing south towards SR-74 and the City of San Jacinto
County Eligible	Ramona Expressway	Reche Canyon/Badlands, Lakeview/Nuevo, San Jacinto Valley: I-215 east towards the City of San Jacinto to SR-74
County Eligible	Interstate 215	Southwestern Riverside County, Sun City and Menifee Valley: SR -74, Menifee Rd, McCall Blvd, I-215 South to I-15
County Eligible	State Route 79	Southwestern Riverside County and San Jacinto Mountains: I-215 from Temecula east to SR-371 at Aguanga
County Eligible	Cajalco Rd, El Sobrante Rd, Mockingbird Cyn Rd and La Sierra Ave	Lake Mathew / Woodcrest: I-15 to Lake Elsinore, around Lake Mathews

Source: Riverside County General Plan, Figure C-9, "Riverside County Scenic Highways," 2003 *and updated per the California Eligible and Officially Designated Routes, 2014, http://www.dot.ca.gov/hq/LandArch/scenic/cahisys.htm.*

Ordinance No. 915 - Regulating Outdoor Lighting: The intent of this ordinance is to establish a countywide standard for outdoor lighting that would generally prohibit light trespass and protect the health, property and well-being of residents within the unincorporated Riverside County. This ordinance will regulate light trespass in those areas that fall outside of the 45-mile radius of Ordinance No. 655, mentioned above. Ordinance No. 915 requires all outdoor lights to be adequately shielded and directed such that no direct light falls outside the parcel of origin or onto public rights-of-way.

Ordinance No. 460 - Regulating the Division of Land and Ordinance No. 461 - Road Improvement Standards and Specifications: The road standards provided in Ordinance No. 461 conform to the Circulation

Element of the General Plan for the purpose of establishing proper standards, specifications and directions for design and construction of any road or other land division improvements required in the unincorporated territory of Riverside County. In regulating road rights-of-way, Ordinance No. 461 requires that the rights-of-way be kept clear for the traveling public, subsequently protecting the visual aspects of scenic highways.

Ordinance No. 460 regulates the division of land for unincorporated Riverside County including the necessary improvements associated with the division of land. As such, the ordinance promotes maintaining visual resources by requiring that subdivisions comply with "Street Tree" provisions as well as installation requirements for electrical and communication facilities, specifically when located near scenic highways.

Together, Ordinance No. 460 and Ordinance No. 461 aid in the preservation and protection of existing aesthetic and visual resources while also potentially adding new visual resources to Riverside County when street trees are required.

Ordinance No. 348 - Land Use: Riverside County's Land Use Ordinance establishes allowable uses of land and sets standards for what and how land may be developed. The ordinance protects the people and property of Riverside County from development of unsuitable land uses and aims to ensure that built areas are developed safely and with minimal conflict with surrounding lands. In regards to Aesthetics and Visual Resources, Ordinance No. 348 specifically requires that all Wind Energy Conversion Systems (WECS) maintain specific setbacks from all State or County eligible or designated scenic highways, thereby reducing potential adverse impacts to scenic highways. The setback distance is determined by the actual location of the highway. Ordinance No. 348 also identifies requirements for landscaping associated with development proposals. The landscaping of development projects enhances the visual character and aesthetic quality of a site and its surroundings.

Ordinance No. 457 - Building Codes and Fees Ordinance: This ordinance regulates grading, buildings and structures within Riverside County. In relation to the Aesthetics and Visual Resources, Ordinance No. 457, enhances the existing visual character and aesthetic quality of development sites and the surrounding areas by requiring development projects that involve cut and fill slopes of particular vertical heights to be landscaped in order to provide proper erosion control measures. Erosion control landscaping plans must be submitted to and approved by the Riverside County Building and Safety Department prior to installation. Landscaping the slopes provides stability for the slope while also providing aesthetic enhancements to the site and surrounding area as well.

County Design Guidelines: Design guidelines provide development guidance for the congruent aesthetic character of a community as envisioned by the community. This may include development guidance for scale, intensity, architectural design, landscaping, light fixtures, sidewalks, trails, community logo, signage program and other visual design features of a project. Riverside County's current community guidelines include the following documents:

- Community Center Design Guidelines (Appendix J of the General Plan)
- Countywide Design Standards and Guidelines
- Third and Fifth District Design Guidelines
- Design and Landscape Guidelines for Development in the 2nd Supervisorial District
- Citrus Vineyard Policy Design Guidelines

- Bermuda Dunes Design Guidelines
- Desert Edge Design Guidelines
- Lakeview Nuevo Design Guidelines
- Temescal Valley Design Guidelines
- Vista Santa Rosa Design Guidelines
- Rubidoux Village Design Workbook
- Landscape Review Design Guidelines
- Live Oak Tree Management Guidelines
- Mecca Design Guidelines
- Thermal Design Guidelines
- Temecula Valley Wine Country Design Guidelines

County Resource Guidelines: Resource guidelines provide guidance for the protection, maintenance and beautification of the county. These guidelines include requirements for the protection of existing oak trees on parcels proposed for development, as well as water-efficient landscaping for development proposals. Current Riverside County Resource Guidelines include the Landscape Review Design Guidelines (Ordinance No. 859) and County Oak Tree Management Guidelines.

C. Existing Riverside County General Plan Policies

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval.

1. Land Use (LU) Element Policies

Policy LU 2.1: Accommodate land use development in accordance with the patterns and distribution of use and density depicted on the General Plan Land Use Map (Figure LU-1) and the Area Plan Land Use Maps, in accordance with the following:

a. Provide a land use mix at the countywide and Area Plan levels based on projected need and supported by evaluation of impacts to the environment, economy, infrastructure, and services.

b. Accommodate a range of community types and character, from agricultural and rural enclaves to urban and suburban communities.

c. Provide for a broad range of land uses, intensities, and densities, including a range of residential, commercial, business, industry, open space, recreation, and public facilities uses.

d. Concentrate growth near community centers that provide a mixture of commercial, employment, entertainment, recreation, civic, and cultural uses to the greatest extent possible.

e. Concentrate growth near or within existing urban and suburban areas to maintain the rural and open space character of Riverside County to the greatest extent possible.

f. Site development to capitalize upon multi-modal transportation opportunities and promote compatible land use arrangements that reduce reliance on the automobile.

g. Prevent inappropriate development in areas that are environmentally sensitive or subject to severe natural hazards.

Policy LU *7.1* (Previously LU 6.1): Require land uses to develop in accordance with the General Plan and Area Plans to ensure compatibility and minimize impacts.

Policy LU *7.4* (Previously LU 6.4): Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing, and traffic.

Policy LU *9.3* (Previously LU 8.3): Incorporate open space, community greenbelt separators, and recreational amenities into Community Development areas in order to enhance recreational opportunities and community aesthetics, and improve the quality of life.

Policy LU *14.1* (Previously LU 13.1): Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public.

Policy LU *14.3* (Previously LU 13.3): Ensure that the design and appearance of new landscaping, structures, equipment, signs or grading within designated and eligible State and County scenic highway corridors are compatible with the surrounding scenic setting or environment.

Policy LU *14.4* (Previously LU 13.4): Maintain at least a 50-foot setback from edge of the right-of-way for new development adjacent to designated and eligible State and County scenic highways.

Policy LU *14.5* (Previously LU 13.5): Require new or relocated electric or communication distribution lines, which would be visible from designated and eligible State and County scenic highways, to be placed underground.

Policy LU *14.6* (Previously LU 13.6): Prohibit offsite outdoor advertising displays that are visible from designated and eligible State and County scenic highways.

Policy LU *14.7* (Previously LU 13.7): Require that the size, height and type of on-premise signs visible from designated and eligible State and County scenic highways be the minimum necessary for identification. The design, materials, color, and location of the signs shall blend with the environment, utilizing natural materials where possible.

Policy LU *14.8* (Previously LU 13.8): Avoid the blocking of public views by solid walls.

Policy LU *16.4* (Previously LU 15.4): Except in unusual circumstances, no wind turbines shall be sited on lands in excess of 25% of slope.

Policy LU *16.5* (Previously LU 15.5): Except in unusual circumstances, restrict lands in excess of 25% of slope from uses associated with wind turbine development, such as access roads, except in specific instances where site-specific investigation indicates that no adverse impacts or increased hazard would result, and that visual impacts can be mitigated.

Policy LU *16.12* (Previously LU 15.12): Require the design and location of commercial wind energy developments to mitigate visual impacts. Issues which may be included in the review may be, but not necessarily limited to, the following list, depending on turbine types, densities and siting:

a. Color of turbines.

b. Location and design of associated facilities such as roads, fencing, non Public Utilities Commission regulated utility lines, substations and maintenance buildings to minimize intrusion or disruption of the landscape.

c. Minimizing of disturbed ground and roadway, and restoring of the surface to natural vegetation.

d. Prohibition of brand names or advertising associated with wind turbines visible from any scenic highways or key viewpoints.

e. Need for interpretation and/or visitors center located at the end of the view shed of turbines.

Policy LU *16.13* (Previously LU 15.13): Require design measures for commercial wind energy development on sites near official or eligible State or County scenic highways designated (Figure C-7, Circulation Element) by Riverside County, and sites within those areas identified as "critical" and "very critical" by Environmental Impact Report No. 158. Issues which may be included in the review may be, but are not necessarily limited to, the following list, depending on turbine types, densities, and sitting:

a. Except in unusual circumstances, no wind turbine would be sited on slopes in excess of 25%; the purpose of this standard is to prevent disturbance and degradation of landforms, and visual scarring by cut and fill, side casting, retaining walls, trenching, and vegetation removal; avoid skyline and ridgeline location.

b. Wind turbines should be set back from scenic highways and viewpoints; set back individual turbines far enough from scenic highways and key viewpoints so they do not obscure or overwhelm distinctive skylines; set back large turbines from small important landmarks so that they do not overwhelm the landform.

c. Coordinate color schemes for all developments; avoid mixing colors within a particular array unless to subordinate a particular turbine type or to provide safety markings; limit use of color patterns as accent for key clusters or individual turbines; consider aviation safety coloration and lighting as may be required by the FAA.

Policy LU 19.1: Where appropriate, use any adopted Density Transfer Program to help implement Rural Village Overlay Study Areas and the Multi-Species Habitat Conservation Program.

Policy LU *21.1* (Previously LU 17.1): Require that grading be designed to blend with undeveloped natural contours of the site and avoid an unvaried, unnatural, or manufactured appearance.

Policy LU *21.3* (Previously LU 17.3): Ensure that development does not adversely impact the open space and rural character of the surrounding area.

Policy LU *26.1* (Previously LU 20.2): Require that development be designed to blend with undeveloped natural contours of the site and avoid an unvaried, unnatural, or manufactured appearance.

Policy LU *26.3* (Previously LU 20.4): Ensure that development does not adversely impact the open space and rural character of the surrounding area.

Policy LU *28.6* (Previously LU 22.6): Require setbacks and other design elements to buffer residential units to the extent possible from the impacts of abutting agricultural, roadway, commercial and industrial uses.

Policy LU *28.10* (Previously LU 22.10): Require that residential units/projects be designed to consider their surroundings and to visually enhance, not degrade, the character of the immediate area.

Policy LU *29.9* (Previously LU 23.9): Require that commercial development be designed to consider their surroundings and visually enhance, not degrade, the character of the surrounding area.

Policy LU *30.8* (Previously LU 24.8): Require that industrial development be designed to consider their surroundings and visually enhance, not degrade, the character of the surrounding area.

Policy LU *31.5* (Previously LU 25.5): Require that public facilities be designed to consider their surroundings and visually enhance, not degrade, the character of the surrounding area.

2. Circulation (C) Element Policies

Policy C 5.3: Require parking areas of all commercial and industrial land uses that abut residential areas to be buffered and shielded by adequate landscaping.

Policy C 19.1: Preserve scenic routes that have exceptional or unique visual features in accordance with Caltrans' Scenic Highways Plan.

Policy C *20.10* (Previously C 20.8): Avoid, where practicable, disturbance of existing communities and biotic resource areas when identifying alignments for new roadways, or for improvements to existing roadways and other transportation system improvements.

3. Open Space (OS) Element Policies

Policy OS 5.6: Identify and, to the maximum extent possible, conserve remaining upland habitat areas adjacent to wetland and riparian areas that are critical to the feeding, hibernation, or nesting of wildlife species associated with these wetland and riparian areas.

Policy OS 9.3: Maintain and conserve superior examples of native trees, natural vegetation, stands of established trees, and other features for ecosystem, aesthetic and water conservation purposes.

Policy OS 9.4: Conserve the oak tree resources in the county.

Policy OS 21.1: Identify and conserve the skylines, view corridors and outstanding scenic vistas within Riverside County.

Policy OS 22.1: Design developments within designated scenic highway corridors to balance the objectives of maintaining scenic resources with accommodating compatible land uses.

Policy OS 22.2: Study potential scenic highway corridors for possible inclusion in the Caltrans Scenic Highways Plan.

Policy OS 22.4: Impose conditions on development within scenic highway corridors requiring dedication of scenic easements consistent with the Scenic Highways Plan when it is necessary to preserve unique or special visual features.

Policy OS 22.5: Utilize contour grading and slope rounding to gradually transition graded road slopes into a natural configuration consistent with the topography of the areas within scenic highway corridors.

D. Proposed New or Revised Riverside County General Plan Policies

The following revision to existing General Plan policies is included as part of GPA No. 960. The revision is intended to enhance the policies' implementation and comprehensive use.

1. Land Use (LU) Element Policies

Policy LU 4.1: Require that new developments be located and designed to visually enhance, not degrade the character of the surrounding area through consideration of the following concepts:

a. Compliance with the design standards of the appropriate Area Plan land use category.

b. Require that structures be constructed in accordance with the requirements of the County's zoning, building and other pertinent codes and regulations.

c. Require that an appropriate landscape plan be submitted and implemented for development projects subject to discretionary review.

d. Require that new development utilize drought tolerant landscaping and incorporate adequate drought-conscious irrigation systems.

e. Pursue energy efficiency through street configuration, building orientation, and landscaping to capitalize on shading and facilitate solar energy, as provided for in Title 24 *Part 6 and/or Part 11* of the California ~~Administrative~~ Code *of Regulations*.

f. Incorporate water conservation techniques, such as groundwater recharge basins, use of porous pavement, drought tolerant landscaping, and water recycling, as appropriate.

g. Encourage innovative and creative design concepts.

h. Encourage the provision of public art *that enhances the community's identity, which may include elements of historical significance and creative use of children's art.*

i. Include consistent and well-designed signage that is integrated with the building's architectural character.

j. Provide safe and convenient vehicular access and reciprocal access between adjacent commercial uses.

k. Locate site entries and storage bays to minimize conflicts with adjacent residential neighborhoods.

l. Mitigate noise, odor, lighting, and other impacts on surrounding properties.

m. Provide and maintain landscaping in open spaces and parking lots.

n. Include extensive landscaping.

o. Preserve natural features, such as unique natural terrain, *arroyos, canyons, and other* drainage ways, and native vegetation, wherever possible, particularly where they provide continuity with more extensive regional systems.

p. Require that new development be designed to provide adequate space for pedestrian connectivity and access, recreational trails, vehicular access and parking, supporting functions, open space, and other pertinent elements.

q. Design parking lots and structures to be functionally and visually integrated and connected.

r. Site buildings access points along sidewalks, pedestrian areas, and bicycle routes, and include amenities that encourage pedestrian activity.

s. Establish safe and frequent pedestrian crossings.

t. Create a human-scale ground floor environment that includes public open areas that separate pedestrian space from auto traffic or where mixed, it does so with special regard to pedestrian safety.

u. Recognize open space, including hillsides, arroyos, riparian areas, and other natural features as amenities that add community identity, beauty, recreational opportunities, and monetary value to adjacent developed areas.

v. Manage wild land fire hazards in the design of development proposals located adjacent to natural open space.

Policy LU *4.5* (Previously 4.4): Permit historically significant buildings to vary from building and zoning codes in order to maintain the historical character of the county; providing that the variations do not endanger human life and buildings comply with the State Historic~~al~~ *Building* Code.

Policy LU *7.2* (Previously LU 6.2): Notwithstanding the Public Facilities designation, public facilities shall also be allowed in any other land use designation except for the Open Space-Conservation and Open Space-Habitat land use designations. For purposes of this policy, a public facility shall include all facilities operated by the federal government, the State of California, the County of Riverside, any special district governed by *or operating within* the County of Riverside or any city, and all facilities operated by any combination of these agencies.

Policy LU *7.6* (Previously LU 6.7): *Require* buffer*ing to the extent possible* and/or maintain a natural edge for proposed development directly adjacent to national forests.

Policy LU *9.1* (Previously LU 8.1): Provide for permanent preservation of open space lands that contain important natural resources, *cultural resources,* hazards, water features, watercourses *including arroyos and canyons*, and scenic and recreational values.

Policy LU *9.4* (Previously LU 8.4): Allow development clustering and/or density transfers in order to preserve open space, natural resources, *cultural resources,* and/or biologically sensitive resources. *Wherever possible, development on parcels containing 100-year floodplains and blue line streams and other higher-order watercourses and areas of steep slopes adjacent to them shall be clustered so as to keep development out of the watercourse and adjacent steep slope areas, and to be compatible with other nearby land uses.*

Policy LU *12.1* (Previously LU 11.1): Apply the following policies to areas where development is allowed and that contain natural slopes, canyons, or other significant elevation changes, regardless of land use designation:

a. Require that hillside development minimize alteration of the natural landforms and natural vegetation.

b. Allow development clustering to retain slopes in natural open space whenever possible.

c. Require that areas with slope be developed in a manner to minimize the hazards from erosion and slope failures.

d. Restrict development on visually significant ridgelines, canyon edges, and hilltops through sensitive siting and appropriate landscaping to ensure development is visually unobtrusive.

e. Require hillside-adaptive construction techniques, such as post and beam construction, and special foundations for development when the need is identified in a soils and geology report which has been accepted by the County.

f. ~~Encourage the~~ *In areas at risk of flooding,* limit~~ation of~~ grading and cut and fill to the amount necessary to provide stable areas for structural foundations, street rights-of-way, parking facilities, and other intended uses.

2. Circulation (C) Element Policies

Policy C 20.1: Ensure preservation of trees identified as superior examples of native vegetation within road rights-of-way through development proposals review process. *Where the County deems preservation to be infeasible, relocation and/or replacement shall be evaluated by a qualified arborist to ensure that the impacts are mitigated.*

Policy C 25.2: Locate new and relocated utilities underground when possible *and feasible*. All remaining utilities shall be located or screened in a manner that minimizes their visibility by the public.

3. Open Space (OS) Element Policies

Policy OS 5.5: ~~New development shall p~~ *P*reserve and enhance existing native riparian habitat and prevent obstruction of natural watercourses. *Prohibit fencing that constricts flow across watercourses and their banks.* ~~Incentives shall be utilized to the maximum extent possible.~~

4.4.4 Thresholds of Significance for Aesthetic and Visual Resources

The proposed project would result in a potentially significant impact on aesthetic or visual resources if it would:

A. Have a substantial adverse effect on a scenic vista.

B. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings and historical buildings within a State scenic highway.

C. Substantially degrade the existing visual character or aesthetic quality of a site and its surroundings.

D. Create a new source of substantial light or glare that would adversely affect day or nighttime views in the areas.

E. Interfere with the nighttime use of the Palomar Astronomical Observatory, as protected through Riverside County Ordinance No. 655.

4.4.5 Effect of GPA No. 960 on the General Plan and on Aesthetic and Visual Resources

A. Method of Aesthetic Analysis

Some components of GPA No. 960 have the potential to affect land use, including some site-specific locations. An evaluation was performed to determine if any of the proposed changes would have the potential to significantly adversely affect a scenic resource within Riverside County, see Appendix EIR-3. First, for those project components for known locations (i.e., Riverside County-initiated land use designation changes, study area and policy area revisions, etc.) existing and proposed land uses were examined for aesthetic compatibility with the existing conditions on and surrounding the sites. Secondly, the proposed changes were evaluated in terms of potential to adversely affect each area or region's existing scenic values. As a result, all of the GPA No. 960 items with spatial components were classed into one of three categories of potential for aesthetic impacts:

No Effect / Nominal Effect: This category includes land found to be already developed (built out) with existing urban, suburban, industrial, agricultural or rural uses; land already fully disturbed, for example graded, scraped or disked, such that the site's own natural aesthetics have been lost or extensively altered, and its role in any scenic viewshed would be minimal. Changes to these types of sites would have a nominal effect on an area's overall viewshed or aesthetics. This category also includes lands that would be fully conserved, for example, parcels going to the Open Space-Conservation Habitat (OS-CH) land use designation. Lands going into designations that do not accommodate development would have no effect on an area's viewshed or aesthetics.

Minor Effect: This category includes land where the disturbance resulting from any future development would most likely be minor. In some cases, this may include a vacant site that is large enough to accommodate the proposed use while making any site-planning or design allowances necessary to ensure minimal aesthetic impacts occur. An example of this would be a 10-acre, lightly forested parcel in which two single-family homes would be permitted. Each resultant parcel would be large enough to allow situating the pad and structures in locations that avoid a ridgeline or viewshed, stately mature pines, large rock formations and so on.

This category also includes vacant or undisturbed lands that contribute to the existing aesthetic ambiance of an area, but are not essential for a region's overall viewshed or aesthetic. An example of this would be a 20-acre parcel of vacant, undisturbed desert scrub located amongst other similar parcels that have been developed with various single-family residences and light agricultural uses. In such case, any potential aesthetic impacts would result merely from the transition of the site from vacant to developed, rather than affecting a region's overall viewshed. This same principle would hold true for lands partially disturbed or developed, particularly within the many scattered rural and agricultural communities within unincorporated Riverside County. In both cases, future development is generally consistent with both the surrounding area and the region's overall aesthetic. As a result, such changes generally would not represent significant conversion of open space to developed uses.

Possible Effect: This category addresses lands where there is potential for visible effects to aesthetics. Examples include completely undeveloped areas not even accessible by dirt road; vacant parcels of open land with minimal disturbances (e.g., no structures and perhaps only a few dirt roads) located in or adjacent to large areas of open space; or areas with significant, unique or noteworthy aesthetic features on or adjacent to the site (such as at the top of an open bluff, sites with ponds or waterfalls, large rock formations, scenic viewpoints, etc.) This category also includes proposed land uses of substantially greater intensity than that of the surrounding region and regional growth pattern. In general, this category captures locations in which conversion of open space to developed uses could visibly affect a viewshed or major aesthetic resource.

B. Results of Aesthetic Analysis

As a result of the above project analysis (see Appendix EIR-3), the areas proposed for specific land use-related changes as part of GPA No. 960 have been categorized as follows:

No Aesthetic Effect: A total of approximately 28,500 acres encompassing over 800 parcels were found to have no potential for aesthetic effects because they would be designated Open Space-Conservation Habitat (OS-CH) for biological conservation purposes or going to other types of conservation (OS-C or OS-W). This includes 460 parcels within policy areas and 283 parcels being acquired by the Riverside Conservation Authority. See Appendix EIR-3 for further details on these sites.

Of the various policy area and study area changes included in GPA No. 960, four would not have an adverse impact on scenic resources: El Cariso Rural Village Study Area (RVSA), Aguanga RVSA, Anza RVSA and the Agriculture/Potential Development Special Study Area. These four policy items are being deleted as part of GPA No. 960. Thus, their existing Land Use Designations would dictate suitability of any future development proposals. As a result, future development is expected to be less intense than that currently potentially permissible under the existing Study Area policies; aesthetic impacts derived from urbanization would also be lessened. In the case of Anza, a Policy Area would also cover the area formerly subject to the RVSA to further ensure that any future development is appropriate to the area's environmental constraints, including viewshed and aesthetics.

There are no new environmental impacts associated with this category of effect. The existing General Plan land use designations, which remain in effect for these areas, were analyzed under EIR No. 441 prepared for the 2003 RCIP General Plan. Also in this category are the Sky Valley and Chiriaco Summit areas as no land use changes are proposed for either of these under GPA No. 960.

Nominal Aesthetic Effect: A total of approximately 64,500 acres encompassing nearly 7,500 parcels were found to have nominal potential for aesthetic effects. See Appendix EIR-3 for list. This includes approximately 4,000 acres (nearly 440 parcels) proposed to change as a result of Riverside County-initiated land use designation

alterations. The total encompasses sites that have previously been disturbed (rural or suburban) and appear to contribute nominally to the existing aesthetic of the area.

Minor Aesthetic Effect: A total of roughly 480 parcels encompassing nearly 1,580 acres were found to have minimal to minor potential for aesthetic effects. See Appendix EIR-3 for list. In general, these parcels include changes to less-intense land use designations, sites already significantly disturbed or developed low-intensity uses on large parcels or combinations of these. In all cases, the proposed land uses were found to be consistent with that of the surrounding area.

Of the various policy area and study area changes included in GPA No. 960, several would potentially have minor aesthetic impact potential, for the same reasons listed above. These include: Meadowbrook and Good Hope Rural Village Study Areas (RVSAs), the proposed Northeast Business Park overlay and areas of scattered Land Use Designation changes associated with Flabob, Blythe and Riverside Municipal Airports. Potential future commercial development in rural areas permitted by the new Incidental Rural Commercial policy also falls into this category, though specific locations affected by this policy cannot be foreseen at this time.

In each of these cases, the potential land use changes would be consistent with existing development patterns and existing levels of disturbances on and around the areas. As a result, future development would generally represent a continuation of existing types and levels of aesthetic impacts (for example, development of residential lots amid scattered existing residences), rather than new, substantial impacts. There are minimal to minor aesthetic impacts associated with this category of effect. However, site-specific analysis required at the time of future development implementation would ensure that these impacts would be less than significant. Existing County of Riverside regulations and processing procedures, as well as General Plan polices, would further ensure that future development proposals in these areas consider and avoid potential aesthetic impacts. See Section 4.4.6 (Aesthetic and Visual Resources – Impacts and Mitigation) for full details on impacts and mitigation.

Possible Aesthetic Effect: Approximately 13 parcels encompassing nearly 400 acres were found to have the potential for major visible aesthetic impacts. See Appendix EIR-3 for list. In all but three cases, this is due to the change of land use designation from OS-CH, which does not allow any development, to a use that allows at least a minimal level of development, most commonly Open Space-Rural (OS-RUR), which allows one home per 20 acres. Such LUD changes were necessary to ensure that lands under private ownership have at least minimal development potential and the OS-RUR designation is the least-intense possible land use designation for residential use. Nevertheless, most of the sites falling into this category are located in, or immediately adjacent to, large expanses of scenic open space. Some are consistent with surrounding development patterns, but are located on the outer fringes of the developing area, adjacent to large areas of open space. It is for these reasons that parcels in this category may require discretionary actions related to aesthetics protection as part of any future development proposals. The nature and scope of such measures are discussed under Section 4.4.6, below. One policy area, Lakeland Village, which spans roughly 65 acres on nearly 300 parcels, is also included in this category because of its location surrounding Lake Elsinore.

C. Effects on Scenic Highways

Of all of the parcel-specific changes proposed under GPA No. 960, only one lies in proximity to a State-designated scenic highway. This project component encompasses approximately 36 acres on 10 parcels amidst the forests outside Idyllwild. The parcels are proposed to change from OS-CH to OS-RUR and are located in proximity to State Route 243 which winds through the San Jacinto Mountains. However, due to the proposed large lot sizes, parcel locations and existing development pattern (numerous large-lot single-family residences and dirt roads already occur immediately adjacent to the subject 36 acres), the proposed changes would not result in a significant adverse effect to the State scenic highway.

A number of parcel changes are also proposed along or near eligible scenic highways, including proposed Rural Residential uses in the Lake Elsinore region along Interstate 15 and Highway 74; proposed Medium-Density Residential development off Highway 74 in the Winchester/ Harvest Valley region and the changing of sites from Rural Desert to Rural Residential along State Route 111, on the east side of the Salton Sea. In total, this category includes nearly 80 parcels (570 acres). All of these proposed changes were found to have either minor or no impact potential for aesthetics due to similar uses nearby.

In addition to the parcel-specific issues discussed above, analysis was also made of the large-scale, non-specific land use changes included as part of GPA No. 960, such as new or revised Policy Areas, Rural Village Overlays and the like. Of these areas, it was found that none occur in proximity to any California scenic highways, but several occur near State- and County-eligible highways.

Specifically, along State-eligible Highway 74, the deletion of the El Cariso Rural Village Study Area and the Agriculture/Potential Development Special Policy Area would limit development potential to existing General Plan land use designations in these areas. Effects would be reduced by the proposed removal of the mechanisms that would have allowed more intense land use designations. Similarly, the deletion of the Aguanga Rural Village Study Area would limit development in the area lying along County-eligible Highway 79, as well as a small stretch of State-eligible Highway 79 running south of Highway 371 to the San Diego County border. All of these changes would have either minor or no effect on area aesthetics and scenic resources.

Along Highway 74, the Good Hope and Meadowbrook Rural Village Study Areas would be replaced with overlays providing specific alternate Land Use Designations to accommodate the anticipated urbanization of the region. These changes provide two or more possible land use options under the General Plan, which may ultimately increase development in these areas. The Ramona Expressway, also a County-eligible highway, would be affected by future development within the proposed Northeast Business Park Overlay in the Lakeview/Nuevo area. In the Blythe area, development within the area subject to the Airport Influence Area has the potential to be visible from Interstate 10, which is also a County-eligible scenic highway. Lastly, incidental rural commercial development potential may affect undetermined future sites, some of which may include locations along State-designated or eligible scenic highways, as well as County-eligible scenic highways.

These larger-scale changes may have potential for environmental impacts associated with this category of effect. However, these impacts would be rendered less than significant with the mitigation provided through regulatory compliance. Specifically, existing County of Riverside regulations and processing procedures, as well as General Plan polices, would further ensure that future development proposals in these areas consider and avoid potential impacts to scenic highways. See Section 4.4.6 for full details on impacts and mitigation.

D. Light, Glare and Effects on Palomar Observatory

As outlined above in Section 4.4.5, many of the proposed land use designation changes, overlays and policy area amendments would allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses throughout Riverside County. Future development of the parcels changed pursuant to GPA No. 960 would contribute to changing the visual character of Riverside County over a period of time. Lighting associated with higher intensity and density uses may adversely affect nighttime and daylight glare on existing residential areas and add to existing commercial and light industrial development. Development on any of the parcels changed or affected by GPA No. 960 would contribute to the overall increase in light levels and skyglow within Riverside County.

For the Palomar Observatory, the County of Riverside has established two zones of potential lighting (skyglow) effects. The first, Zone A, extends 15 miles around Palomar Observatory. Due to its proximity, excessive

lighting within Zone A has the greatest potential to adversely affect Observatory operations. Among the foreseeable land use-related components of GPA No. 960, a total of approximately 20 acres would potentially be subject to future development within the Rancho California area, approximately 240 acres within the Aguanga area and up to 750 acres in the Anza area, as well as the area covered by the proposed Anza Policy Area itself. Within these areas, compliance with existing lighting control policies and ordinances, Ordinance No. 655, in particular, would be necessary to ensure additional skyglow does not adversely affect the scientific operations at Palomar Observatory. Parcels within Zone B, the 45-mile radius, are more numerous and would also comply with the applicable regulations to ensure appropriate control of any night lighting or skyglow.

These changes may have potential for environmental impacts associated with this category of effect. However, these impacts would be less than significant with the mitigation provided through regulatory compliance. Specifically, existing County of Riverside regulations and processing procedures, as well as General Plan polices, would further ensure future development proposals in these areas consider and avoid potential impacts due to light and glare. See Section 4.4.6 for full details on impacts and mitigation.

4.4.6 Aesthetic and Visual Resources - Impacts and Mitigation

A. Would the project have a substantial adverse effect on a scenic vista?

Impact 4.4.A – Adversely Affect Scenic Vistas: Future development consistent with the changes proposed by GPA No. 960 would increase rural, suburban and urban uses in select portions of the county, adversely affecting scenic vistas in some areas. Compliance with existing laws, regulatory programs, General Plan policies and existing Mitigation Measure 4.4.1A from EIR No. 441, help reduce potential impacts to scenic resources. Compliance with these, plus a new project-specific mitigation measure (4.4.A-N1) would ensure that future development accommodated by the project would have a less than significant impact on scenic vistas.

1. Analysis of Impact 4.4.A

Scenic vistas occur throughout the county and would potentially be affected by future development activities authorized pursuant to the revised land use designations and policies resulting from GPA No. 960. In some locations, changes to land use designations proposed under GPA No. 960 would allow future development projects that would result in the physical conversion of open space, vacant and agricultural lands to more urban types of uses. In a few areas, as outlined in Section 4.4.5, these conversions could contribute to the substantial alteration of existing scenic vistas or reduce access to these viewsheds.

As outlined above in Section 4.4.5, a total of approximately 400 acres scattered throughout eastern and western Riverside County were found to have to potential for major visible aesthetic effects. Most of these sites are located in, or immediately adjacent to, large expanses of scenic open space. These sites generally have limited access and the construction of roads leading to them would involve extending disturbances into areas of undeveloped viewsheds. For parcels in eastern Riverside County, this generally would mean affecting viewsheds of open, trackless desert or hills. In western Riverside County, this would mean affecting open views of local foothills or mountains.

The development of structures and facilities, particularly on vacant properties, is required to be consistent with the policies and regulatory programs outlines in the General Plan. Similarly, the replacement, expansion or refurbishment of existing development would also be required to conform to these policies and programs. Based

on their location, extent, density and configuration, future development consistent with General Plan changes made by GPA No. 960 could alter the characteristics of a local or regional viewshed or visual resource. This may also be the case for future development or infrastructure improvements that may occur in conjunction with project build out at locations not foreseeable at this time, including the introduction of incidental rural-commercial uses.

For the above reasons, a small subset of parcels and policy items arising from GPA No. 960 were found likely to require regulatory actions related to aesthetics protection as part of any future development proposals. As a group, the regulatory compliance measures outlined below would serve to reduce various potential aesthetic impacts, as indicated, for new development proposals, regardless of location. In addition, a new project-specific Mitigation Measure (4.4.A-N1) is also included to address this impact. All of these measures are assigned on a discretionary basis as a result of subsequent site-specific CEQA review. Together they would ensure that potential impacts to viewsheds and scenic vistas would be less than significant.

2. Regulatory Compliance for Impact 4.4.A

As explained below, compliance with the following existing laws, regulatory programs and General Plan policies would aid in avoiding or reducing potentially significant impacts to scenic vistas and viewsheds as a result of GPA No. 960.

a. Compliance with Riverside County Regulations

Several local regulations would reduce impacts related to substantial adverse effects on scenic vistas. These include, but are not limited to, the following: Riverside County Ordinance No. 460, which regulates the division of land within the county; Ordinance No. 461, which regulates road improvement standards and specifications for Riverside County right-of-ways and Riverside County Design Guidelines, which detail specific standards that establish and protect the aesthetic value of certain identified communities. Through these programs and ordinance standards, development near scenic vistas that would have the potential to adversely affect scenic vistas are highly regulated and addressed at various levels of Riverside County's review process.

Ordinance No. 460 - Regulating the Division of Land: This ordinance regulates the division of land in unincorporated Riverside County, including any improvements associated with the division. In relation to scenic highways and vistas, Ordinance No. 460 requires that the installation of electrical and communication distribution lines "be underground when alignments parallel or cross scenic highways, natural scenic and historic sites… when it is deemed feasible," to protect scenic vistas and highways.

Ordinance No. 461 - Road Improvement Standards and Specifications: This ordinance regulates and implements standards and engineering specifications for roads, bridges and other transportation-related facilities. This ordinance ultimately reinforces and details specific road standards for the regulations set in place by Ordinance No. 460, as well as ensuring that the road right-of-way is kept clear for the traveling public, therefore protecting the scenic highway designation.

Riverside County Design Guidelines: County Design Guidelines provide guidance for the aesthetic development of communities as envisioned by the community itself. County Design Guidelines uphold the visions for these communities by creating development standards which may include guidance for scale, intensity, architectural design, landscaping, light fixtures, sidewalks, trails, community logo, signage and other visual design features of a project. Application of these design standards would further ensure that potential aesthetic impacts are less than significant for development proposals.

b. Compliance with Existing General Plan Policies

Of the General Plan Policies listed in Section 4.4.3.C, above, the policies below provide mitigation that would reduce the impacts of future growth and development within the county on scenic vistas.

Policies LU 14.3, 14.4, 14.5, 14.8, 16.4, 16.5, 16.12, 19.1, 28.6, 28.10, 29.9, 30.8 and 31.5: These policies directly address avoiding impacts to scenic vistas by requiring that future development be designed in such a manner that the visual aspects within a particular area are enhanced and not degraded. Specific development standards such as setback and grading requirements are set forth in these policies in order to protect scenic vistas as well as those policies set in place for the protection of open space in order to ensure reduced impacts to scenic vistas.

Policies LU 14.6 and 14.7: These two policies specifically address the protection of scenic vistas through the regulation of signage, including outdoor advertising displays for Riverside County.

Policies C 5.3 and C 19.1: These policies address circulation-related issues such as parking and maintaining those roadways that have been designated as official or eligible scenic highways.

c. Compliance With Proposed New or Revised General Plan Policies

The following revised policy of the Riverside County General Plan will further prevent significant impacts to scenic vistas. See Section 4.4.3.C for full text of this policy.

Policy LU 4.1: This policy directly addresses avoiding impacts to scenic vistas by requiring that future development be designed in such a manner that the visual aspects within a particular area are enhanced and not degraded. Specific development standards such as setback and grading requirements are set forth in these policies in order to protect scenic vistas as well as those policies set in place for the protection of open space in order to ensure reduced impacts to scenic vistas.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, which was certified for the 2003 RCIP General Plan, it was determined that in order to reduce impacts associated with scenic vistas, mitigation would be necessary. The mitigation measure listed below is from EIR No. 441 and shall also apply as part of the mitigation for Program EIR No. 521.

Existing Mitigation Measure 4.4.1A: Development projects shall be subject to the requirements of all relevant guidelines, including the community center guidelines, Riverside County supervisorial district guidelines and all applicable standards, policies and/ or regulations of the County of Riverside or other affected entities pertaining to scenic vistas and aesthetic resources. Factors considered in these guidelines include the scale, extent, height, bulk or intensity of development; the location of development; the type, style and intensity of adjacent land uses; the manner and method of construction, including materials, coatings and landscaping; the interim and/or final use of the development; the type, location and manner of illumination and signage; the nature and extent of terrain modification required; and the potential effects to the established visual characteristic of the project site and identified scenic vista or aesthetic resource.

3. Additional Mitigation Measure for Impact 4.4.A

As detailed below, a new mitigation measure is proposed in order to further reduce potential adverse impacts related to scenic vistas pursuant to GPA No. 960. For parcels in which future development would potentially

result in a major visible effect to an existing viewshed or significant aesthetic feature, the following new project mitigation measure shall be required. Compliance with this measure would ensure a potentially significant impact is avoided by preventing inappropriate development in scenic areas.

NEW Mitigation Measure 4.4.A-N1: No development shall be approved for parcels without adequate legal access and adequate physical access. Adequate and accessible circulation facilities must also exist to meet the demand of the proposed land use.

4. Finding on Significance for Impact 4.4.A

Compliance with the above existing regulations, programs, policies and existing mitigation measures, including new Mitigation Measure 4.4.A-N1, would ensure that impacts to scenic vistas associated with future development consistent with the proposed project would be less than significant.

B. Would the project substantially damage trees, rock outcroppings and historical buildings within a State scenic highway?

Impact 4.4.B – Adversely Affect Scenic Resources Within State Scenic Highways: Future activities consistent with GPA No. 960 would increase development of rural, suburban and urban uses, potentially substantially damaging scenic resources in some areas. Compliance with existing regulatory programs, General Plan policies and existing Mitigation Measure 4.4.1A from EIR No. 441 would reduce potential impacts to scenic resources to less than significant.

1. Analysis of Impact 4.4.B

Scenic resources occur throughout Riverside County and would potentially be affected by development activities consistent with the revised land use designations and policies of GPA No. 960. The land use-related changes proposed under GPA No. 960 would allow for future development projects that would result in the physical conversion of open space, vacant and agricultural lands to more urban types of uses. These conversions could contribute to the substantial alteration of existing scenic resources on or in the vicinity of individual sites.

As outlined in Section 4.4.5, previously, in areas located in, or immediately adjacent to, large expanses of scenic open space have the greatest potential for adverse effects to scenic resources, as such areas tend to contain undisturbed or minimally-altered naturally-occurring scenic resources, such as individual trees and stands, ponds, lakes, waterfalls and wetlands, rocks, groupings of boulders and other scenic geological features.

In addition, impacts to aesthetic resources can include changes in the built environment, particularly to historic structures that capture the aesthetic of bygone eras. This is most readily apparent for historic buildings along a State scenic highway. GPA No. 960 land use changes include only one site located near a State scenic highway, Highway 243 in the San Jacinto Mountains outside of Idyllwild. The 36-acre site consists of 13 parcels of forested land, some of which are sited with single large-lot homes.

Besides the "possible effect" category, there are also sites from the "minor effect" category that may have potential for adverse impacts to the aesthetics of the built environment, including historic structures or other notable man-made features. This category, in particular, includes sites located in rural and less-dense suburban areas. Such areas may have a greater potential for historic structures, such as those associated with Riverside County's long agrarian past.

The development of structures and facilities, particularly on vacant properties, would be required to be consistent with the policies and regulatory programs outlined in the General Plan (see below). Similarly, the replacement, expansion or refurbishment of existing development, including any historic buildings or scenic structures, and any within a scenic highway, would also be required to conform to these policies and programs. Based on its location, extent, density and configuration, future development consistent with the General Plan changes made by GPA No. 960 would be subject to existing laws and regulations to ensure that no significant impacts would occur.

For the above reasons, parcels and policy items arising from GPA No. 960 from both the "possible effect" and "minor effect" categories potentially require regulatory actions related to aesthetics protection as part of any future development approvals. As a group, the regulatory compliance measures outlined below would serve to reduce potential aesthetic impacts for all new development proposals, regardless of location. As such, they would ensure that potential aesthetic impacts remain less than significant.

2. Regulatory Compliance for Impact 4.4.B

The above analysis indicates this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, compliance with the following regulatory programs, General Plan policies and existing EIR No. 441 mitigation measure would ensure that adverse impacts to trees, rock outcroppings and historical buildings within a State scenic highway are less than significant. Through these policies and programs, development near trees, rock outcroppings and historical buildings within State scenic highways are regulated and addressed at all levels of Riverside County's development review process.

a. Compliance with State and County Regulations

State and local regulations exist that would reduce impacts related to trees, rock outcroppings and historical buildings within a State scenic highway, including, but not limited to, the following:

California Scenic Highway Program: This program of the California Department of Transportation (Caltrans) provides for the designation of scenic or eligible scenic highways and corridors to enhance and protect the natural scenic beauty along California's highways. It includes development standards for official scenic highways and also by requires that local governments establish and implement standards that promote and protect the appearance of the scenic highway. Local governments are required to protect the visual character of a site and its surroundings through the development of standards that include:

- Regulation of land use and density of development (i.e., density classifications and types of allowable land uses).
- Detailed land and site planning (i.e., permit or design review authority and regulations for the review of proposed developments).
- Control of outdoor advertising (i.e., prohibition of off-premise advertising signs and control of on-premise advertising signs).
- Careful attention to and control of earthmoving and landscaping (i.e., grading ordinances, grading permits, design review authority, landscaping and vegetation requirements).

- Regulating the design and appearance of structures and equipment (i.e., design review authority and regulations for the placement of utility structures, microwave receptors, wireless communication towers, etc.).

Riverside County currently addresses the protection of scenic highways through the implementation of programs and ordinances that address each of these five standards. The County of Riverside addresses the regulation of land use and the density of development through the General Plan's Land Use Designations (LUDs). The LUDs are separated into five Foundation Components that guide the pattern of development and the extent of land uses. Detailed site and land planning, along with the control of outdoor advertising displays, are regulated through Riverside County's Land Use Ordinance No. 348. This ordinance regulates specific land uses and associated development standards to ensure consistency with Riverside County's General Plan. Riverside County Ordinance No. 457, Building Codes and Fees Ordinance, regulates and controls earthmoving, while Ordinance No. 859 regulates landscaping within the county. Lastly, a number of Community Design Guidelines address the design and appearance of structures and equipment in the county in order to ensure a consistent character within individual communities. Ordinance No. 348 (Section 19.400) also addresses cell towers and related equipment, including aesthetic standards for such sites

Ordinance No. 348 - Land Use Ordinance of Riverside County: As mentioned previously, this ordinance establishes allowable uses of land and sets standards for what and how land may be developed. In regards to aesthetics, Ordinance No. 348 specifically requires that all Wind Energy Conversion Systems (WECS) maintain specific setbacks from all State- or County-eligible or designated scenic highways, thereby reducing potential adverse impacts to scenic highways.

Ordinance No. 460 - Regulating the Division of Land: This ordinance regulates the division of land in unincorporated Riverside County, including any improvements associated with the division. In relation to scenic highways and vistas, Ordinance No. 460 requires that installation of electrical and communication distribution lines "be underground when alignments parallel or cross scenic highways, natural scenic and historic sites…when it is deemed feasible," in order to protect these scenic resources. As scenic highways and vistas add to the visual character of a site and its surroundings, this ordinance also reduces potential adverse impacts to the visual character of those areas impacted by the project.

Ordinance No. 461 - Road Improvement Standards and Specifications: No. 461 regulates and implements standards and engineering specifications for roads, bridges and other transportation-related facilities. This ordinance ultimately reinforces and details specific road standards for the regulations set in place by Ordinance No. 460 as well as ensuring that road rights-of-way are kept clear for the traveling public, therefore protecting scenic highway designations as well as maintaining the visual character of an area.

Riverside County Design Guidelines: Riverside County Design Guidelines (as set forth in General Plan Appendix J, among others) provide guidance for the aesthetic development of communities as envisioned by the community itself. Riverside County Design Guidelines uphold the visions for these communities by creating development standards which may include guidance for scale, intensity, architectural design, landscaping, light fixtures, sidewalks, trails, community logo, signage and other visual design features of a project. Application of these design standards would further ensure that potential impacts to the visual character of an area are less than significant for development proposals.

Riverside County Oak Trees Design Guidelines: These guidelines address the treatment of parcels with existing oak tree resources as well as design provisions for development of those parcels. The guidelines protect oak trees as a scenic resource in a number of ways including, but not limited to, requiring a biological study of onsite vegetation, encouraging development to be designed in a manner where any disturbed land avoids oak trees

as well as the protected zone of any oak tree. Compliance with these guidelines would reduce potential impacts to less than significant.

b. Compliance with Existing General Plan Policies

Of the General Plan policies listed in Section 4.4.3.C above, several in particular provide mitigation for impacts associated with development near trees, rock outcroppings and historical buildings within a State scenic highway. Implementation of these General Plan policies would reduce even further the impacts of future growth and development upon these scenic resources. Specifically:

Policies OS 9.3 and 9.4: These policies directly address this impact by conserving trees and native vegetation for aesthetic purposes among other reasons. As such, they protect existing visual resources within Riverside County from the effects of future development.

c. Compliance with Proposed New or Revised General Plan Policies

Policy LU 4.5: This policy directly address allowing historical buildings to vary from regulatory codes in order to preserve the historical character of Riverside County, thereby maintaining existing aesthetic resources within Riverside County and further reducing impacts.

Policy C 20.1: This policy directly addresses this impact by conserving trees and native vegetation for aesthetic purposes among other reasons. As such, they protect existing visual resources within Riverside County from the effects of future development.

d. Compliance with Existing Mitigation Measures from EIR No. 441

For the same reasons as for Impact 4.4.A, Mitigation Measure 4.4.1A from EIR No. 441 also applies here. Hence, this measure is also included as an existing programmatic compliance measure for this project as well.

3. Finding on Significance for Impact 4.4.B

Compliance with the above regulatory programs, policies and mitigation measures would ensure that trees, rock outcroppings and historical buildings within a State scenic highway are not adversely impacted by this project or future development. As a result, impacts to trees, rock outcroppings and historical buildings within a State scenic highway would be less than significant.

C. Would the project substantially degrade the existing visual character or aesthetic quality of a site and its surroundings?

Impact 4.4.C – Adversely Affect Existing Visual Character: The existing visual character or aesthetic quality of some sites affected by the proposed project may be altered by future activities consistent with proposed GPA No. 960 land use changes. Compliance with existing regulatory programs, existing General Plan policies, existing Mitigation Measure 4.4.1A from EIR No. 441 and new project-specific Mitigation Measure 4.4.A-N1 would ensure that potential adverse impacts to visual character resulting from GPA No. 960 are less than significant.

1. Analysis of Impact 4.4.C

It is anticipated that future activities consistent with GPA No. 960 land use changes would slightly increase the amount of urban development within Riverside County. Where such development occurs on vacant, undeveloped and generally open land, this would potentially degrade the existing visual character in some areas. This includes many of the GPA No. 960-affected sites categorized with "possible effect" potential. On these sites, long-term aesthetic impacts would be primarily associated with the change in visual character resulting from conversion of previously vacant lands to developed uses. This would be particularly noticeable in areas that currently are predominantly rural, agricultural or vacant (open space).

The proposed land use overlays and new land use designations would include a combination of low to medium-high density residential, commercial, light industrial, office and business park uses, civic uses, transit facilities, recreational uses and open space uses. The Rural Incidental Commercial and Sphere of Influence policies would allow for small-scale commercial uses and suburban residential lots in rural and semi-rural areas. This may significantly change the visual character of sites and surrounding areas. However, the specific locations in which this may occur as a result of the new policies cannot be foreseen at this time. Thus, any potential future impacts must be addressed programmatically.

Based on its location, extent, density and configuration, future development may alter the characteristics of a locally or regionally significant visual resource. Development proposed in areas subject to adopted Design Guidelines shall be required to comply with the aesthetic measures of those guidelines. Such sites would be subject to County of Riverside design review, as appropriate to their nature and location, to ensure aesthetic impacts have been ameliorated. Compliance with existing regulations, EIR No. 441 mitigation measures and new project-specific Mitigation Measure 4.4.A-N1 would ensure that impacts are less than significant.

2. Regulatory Compliance for Impact 4.4.C

As detailed and explained below, compliance with the following regulations, programs and General Plan policies are sufficient to ensure that adverse impacts associated with visual character as a result of GPA No. 960 would be less than significant for the majority of the affected areas within Riverside County. The previously discussed 400 acres (13 parcels) of land that have been identified as having the potential for major visible aesthetic impacts, plus any site not presently foreseeable arising as the General Plan builds out, would be reduced to less than significant through the mitigation of proposed New Mitigation Measure 4.4.A-N1, as well as the existing regulations, programs and General Plan policies described below.

a. Compliance with Riverside County Regulations

Local regulations exist that would reduce impacts related to substantial adverse effects on the visual character of an area. These include, but are not limited to, the following: Ordinance No. 460, Ordinance No. 461 and the Riverside County Design Guidelines. Through these programs and ordinance standards, developments that would have the potential to adversely affect the visual character of an area are highly regulated and addressed at various levels of Riverside County's review process.

Ordinance No. 348 - Land Use Ordinance of Riverside County: Among other things, this ordinance protects the people and property of Riverside County from development of unsuitable land uses and aims to ensure that built areas are developed safely and with minimal conflict with surrounding lands. In regards to the existing visual character and aesthetic quality of a site and its surroundings, Ordinance No. 348 identifies requirements for landscaping associated with development proposals. The landscaping of development projects

enhances the visual character and aesthetic quality of a site and its surroundings, thereby maintaining and many times improving the existing visual character and aesthetic quality of a site.

Ordinance No. 457 - Building Codes and Fees Ordinance: In relation to the existing visual character and aesthetic quality of an area, Ordinance No. 457 requires development projects that involve cut and fill slopes of particular vertical heights to be landscaped in order to provide proper erosion control measures. Erosion control landscaping plans must be submitted to and approved by the Riverside County Building and Safety Department prior to installation. Landscaping these cut and fill slopes enhances the existing visual character and aesthetic quality of sites and the surrounding areas.

Ordinance No. 460 - Regulating the Division of Land: In relation to scenic highways and vistas, Ordinance No. 460, requires that installation of electrical and communication distribution lines "be underground when alignments parallel or cross scenic highways, natural scenic and historic sites…when it is deemed feasible," in order to protect these scenic resources. As scenic highways and vistas add to the visual character of a site and its surroundings, this ordinance also reduces potential adverse impacts to the visual character of those areas impacted by the project.

Ordinance No. 461 - Road Improvement Standards and Specifications: This ordinance ultimately reinforces and details specific road standards for the regulations set in place by Ordinance No. 460 as well as ensuring that road rights-of-way are kept clear for the traveling public, therefore protecting scenic highway designations as well as maintaining the visual character of an area.

Riverside County Design Guidelines: Riverside County Design Guidelines (as set forth in General Plan Appendix J, among others) provide guidance for the aesthetic development of communities as envisioned by the community itself. Riverside County Design Guidelines uphold the visions for these communities by creating development standards which may include guidance for scale, intensity, architectural design, landscaping, light fixtures, sidewalks, trails, community logo, signage and other visual design features of a project. Application of such design standards would further ensure that potential impacts to the visual character of an area are less than significant for development proposals.

b. Compliance with Existing General Plan Policies

Implementation of the General Plan policies listed in Section 4.4.3.C provide mitigation for impacts associated with the visual character of an area and would reduce the impacts of future growth and development in Riverside County on visual character. Specifically:

Policy LU 14.8: This policy directly addresses preserving the visual character of an area by prohibiting the blocking of public views by solid walls and thereby maintaining visual character.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised policy of the Riverside County General Plan will further prevent significant impacts that would adversely affect existing visual character. See Section 4.4.3.C for full text of each.

Policy LU 4.1: This policy directly addresses avoiding adverse impacts to the visual character of an area by requiring that new developments be located and designed to visually enhance and not degrade the character of the surrounding area through a number of concepts including, preserving the natural features, such as unique natural terrain, drainage ways and native vegetation, wherever possible.

d. Compliance with Existing Mitigation Measures from EIR No. 441

For the same reasons as for Impact 4.4.A, existing Mitigation Measure 4.4.1A from EIR No. 441 also applies here. Hence, this measure is also included as an existing programmatic compliance measure for this project as well.

3. Additional Mitigation Measures for Impact 4.4.C

As detailed below, a new mitigation measure is being proposed in order to further reduce potential adverse impacts related to scenic vistas. For parcels in which future development would potentially result in a major visible effect to an existing viewshed or significant aesthetic feature, new project-specific Mitigation Measure 4.4.A-N1, as set forth under Impact 4.4.A, above, shall be required. Compliance with this measure would ensure a potentially significant impact is avoided by preventing inappropriate development in scenic areas.

4. Finding on Significance for Impact 4.4.C

With the implementation of, and compliance with, the above-listed existing regulations, programs and General Plan policies, including existing Mitigation Measure 4.4.1A from EIR No. 441, plus newly proposed Mitigation Measure 4.4.A-N1, GPA No. 960 would have less than significant impacts on the existing visual character. Aesthetic quality impacts and impacts resulting from conversion of open space or undisturbed areas to developed uses would also be reduced to less than significant.

D. Would the project create a new source of substantial light or glare that would adversely affect day or nighttime views in the areas?

Impact 4.4.D – Cause Adverse Light and Glare Effects: Future development consistent with GPA No. 960 would introduce new sources of light and glare which would adversely affect day and/or nighttime views in some areas. Compliance with a variety of existing regulatory programs, including General Plan policies and existing measures from EIR No. 441, would ensure that light and glare impacts to views are less than significant.

1. Analysis of Impact 4.4.D

Future development consistent with the land use changes of GPA No. 960 would increase the effects of light and glare on existing and future residences in some areas. New light and glare would arise from the addition of residences, commercial uses, public facilities and other structures. Light and glare would be emitted by developed uses with artificial lighting, for example, parking lots, commercial landscaped areas, exterior signage, interior building lighting and residential yards. Signage that is lit at night and visible from roadways is also a particular issue.

Light from all of these new uses would also contribute to nighttime light pollution levels and skyglow, i.e., the overall lightening of the night sky resulting from illumination of air and water particles in the atmosphere. Glare, that is, reflected sunlight or artificial light that interferes with vision or navigation may also arise from any of these sources, as well as from the use of reflective materials on building exteriors. Certain industrial processes and agricultural facilities, such as fish ponds or solar farms, can also be significant sources of glare.

Sites categorized with "possible effect" for aesthetic impacts are also generally those most likely to contribute to potentially significant nighttime lighting impacts due to their locations in previously undisturbed open areas or

along urbanizing fringes. Sites on either the "minor effect" or "nominal effect" lists would also potentially introduce new sources of light and glare to their locales, particularly where increased intensities are proposed. However, because of the urban or suburban nature of most of these sites and their typically nominal aesthetic value, individual site impacts would be less than significant. Nevertheless, all development from GPA No. 960 would contribute incrementally to the cumulative light pollution levels and skyglow experienced in Riverside County and Southern California.

2. Regulatory Compliance for Impact 4.4.D

As explained below, compliance with the following existing regulations, design guidelines, General Plan policies and existing EIR No. 441 mitigation measures are sufficient to ensure adverse effects associated with light and glare impacts as a result of GPA No. 960 would be less than significant.

a. Compliance with Federal, State and County Regulations

Local regulations that would reduce impacts related to light and glare include, but are not limited to, Riverside County Ordinance No. 461, which includes standards for residential lighting, as well as lighting for highways, roadways, intersections and traffic signage, and Ordinance No. 655, which addresses standards for acceptable nighttime lighting within Riverside County and protection of the Palomar Observatory. The following County of Riverside regulations would also aid in reducing impacts:

Ordinance No. 348 - Land Use Ordinance of Riverside County: In regards to new sources of light and glare that would adversely affect day or nighttime views, Ordinance No. 348 specifically requires compliance with Ordinance No. 655 and identifies standards related to lighting for signs, outdoor advertising displays, mini-warehouses and recreational vehicle parks. Compliance with Ordinance No. 348 reduces potential adverse impacts to the day or nighttime views from light and glare.

Ordinance No. 461 - Road Improvement Standards and Specifications: This ordinance includes standards for residential lighting, as well as lighting for highways, roadways, intersections and traffic signage, requiring that all lighting standards, including private residential lighting comply with Ordinance No. 655. Compliance with this ordinance would further reduce any potential adverse light and glare impacts as a result of future development from the project.

Ordinance No. 655 - Regulating Light Pollution: This ordinance addresses standards for acceptable nighttime lighting within Riverside County and measures related to development within 15-45 miles of the Palomar Observatory by requiring the usage of low pressure sodium lamps for outdoor lighting fixtures and regulating the hours of operation for commercial/ industrial uses in order to reduce lighting impacts on the observatory. Compliance with Ordinance No. 655 would further reduce potential light and glare impacts.

Ordinance No. 915 - Regulating Outdoor Lighting: The intent of this ordinance is to establish a countywide standard for outdoor lighting that would generally prohibit light trespass and protect the health, property and well-being of Riverside County's residents. The ordinance regulates light trespass in areas that fall outside of the 45-mile radius of Ordinance No. 655 (see above). It requires all outdoor luminaries to be located, adequately shielded and directed such that no direct light falls outside the parcel of origin or onto the public right-of-way. Compliance with Ordinance No. 915 would further reduce potential light and glare impacts.

Riverside County Design Guidelines: Application of the Riverside County Design Guidelines would further ensure that impacts associated with lighting and glare are less than significant for development proposals resulting

from GPA No. 960. For the same reasons as for Impact 4.4.A, and due to various standards set forth in the design guidelines requiring hooded, shielded or low-to-the-ground lighting. Standards for backlighting and indirect lighting to promote "night skies" are also included in the Guidelines and would reduce potential lighting and glaring impacts.

b. Compliance with Existing General Plan Policies

Of the General Plan Policies listed in Section 4.4.3.C, above, Policy LU 14.6, in particular provides mitigation for potential impacts associated with light and glare. This policy directly addresses prohibiting offsite outdoor advertising displays that are visible from designated and eligible scenic highways. By regulating billboards and signs, it would reduce the obstruction of visual resources from structures and from outdoor advertising displays. As a result, it would reduce any potential light or glare impacts resulting from future growth and development.

c. Compliance With Proposed New or Revised General Plan Policies

Revised Policy LU 4.1 would further prevent significant impacts associated with light and glare effects. It requires that new developments be located and designed to visually enhance and not degrade the character of the surrounding area through consideration of a number of concepts, including, mitigating noise, odor, lighting and other impacts on surrounding properties. This policy would ensure that potential light and glare impacts from new development are reviewed and addressed early on during the entitlement process. See Section 4.4.3.C for full text of the policy.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, which was certified for the 2003 RCIP General Plan, it was determined that to fully reduce impacts associated with light and glare, several mitigation measures were also necessary. These mitigation measures from EIR No. 441 are listed below and shall also apply as part of the mitigation for this Program EIR No. 521.

Existing Mitigation Measure 4.4.2A: Riverside County shall require that sources of lighting within the General Plan area be limited to the minimum standard required to ensure safe circulation and visibility.

Existing Mitigation Measure 4.4.2B: Riverside County shall require street lighting to be limited to intersections and other locations that are needed to maintain safe access (e.g., sharp curves).

Existing Mitigation Measure 4.4.2C: Riverside County shall require exterior lighting for buildings to be of a low profile and intensity.

Existing Mitigation Measure 4.4.2D: The County [of Riverside] shall establish a liaison with California Institute of Technology [which operates the Palomar Observatory] to ensure "dark skies" preservation procedures are incorporated, as necessary, in future County ordinances.

Existing Mitigation Measure 4.4.2E: The County [of Riverside] shall participate in Palomar Observatory's "dark sky" conservation area.

3. Finding on Significance for Impact 4.4.D

With the implementation of, and compliance with, the above-listed regulations, design standards and guidelines, policies and existing mitigation measures, potential adverse visual resource impacts would be avoided, minimized or reduced. As a result, light and glare impacts associated with future development consistent with the proposed project would be less than significant.

E. Would the project interfere with the nighttime use of the Palomar Astronomical Observatory, as protected through Riverside County Ordinance No. 655?

Impact 4.4.E – Interfere with Nighttime Use of the Palomar Astronomical Observatory: Future development accommodated by GPA No. 960 would introduce new sources of light within 15-45 miles of the Palomar Observatory, which requires dark skies to function. New sources of light resulting from GPA No. 960 would also contribute incrementally to the overall skyglow of the region, which interferes with nighttime operations at the Observatory. Compliance with a variety of existing regulatory programs, including General Plan policies, County of Riverside ordinances, Ordinance No. 655 (Regulating Light Pollution) in particular, and existing measures from EIR No. 441, would ensure that light impacts on operations at Palomar Observatory are less than significant.

1. Analysis of Impact 4.4.E

Future development consistent with the land use changes resulting from GPA No. 960 would increase the amount of night lighting in the region and contribute incrementally to the region's skyglow. New light would arise from the addition of a variety of new development, most particularly commercial uses with outdoor parking or lit signage. The scope and extent of lighting impacts anticipated as a result of GPA No. 960 are analyzed under Impact 4.4.D, above.

To ensure that nighttime skies would not be brightened, astronomical observatories generally need to be located at least 30 to 40 miles from large, lit urban areas. The Palomar Observatory is located approximately 5.5 miles south of the Riverside-San Diego county line. Originally, the observatory was located in a generally non-urbanized area. However, in the century since the observatory's founding, southwestern Riverside County, particularly the cities of Temecula and Murrieta have grown significantly, greatly increasing the nighttime lighting and skyglow of the region in the process. While not located within Riverside County, astronomical observations at Palomar Observatory rely on dark skies and are affected by increases in light sources within Riverside County.

Some areas expected to develop consistent with GPA No. 960 changes are located within Zone A (15 miles or less from Palomar), including any future development within the Anza Policy Area, and many sites are located within Zone B (15 to 45 miles from the observatory). Sites within these restriction zones (Zones A and B) would be subject to protection and lighting restrictions under Ordinance No. 655. Compliance with this ordinance would ensure that additional light sources are not individually significant or contribute to cumulatively significant light increases in the region.

2. Regulatory Compliance for Impact 4.4.E

As detailed and explained below, compliance with the following existing regulations, programs, design standards and guidelines, General Plan policies and EIR No. 441 mitigation measures are sufficient to ensure that adverse effects associated with the Palomar Astronomical Observatory as a result of GPA No. 960 would be less than significant.

a. Compliance with Federal, State and County Regulations

Compliance with the following existing laws, regulatory programs, General Plan policies and existing mitigation measures are sufficient to ensure that adverse impacts associated with the Palomar Astronomical Observatory as a result of GPA No. 960 would be less than significant. Through these policies, programs and standards, development that would have the potential to adversely impact the observatory are highly regulated and addressed at all levels of Riverside County's development review process.

Ordinance No. 348 - Land Use Ordinance of Riverside County: In regards to the Palomar Astronomical Observatory, this ordinance specifically requires compliance with Riverside County Ordinance No. 655 and identifies standards related to lighting for signs, outdoor advertising displays, mini-warehouses and recreational vehicle parks. Compliance with Ordinance No. 348 reduces potential adverse impacts to the Palomar Astronomical Observatory.

Ordinance No. 461 - Road Improvement Standards and Specifications: The ordinance includes standards for residential lighting, as well as lighting for highways, roadways, intersections and traffic signage. It also requires that all lighting standards, including private residential lighting, comply with Ordinance No. 655. Compliance with Ordinance No. 461 would further reduce any potential adverse light and glare impacts as a result of GPA No. 960 and future development.

Ordinance No. 655 - Regulating Light Pollution: This ordinance addresses standards for acceptable nighttime lighting within Riverside County and measures related to development within 15-45 miles of the Palomar Observatory by requiring the usage of low pressure sodium lamps for outdoor lighting fixtures and regulating the hours of operation for commercial/ industrial uses in order to reduce lighting impacts on the Observatory. Both Zones A and B require the use of low-pressure sodium lamps, shielded outdoor lighting, restricted hours of operation as well as restrictions for outdoor advertising displays. The specific zone would also detail the lamp types, parking lot, walkway and security lighting as well as the decorative lighting that is allowable or prohibited for each zone. Compliance with Ordinance No. 655 would further reduce potential impacts to the Palomar Astronomical Observatory.

Riverside County Design Guidelines: Application of the Riverside County Design Guidelines would further ensure that impacts associated with lighting and glare are less than significant for development proposals resulting from GPA No. 960 for the same reasons as for Impact 4.4.A and due to various standards set forth in the design guidelines requiring hooded, shielded or low-to-the-ground lighting. Standards for backlighting and indirect lighting to promote "night skies" also included in the Guidelines in order to reduce effects on Palomar Astronomical Observatory.

b. Compliance With Proposed New or Revised General Plan Policies

Of the General Plan policies listed in Section 4.4.3.C, above, Policy LU 4.1, in particular provides mitigation for potential impacts associated with the Palomar Astronomical Observatory. Implementation of this General Plan policy related to the Observatory would reduce any potential impacts of future growth and development. Specifically:

Policy LU 4.1: This policy requires that new developments be located and designed to visually enhance and not degrade the character of the surrounding area through consideration of a number of concepts, including, mitigating noise, odor, lighting and other impacts to surrounding properties. This policy ensures that potential adverse impacts to the Palomar Observatory from new development would be reviewed and addressed early on during the entitlement process.

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, five mitigation measures were adopted to reduce the impact of light and glare to less than significant levels. Since measures that reduce night lighting in general also serve to mitigate light impacts on the Palomar Observatory and because there measures remain applicable to the areas covered by GPA No. 960, continued compliance with these existing measures would also reduce impacts to the observatory.

Existing Mitigation Measure 4.4.2A: Riverside County shall require that sources of lighting within the General Plan area be limited to the minimum standard required to ensure safe circulation and visibility.

Existing Mitigation Measure: 4.4.2B: Riverside County shall require street lighting to be limited to intersections and other locations that are needed to maintain safe access (e.g., sharp curves).

Existing Mitigation Measure 4.4.2C: Riverside County shall require exterior lighting for buildings to be of a low profile and intensity.

Existing Mitigation Measure 4.4.2D: The County [of Riverside] shall establish a liaison with California Institute of Technology [which operates the Palomar Observatory] to ensure "dark skies" preservation procedures are incorporated, as necessary, in future County ordinances.

Existing Mitigation Measure 4.4.2E: The County [of Riverside] shall participate in Mount *[sic]* Palomar Observatory's "dark sky" conservation area.

3. Finding on Significance for Impact 4.4.E

Implementation of, and compliance with, the above listed regulations, design standards and guidelines, General Plan policies and existing mitigation measures would ensure that potential adverse impacts to the Palomar Astronomical Observatory are avoided, minimized or reduced. As a result, impacts to the Palomar Astronomical Observatory associated with future development accommodated by the proposed project would be less than significant.

4.4.7 Significance After Mitigation for Aesthetic and Visual Resources

Development and implementation activities resulting from the proposed project, General Plan Amendment No. 960, would be subject to a number of existing General Plan policies, existing Riverside County Ordinances, existing mitigation measures from EIR No. 441 and newly proposed project-specific Mitigation Measure 4.4.A-N1, as identified above. These mitigation and regulatory compliance measures would reduce to below the level of significance any potential adverse impacts to scenic vistas, scenic resources, including, but not limited to, trees, rock outcroppings and historical buildings within State scenic highways, and the existing visual character and aesthetic quality of urban, suburban and other already-developed areas. They would also ensure that impacts associated with light and glare adversely affecting day or nighttime views, as well as nighttime use of Palomar Astronomical Observatory, are also less than significant. For impacts to the existing visual character and aesthetic quality of 400 acres that would transition from undisturbed open space to developed urban, suburban or rural uses as a result of GPA No. 960 and have the potential for major visible impacts, the above measures would

reduce impacts to less than significant. In total, all project-related visual and aesthetic effects would ultimately be less than significant with the mitigation cited.

Section 4.5

Agricultural and Forestry Resources

Section 4.5
Agricultural and Forestry Resources

4.5.1 Introduction

Riverside County's agricultural industry plays a vital role in the local economy and consistently ranks among the most profitable in California. The wide variety of climates and soil types within the county allows a diverse array of crops to be grown. The industry provides a large number of jobs associated with the growing, harvesting, processing, packing and shipping of produce. In terms of dollar value, agriculture is today the largest industry in Riverside County, providing employment for a notable portion of Riverside County's population. This industry creates revenues over triple the base gross value of the products grown and raised here in Riverside County. Currently, agriculture faces continuing pressure from urbanization, water availability, foreign competition and rising production costs. Despite these pressures, the areas which remain in agricultural production represent a significant open space and economic resource for Riverside County.

The Riverside County General Plan defines productive agricultural lands as those "involved in a long-term, substantial investment to agricultural use and with long-term economic viability for agricultural use." Factors affecting the economic viability of these areas include weather, water prices, crop selection, management techniques, commodity prices, new technology tax structure and proximity of developed lands.

Riverside County's forestry resources also play a vital role in establishing the character of Riverside County; the Cleveland National Forest frames southwestern Riverside County and the San Bernardino National Forest frames edges of eastern Riverside County. Both the Cleveland National Forest and the San Bernardino National Forest are part of the Sierran montane range. Montane forests can be found all over the world; however, the montane forest is the most complex bio-region in North America and is home to many animal species. The County of Riverside aims to preserve its forest resources within the Cleveland and San Bernardino National Forests through careful management of the forest ecosystem, protection of forest resources and discouraging and limiting the development of land uses that conflict with valuable forest lands.

4.5.2 Existing Environmental Setting - Agricultural and Forestry Resources

A. Agricultural Production in Riverside County

Agricultural resources include lands cultivated for crops for both human and animal use, providing livestock forage or as a source of fiber or other raw materials. Commercial agricultural activities also include non-cultivation (ranch) activities, such as the raising of livestock for production of meat, milk and dairy products, as

well as fiber and other non-edible products (wool, leather, etc.). Also in this category are aquaculture (fish farms) and the poultry industry, which produces poultry meat, eggs, chicks and other products. In total, the Riverside County Agricultural Commissioner tracks nine categories of agricultural production: citrus; tree and vine crops; vegetables, melons and miscellaneous crops; field and seed crops; livestock and poultry; livestock and poultry products; nursery stock production (i.e., ornamental plants, cut flowers, Christmas trees, etc.); aquaculture and apiculture (bee keeping). There is no commercial forestry or timber production industry within Riverside County other than Christmas tree farms of nursery stock production (that is, cultivated, rather than wild-harvested).

Farms within Riverside County produce over 50 different varieties of crops, from bell peppers to broccoli, dates to potatoes and many others. Livestock raised commercially in Riverside County includes everything from ducks to crayfish, in addition to cattle, sheep and chickens. Agricultural products grown in Riverside County are exported to over 60 countries around the world, ranging from Angola to Vietnam. In *2006*, the top five countries importing Riverside County produce *were as follows*: *(1) Japan (2) China (3) Mexico (4) Korea and (5) Australia. In 2013, the top five countries importing Riverside County produce changed order to (1) Japan, (2) Mexico, (3) China, (4) Korea and (5) Canada.*

After a ~~record-breaking~~ production peak of $1.25 billion in 2006, *values decreased as water availability and general economic issues "caught up with" the agricultural industry,* ~~values have continued to decrease as water availability and general economic issues "catch up with" the agricultural industry~~ according to the Agricultural Commissioner. *According to the 2013 Agricultural Production Report issued by the Riverside County Agricultural Commissioner's Office, in 2013 the County of Riverside's total gross agricultural valuation was roughly $1.3 billion ($1,327,804,000). This was a 6% increase from the previous year. Each of the top ten fruit and vegetable commodities enjoyed increased values, due to a combination of strong market prices and increased production. The 2013 gross value for crops was approximately $1billion ($1,068,121,000), a 9.37% increase from the previous year. Livestock was at $259.7 million, a 6.1% decrease from the prior year.*

~~According to the 2009 Agricultural Production Report issued by the Riverside County Agricultural Commissioner's Office, in 2009 the County of Riverside's total gross agricultural valuation was roughly $1 billion ($1,015,755,300). This was a decrease of $252.8 million (19.9%) from the 2008 total, the second straight year of declining values. The 2009 gross value for crops was $801.0 million, a 15.5% decrease. Livestock was $214.7 million, a 33.1% decrease from the prior year.~~

According to the Agricultural Commissioner, for the *tenth* ~~sixth~~ year in a row, nursery stock ranked as the top valued crop in Riverside County ~~even though its production values fell by 10% from the prior year~~. *Milk, table grapes, hay and bell peppers rounded out the top crops in 2013.* ~~Milk, table grapes, eggs and bell peppers rounded out the top crops in 2009.~~ Table 4.5-A (Cultivated Crop Production Statistics) shows the valuations and amounts of acreage in production for key crops within Riverside County and *Table 4.5-B (Other Agricultural Product Valuation Data) shows other non-crop agricultural products. Despite a decrease in the amount of land in agricultural cultivation between the years 2009-2011, the amount of agricultural land in cultivation is up at 210,500 acres.* Statewide, Riverside County ranked thirteenth in the value of its agricultural production in *2012* ~~2009~~.

~~Despite a reported decrease of nearly 22% in the amount of land in agricultural cultivation between 2003 and 2007, the value of Riverside County's agricultural products went up over 14% during that same period. Other non-crop agricultural products, as shown in Table 4.5-B (Other Agricultural Product Valuation Data), rose by over $111 million (nearly 22%) as well.~~

Agricultural statistics are maintained by the County of Riverside for four districts: Riverside/Corona, San Jacinto/ Temecula Valley, Coachella Valley and Palo Verde Valley. Per Table 4.5-C (Crop Valuation by Agricultural District), in *2013* ~~2009~~ the Coachella Valley District recorded the highest valuation for non-livestock related agricultural production.

~~Table 4.5-A: Cultivated Crop Production Statistics~~

~~CROP~~	~~Stat.~~	~~2003~~	~~2004~~	~~2005~~	~~2006~~	~~2007~~	~~2008~~	~~2009~~
~~Citrus~~	~~Acreage~~	~~23,500~~	~~20,900~~	~~20,700~~	~~18,600~~	~~19,400~~	~~17,200~~	~~16,800~~
	~~Valuation~~	~~$84.9M~~	~~$123.6M~~	~~$138.2M~~	~~$107.9M~~	~~$121.4M~~	~~$135.8M~~	~~$101.7M~~

B. Farmland Resources

The California Department of Conservation runs the Farmland Mapping and Monitoring Program (FMMP) to produce maps and statistical data on California's agricultural resources. Agricultural lands within each county are rated on their production value according to soil quality and irrigation status to produce maps that are updated every two years. The maps also incorporate soils data issued by the Natural Resource Conservation Service (NRCS), a branch of the U.S. Department of Agriculture. Most recently, in September 2009, the FMMP released a set of three maps of 2008 data for western, central and eastern Riverside County, see Figure 4.5.1 (Agricultural Resources Map). The relationship of this new data to the project and existing General Plan is described further, below.

The farmland and other land categories used by the FMMP are described briefly below. Additional information on these can be found on the Department of Conservation's website.

Table 4.5-D: State-Designated Farmland Data for Riverside County

LAND CATEGORY	County Total 2006	County Total 2008* (Unincorp. Portion)	Change Between 2006-2008*
Prime Farmland	128,510 ac	122,940 ac (105,390 ac)	-5,570 ac (-4.3%)
Farmlands of Statewide Importance	46,920 ac	44,650 ac (36,660 ac)	-2,270 ac (-4.8%)
Unique Farmlands	37,950 ac	37,140 ac (32,360 ac)	-810 ac (-2.1%)
Farmlands of Local Importance	231,090 ac	229,160 ac (162,410 ac)	-2,050 ac (-0.8%)
Grazing Lands	111,700 ac	111,220 ac (96,620 ac)	-480 ac (-0.4%)
Water	62,350 ac	62,350 ac (58,110 ac)	0 ac (0%)
Urban and Built-Up Lands	300,540 ac	315,680 ac (78,830 ac)	+15,140 ac (+5.0%)
Other Lands	1,015,580 ac	1,021,340 ac (832,370 ac)	+5,760 ac (+3.5%)
COUNTY TOTALS	**1,934,620 ac**	**1,944,470 ac (1,402,750 ac)**	**- 11,180 ac agric. lands lost**

* Most recent year for which data was available (released in 2010; includes cities). All data rounded to the nearest 10 acres. Totals across years due not sum exactly due to changes in county boundaries (increase) during this period.
Source: California Dept. of Conservation, Farmland Mapping and Monitoring Program 2008 Data, released 2010.

Prime Farmland: Farmland with the best combination of physical and chemical characteristics (soil quality, growing season, moisture supply, etc.) for the long-term production of crops in high yields. These lands must have also been used for irrigated agricultural production at some time during the four years prior to the update cycle.

Farmland of Statewide Importance: Farmland other than Prime with a good combination of physical and chemical characteristics, but with minor shortcomings, such as greater slopes or less ability to store moisture. The land must also have been under irrigated production during the prior four-year cycle. Per the Riverside County General Plan, this category can include forest land, in addition to crop land, pastureland, rangeland and other lands that are not urban or water.

Unique Farmland: Lands other than the above categories that are currently used for the production of specific high value food and fiber crops, such as citrus, avocados, vegetables, etc. These lands may be of lesser quality soils, but still have the combination of traits needed to produce high quality or high yields of specific crops. This category may include non-irrigated orchards or vineyards, as well as citrus, olives, avocados, grapes, etc. The land must also have been cropped at some time during the prior four-year cycle.

Farmland of Local Importance: Farmland in this category generally does not qualify for any of the above categories, but has been deemed locally important by the Riverside County Board of Supervisors. This land may also have been suitable for "Prime" or "Statewide Importance" designation, but for the lack of available irrigation water. They can include lands in production of major, but not unique, crops, as well as dairy lands, agricultural zones (including contract lands and those in jojoba production).

Grazing Land: This includes lands on which the existing vegetation is suited to grazing livestock.

Urban and Built-Up Land: These are defined as lands occupied by structures with a building density of at least one unit per 1.5 acres or approximately six structures per 10-acre parcel. Agricultural lands surrounded by urban areas must exceed 40 acres minimum in size in order to be mapped as farmlands.

Water: This category covers perennial water bodies measuring at least 40 acres in size and larger. Those less than 40 acres are included under "Other Land."

Other Land: This refers to land not included in any other category. Commonly, this includes low-density rural developments (with five sub-categories); brush and timberlands; wetlands and riparian areas, confined livestock, poultry or aquaculture facilities; strip mines; etc. Also included are water bodies less than 40 acres in size and agricultural lands of less than 40 acres in size when surrounded by urban uses.

C. Changes in State-Mapped 'Important Farmlands'

Since the adoption of the 2003 RCIP General Plan, additional FMMP data was issued by the State Department of Conservation. In response, the County of Riverside is updating its General Plan map to reflect the new information from the State of California. These proposed changes are reflected in General Plan Figure OS-2 (Agricultural Resources). The same data is also reflected in the baseline conditions for this EIR, as shown in Figure 4.5.1.

Since preparation of the 1999 Existing Settings Report, and subsequently EIR No. 441 for the 2003 General Plan, additional information on environmental conditions related to farmland resources in Riverside County have been released. Under the FMMP, the California Department of Conservation produces maps and statistical data used for analyzing impacts on California's agricultural resources. Agricultural land is rated according to soil quality and irrigation status; the best quality land is called Prime Farmland. The maps are updated every two years through a combination of computer mapping, aerial imagery, public review and field reconnaissance. In January 2011, the FMMP released a report on additional farmland data, entitled "California Farmland Conversion Report, 2006-2008."

The State of California's report affects Riverside County's known farmland resources and is reflected in both the revised baseline conditions for this EIR (Figure 4.5.1) and the resultant updated General Plan Figure OS-2, which is based on Figure 4.5.1. The revised maps reflect changes in farmland resources resulting from conversion of irrigated farmland, dryland or idle farmland and other uses to urban. Information on these changes is developed from air photos, local comments and field reconnaissance by FMMP staff.

According to the FMMP Report for 2006-2008, approximately 19,400 acres of irrigated farmland were removed from agriculture use in Riverside County (including cities) in the State of California's 2006-2008 mapping cycle. Meanwhile, Riverside County as a whole gained just over 15,100 acres of urban land, well above the biennial average of 12,400 acres between 1984 and 2006. Homes, golf courses, commercial and community facilities constituted much of the new urban uses. Land idling continued to be common in Riverside County; nearly 5,500 acres were removed from irrigated agricultural categories to grazing uses. The State of California had pinpointed the lack of water availability and agricultural market conditions as driving the trend towards agricultural lands being fallowed (fallowing is typically seen in agricultural areas as an "interim" use in the transition of an area from active agricultural production to eventual urban, non-agricultural uses).

D. Agricultural Preserves in Riverside County

The California Land Conservation Act, better known as the Williamson Act, was enacted by the State of California in 1965 to encourage property owners to continue to farm their land and to prevent the premature conversion of farmland to urban uses. It is a voluntary program that allows property owners to have their property assessed on the basis of its agricultural production rather than at the current market value. In this way, the State of California creates a financial incentive for lands to remain in agricultural production.

Participation requires that the area consist of at least 100 contiguous acres of agricultural land under one or more ownerships. Once established, the land within the preserve is restricted to agricultural and compatible uses for 10 years, with one-year renewals unless cancelled. County of Riverside Ordinance No. 509 establishes uniform rules which apply to agricultural preserves. Riverside County lands encompass a number of Williamson Act contracts and thousands of acres lie within agricultural preserves within the county.

E. Forestry Industry

In 1982, the California Timberland Productivity Act (California Government Code [CGC] Section 51100 *et seq.*) was passed because, per the Act, "The state's increasing population threatens to erode the timberland base and diminish forest resource productivity through pressures to divert timberland to urban and other uses and through pressures to restrict or prohibit timber operations when viewed as being in conflict with non-timberland uses." The Act was designed to establish policy to "fully realize the productive potential of the forest resources and timberlands of the state." Among other things, Section 51104 of the Act includes the following definitions:

- **Timber:** Means trees of any species maintained for eventual harvest for forest products purposes, whether planted or of natural growth, standing or down, on privately or publicly owned land, including Christmas trees, but does not mean nursery stock.

- **Timberland Production Zone:** Means an area which has been zoned pursuant to [CGC] Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses.

RIVERSIDE COUNTY PLANNING DEPARTMENT

AGRICULTURAL RESOURCES

Path: \\agency\Umagis\Projects\Planning\CindysPurpleMapGallery\Fig4.5.1-AgriculturalResources.mxd

This page intentionally left blank

Other pertinent terms and definitions used in this chapter, as referenced by Appendix G of the State CEQA Guidelines, include:

- **Forest Land:** As per Public Resources Code [PRC] Section 12220(g), this is defined as land that can support 10% native tree cover of any species, including hardwoods, under natural conditions and that allows for management of one or more forest resources**,** including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation and other public benefits.

- **Timberland:** Per PRC Section 4526, timberland means land, other than land owned by the federal government and land designated by the [California Board of Forestry and Fire Protection] as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species are determined by the Board on a district basis after consultation with the district committees and others.

Lastly, Riverside County Ordinance No. 559, "Regulating the Removal of Trees," includes the following definitions:

- **Native Tree:** Means both any woody plant which is indigenous to Riverside County, and all smog-resistant species introduced as part of a reforestation program, which have one well-defined stem that at maturity normally attains a height of at least 15 feet and which is not less than 6 inches in diameter measured four feet about the ground.

- **Tree Removal:** Means any activity by which the death of a tree is caused within a reasonably short period of time. Such activities include, but shall not be limited to, cutting down, falling, pushing over, digging up, burning, poisoning or severely pruning a tree to the extent that the tree cannot survive.

- **Woody Biomass:** Trees and woody plants that are grown in a forest or woodland and are the by-products of dead forest trees, including, but not limited to, limbs, tops, needles and leaves are considered woody biomass. These forest byproducts are collected (harvested) and can then be used as fuel to produce bio-energy or as the raw materials to produce other products.

F. Forest Resources Riverside County

Riverside County includes parts of two major forests of the Sierran montane range: the Cleveland and San Bernardino National Forests, both managed by the U.S. Forest Service (USFS). These forests occupy the higher mountain ranges of the Pacific Coast region, which stretches from southern to northern Baja California, in Mexico. They are generally characterized by winter snows and summer fires, large conifers (pine and fir trees) and a great diversity of animal species. At lower elevations (generally below 5,000 feet), these forests commonly border mixed evergreen forest, oak woodland and chaparral.

As shown in Figure 4.5.2 (High Elevation Forestry Resources – Western Riverside County), portions of the Cleveland National Forest occur in the southwestern most corner of Riverside County and cover roughly 90,750 acres. The edge of the San Bernardino National Forest falls within northwestern Riverside County and covers roughly 241,600 acres.

The Riverside County portions of the Cleveland National Forest only reach elevations of about 2,000 to 3,000 feet and generally do not support large expanses of mature conifers. Stands of mixed hardwood and other trees

species in these areas are generally not subject to intensive fixed site timber operations due to their sparseness, species and locations. Portions of the San Bernardino National Forest (nearly 250,000 acres) fall within Riverside County and provide elevations and climates sufficient to support old growth forests and other forest resources.

The largest Riverside County portion of the San Bernardino National Forest is the Santa Rosa/San Jacinto Mountains National Monument, located in the central mountains that separate western and eastern Riverside County. This area contains the largest expanse of mountainous lands above 5,000 feet in which conifer forest-type vegetation occurs within Riverside County. The National Monument encompasses roughly 150,000 acres of federal lands, including the U.S. Forest Service's Santa Rosa Wilderness and San Jacinto Wilderness Ranger Districts and BLM lands, as well as roughly 120,000 acres owned or controlled by a variety of other public and quasi-public entities including the State of California, various tribes and educational institutions, plus private owners. The San Jacinto Mountains area features montane coniferous forest at the highest elevations and mixed forests (hardwoods and conifers) at lower elevations. The lands in and around the Monument provide the largest single extent of mature coniferous forests in Riverside County.

Lastly, Riverside County also includes portions of the Joshua Tree National Park, located northeast of the Coachella Valley in the Mojave Desert bioregion. This BLM-managed National Park encompasses a total of approximately 1,017,750 acres spanning Riverside and San Bernardino counties, with approximately 794,000 of those acres in Riverside County. Although much of this National Park is located above 4,000 feet in elevation, it does not offer extensive stands of forests of the types generally suitable for timber industry. The dryness, temperature extremes, slow growth rates and sparseness of the vegetation make commercial timber uses generally unlikely.

G. Forest Production in Riverside County

Within the State of California, there are roughly 85 million acres classified as wildlands. Of these, nearly 17 million are commercial forest land. According to the State, California's forests grow roughly 3.8 billion board feet annually. Each year approximately 2 billion board feet of timber, valued at over $1 billion, is harvested. Since the early 1990s the amount of timberland production in the state has declined. It is rare to find commercial timber production uses of less than 5,000 acres because the "increasing cost of regulation" generally makes smaller production levels economically infeasible (Cal Fire, "Non-Industrial Timber Management Plans in California," 2003).

In total, the California Department of Forestry and Fire Protection (Cal Fire) estimates commercial timberland area in the state covers 16.6 million acres, including federal, state and private lands (Cal Fire, "Non-Industrial Timber Management Plans in California," 2003). Of these, private timberland areas total 7.4 million acres (45%). Within the privately held timberlands, roughly 41% (3.2 million acres) belong to private, non-industrial owners and are generally of less than 5,000 acres and not used for commercial forestry purposes. The remainder is held by industrial forest landowners. Figures released by the State of California indicate that no "California forest land" ownership, either public or private, is mapped for Riverside County.

Any time timber is harvested for commercial purposes in the state, an approved Timber Harvest Plan (THP) or exemption must be obtained from the State of California pursuant to the Forest Practice Act and rules. The exemptions generally allow for activities such as harvesting Christmas trees, clearing dead, dying or diseased trees, establishing a right-of-way, or removing fire hazard trees within 150 feet of a structure. Cal Fire also provides for a one-time exemption for the conversion of 3 acres of timberland to a non-timber use. These exemptions from THPs have been authorized under the Forest Practice Act because they were found to be of a size and scale that would not significantly affect forest resources. THPs are reviewed and approved by Cal Fire.

Some coniferous forests occur within Riverside County. As shown in Figure 4.5.2, however, most are located on state or federal lands. There are no State Demonstration Forests located in Riverside County. Forests extensive enough to support large-scale commercial timber operations generally occur at the higher elevations associated with the northern Sierra Nevada Range. According to Cal Fire, there are no fixed commercial timber operations subject to a Timber Harvesting Plan in Riverside County (CalFire, 2003).

There is, however, the utilization of logs and biomass which result in dead tree removal, fuels reduction and thinning projects on private lands in Southern California. Total forest biomass, potentially treated or removed in San Bernardino, Riverside and San Diego counties peaked in 2005 at about 673,000 green tons, and was forecasted to drop to about 127,000 green tons by 2007 (approximately 20% of peak production). Utility companies, primarily Southern California Edison, accounted for approximately 70% of forest biomass tonnage removed or disposed of in 2004, which dropped to 16% in 2005.

As mentioned above, there are no existing land use designations explicitly for timber production zones or other commercial timber activities in Riverside County, although such activities could be conducted under the General Plan's 'AG' land use designation and subject to County of Riverside review and approval. There are no commercial timber operations occurring in Riverside County that rely on existing forestry resources (i.e., existing stands of trees or "old growth"). The only fixed commercial forestry activities in the county, roughly 30 to 60 acres of Christmas tree farms, are conducted as agricultural activities (nursery stock production), since the trees produced are planted onsite and grown from stock, rather than harvested from naturally occurring forest.

Nevertheless, there are existing stands of mature forest trees in several locations in the county that reach appropriate elevations (generally above 5,000 feet). Of these, most such forest resources are located on public or quasi-public lands, including National Forests (under U.S. Department of Forestry) and National Monuments (under federal BLM management) as well as others. The relationship between forestry resources and these public lands are shown in Figure 4.5.2 and Figure 4.5.3 (High Elevation Forestry Resources – Central & Eastern Riverside County).

Though not a commercial timber activity, the County of Riverside does also participate in a "woody biomass utilization program" funded by grants issued by the U.S. Forest Service. The program run by the Riverside County Fire Department (~~actually,~~ Cal Fire) is designed to utilize dead trees and biomass materials resulting from tree mortality caused by drought and bark beetle infestation in the local mountains. The woody materials are used for "value-added commercial uses," including fuel for steam electricity generation. The program is currently set to continue through to 2013.

FORESTRY RESOURCES
EASTERN RIVERSIDE COUNTY

This page intentionally left blank

H. Baseline Data Sources

Pursuant to CEQA, the description of the physical environmental conditions provided in this EIR is as they exist at the time the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting will constitute the baseline physical conditions by which the County of Riverside, as Lead Agency under CEQA, determines whether an impact to agricultural and forest resources is significant. Because of the countywide scope and nature of this project and its programmatic EIR, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence will be used. For the agricultural and forestry baseline data presented and used herein, the following sources were determined to be the best-supported substantial evidence available and were used for the reasons stated. Land use data and other environmental data sets are described in their respective chapters elsewhere.

Agricultural production values are aggregates collected by the Agricultural Commissioner's Office and reported on an annual basis, pursuant to the requirements and directives of the California Food and Agriculture Code, Section 2279. The data source used herein, Riverside County 2009 Agricultural Production Report, Riverside County Agricultural Commissioner's Officer, issued May 2010, represents the most recent data set for countywide agricultural production available. Given the trends of declining agricultural production continuing over time, as documented in said report, it is reasonable and supportable to assume the 2009 available data set represents the physical state of agricultural production in Riverside County as a 'worst case.' That is, if anything, it would over-estimate the amount of productive agricultural lands potentially adversely affected by the proposed project.

The data source of State-designated farmlands used herein is Important Farmland Maps 2008, California Department of Conservation, Farmland Mapping and Monitoring Program, issued September 2009. This is the most recent data set available from the State of California, which performs biennial farmland mapping updates as directed by state law. For reasons similar to those given above, this data set is also assumed to represent a 'worst case' scenario which, if anything, would over-estimate potential impacts to designated Farmlands. This scenario is used to ensure the analysis affords an abundance of caution in its findings.

The forest resource data in Figure 4.5.2 and Figure 4.5.3 is based on the vegetation and biota data described in Section 4.8 (Biological Resources). See Section 4.8 for additional information, including detailed summaries of the types and locations of the various forest habitats occurring in Riverside County. Details on the status of timber industry in California is based primarily on the 2006 Southern California Forest Products Utilization and Marketing Technical Assistance Activities Interim Report, dated May 2007, prepared for the California Department of Forestry and Fire Protection by Larry Swan and Jerry Pattison of the USDA Forest Service. This report represents the most recent available data on forestry and timber activities in Southern California. Additional supporting data was also obtained from the 2003 CalFire report, "Non-Industrial Timber Management Plans in California."

4.5.3 Policies and Regulations Addressing Agricultural and Forestry Resources

A. State Regulations

Several key state laws play a role in governance and protection of agricultural lands in Riverside County. The State of California's FMMP, as mentioned above, operates pursuant to the provisions of CGC Section 65570. The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (CGC Section 56377) sets forth the policies under which the Riverside County Local Agency Formation Commission (LAFCO) operates. These policies include directing LAFCO to consider the impacts on agricultural lands, particularly related to soil quality and irrigation water availability, when evaluating annexation and sphere of influence proposals. Specifically, LAFCO policies direct that development or use of land for other than open space shall be guided away from existing prime agricultural lands, unless detrimental to the orderly, efficient development of an area.

The California Land Conservation Act, also known as the 'Williamson Act,' is a voluntary program that allows property owners to have their property assessed on the basis of its agricultural production rather than at the current market value. The property owner is thus relieved of having to pay higher property taxes, as long as the land remains in agricultural production. Participation requires that the area consist of at least 100 contiguous acres of agricultural land under one or more ownerships. The purpose of the Act is to encourage property owners to continue to farm their land and to prevent the premature conversion of farmland to urban uses. Upon approval of the Board of Supervisors, an agricultural preserve is established and the land within the preserve is restricted to agricultural and compatible uses for 10 years, with one-year renewals unless cancelled. County of Riverside Ordinance No. 509 establishes uniform rules which apply to agricultural preserves.

In addition to the California Forest Protection Act, mentioned earlier, the State of California has a number of regulations aimed at protecting and preserving both the economic and biological values of the state's forest resources. Among these is PRC Section 4631 which states that "it is in the interest of the welfare of the people of this state and their industries and other activities involving the use of wood and other forest products that desirable cutover forest lands be made fully productive and that the holding and reforestation of such lands is a necessary measure." PRC Section 4631.5 provides that the State of California shall retain the existing land base of state forests in timber production for research and demonstration purposes. The California Department of Forestry and Fire Protection (Cal Fire), in accordance with plans approved by the Forestry Board, may engage in the management, protection and reforestation of state forests. Per PRC Section 4645, "management" means "the handling of forest crop and forest soil so as to achieve maximum sustained production of high quality forest products while giving consideration to values relating to recreation, watershed, wildlife, range and forage, fisheries, and aesthetic enjoyment."

To retain and improve California's productive timberlands, the State of California offers several incentive programs to encourage sustainable forest management. These include:

- For all private timberland owners whose lands qualify, the Timberland Production Zone (TPZ) provides a property tax incentive to manage forest lands for timber production. Such lands must be devoted to and used for growing and harvesting timber and compatible uses. Approximately 77% of the 7.4 million acres of private forestlands is zoned TPZ.

- For non-industrial landowners, the California Forest Improvement Program (CFIP) provides up to a 75% reimbursement for reforestation, soil and water protection and improvement, and wildlife habitat enhancement in concert with development of a forest management plan. The reimbursement may

increase to 90% for rehabilitation work following natural disasters, such as wildfire. The funds for supporting this program come from the Forest Resources Investment Fund (FRIF) derived from sustainable harvesting on the state's demonstration forests.

- The Forest Legacy Program supports use of conservation easements on private Forest lands that are at risk of being converted to non-forest uses. These easements allow the landowner to sell development rights to a government agency while still being able to sustainably manage their forestland. Legacy funds are allocated to the states through the "State and Private Forestry" program of the U.S. Forest Service, and the State of California may match federal distributions with bond funds.

- The Non-Industrial Timber Management Plan (NTMP) allows smaller NIPF timberland owners to prepare a long-term management plan that reduces regulatory time and expense by providing an alternative to filing individual timber harvesting plans (THPs). In exchange, landowners agree to manage their forests through uneven-aged management and long-term sustained yield.

B. Riverside County Regulations

The following existing regulations and policies are intended to protect existing agricultural and forestry resources within Riverside County. These policies and regulations have been approved by the County of Riverside as separate prior discretionary actions and are not part of GPA No. 960.

Ordinance No. 559 - Regulating the Removal of Trees: The purpose of this ordinance is to ensure that Riverside County's timberlands are protected and their ecological balance preserved by requiring the review and issuance of a permit prior to removal of living native trees on properties greater than one-half acre and located in the unincorporated area of the County of Riverside above 5,000 feet in elevation. In view of the proximity of the timberlands to urban centers of expanding population, and the unique nature of the timberlands themselves, this ordinance is necessary to protect and preserve such lands to serve the interests and provide for the welfare of the people of Riverside County.

This ordinance does not apply to: timber operations conducted under the Forest Practice Act; trees removed on lands owned by the United States government or the State of California; activities conducted by a public utility, subject to the jurisdiction of the Public Utilities Commission or any other constituted public agency, where, to construct and maintain safe operation of facilities under their jurisdiction, trees are removed, pruned, topped or braced; trees removed by a federal or state agency; trees required to be removed per other codes, ordinances or laws of the county, state or federal government; trees which Cal Fire recommends be removed because they are diseased, dying, dead or otherwise detrimental to the forest health; trees constituting immediate threats to public health, safety or general welfare and requiring emergency removal; trees needing removal for stand management or stocking control (when accompanied by the written plan approved by Cal Fire); trees removed pursuant to a County of Riverside permit containing conditions for the removal of trees; trees which a fire protection agency require be removed as part of an approved fire hazard reduction program; and, lastly, any tree within 20 feet of an existing legal structure.

Ordinance No. 509 - Establishing Agricultural Preserves: Agricultural preserves are lands identified for, and devoted to, agricultural and compatible uses, and are established through resolutions adopted by the Riverside County Board of Supervisors. The purpose of this ordinance is to ensure that incompatible uses are not allowed within established agricultural preserves. It sets forth the powers of the County of Riverside in establishing and administering agricultural preserves pursuant to the California Land Conservation Act of 1965 (CGC Section 51200, *et seq.*). The ordinance also establishes "Uniform Rules" for the agricultural and compatible uses allowed in an agricultural preserve. Land uses not covered in the ordinance are prohibited within agricultural preserves.

Ordinance No. 625 – Right To Farm: The purpose of this ordinance is to "conserve, protect and encourage the development, improvement and continued viability of agricultural land and industries for the long-term production of food and other agricultural products, and for the economic well-being of the county's residents." It seeks to "balance the rights of farmers to produce food and other agricultural products with the rights of non-farmers who own, occupy or use land within or adjacent to agricultural areas." Thus, the ordinance includes regulations to reduce the loss of agricultural resources in Riverside County by limiting the circumstances under which agricultural operations may be deemed a "nuisance." It states that an agricultural activity that has been operating for more than three years on a site (and assuming it was not a nuisance at the time it began) cannot be later classed as a public or private nuisance due to "any changed condition in or about the locality." This prevents, for example, existing dairies from being targeted by odor complaints from residents of housing units constructed in the surrounding area three or more years after the dairy use began. Further, it requires buyers of properties within 300 feet of any land zoned primarily for agricultural purposes to be given notice of the pre-existing agricultural use and its right to continue.

Resolution No. 84-526 - Riverside County Rules and Regulations Governing Agricultural Preserves: These rules and regulations were adopted pursuant to CGC Section 51231 to govern agricultural preserve procedures within Riverside County and to aid in implementation of the Williamson Act. The rules and regulations address procedures for the initiation, establishment, enlargement, disestablishment and diminishment of agricultural preserves. To protect existing agricultural lands and agricultural preserves within Riverside County, Division VI of the rules require a "Comprehensive Agricultural Preserve Technical Advisory Committee" (CAPTAC) to review and report on land use proposals and applications related to agricultural preserves and advise the Riverside County Board of Supervisors on the administration of agricultural preserves, as well as Williamson Act contract-related matters. In particular, the CAPTAC is charged with reviewing any proposals for the diminishment or disestablishment of an agricultural preserve and providing its recommendations to the Board of Supervisors. Regarding diminishments and disestablishments, the CAPTAC reviews the following findings:

- Whether a notice of nonrenewal has been served pursuant to the Williamson Act, Section 401 of these rules.
- Whether the cancellation is likely to result in the removal of adjacent lands from agricultural use.
- Whether the proposed alternative use of land is consistent with the provisions of the Riverside County General Plan.
- Whether the cancellation will result in discontiguous patterns of urban development.
- Whether there is proximate non-contracted land which is both available and suitable for the use for which the contracted land is being proposed.
- Whether the development of the contracted land would provide more contiguous patterns of urban development than that of proximate non-contracted land.

C. Existing Riverside County General Plan Policies

The following policies are already part of the General Plan and not part of GPA No. 960. Rather, these policies are those considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis when a given development proposal warrants their use.

1. Open Space (OS) Element Policies

Policy OS 7.1: Work with State and federal agencies to periodically update the Agricultural Resources map to reflect current conditions.

Policy OS 7.3: Encourage conservation of productive agricultural lands and preservation of prime agricultural lands.

Policy OS 7.4: Encourage landowners to participate in programs that reduce soil erosion, improve soil quality, and address issues that relate to pest management. To this end, the County shall promote coordination between the Natural Resources Conservation Service, Resource Conservation Districts, UC Cooperative Extension, and other agencies and organizations.

Policy OS 7.5: Encourage the combination of agriculture with other compatible open space uses in order to provide an economic advantage to agriculture. Allow by right, in areas designated Agriculture, activities related to the production of food and fiber, and support uses incidental and secondary to the on-site agricultural operation.

Policy OS 8.1: Cooperate with federal and State agencies to achieve the sustainable conservation of forest land as a means of providing open space and protecting natural resources and habitat lands, included within the MSHCPs.

Policy OS 8.2: Support conservation programs to reforest privately held forest lands.

Policy OS 9.4: Conserve the oak tree resources in the county.

2. Land Use (LU) Element Policies

Policy LU *20.1* (previously 16.1): Encourage retaining agriculturally designated lands where agricultural activity can be sustained at an operational scale, where it accommodates lifestyle choice, and in locations where impacts to and from potentially incompatible uses, such as residential uses, are minimized, through incentives such as tax credits.

Policy LU *20.2* (previously 16.2): Protect agricultural uses, including those with industrial characteristics (dairies, poultry, hog farms, etc.) by discouraging inappropriate land division in the immediate proximity and allowing only uses and intensities that are compatible with agricultural uses.

Policy LU *20.4* (previously 16.4): Encourage conservation of productive agricultural lands. Preserve prime agricultural lands for high-value crop production.

Policy LU *20.5* (previously 16.5): Continue to participate in the California Land Conservation Act (the Williamson Act) of 1965.

Policy LU *20.6* (previously 16.6): Require consideration of State agricultural land classification specifications when a 2.5-year Agriculture Foundation amendment to the General Plan is reviewed that would result in a shift from an agricultural to a non-agricultural use.

Policy LU *20.7* (previously 16.7): Adhere to Riverside County's right-to-farm ordinance.

Policy LU *20.9* (previously 16.9): Weigh the economic benefits of surface mining with the preservation/conservation of agriculture when considering mineral excavation proposals on land classified for agricultural uses.

Policy LU *20.11* (previously 16.11): The County shall pursue the creation of new incentive programs, such as tax credits, that encourage the continued viability of agricultural activities.

D. Proposed New or Revised Riverside County General Plan Policies

The following new or revised General Plan policies are proposed as part of GPA No. 960 to enhance the General Plan's treatment of development considerations on forest lands.

Policy LU *7.6* (previously 6.7): *Require* ~~B~~*b*uffer*ing to the extent possible* and/or *the* maintain*ing of* a natural edge for proposed development directly adjacent to ~~n~~*N*ational ~~f~~*F*orests.

***NEW* Policy LU 7.10:** *The proponent for new development proposals on forested lands with at least 10% coverage of mature conifer trees, forest land or timber in which three or more acres of forested lands will be cleared (removed) of trees must demonstrate to the County compliance with any/all applicable State regulations regarding the protection and operation of said forest resources. As used here, the term "native trees" shall only apply to naturally-occurring conifers growing above 5,000 feet AMSL elevation. Additionally, replacement trees for all qualifying mature trees removed must be planted at a ratio of 1:1. The replacement trees must be planted on the project site or, where that is infeasible because the entire site must be permanently cleared, on property in an acceptable alternate location, preferably nearby.*

***NEW* Policy LU 20.8:** *Encourage educational and incentive programs in coordination with the County Agricultural Commissioner's Office, the University of California Cooperative Extension Service and the Riverside County Farm Bureau, that convey the importance of conserving watercourses and their associated habitat, as well as protective buffers for domestic and farm livestock grazing.*

Policy LU *20.10* (previously 16.10): Allow agriculturally related retail uses such as feed stores and permanent produce stands in all areas and land use designations. ~~It is not the County's intent pursuant to this policy to subject agricultural related uses to any discretionary permit requirements other than those in existence at the time of adoption of the General Plan. Where a discretionary permit or other discretionary approval is required under the County zoning ordinances in effect as of December 2, 2002, then allow such retail uses with the approval of such a discretionary permit or other approval. The following criteria shall be considered in approving any discretionary permit or other discretionary approval required for these uses.~~

~~a. Whether the use provides a needed service to the surrounding agricultural area that cannot be provided more efficiently within urban areas or requires location in a non urban area because of unusual site requirements or operational characteristics;~~

~~b. Whether the use is sited on productive agricultural lands and less productive land is available in the vicinity;~~

~~c. Whether the operational or physical characteristics of the use will have a detrimental impact on water resources or the use or management of surrounding properties within at least ¼ mile radius;~~

~~d. Whether a probable workforce is located nearby or is readily available.~~

~~Allow for proposed agriculturally-related processing uses whether or not in conjunction with a farming operation, such as commercial canning, packing, drying, and freezing operations, in all areas and land use designations.~~

~~Where a discretionary permit or other discretionary approval is required under the County zoning ordinances in effect as of December 2, 2002, then allow such processing uses with the approval of such a discretionary permit or other approval. The following criteria shall be considered in approving any discretionary permit required for these uses:~~

~~a. Whether the uses are clustered in centers instead of single uses;~~

~~b. Whether the centers are located a sufficient distance from existing or approved agricultural or rural residential commercial centers or designated commercial areas of any city or unincorporated community;~~

~~c. Whether sites are located on a major road serving the surrounding area;~~

~~d. Whether the road frontage proposed for the uses and the number of separate uses proposed are appropriate;~~

~~e. For proposed value-added uses such as canneries and wineries with on-premises retail uses, the evaluation under the criteria above shall consider the service requirements of the uses and the capability and capacity of cities and unincorporated communities to provide the required services.~~

4.5.4 Thresholds of Significance for Agricultural and Forestry Resources

The proposed project would result in a significant impact on agricultural resources or forestry resources if it would:

A. Convert Prime Farmland, Unique Farmland or Farmland of Statewide Importance ("Farmland"), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Natural Resources Agency [as reflected in Figure 4.5.1], to non-agricultural use.

B. Conflict with existing agricultural zoning, agricultural use or with land subject to a Williamson Act contract or land within a Riverside County Agricultural Preserve.

C. Cause development of non-agricultural uses within 300 feet of agriculturally zoned property.

D. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use.

E. Conflict with existing zoning for, or cause rezoning of, 'forest land' (as defined in PRC Section 12220(g)), 'timberland' (as defined by PRC Section 4526), or timberland zoned 'timberland production' (as defined by CGC Section 51104(g)).

F. Result in the loss of forest land or conversion of forest land to non-forest use.

G. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use.

4.5.5 Effect of GPA No. 960 on the General Plan and on Agricultural and Forestry Resources

The proposed project, GPA No. 960, would have spatial effects where it involves a variety of specific General Plan Land Use Designation (LUD) corrections and changes, several Policy Area, Study Area and overlay changes, proposals for new trail and road alignments and an incidental commercial policy for rural areas. In addition, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County. In this section, the changes to the General Plan related to agriculture and forestry are outlined and the effects of proposed changes relative to these resources are discussed. Specific impacts and mitigation for the project are then evaluated according to identified significance thresholds in the section following this one.

A. Proposed Changes to the General Plan

As part of the project review process, agricultural and farmland-mapping data in the General Plan was updated and related policies reviewed and revised where necessary. The existing General Plan addresses agricultural and forestry resources mainly in the Multipurpose Open Space (OS) Element, although the Land Use (LU) Element also has many policies related to agricultural land uses as well. GPA No. 960 includes the following updates related to agriculture and forestry; text of relevant revised General Plan policies is provided in Section 4.5.4 (Thresholds of Significance for Agricultural and Forestry Resources).

Farmlands Mapping: As noted in Section 4.5.2.C, the County of Riverside updated Figure OS-2, Agricultural Resources, pursuant to new FMMP data made available by the California Department of Conservation, to ensure that the General Plan reflects the current level of information regarding important farmlands. This proposed figure (equivalent to Figure 4.5.1 herein) encompasses the new mapping information and changes issued by the State of California FMMP. Several agriculture-related policies within the Land Use Element were also revised and Policy LU 20.8 was added.

Forestry Mapping: In conjunction with new regulatory guidance on greenhouse gases (GHG), the State of California has also increased focus on protection of forestry resources (trees provide significant GHG-absorbing benefits). In response, GPA No. 960 includes revisions to the General Plan to provide more robust direction on the relationship between forest resources and future development within Riverside County. In particular, maps showing the general location and extent of forest resources within the county were developed and proposed for incorporation into the General Plan as new Figures OS-3b and OS-3c (for west and east Riverside County, respectively). To accompany these maps, and provide additional guidance on land use development proposals on forested lands, a new policy, LU 7.10, is proposed as part of GPA No. 960.

In addition to these mapping and specific policy changes, a variety of LUD and policy area changes are proposed, as per the descriptions in Section 3.0 (Project Description) of the EIR and associated Figure 3-1 (and corresponding maps within each Area Plan) that may directly or indirectly affect agricultural or forestry resources. Such changes would lead to either an increase or decrease in development potential (density or intensity); the risks associated with introducing new people and property into areas with agricultural or forestry resources would be

increased correspondingly. The potential for conflicts between agricultural and urban uses would also be increased where urbanizing development spreads into previously rural and agriculture-based areas.

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies, and others as described in Section 3.0 of the EIR. Similarly, new maps for trails and county roads (GP Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements will be determined based on site assessment of opportunities and constraints, including farmland designations and soils, forestry resources and compatibility with surrounding uses, to determine environmentally preferred alignments that minimize adverse effects. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines and such, are also developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need.

Accordingly, specific locations and timing of future infrastructure, including power and natural gas transmission lines, water and sewer lines and pumps, as well as roads, schools and other public services, are not presently foreseeable beyond the master countywide level already depicted in the 2003 General Plan and addressed previously in EIR No. 441. These improvements will require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the General Plan builds out. As such, future impacts and mitigation, including those for agriculture and forestry resources, would be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed at the later individual project stage.

B. Analysis of GPA No. 960 Effects on Agriculture

GPA No. 960 includes items that would directly or indirectly affect agricultural resources as a result of land use designation (LUD) changes in development potential on individual sites; changes to policy areas or other large-scale planning policies affecting development potential across regions; and, changes to the General Plan circulation network that may affect existing or future roadways either directly (establishing new future roadway locations or sizes) or indirectly (triggering the need for a new road on previously vacant lands or changing the size of roadway needed). The specifics of each of these types of changes proposed by the project are fully detailed in EIR Section 3.0.

1. Effects on Agricultural Usage and General Plan Designated "AG" Lands

Among other things, GPA No. 960 includes changes that would directly alter the agricultural ("AG") land use designations in the General Plan for a variety of locations. A summary of these General Plan changes is provided in Table 4.5-E (Project Effects on Agriculture Land Use Designations in the General Plan), below. Of the areas directly affected by changes proposed by GPA No. 960, a total of 4,080 acres are designated AG under the existing General Plan. The proposed changes would result in an overall net loss of 170 acres of designated AG in the General Plan. Per Table 4.2-D (Existing General Plan Mapped Land Uses (Countywide)), this is less than 0.10% of the countywide total of 189,730 acres designated AG.

The subsequent table, Table 4.5-F (Project Effects on Lands in Agricultural Use), shows the approximate amount of agricultural uses existing on the sites in question, as assessed by photo-interpretation of GIS data. In terms of

build out (over the next 50 years), it is assumed that *all* of the proposed land use designations indicated in the Riverside County General Plan are developed according to their mapped uses. Thus, since agricultural uses are present on lands *not* currently designated with an 'AG' LUD, as shown in Table 4.5-F, the project's changes would mean the loss of over 5,300 acres of agricultural lands (which include croplands, grazing and fallow lands, as well as ranches and similar uses). This is approximately 2% of the 226,900 acres of agriculture estimated currently in unincorporated Riverside County (per Table 4.2-C). In reality, however, it is highly unlikely that all the land uses designated in the General Plan will ever build out. It would require new development on all of the developable vacant land in the county and also the replacing of many long-standing existing uses which historically never occurs 100%. Nevertheless, it is assumed to occur for the purposes of this EIR to ensure that the worse-case environmental effects and resource needs are addressed programmatically.

Table 4.5-E: Project Effects on Agriculture Land Use Designations in the General Plan

Project Component	Current General Plan "AG" LUD (acres)	Proposed "AG" LUD (acres)	Change in "AG" LUD (acres)
Aguanga RVSA	0	0	NC
Anza Valley PA	950	950	NC
Blythe Airport	0	0	NC
El Cariso RVSA	0	0	NC
Fish Farms	0	470	+ 470 acres
Flabob Airport	0	0	NC
Goodhope RVO	0	0	NC
Meadowbrook RVO	0	0	NC
Northeast Business Park OV	180	0	- 180 acres
Parcel-Specific LUD Changes	80	0	- 80 acres
Riverside Municipal Airport	0	0	NC
San Jacinto Ag/Development Potential Study Area	2,870	2,830	- 40 acres
Totals	**4,080**	**4,250**	**- 170 acres**

* All values rounded to nearest 10; those under 10 rounded to nearest whole number. Thus, totals may not sum.

Key: LUD = General Plan Land Use Designation NC = No Change OV = Overlay
RVSA = Rural Village Study Area RVO = Rural Village Overlay PA = Policy Area

Source: Riverside County Planning and GIS Departments, GIS analysis of project application data, 2011.

2. Effects on Important Farmlands Designated by the State

Based on farmland mapping data from the State Department of Conservation, the relationship of the project's known spatial components was analyzed relative to Prime Farmlands, Farmlands of Statewide Importance, Farmlands of Local Importance and Unique Farmlands (collectively referred to as "Farmlands" herein). Table 4.5-F, below, shows how the land use designation changes summarized in Table 4.5-E would affect mapped Farmlands for the sites.

Overall, extremely small amounts (roughly 32 acres) of Prime and State-Important Farmlands would potentially be directly adversely affected (i.e., made unavailable for agricultural uses) due to GPA No. 960 LUD changes. In terms of Farmlands of Local Importance, gains in AG-designated lands from the fish farm changes offset those lost elsewhere, resulting in an overall net gain of 74 acres.

3. Effects on Existing Agricultural Preserves

Analysis of the known spatial components of the proposed project indicates that roughly 4,900 acres fall within an existing Agricultural Preserve. Of these, nearly 90% (4,280 acres) fall within revised policy areas in which land

use development potentials are being reduced (this includes the removal of the potential urbanizing development from the San Jacinto Agriculture/Potential Development Study Area). Roughly 20 acres within preserves are being designated OS-CH for biological and open space conservation (which also preserves any farmland soils) and 120 acres are going to OS-C for other reasons. Just over 30 acres are being changed *to* AG designation to preserve and foster fish farms (aquaculture) in the Salton Sea region.

Table 4.5-F: Project Effects on Lands in Agricultural Use

Project Component	Land Currently in Agricultural Use[1] (acres)	Proposed for Agricultural Use ("AG" LUD) (acres)	Change in Agri. Land Usage at Build out[2] (acres)
Aguanga RVSA	630	0	- 630 acres
Anza Valley PA	3,880	950	NC
Blythe Airport	310	0	-310 acres
El Cariso RVSA	2	0	- 2 acres
Fish Farms	470	470	NC
Flabob Airport	40	0	- 40 acres
Goodhope RVO	20	0	- 20 acres
Meadowbrook RVO	30	0	- 30 acres
Northeast Business Park OV	180	0	- 180 acres
Parcel-Specific LUD Changes	530	0	- 530 acres
Riverside Municipal Airport	10	0	- 10 acres
San Jacinto Ag/Development Potential Study Area	3,500	2,830	-530 acres
Totals	**9,590**	**4,250**	**- 5,340 acres**

Key: LUD = General Plan Land Use Designation; NC = No Change; OV = Overlay; RVSA = Rural Village Study Area; RVO = Rural Village Overlay; PA = Policy Area

Footnotes:

1. Existing uses derived from photo-inspection of aerial parcel data, *not* General Plan LUDs (which may or may not be "AG" under the existing General Plan). Uses deemed "existing agriculture" include crops, pastures, grazing lands, dairylands, orchards, groves, vineyards, etc., as well as feedlots, ranches (i.e., non-residential facilities for animal keeping, handling, etc.) and dairies. Where distinguishable from these agricultural uses, residential uses (homes and their yards) are *not* included in this category. All values rounded to nearest 10 or whole number if under 10.
2. Difference between lands in existing agricultural uses and lands that would be in agricultural usage at build out of the General Plan as amended by GPA No. 960 (assuming 100% build out of all lands proposed for AG designation and that all lands build out as per their proposed General Plan LUDs).

Source: Riverside County Planning and GIS Departments, GIS analysis of project application data, 2011.

The 4,900-acre total also includes the proposed Northeast Business Park Overlay which provides an alternate industrial (business park) designation on an AG-designated area with existing dairies (affecting roughly 260 acres within preserves). A number of parcel-specific changes totaling roughly 180 acres within agricultural preserves would also be changed to developed land uses; mostly rural residential. In addition, the changes proposed near Blythe Airport plus a number of other parcel-specific proposed changes would occur within one-quarter mile of an existing agricultural preserve. None of the new policy areas or overlays increasing development potential (e.g., Meadowbrook RVO, Goodhope RVO, Lakeland Village) are within a quarter-mile of any agricultural preserves.

Table 4.5-G: Effects on State-Designated Farmlands

State Farmland Classification / Designation	Total Acreage in Unincorp. Riverside County	Areas to Non-AG LUD* GPA No. 960 (acres)	AG LUD Gains* GPA No. 960 (acres)
Prime Farmland	105,390	- 5	0
Farmland of Statewide Importance	36,660	- 27	0
Unique Farmland	32,360	0	0
Farmland of Local Importance	162,410	- 210	317
TOTALS	**336,830 ac**	**- 243 ac**	**+ 317 ac**
		Overall net change = + 74 acres	

* Only areas going into AG land use designations (LUDs) calculated. Additional farmlands are expected to be conserved where lands are proposed to be placed under OS-CH or OS-C designations for conservation of biological/habitat values.

Table 4.5-H: Project Relationship to Existing Agricultural Preserves

Project Component[1]	Near Ag. Preserve (Within 1/4 mile)	Within Ag. Preserve (Acres)[2]
Aguanga RVSA[3]	yes	200
Anza Valley PA[3]	yes	1,020
Blythe Airport	yes	---
Fish Farms[3]	yes	30
Northeast Business Park OV	yes	260
Parcel-Specific LUD Changes	yes	300 (120)[3]
RCA-Acquired Conservation Lands[3]	yes	20
San Jacinto Ag/Development Potential Study Area[3]	yes	3,060
Totals		**4,890 acres**

Key: LUD = General Plan Land Use Designation; NC = No Change; OV = Overlay; RVSA = Rural Village Study Area; RVO = Rural Village Overlay; PA = Policy Area

Footnotes:
1. Project components *not* in or near an agricultural preserve are not listed.
2. All values rounded to nearest 10. Thus, totals may not sum precisely.
3. Changes proposed would generally reduce development potential or be consistent with agricultural uses; that is, they would *not* adversely affect agricultural activities.

Source: Riverside County Planning and GIS Departments, GIS analysis of project application data, 2012.

C. Analysis of Effects on Forestry Resources

Of land use changes associated with GPA No. 960, only two sites have existing forestry resources. Site C2-3b encompasses just under 36 acres forested with mature pines and firs in the Idyllwild region off Highway 243. Site C2-4 encompasses roughly 41 acres similarly forested and also located northwest of Idyllwild in the San Jacinto Mountains. These two sites are vegetated with a high percentage of cover by "Montane Coniferous Forest" vegetation of varying densities, according to Western Riverside County mapping data (see Figure 4.5.2) and aerial photo (RCLIS layer) inspection. These are the only two sites included in GPA No. 960 located at elevations at which commercially important timber resources are known to occur (that is, generally above 5,000 feet).

Both sites are proposed to change from OS-CH (Open Space – Conservation Habitat, which is a designation used only from public lands acquired for conservation and, thus, was misapplied to this privately owned land) to OS-RUR (Open Space – Rural, which allows one single-family home per 20 acres). Although the placement of houses on these sites would be inconsistent with commercial timber operations, neither site is of sufficient size to offer significant potential for commercial timber operations. Further, any timber/tree removal necessary for potential future single-family residential development on these sites could readily be accomplished under the 3-acre timber clearing exemptions discussed earlier.

Other areas proposed for foreseeable land use changes have sporadic or occasional stands of forest vegetation. For example, scattered stands of "Montane Hardwood" and "Montane Hardwood-Conifer Forest" occur sporadically within the bounds of the proposed Anza Policy Area. None of these areas or forest resources, however, occurs to the extent necessary to support industrial or commercial timber resource production. No known Christmas tree farms, the only type of on-going commercial timber activity known to occur in Riverside County, occurs on or in the vicinity of any of the proposed land use or other project changes. Woody biomass clearance activities would not be affected by the project as such activities are triggered by fire safety needs not development potential.

4.5.6 Agricultural and Forestry Resources - Impacts and Mitigation

A. Would the project convert Prime Farmland, Unique Farmland or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Natural Resources Agency, to non-agricultural use?

Impact 4.5.A – Cause the Conversion of Designated Farmlands: The specific land use and policy changes proposed by the project, GPA No. 960, would adversely affect (i.e., result in the conversion of) only minimal amounts of State-designated Prime Farmland, Farmland of Statewide Importance and Farmland of Local Importance ("Farmlands") to a variety of non-agricultural uses. No Unique Farmland would be affected. Due to the very small areas involved, these impacts would be less than significant. Indirectly, the growth accommodated and facilitated by the project would result in additional development and infrastructure demand that would further conversion of designated Farmlands to urban uses and result in other changes in the existing environment leading to additional Farmland conversion. This indirect impact would be significant and unavoidable.

1. Analysis of Impact 4.5.A

Assuming that 100% of the lands with LUDs being revised are built out with their new designated use, as shown in Table 4.5-G (Effects on State-Designated Farmlands), the specific land use and policy changes proposed by the project would adversely affect (i.e., result in the conversion of) only minimal amounts (32 acres) of State-designated Prime Farmland or Farmland of Statewide Importance. In addition, while 210 acres of Farmland of Local Importance would be converted to a variety of non-agricultural uses, nearly 220 acres of lands, including existing fish farms (aquaculture) are proposed for new designation as agriculture ("AG" LUD).

As mapped according to the baseline data provided by the State of California, the unincorporated portion of Riverside County has designated Farmland totals of 105,390 acres of Prime, 36,660 acres of Statewide Importance, 32,360 acres of Unique and 162,410 acres of Farmland of Local Importance (See Table 4.5-D (State-Designated Farmland Data for Riverside County)). According to the Riverside County Agricultural Commissioner, the amount of land in agricultural production totaled 187,800 acres as of 2009 (inclusive of cities) (See Table 4.5-A). Thus, in light of these totals, the loss of 32 acres represents an insignificant amount overall.

However, the total amount of land designated for agricultural uses under both the existing General Plan and the General Plan as amended GPA No. 960 at full build out (roughly 190,000 acres) is *less* than the amount of agricultural land currently designated as Prime, Unique, Statewide and Locally Important Farmland (roughly 336,800 acres). Thus, future development accommodated by the project in locations not foreseeable at this time would still likely result in the loss of additional Prime, Unique, Statewide and Locally Important Farmlands.

Indirectly, the growth accommodated and facilitated by the project would also result in additional development and infrastructure demand that would further fuel conversion of agricultural uses to urban resulting in further loss of designated Farmlands. Compliance with existing and proposed regulations, General Plan policies and mitigation measures would help reduce this indirect impact. However, it would still be significant and unavoidable.

2. Regulatory Compliance for Impact 4.5.A

The adverse effects associated with potential changes to agricultural resources would be avoided, reduced or minimized through adherence to or compliance with the following regulations and policies.

a. Compliance with Riverside County Regulations

Compliance with the following Riverside County regulations would prevent or reduce significant impacts due to, or resulting in, the conversion of State-designated Farmlands to non-agricultural uses. The existing regulations and policies presented here are not part of proposed GPA No. 960. Rather, they are policies within the existing General Plan and ordinances.

Ordinance No. 509 - Establishing Agricultural Preserves: Compliance with Ordinance No. 509 would protect agricultural uses from incompatible uses by limiting what types of development and use may occur within an agricultural preserve and ensuring such preserves are operated and managed pursuant to all applicable State of California regulations.

Ordinance No. 625 – Right to Farm: Existing agricultural uses, including any lands zoned primarily for agricultural purposes, are protected from nuisance complaints often generated by encroaching non-agricultural uses via the "right to farm" ordinance. It reduces legal nuisance liabilities potentially directed at pre-existing agricultural uses by requiring new properties within 300 feet of any land zoned primarily for agricultural purposes be given notice of the pre-existing use and its rights to continue.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would contribute to ensuring development impacts on Farmlands, including their conversion to non-agricultural uses, are less than significant. See Section 4.5.3.C for full text of each of these policies. Implementation of these agricultural General Plan policies would help reduce the interface effects of development encroachment from surrounding area upon farmlands, but would not reduce the significant impact associated with the conversion of agricultural land to non-agricultural uses.

Policy OS 7.1: This policy encourages the County of Riverside to collaborate with federal and state agencies in updating and maintaining accurate agricultural resources maps. Identifying and mapping agricultural resources throughout Riverside County aids in the preservation and protection of those resources and ultimately reduces potential adverse impacts to those areas including impacts due to farmland conversion.

Policy OS 7.3: This policy encourages "conservation of productive agricultural lands and the preservation of prime agricultural lands."

Policy OS 7.5: This policy addresses combining agriculture with "other compatible open space uses in order to provide an economic advantage to agriculture."

Policy LU 20.1: This policy encourages the preservation of agriculturally designated lands through various incentives such as tax credits for those lands where agricultural activity can be sustained, impacts from incompatible uses are minimized and the character and lifestyle of the area is accommodated, thereby reducing the potential amount of land being proposed for farmland conversions.

Policy LU 20.2: This policy ensures the protection of agricultural uses by discouraging incompatible land uses, intensities and land divisions in the proximity of agricultural operations, thereby reducing potential adverse impacts related to farmland conversion.

Policy LU 20.4: This policy encourages conservation of productive agricultural lands, including those in high-value crop production, reducing potential adverse impacts related to farmland conversion.

Policy LU 20.5: This policy encourages Riverside County's continued participation in the California Land Conservation Act of 1965 (Williamson Act). Continuing to restrict lands subject to the Williamson Act to agricultural and related open space uses aids in the prevention of farmland conversions.

Policy LU 20.6: This policy requires that State of California agricultural land classifications be taken into consideration when 2.5-year Agriculture Foundation Component Amendments are reviewed by the County of Riverside, ensuring that any potential conversion of agricultural land to non-agricultural uses will also include review of and compliance with State of California procedures.

Policy LU 20.9: This policy promotes weighing the preservation of agriculture with the economic benefits of surface mining when mineral excavation is proposed on agricultural lands. Studying and weighing the benefits of both proposals will ensure that potential adverse impacts related to the conversion of farmland are reduced.

Policy LU 20.11: This policy encourages the County of Riverside to pursue programs that will create incentives for the continued viability of agricultural activities. This policy recognizes the importance of agricultural activity to Riverside County and promotes the preservation of those activities, thereby reducing potential impacts to farmland conversion.

3. Finding on Significance for Impact 4.5.A

In terms of direct impacts, the project would have a net increase in the amount of land designated 'Agriculture,' which includes a net increase of roughly 74 acres of land designated as Farmland of Local Importance by Riverside County. This net increase, as well as compliance with the above-cited regulations, programs and General Plan policies, would offset project impacts associated with the direct loss of land designated by the State of California as Prime Farmland and Farmland of Statewide Importance (roughly 32 acres, respectively). Hence, for these reasons, direct impacts resulting from the land use-related changes to the General Plan proposed by GPA No. 960 would be less than significant. Indirectly, however, the growth accommodated and facilitated by the project would also result in additional development and infrastructure demand that would further fuel conversion of agricultural uses to urban resulting in further loss of designated Farmlands. Compliance with existing Riverside County ordinances and General Plan policies would help reduce this indirect impact. However, consistent with the findings made previously for the General Plan in EIR No. 441, these indirect impacts would still be significant and unavoidable.

B. Would the project conflict with existing agricultural zoning, agricultural use or with land subject to a Williamson Act contract or land within a Riverside County Agricultural Preserve? Cause development of non-agricultural uses within 300 feet of agriculturally zoned property? Or involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use?

Impact 4.5.B – Encroach On or Conflict With Existing Agricultural Uses: Future development pursuant to the land use and policy changes proposed by the project, GPA No. 960, has the potential to result in conflicts with existing zoning, agricultural uses, lands subject to a Williamson Act contract or within a Riverside County Agricultural Preserve. It may also result in the introduction of new urban uses within 300 feet of agriculturally-zoned property. Indirectly, the growth accommodated and facilitated by the project would result in additional development and infrastructure demand that would further conversion of agricultural lands to urban uses, encroach on existing agricultural activities and mapped Farmlands, and result in other changes in the existing environment leading to additional Farmland conversion. This indirect impact would be significant and unavoidable.

1. Analysis of Impact 4.5.B

According to the Riverside County Agricultural Commissioner (Table 4.5-A), nearly 190,000 acres of land was in agricultural production countywide (inclusive of cities) as of 2009. Assuming all land designated for agricultural use was actively farmed at the time of build out (approximately 2065), implementation of the urbanizing overlays, policy areas and other options proposed in the project would result in the loss of approximately 5,340 acres of lands currently in agricultural production (Table 4.5-F). This is despite the overall net *increase* in land designated "AG" pursuant to the General Plan; many agricultural activities within Riverside County occur on lands not formally designated AG under the General Plan. Hence, in addition to the 5,340 acres that would potentially be directly lost by foreseeable spatial changes associated with the project, other development resulting from the project not foreseeable at this time would also be expected to adversely affect existing agricultural uses.

In terms of agricultural preserves and Williamson Act contracts, GIS data indicates that of the 4,890 acres of spatial changes associated with the project, only about 560 acres would adversely affect (result in the conversion of or conflict with) lands within existing agricultural preserves. The remaining 4,330 acres would be subject to changes *decreasing* development potential for sites (e.g., Anza Valley Policy Area) or strengthen agricultural usage (fish farm AG LUD designations). See Table 4.5-H (Project Relationship to Existing Agricultural Preserves).

Nevertheless, as the total amount of land designated for agricultural uses under both the existing General Plan and as proposed under GPA No. 960 at full build out is less than the amount of agricultural land currently designated as Prime, Unique, Statewide and Locally Important Farmland (336,830 acres), future development accommodated pursuant to the General Plan as revised by the project would still likely result in significant conflicts with existing agricultural uses, zones and activities, as well as encroachment and other indirect effects leading to further conversion and loss of Farmlands.

Throughout California, Prime Farmland is being lost to urban expansion near existing cities. Urban encroachment of development into areas in agricultural production, particularly if within 300 feet, increases the likelihood of conflicts between these two fundamental types of uses. When residential and other urban-density land uses encroach into areas in agricultural production, traditional agricultural nuisances become much more problematic to the arriving residents. Typical agricultural nuisance effects can include generation of dust, odors and noise from agricultural operation, proliferation of flies and other pests around livestock, potential soil or groundwater

contamination (from large-scale feed lots and dairies) and overspray or runoff exposure from aerial application of agricultural chemicals. For farmers, urban encroachment adversely affects the efficiency of remaining farming operations due to increased air pollution, livestock predation by pets, crop diseases resulting from inadequate care of off-farm ornamental plants, restrictions on pesticide use and burning and requirements to set aside on-farm buffer zones. At the same time, production costs increase due to rising land values, water scarcity, theft and vandalism of farm equipment, crop pilferage, road congestion, change in property tax structure and personal injury liability resulting from trespassing on farms.

By reducing the profitability of remaining farming operations, urban encroachment tends to have a spiraling effect, encouraging further losses of farmland to urban development. The Agricultural Commissioner reports that over the last decade, land in agricultural production (cultivation) has fallen markedly by nearly 30% within Riverside County (including incorporated cities), with accompanying decreases in the number of full-time farms in Riverside County and farm sizes.

2. Regulatory Compliance for Impact 4.5.B

The adverse effects associated with potential changes to agricultural resources would be avoided, reduced or minimized through adherence to or compliance with the following regulations and policies.

a. Compliance with Riverside County Regulations

Compliance with the following Riverside County regulations would prevent or reduce significant impacts due to, or resulting in, the conversion of Farmlands to non-agricultural uses, encroachment of incompatible uses on agricultural areas and other related changes. The existing regulations and policies presented here are not part of proposed GPA No. 960. Rather, they are regulations and policies that have been approved by the County of Riverside as separate prior discretionary actions.

Ordinance No. 509 - Establishing Agricultural Preserves: Compliance with Ordinance No. 509 would protect agricultural uses from incompatible uses by limiting what types of development and use may occur within an agricultural preserve and ensuring such preserves are operated and managed pursuant to all applicable State of California regulations.

Ordinance No. 625 – Right to Farm: Existing agricultural uses, including any lands zoned "primarily for agricultural purposes," are protected from nuisance complaints often generated by encroaching non-agricultural uses via Riverside County Ordinance No. 625, the "right to farm" ordinance. It reduces legal nuisance liabilities potentially directed at pre-existing agricultural uses by requiring new properties within 300 feet of any land zoned primarily for agricultural purposes be given notice of the pre-existing use and its rights to continue.

Riverside County Rules and Regulations Governing Agricultural Preserves: In relation to the preservation of existing agricultural lands and the protection of land subject to the Williamson Act, CAPTAC reviews any diminishment or disestablishment of agricultural preserves and provides a recommendation to the Board based on a number of findings:

- Whether a notice of nonrenewal has been served pursuant to the Williamson Act, Section 401 of these rules.
- Whether the cancellation is likely to result in the removal of adjacent lands from agricultural use.

- Whether the proposed alternative use of land is consistent with the provisions of the Riverside County General Plan.
- Whether the cancellation would result in discontiguous patterns of urban development.
- Whether there is proximate non-contracted land which is both available and suitable for the proposed use or whether the development of the contracted land would provide more contiguous patterns of urban development of proximate non-contracted land.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would contribute to ensuring development impacts on Farmlands, including their conversion to non-agricultural uses, are less than significant. See Section 4.5.3.C for full text of each of these policies. Implementation of these agricultural resource-related General Plan policies would help reduce the interface effects of development encroachment upon farmlands, but would not reduce the significant impact associated with the conversion of agricultural land to non-agricultural uses.

Policy OS 7.1: This policy encourages the County of Riverside to collaborate with federal and state agencies in updating and maintaining accurate Agricultural Resources maps. Identifying and mapping agricultural resources throughout Riverside County aids in the preservation and protection of those resources and ultimately reduces potential adverse impacts including the potential encroachment on existing agriculture.

Policy OS 7.3: This policy encourages "conservation of productive agricultural lands and the preservation of prime agricultural lands." Implementation of Policy OS 7.3 will aid in preventing new development from encroaching on existing agriculture.

Policy OS 7.5: This policy addresses combining agriculture with "other compatible open space uses in order to provide an economic advantage to agriculture," thereby locating those land uses that are incidental to agriculture near land currently designated as agriculture, preventing the encroachment of those uses that are not compatible with agriculture.

Policy LU 20.1: This policy encourages the preservation of agriculturally designated lands through various incentives such as tax credits for those lands where agricultural activity can be sustained, impacts from incompatible uses are minimized and the character and lifestyle of the area is accommodated. Compliance with this policy encourages the preservation of land currently designated as agriculture, thereby reducing potential adverse impacts pursuant to GPA No. 960 in relation to encroachments and conflicts with existing agriculture.

Policy LU 20.2: This policy ensures the protection of agricultural uses by discouraging incompatible land uses, intensities and land divisions in the proximity of agricultural operations, thereby reducing potential adverse impacts pursuant to GPA No. 960 related to encroachments and conflicts with existing agriculture.

Policy LU 20.4: This policy encourages productive agricultural lands to be conserved, including agricultural land that maintains high-value crop production, thereby reducing potential adverse impacts pursuant to GPA No. 960 in relation to encroachments and conflicts with existing agriculture.

Policy LU 20.5: This policy encourages Riverside County's continued participation in the California Land Conservation Act of 1965 (Williamson Act). Continuing to restrict lands subject to the Williamson Act to agricultural and related open space uses aids in the preservation and protection of existing agriculture and prevents encroachments and conflicts on existing agriculture.

Policy LU 20.6: This policy requires that State of California agricultural land classifications be taken into consideration when 2.5-year Agriculture Foundation Component Amendments are reviewed by the County of Riverside, ensuring that any potential conversion of agricultural land to non-agricultural uses would also include review of and compliance with State of California procedures.

Policy LU 20.7: This policy requires the adherence to Riverside County's right-to-farm ordinance. The implementation of and compliance with Ordinance No. 625 would reduce potential adverse impacts to existing agriculture by establishing standards throughout Riverside County to continue to "conserve, protect and encourage the development, improvement, and continued viability" of agricultural lands and related industries.

Policy LU 20.11: Through Policy LU 20.11, the County of Riverside will explore and create various incentive programs that would encourage the continued viability of agricultural activities. Creating such incentive programs would encourage Riverside County residents and developers alike to preserve and develop agricultural activities throughout Riverside County, thereby reducing potential adverse impacts to existing agriculture.

c. Compliance with Proposed New and Revised General Plan Policies

The following new or revised policies of the Riverside County General Plan, proposed as part of GPA No. 960, would contribute to ensuring development impacts on agricultural activities and uses are less than significant. See Section 4.5.3.C for full text of each of these policies.

Policy LU 20.8: This policy encourages educational and incentive programs in coordination with the Agricultural Commissioner's Office, the University of California Cooperative Extension Service and the Riverside County Farm Bureau to convey the importance of conserving watercourses and their associated habitat and providing protective buffers for domestic and farm livestock grazing. Increasing awareness on this issue will help reduce potential adverse impacts to agriculture.

3. Finding on Significance for Impact 4.5.B

As noted for Impact 4.5.B, above, in EIR No. 441, prepared for the 2003 RCIP General Plan, it was found under "Impact 4.2.2" (Final EIR, page 4.2-32) that implementation of the General Plan would "result in the significant conversion of active agricultural land and agricultural soils to non-agricultural uses." Although the existing General Plan includes policies intended to identify and implement programs that would limit the conversion of agricultural land to non-agricultural uses, EIR No. 441 finds that these policies do not set specific requirements that would limit the conversion of agricultural lands to non-agricultural uses. Further, EIR No. 441 finds the policies do not identify the amount, extent or location of agricultural land to be conserved and that it is impossible to assess if policies would effectively reduce potentially significant impacts associated with the conversion of agricultural land to non-agricultural uses.

As a result, future development accommodated by the land use and policy changes proposed by the project is similarly found to have the potential for significant and unavoidable indirect impacts to agricultural uses through introducing new urban uses within 300 feet of agriculturally zoned property and contributing to the demand for additional development and infrastructure that would further fuel conversion of agricultural lands to non-agricultural uses. Pursuant to EIR No. 441, no additional project-specific mitigation measures are feasible. Thus, impacts due to conflict with existing agricultural zoning or uses, including those leading to the conversion of designated Farmlands, as well as encroachment impacts, would be significant and unavoidable.

C. Would the project result in the loss of forest land or conversion of forest land to non-forest use? Conflict with existing zoning for, or cause rezoning of, forest land, timberland or timberland zoned Timberland Production? Or involve other changes in the existing environment which, due to their location or nature, could result in conversion of forest land to non-forest use?

Impact 4.5.C – Adversely Affect Forest Lands and Forestry Uses: In Southern California, including Riverside County, climate and topography limit the types and locations of forest lands and their potential for commercial or industrial timber utilization. Accordingly, there are no existing or currently proposed zoning of forest land, timberland or Timberland Production Zones within the county; and the project would not conflict with any of these. Woody biomass removal, a type of forestry utilized by utility companies and forest management agencies for fire safety purposes, occurs with Riverside County, but not within fixed locations. Nevertheless, forest lands do occur in scattered locations within the county. Hence, future development accommodated by the land use and policy changes proposed by the project, GPA No. 960, has the potential to result in loss or conversion of forest land to non-forest uses or result in other changes in the existing environment which, due to their location or nature, could result in forest land conversion as well. Further, growth accommodated and facilitated by the project would indirectly result in additional development and infrastructure demand that would create additional potential for forest land conversion or encroach of incompatible uses. Compliance with existing and proposed regulations and policies would ensure forestry impacts are less than significant.

1. Analysis of Impact 4.5.C

As discussed in Section 4.5.2.f, above, according to the State of California there are no commercial timber operations or yields within Riverside County. Nor does Riverside County have any existing or currently proposed zoning of forest land, timberland or Timberland Production Zones within the county. Hence, this project would not conflict with any of these. In addition, since the Woody Biomass Program operates on the basis of slash and overgrowth removal, such as removal of brush from under a power line easement or removal of trees killed by bark beetle infestation, none of the changes proposed by GPA No. 960 would have an adverse effect on this program.

Analysis presented in Section 4.5.4, above, indicates that of land use changes associated with GPA No. 960, only two sites have existing forestry resources. These sites, located in the San Jacinto Mountains in central Riverside County, are vegetated with high percentages of "Montane Coniferous Forest" of varying densities totaling approximately 76 acres. These are the only two sites included in GPA No. 960 located at elevations at which commercially important timber resources are known to occur (that is, generally above 5,000 feet). These sites are proposed to change from OS-CH (Open Space – Conservation Habitat), which generally does not allow any development, to OS-RUR (Open Space – Rural), which allows one single-family home per 20 acres. These sites are too small for most economically viable commercial timber operations. Also, due to the low densities allowed, it is possible that any timber/tree removal necessary for potential future single-family residential use of these sites could be accomplished under the 3-acre timber clearing exemptions discussed earlier. Direct project-related forestry impacts associated with these land use designation changes would be less than significant.

Other areas proposed for land use changes have sporadic or occasional stands of forest vegetation, such as scattered and sporadic stands of "Montane Hardwood" and/or "Montane Hardwood-Conifer Forest," particularly at elevations below 5,000 feet. None of these areas or forest resources, however, occurs to the extent necessary to support industrial or commercial timber resource production. The only "Christmas tree farms" within Riverside County consist of nursery stock operations and do not utilize naturally occurring stands of trees.

Thus, overall any forestry impacts associated with these resources and the proposed changes, both the known spatial changes and changes not foreseeable at this time, would be minor or less than significant.

In the case of the two sites mentioned above, as well as the sporadic or occasional stands of forest vegetation, where existing forest lands or timber resources may be affected by future development encroachment or other changes in the existing environment as a result of the proposed project, compliance with the regulatory measures and existing and proposed General Plan policies outlined below would be sufficient to ensure any such forestry impacts are less than significant.

2. Regulatory Compliance for Impact 4.5.C

Adverse effects related to forest lands and timber resources, including loss of forest land, conversion of forest land to non-forest use, zoning or use conflicts, or other changes resulting in conversion of forest land to non-forest uses, would be avoided, reduced or minimized through adherence to or compliance with the following regulations and policies.

a. Compliance with State and County Regulations

The existing regulations and policies presented here are not part of proposed GPA No. 960. Rather, they are regulations and policies that have been approved by the County of Riverside as separate prior discretionary actions. Compliance with the following California State and Riverside County regulations would prevent significant impacts to forest lands and uses.

California Forest Practice Act: Forest land resources shall be protected through the County of Riverside requiring all applicable projects (for example, commercial clearing or other timber operations, site clearances of greater than 3 acres of timber, etc.) to comply with applicable State Forest Practice Act rules and regulations, including attainment of an approved Timber Harvest Plan (THP), Non-Industrial Timber Management Plan or exemption, as warranted by the proposed project and resources of the site. Compliance with these state regulations ensures that any future timberland uses within Riverside County are conducted according to the standards established by the State of California for the protection and safe utilization of forest lands and timber resources. THPs reduce potential adverse impacts on forest lands and uses by establishing a harvest blueprint for a particular site that would detail exactly what would be harvested, how any harvesting would be done, as well as the necessary steps that would be taken to protect the environment. All THPs are required to be in compliance with the appropriate federal and state laws, further ensuring that impacts associated with any harvesting activities would have a minimal impact on forest land and uses.

Ordinance No. 559 - Regulating the Removal of Trees: This ordinance protects forest and timber resources within the county by requiring the review and issuance of a permit for the removal of living native trees on parcels or property greater than one-half acre and located above 5,000 feet elevation. For lots greater than one-half acre and located above 5,000 feet in elevation, the County of Riverside requires projects to demonstrate compliance with this ordinance prior to the issuance of any grading or other ground-disturbing permits. Ordinance No. 559, reduces potential adverse impacts to agricultural and forest lands and uses by protecting existing native trees, thereby protecting the timberlands of Riverside County.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would contribute to ensuring development impacts on forest lands, including their conversion to non-forest uses, are less than significant. See Section 4.5.3.C for full text of each of these policies.

Policies OS 8.1 and 8.2: These policies reduce potential adverse impacts to forest lands and uses by requiring development proposals cooperate with the appropriate federal and state agencies in order to achieve "sustainable conservation of forest land" and to provide the support for "conservation programs to reforest privately held forest lands." These policies would aid in protection of Riverside County's natural resources and habitat lands, including those of the MSHCPs.

Policy OS 9.4: This policy reduces potential adverse impacts to woodlands by promoting the conservation of oak tree resources within the county.

c. Compliance with Proposed New and Revised General Plan Policies

The following new Riverside County General Plan policies, proposed as part of GPA No. 960, would contribute to ensuring development impacts to forest lands are less than significant.

Policy LU 6.8: This new policy is proposed to directly prevent loss of valuable forest lands and timber resources by specifying when compliance with State of California forestry regulations and the Riverside County tree-removal ordinance shall be required. Lastly, it specifies a minimum of 1:1 tree replacement ratio for mature trees lost.

Policy LU 7.6: This proposed policy would require that proposed developments buffer and/or maintain a natural edge when directly adjacent to National Forests. Such buffering and natural edges aid in protecting forests from urban interface conflicts and edge effects.

3. Finding on Significance for Impact 4.5.C

As discussed above**,** implementation of, and compliance with, the above-listed regulatory programs and General Plan policies, would ensure that potential adverse impacts to forest lands and uses from development pursuant to GPA No. 960 would have less than significant impacts.

4.5.7 Significance After Mitigation for Agricultural and Forestry Resources

With the implementation of, and compliance with, the above-listed existing regulatory programs, Riverside County Ordinance No. 559 and General Plan policies, development accommodated under the project, GPA No. 960, would be less than significant with respect to forest land and forestry impacts.

Development and implementation activities accommodated by the proposed project would also be subject to a number of existing General Plan policies, existing Riverside County ordinances and other existing governmental regulations, as identified previously, to reduce to below the level of significance potential adverse impacts on

direct conversion of State-designated Prime Farmland, Farmland of Statewide Importance and Farmland of Local Importance, or land actively utilized for agricultural production, to a variety of non-agricultural uses.

Future development accommodated by the land use and policy changes proposed by the project also has the potential for significant and unavoidable indirect impacts to agricultural uses through introducing new urban uses within 300 feet of agriculturally-zoned property and contributing to demand for additional development and infrastructure that would further spur conversion of agricultural lands to non-agricultural uses. It also has the potential to conflict with existing zoning, agricultural uses and lands subject to a Williamson Act contract or within a Riverside County agricultural preserve. Pursuant to EIR No. 441, no additional project-specific mitigation measures have been identified for General Plan implementation. Thus, indirect impacts leading to the conversion of designated Farmlands and conflicts between urban and agricultural land uses remain significant and unavoidable.

Section 4.6

Air Quality

Section 4.6 Air Quality

4.6.1 Introduction

This section assesses the potential impacts on air quality resulting from implementation of further development accommodated by the Riverside County General Plan, as amended pursuant to the proposed project, GPA No. 960. This includes the potential for the project to conflict with or obstruct implementation of applicable air quality plans; violate an air quality standard or contribute substantially to an existing or projected air quality violation; result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment; expose sensitive receptors to substantial pollutant concentrations; or create objectionable odors that would affect a substantial number of people. Global climate change and greenhouse gas emissions are addressed separately in Section 4.7 (Greenhouse Gases). Air quality modeling results used herein are provided in Appendix EIR-5.

The State CEQA Guidelines require that the project baseline consist of the physical environmental conditions at the project site and vicinity of the project as they exist at the time the notice of preparation (NOP) of the EIR is published or at the time the environmental analysis begins. The NOP for the project was published in 2009, and the existing conditions at that time are the baseline for purposes of the analysis in this section. However, the data used for purposes of calculating those baseline conditions includes multiple years of data, where that data was the most current available. For example, with respect to ambient air quality emissions for the project area, the years 2007 through 2009 were used because that was the most current validated data available at the time of the analysis and provided the most accurate means of assessing air quality conditions across the project area. Similarly, for the analysis of land use-based impacts, data from 2008 was included in the analysis because it was the most complete set of data addressing the project area's existing conditions in 2009. Because the baseline is built and the existing air quality plans and programs already take the impacts from the baseline into account, the analysis only discussed the effects from the development under the entire General Plan Area as proposed to be built out under GPA No. 960. Air quality impacts are of regional as well as local importance, therefore impacts within this section addressed countywide changes that would occur through build out of Riverside County and not just the areas specifically affected by the changes between the previous General Plan and GPA No. 960.

4.6.2 Existing Environmental Setting – Air Quality

A. Air Basins in Riverside County

Riverside County spans three different air basins: South Coast, Salton Sea and Mojave Desert (Figure 4.6.1 (Air Basins in Riverside County)). The portions of Riverside County within the South Coast and Salton Sea Air Basins

are regulated by the South Coast Air Quality Management District (SCAQMD). SCAQMD also governs Los Angeles and Orange counties, plus a small portion of San Bernardino County. The easternmost third of Riverside County, within the Mojave Desert Air Basin, is under the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD), which also governs the desert portion of San Bernardino County.

The three air basins in Riverside County have unique characteristics that affect the air quality in the region. The following sections describe the climate and meteorology of each air basin and the effects these characteristics have on air quality.

1. South Coast Air Basin

The South Coast Air Basin (SCAB) is surrounded by mountains trapping the air and its pollutants in the valleys or basins below. This area includes all of Orange County and the non-desert portions of Los Angeles, San Bernardino and Riverside counties. Bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino and San Jacinto Mountains to the north and east, the South Coast Air Basin is an area of high air pollution potential. The regional climate within the SCAB is considered semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes and moderate humidity. Air quality within the SCAB is influenced by a wide range of emissions sources – such as dense population centers, heavy vehicular traffic and industry.

The annual average temperature varies throughout the SCAB, ranging from the low to mid 60s to over 100 degrees during the summer, measured in Fahrenheit (°F). Riverside County is located in the inland, eastern portion of the SCAB and experiences more variation in temperature than the coastal areas. The annual average temperature in the SCAB region of Riverside County is approximately 60°F, although temperatures can often exceed 90°F. Typically, the hottest months are July and August with the coldest months being December and January. The majority of the annual rainfall within the SCAB occurs between December and March. Summer rainfall is minimal and generally limited to scattered thundershowers in the coastal regions. Annual average rainfall in the Riverside County SCAB area is 9.1 inches.

The SCAB experiences a persistent temperature inversion, which is characterized by increasing temperature with increasing altitude. This inversion limits the vertical dispersion of air contaminants, holding them relatively near the ground. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. Aside from a persistent temperature inversion, the vertical dispersion of air contaminants in the basin is also affected by wind conditions. The combination of stagnant wind conditions and low inversions produces the greatest pollutant concentrations. Conversely, on days with no inversion or with high wind speeds, ambient air pollutant concentrations are the lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas in the basin are transported eastward, predominantly into Riverside and San Bernardino counties. Santa Ana winds, which are strong and dry north or northeasterly winds that occur during the fall and winter months, disperse air contaminants differently through the SCAB, generally resulting in worse air conditions in the western parts of the basin. Santa Ana conditions tend to last for several days at a time.

The SCAB has very low average wind speeds; the dominant daily wind pattern is an onshore 8 to 12 mph during the day and offshore 3 to 5 mph winds during the night. These wind patterns are disrupted occasionally by winter storms or strong northeasterly Santa Ana winds from the mountains and deserts northeast of the SCAB.

2. Mojave Desert Air Basin

The Mojave Desert Air Basin (MDAB) covers a large portion of easternmost Southern California. The terrain is made up of mountain ranges interspersed with long broad valleys that often contain dry lakes. The MDAB covers most of San Bernardino County and portions of Riverside, Los Angeles and Kern counties. This basin is bordered in the southwest by the San Bernardino Mountains and separated from the San Gabriel Mountains by the Cajon Pass.

The MDAB is an assemblage of mountain ranges rising up to 10,000 feet above long broad valleys. Prevailing winds out of the west and southwest are due to the proximity of the MDAB to coastal and central regions and the presence of the Sierra Nevada Mountains, a natural barrier to the north. The MDAB is separated from the Southern California coastal and central California valley regions by mountains whose passes from the main channels for offshore air masses.

During the summer months, the Pacific Subtropical High Cell that sits off the coast inhibits cloud formation and encourages daytime solar heating. Cold air masses moving south from Canada and Alaska rarely influence the MDAB as these systems are weaker and diffuse before reaching the desert.

Most moisture in the basin arrives from infrequent warm, moist and unstable air masses from the south and averages about 3.9 inches of precipitation per year. Classified as a dry-hot desert climate, with portions classified as dry-very hot desert, the MDAB has at least three months where maximum average temperatures exceed 100°F. Because the basin is a desert, it has many days of high temperatures; the annual average for the Riverside County portion of the MDAB is approximately 71°F with many days during the summer exceeding 100°F. The hottest months for the basin are July and August, while the coldest months are December and January.

Topography of the region affects the local meteorological conditions with wind direction primarily from the west, west-southwest and southwest. The "orographic effect" is responsible for a large portion of the prevailing winds in the MDAB. Because of the "orographic effect," air is forced over the mountain range and loses moisture as it rises. As it descends, it also compresses and heats up. Similar to the SCAB, pollutants in the MDAB are trapped and accumulate close to ground level through frequent temperature inversions.

3. Salton Sea Air Basin

Air quality conditions in this portion of Riverside County, although in the Salton Sea Air Basin (SSAB), are administered by the SCAQMD. The SSAB covers all of Imperial County and the central portion of Riverside County (the Coachella Valley area). The Riverside County portion of the basin is bordered by the San Jacinto Mountains in the west and the Little San Bernardino Mountains in the east. Similar to the MDAB, the SSAB receives little moisture from the south and averages about 2.8 inches of rain per year. The annual average temperature for the region is 73°F with temperatures often exceeding 100°F during the hottest months of the summer. These hottest months for the SSAB are July and August with the coldest months being December and January.

During the summer, the SSAB is influenced by a Pacific Subtropical High Cell that sits off the coast. Similar to the MDAB, the cell inhibits cloud formation and encourages daytime solar heating. The SSAB is rarely influenced by weakened and diffuse cold air masses moving south from Canada and Alaska. Most desert moisture arrives from infrequent warm, moist and unstable air masses from the south. The SSAB averages between three and seven inches of precipitation per year.

The Salton Sea Air Basin is currently impacted by significant air pollution levels caused by the transport of pollutants from coastal air basins primarily consisting of ozone and PM_{10}. As the desert heats up, it draws cooler coastal air through the narrow San Gorgonio Pass, generating strong and sustained winds that cross erosion zones. These winds suspend and transport large quantities of sand and dust, reducing visibility, damaging property and constituting a significant health threat.

B. Air Pollutants

Air pollutant emissions within the air basins are generated from stationary, mobile and natural sources. Stationary sources can be divided into two major subcategories: point and area sources. Point sources occur at an identified location and are usually associated with manufacturing and industry. Examples are boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and produce many small emissions. Examples of area sources include residential and commercial water heaters, painting operations, portable generators, lawn mowers, agricultural fields, landfills and consumer products, such as barbeque lighter fluid and hair spray. Construction activities such as excavation and grading that create fugitive dust also contribute to area source emissions.

Mobile sources refer to emissions from on- and off-road motor vehicles, including tailpipe and evaporative emissions. On-road sources are vehicles that may be legally operated on roadways and highways. Off-road sources include aircraft, trains and construction equipment. Mobile sources account for the majority of the air pollutant emissions within most air basins. Air pollutants can also be generated by the natural environment, such as when fine dust particles are pulled off the ground surface and suspended in the air during high winds.

To protect the public health and welfare, the federal and state governments have identified five criteria air pollutants and a host of air toxics that have established ambient air quality standards through the federal Clean Air Act (CAA) and the California Clean Air Act (CCAA). Criteria pollutants are those air pollutants for which acceptable levels of exposure have been determined and for which an ambient air quality standard has been set. Also, the U.S. EPA has described its characteristics and potential health effects. The air pollutants for which federal and state standards have been promulgated and which are most relevant to air quality planning and regulation in the air basins include ozone, carbon monoxide, suspended particulate matter, sulfur dioxide and lead.

Air pollutants are typically classified as primary or secondary pollutants. Of the five criteria pollutants listed above, carbon monoxide (CO), particulate matter (PM), sulfur dioxide (SO_2) and lead (Pb) are considered primary pollutants because they are emitted directly into the atmosphere. Ozone (O_3) is considered a secondary pollutant because it is not directly emitted but formed through a photochemical reaction in the atmosphere when reactive organic gases (ROGs) and nitrogen oxides (NO_X) combine in the presence of sunlight and produce O_3.

Both the federal and state governments have established ambient air quality standards for outdoor concentrations of various pollutants in order to protect public health. The national and state ambient air quality standards delineate the concentrations that could be generally harmful to human health and welfare in order to protect the most sensitive persons from illness or discomfort, and provide a margin of safety.

1. Criteria Pollutants

The criteria pollutants of issue for Riverside County are each described below.

Ozone (O_3): A gas that is formed when volatile organic compounds (VOCs) (also referred to as reactive organic gases (ROGs)) and nitrogen oxides (NO_X), both byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. Because of the way ozone is formed, ROGs and NO_X are known as ozone precursors. Meteorological conditions needed to produce high concentrations of ozone include direct sunshine, early morning stagnation in source areas, high ground surface temperatures, strong and low morning inversions, greatly restricted vertical mixing during the day and daytime air subsidence that strengthens the inversion layer. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind and warm temperature conditions are favorable.

Carbon Monoxide (CO): A colorless, odorless gas produced by the incomplete combustion of fuels. CO concentrations tend to be the highest during winter mornings with little to no wind, when surface-based air inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines and motor vehicles operating at slow speeds are the primary source of CO, the highest ambient CO concentrations are generally found near congested transportation corridors and intersections.

Respirable Particulate Matter (PM_{10}) and Fine Particulate Matter ($PM_{2.5}$): Extremely small, suspended particles or droplets 10 microns and 2.5 microns or smaller in diameter. Some sources of particulate matter, like pollen and windstorms, are naturally occurring. However, in populated areas, most particulate matter comes from road dust, diesel soot, combustion products, abrasion of tires, abrasion of brakes and construction activities.

Sulfur dioxide (SO_2): A colorless, extremely irritating gas or liquid. It enters the atmosphere mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. Although sulfur dioxide concentrations in Southern California have been reduced to levels well below state and national standards, further reductions are desirable because SO_2 is a precursor to sulfates which can also affect human health. Due to regional meteorological features in Southern California, sulfur dioxide converts rapidly to sulfates which are formed through the photochemical oxidation of SO_2.

Lead (Pb): Occurs in the atmosphere as particulate matter. The combustion of leaded gasoline is the primary source of airborne lead in the region. However, since use of leaded gasoline is no longer permitted for on-road motor vehicles, most lead combustion emissions currently arise from off-road vehicles, such as racecars, and some jet fuels. Other sources of lead include the manufacturing and recycling of batteries, paint, ink, ceramics, ammunition and secondary lead smelters.

Toxic Air Contaminants (TACs): TACs are a diverse group of air pollutants that can affect human health, but do not yet have established ambient air quality standards. Though not fundamentally different from the pollutants discussed above, the effects of TACs tend to be local rather than regional. The California Air Resources Board (CARB) has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines.

2. Health Effects of Air Pollutants

Ozone: Individuals exercising outdoors, children and people with pre-existing lung disease, such as asthma and chronic pulmonary lung disease, are considered to be most susceptible to ozone effects. Short-term exposure (lasting for a few hours) to ozone at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of lung tissue and immunological changes. Elevated ozone levels are associated with increased school absences. In recent years, a correlation between elevated ambient ozone levels and increased daily hospital admission rates, as well as

mortality, has been reported. Also, an increased risk for asthma has been found in children who participate in multiple sports and live in communities with high ozone levels.

Ozone exposure while exercising is known to increase the severity of the responses described above. Animal studies suggest that exposure to a combination of pollutants that includes ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

Reactive Organic Gases: Reactive organic gases are carbon-containing compounds that typically evaporate into the air where they can react with other chemicals. ROGs contribute to the formation of smog, and in some cases may themselves be toxic. ROGs often have an odor and some examples include chemicals in gasoline, alcohol and the solvents used in paints.

Because ROGs encompass a large range of compounds, the health effects resulting from exposure to the various forms of ROGs range from minor and temporary irritation of the mucous membranes to death. As an example, formaldehyde is an ROG and many building materials such as paints, adhesives, wall boards and ceiling tiles slowly emit formaldehyde, which irritates the mucous membranes and can make a person irritated and uncomfortable when indoor concentrations of formaldehyde build up. By contrast, brief exposure (as little as ten minutes) to high concentrations of benzene (another form of ROG) can cause death. Short-term exposure to lower concentrations of benzene can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion and unconsciousness; in most cases people will stop feeling these effects when they are no longer exposed. People who inhale benzene for long periods of time (months or years) at high enough levels may experience harmful effects in the tissues that form blood cells, especially the bone marrow. Long-term exposure to benzene can cause various forms of cancer. Because benzene is carcinogenic, it is also listed as a toxic air contaminant (TAC). TACs are described in more detail below. These examples give the full range of health effects associated with ROGs. This range of health effects depend upon the concentration, length of exposure and particular species of ROG.

Nitrogen Dioxide: Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposure to NO_2 at levels found in homes with gas stoves. NO_2 levels in homes with gas stoves can be higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis or emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups.

In animals, exposure to levels of NO_2 considerably higher than ambient concentrations results in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of ozone and NO_2.

Carbon Monoxide: Inhaled CO has no direct toxic effect on the lungs but effects tissues by interfering with oxygen transport and by competing with oxygen in combining with hemoglobin. Hence, individuals that have conditions that restrict oxygen intake can be adversely affected by exposure to CO. Individuals most at risk include fetuses, patients with diseases involving heart and blood vessels and patients with chronic hypoxemia (oxygen deficiency), such as that seen at high altitudes. Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects of CO inhalation include earlier onset of chest pain with exercise and electrocardiograph changes indicative of worsening oxygen supply to the heart.

Reduction in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO, resulting in lowered oxygen levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels; these include pre-term births and heart abnormalities.

Particulate Matter: A consistent correlation between elevated ambient fine particulate matter (PM_{10} and $PM_{2.5}$) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in life span and an increased mortality from lung cancer.

Daily fluctuations in $PM_{2.5}$ concentrations have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long-term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease and children appear to be more susceptible to the effects of high levels of PM_{10} and $PM_{2.5}$.

Sulfur Dioxide: The effects of sulfate exposure at levels above the standard include the aggravation of asthmatic symptoms, an increased risk of cardio-pulmonary disease and a decrease in respiratory function. A few minutes of exposure to low levels of SO_2 can result in airway constriction in some asthmatics. In asthmatics, increased lung resistance, as well as reduction in breathing capacity leading to severe breathing difficulties, is observed after acute exposure to SO_2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO_2. Animal studies suggest that, despite being a respiratory irritant, SO_2 does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage and sloughing off of cells lining the respiratory tract. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO_2 levels. In these studies, efforts to separate the effects of SO_2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.

Lead: Fetuses, infants and children are more sensitive than others to the adverse effects of exposure to lead (Pb). Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands and lower intelligence. In adults, increased lead levels are associated with increased blood pressure. Lead poisoning can cause anemia, lethargy, seizures and death although it appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bones from early age environmental exposure and elevated blood lead levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of lead because of previous environmental lead exposure of their mothers. Strict control of stationary sources and reformulation of gasoline in 1980 eliminated lead from stationary source exhaust stacks and vehicle tailpipes. For these reasons, lead concentrations in the atmosphere are negligible countywide and not analyzed further in this evaluation.

Toxic Air Contaminants (TACs): Toxic air contaminants are airborne substances that are capable of causing chronic (i.e., of long duration) and acute (i.e., severe but of short duration) adverse effects on human health. TACs are a broad class of substances known to have toxic properties. All airborne materials known to cause cancer are categorized as TACs. Note that benzene used as an example as an ROG is also defined as a TAC.

Any ROG that is carcinogenic is also defined as a TAC. Another form of TAC is diesel particulate matter (DPM). DPM is a fine particulate found within diesel exhaust. What makes DPM different from fine particulate matter is that the outer surface of the DPM particle is coated with a variety of toxic substances including arsenic, benzene and nickel. Long-term exposure to DPM has the potential to contribute to mutations in cells that can lead to cancer. In fact, long-term exposure to DPM poses the highest cancer risk of TAC evaluated by the Office of Environmental Health Hazard Assessment (OEHHA, 2012). CARB estimates that about 70% of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles (SCAQMD, 2008).

TACs include both organic and inorganic chemical substances that may be emitted from a variety of common sources including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations and research and teaching facilities.

Because of the carcinogenic nature of TACs, exposure to TACs require additional evaluation in a health risk assessment (HRA) to determine the lifetime cancer risk associated with exposure to TACs. Lifetime cancer risk is defined as the increased chance of contracting cancer over a 70-year period as a result of exposure to a toxic substance or substances. It is the product of the estimated daily exposure of each suspected carcinogen by its respective cancer unit risk. The end result represents a worst-case estimate of cancer risk. Determining the lifetime cancer risk from exposure to TACs in an HRA requires project-specific information on the exact location, amount and type of TAC being emitted and the exact location, exposure rate and duration of exposure at receptors that are being exposed to the TAC. Because of the detailed project-specific information required to make such an assessment, it is impossible to provide an HRA for TACs in this programmatic level analysis of the General Plan update. However, HRAs are required for projects known to emit TACs prior to approval of such projects.

Odors: The science of odor as a health concern is still new. Odors are caused by the release of volatile or reactive organic gasses. Merely identifying the hundreds of ROGs that cause offensive odors poses a big challenge. Odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose and throat, which can reduce respiratory volume. Second, the ROGs that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

C. Existing Regional Air Quality Emissions

Measurements of ambient concentrations of criteria pollutants are used by the United States Environmental Protection Agency (EPA) and CARB to assess and classify the air quality of each air basin, county or, in some cases, a specific developed area. The classification is determined by comparing monitoring data with national and California air quality standards. If a pollutant concentration in an area is lower than the standard, the area is classified as being in "attainment." If the pollutant exceeds the standard, the area is in marginal, moderate, serious, severe or extreme "nonattainment," depending on the magnitude of the exceedance. If there is not enough data available to determine whether the standard is exceeded, the area is designated "unclassified." The following discussion, along with Table 4.6-A (Ambient Air Quality Reporting for Criteria Pollutants – SCAB (2007-2009) and Table 4.6-B (Ambient Air Quality Reporting for Criteria Pollutants – SSAB (2007-2009)), outlines the air quality data for the basins within Riverside County.

1. South Coast Air Basin

At the federal level, the SCAB is designated as an extreme nonattainment area for ozone and a serious nonattainment area for PM_{10}. The area is also a federal-level nonattainment area for $PM_{2.5}$. The federal status of the SCAB was recently upgraded from nonattainment to "serious maintenance area" for CO. The SCAB is in attainment for NO_2 and SO_2.

At the state level, the SCAB is also designated as an extreme nonattainment area for ozone and a nonattainment area for $PM_{2.5}$ and PM_{10}. It is in attainment for the California State CO standard and for SO_2 and NO_2, a subcategory of NO_X. In an effort to monitor the various concentrations of air pollutants throughout the basin, the SCAQMD has divided the region into 38 source receptor areas (SRAs), which are tracked by 32 monitoring stations. The portion of the County of Riverside located in the SCAB is within SRAs 22, 23, 24, 25, 26, 27, 28 and 29.

Table 4.6-A: Ambient Air Quality Reporting for Criteria Pollutants – SCAB (2007- 2009)

Air Pollutants Monitored	Year		
	2007	2008	2009
Ozone (O_3)			
Maximum 1-hour concentration measured	0.139 ppm	0.146 ppm	0.128 ppm
Number of days exceeding California State 0.09 ppm 1-hour standard	66	65	53
Maximum 8-hour concentration measured	0.116 ppm	0.118 ppm	0.108 ppm
Number of days exceeding national 0.075 ppm 8-hour standard	73	77	67
Number of days exceeding California State 0.07 ppm 8-hour standard	88	94	88
Nitrogen Dioxide (NO_2)			
Maximum 1-hour concentration measured	0.07 ppm	0.09 ppm	0.08 ppm
Number of days exceeding California State 0.18 ppm 1-hour standard	0	0	0
Annual average	0.0206 ppm	0.0258 ppm	0.0200 ppm
Number of days exceeding California State 0.03 ppm annual average	0	0	0
Number of days exceeding national 0.0534 ppm annual average	0	0	0
Carbon Monoxide (CO)			
Maximum 1-hour concentration measured	4 ppm	7 ppm	3 ppm
Number of days exceeding national 35.0 ppm 1-hour standard	0	0	0
Number of days exceeding California State 20.0 ppm 1-hour standard	0	0	0
Maximum 8-hour concentration measured	2.9 ppm	2 ppm	2.4 ppm
Number of days exceeding national 9.0 ppm 8-hour standard	0	0	0
Number of days exceeding California State 9.0 ppm 8-hour standard	0	0	0
Suspended Particulates (PM_{10})			
Maximum 24-hour concentration measured	142 µg/m^3	135 µg/m^3	108 µg/m^3
Number of days exceeding national 150 µg/m^3 24-hour standard	0	0	0
Number of days exceeding California State 50.0 µg/m^3 24-hour standard	41	49	33
Annual Average Concentration µg/m^3	68.5 µg/m^3	57.4 µg/m^3	53.4 µg/m^3
Suspended Particulates ($PM_{2.5}$)			
Maximum 24-hour concentration measured	75.7 µg/m^3	57.7 µg/m^3	49.3 µg/m^3
Number of days exceeding national 35 µg/m^3 24-hour standard	33	14	16
Sulfur Dioxide (SO_2)			
Maximum 24-hour concentration measured	0.002 ppm	0.003 ppm	0.003 ppm
Number of days exceeding California State 0.04 ppm 24-hour standard	0	0	0

Key: ppm = parts per million ug/m^3 = micrograms per cubic meter
Source: SCAQMD, Historical Data Website (www.aqmd.gov/smog/historical data.htm), accessed March 2011.

Table 4.6-B provides a summary of highest ambient air concentrations measured at the three monitoring stations between 2007 and 2009. As identified in the table, the California State 1-hour standard for ozone was exceeded 141 times during the three-year period. The national 8-hour ozone standard was exceeded 202 times, and the California State 8-hour standard was exceeded 271 times. The California State 24-hour standard for PM_{10} was

exceeded 85 times between 2007 and 2009. CO, NO_X, $PM_{2.5}$ and SO_2 standards were not exceeded during this three-year period.

Table 4.6-B: Ambient Air Quality Reporting for Criteria Pollutants – SSAB (2007-2009)

Air Pollutants Monitored	Results by Year		
	2007	2008	2009
Ozone (O_3)			
Maximum 1-hour concentration measured	0.129 ppm	0.149 ppm	0.133 ppm
Number of days exceeding California State 0.09 ppm 1-hour standard	29	57	55
Maximum 8-hour concentration measured	0.113 ppm	0.120 ppm	0.104 ppm
Number of days exceeding national 0.075 ppm 8-hour standard	58	74	70
Number of days exceeding California State 0.07 ppm 8-hour standard	83	95	93
Nitrogen Dioxide (NO_2)			
Maximum 1-hour concentration measured	0.08 ppm	0.08 ppm	0.06 ppm
Number of days exceeding California State 0.18 ppm 1-hour standard	0	0	0
Annual average	0.0147 ppm	0.0128 ppm	0.0109ppm
Number of days exceeding California State 0.03 ppm annual average	0	0	0
Number of days exceeding national 0.0534 ppm annual average	0	0	0
Carbon Monoxide (CO)			
Maximum 1-hour concentration measured	2 ppm	1 ppm	2 ppm
Number of days exceeding national 35.0 ppm 1-hour standard	0	0	0
Number of days exceeding California State 20.0 ppm 1-hour standard	0	0	0
Maximum 8-hour concentration measured	1 ppm	0.6 ppm	0.7 ppm
Number of days exceeding national 9.0 ppm 8-hour standard	0	0	0
Number of days exceeding California State 9.0 ppm 8-hour standard	0	0	0
Suspended Particulates (PM_{10})			
Maximum 24-hour concentration measured	146 µg/m^3	128 µg/m^3	140 µg/m^3
Number of days exceeding national 150 µg/m^3 24-hour standard	0	0	0
Number of days exceeding California State 50.0 µg/m^3 24-hour standard	51	25	9
Annual Average Concentration µg/m^3	53.5 µg/m^3	39.9 µg/m^3	32.5 µg/m^3
Suspended Particulates ($PM_{2.5}$)			
Maximum 24-hour concentration measured	32.5 µg/m^3	21.6 µg/m^3	27.6 µg/m^3
Number of days exceeding national 35 µg/m^3 24-hour standard	0	0	0
Sulfur Dioxide (SO_2)			
Maximum 24-hour concentration measured	---	---	---
Number of days exceeding California State 0.04 ppm 24-hour standard	---	---	---

Key: ppm = parts per million ug/m^3 = micrograms per cubic meter

2. Salton Sea Air Basin

The SSAB is federally designated as a severe nonattainment area for ozone and as a serious nonattainment area for PM_{10}. The SSAB is in attainment for both CO and NO_2, but is unclassified for $PM_{2.5}$ and SO_2. At the state level, the SSAB is designated as a nonattainment area for both ozone and PM_{10}. It is in attainment for the California State CO, NO_2 and SO_2 standards, but unclassified for $PM_{2.5}$. Air quality in the Coachella Valley portion of the Salton Sea Air Basin is under the jurisdiction of the SCAQMD, therefore is monitored as part of its program. This portion of Riverside County is located within SRAs 29, 30 and 31, which are monitored by stations in Banning Pass, Palm Springs and Indio.

Table 4.6-B provides a summary of highest ambient air concentrations measured at the three monitoring stations between 2007 and 2009. As identified in the table, the California State 1-hour standard for ozone was exceeded 141 times during the three-year period. The national 8-hour ozone standard was exceeded 202 times, and the California State 8-hour standard was exceeded 271 times. The California State 24-hour standard for PM_{10} was

exceeded 85 times between 2007 and 2009. CO, NO_X, $PM_{2.5}$ and SO_2 standards were not exceeded during this three-year period.

3. Mojave Desert Air Basin

The MDAB is designated as severe nonattainment for ozone, nonattainment for PM_{10}, unclassified/attainment for $PM_{2.5}$, and attainment for CO, NO_2 and SO_2 at the federal level. At the state level, the MDAB is designated as a moderate nonattainment area for ozone and is also in nonattainment for PM_{10} and $PM_{2.5}$. It is in attainment for the California State CO, SO_2 (attainment/unclassified) and NO_2.

The MDAQMD monitors air quality within the MDAB, but does not have a monitoring station within the Riverside County portion of the basin. Due to the geographic difference between the Riverside County portion of the basin and the nearest monitoring station at Twenty-nine Palms, using the monitoring data from the Twenty-nine Palms stations would show markedly different air quality than would be anticipated in Riverside County. Therefore, no monitoring data is reported for this portion of Riverside County.

D. Toxic Air Contaminants

CARB has produced a series of estimated inhalation cancer risk maps based on modeled levels of outdoor composite toxic pollutant levels (CARB 2010). The 2010 estimated map indicates that the majority of Riverside County is exposed to a theoretical inhalation cancer risk of less than 250 persons per million. The estimated theoretical inhalation cancer risk shown on the CARB cancer risk maps are based upon the 2008 Multiple Air Toxics Exposure Study (MATES III) conducted by SCAQMD. The northwestern portion of Riverside County that includes portions of the Jurupa, Highgrove, Eastvale, Reche Canyon and Temescal Area Plans are exposed to inhalation cancer risks of greater than 250 persons per million. These risk maps depict theoretical inhalation cancer risk due to modeled outdoor toxic pollutant levels and do not account for cancer risk due to other types of exposure. The largest contributors to inhalation cancer risk are diesel engines.

E. Sensitive Receptors

Sensitive receptors are populations that are more susceptible to the effects of air pollution than is the population at large. While the ambient air quality standards are designed to protect public health and are generally regarded as conservative for healthy adults, there is greater concern for protecting adults who are ill or have long-term respiratory problems and young children whose lungs are not fully developed. According to CARB, sensitive receptors include children less than 14 years of age, the elderly over 65 years of age, athletes and people with cardiovascular and chronic respiratory diseases.

The SCAQMD and the MDAQMD identify the following as locations as tending to contain high concentration of sensitive receptors: long-term health care facilities, rehabilitation centers, convalescent centers, retirement homes, residences, schools, playgrounds, childcare centers and athletic facilities. The County of Riverside, which has built-out urban as well as rural communities, contains many of each of these sensitive land uses.

F. General Plan Update and Air Quality

The location and densities of development affect the amount of air pollutants generated by communities. Land uses that are spread throughout a community increase the number and length of motor vehicle trips and associated air pollutant emissions. This is due to the relatively few opportunities to walk, ride bicycles and use

public transportation between such uses as homes and work or shopping. Compact communities often mix residential uses with or near commercial, business and employment uses, thereby reducing dependence on motor vehicles and reducing necessary vehicle trips. Smaller, higher density uses also produce less air emissions from natural gas on a per-unit basis.

4.6.3 Policies and Regulations Addressing Air Quality

A. State and Federal Regulations

Air quality within Riverside County is addressed through the efforts of various federal, state, regional and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education and a variety of programs. The agencies responsible for improving the air quality within the air basins, and their key regulatory efforts, are discussed below.

1. U.S. Environmental Protection Agency

The CAA of 1970 and the CAA Amendments of 1971 required the EPA to establish National Ambient Air Quality Standards (NAAQS), with states retaining the option to adopt more stringent standards or to include other specific pollutants. NAAQS are the levels of air quality considered safe, along with an adequate margin of safety to protect the public health and welfare. They are designed to protect those sensitive receptors most susceptible to further respiratory distress such as asthmatics, the elderly, very young children, people already weakened by other disease or illness and persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollutant concentrations considerably above these minimum standards before adverse effects are observed.

The CAA (and its subsequent amendments) requires each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The CAA Amendments dictate that states containing areas violating the NAAQS must revise their SIPs to include extra control measures to reduce air pollution. California's SIP includes strategies and control measures to attain the NAAQS by deadlines established by the CAA. The SIP is periodically modified to reflect the latest emissions inventories, plans and rules and regulations of the various agencies with jurisdiction over the state's air basins. The EPA has the responsibility to review all SIPs to determine if they conform to the requirements of the CAA.

2. California Air Resources Board

The California Air Resources Board (CARB), a part of the California EPA (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets state ambient air quality standards (California Ambient Air Quality Standards, CAAQS), compiles emission inventories, develops suggested control measures and provides oversight of local programs. CARB also establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints and barbecue lighter fluid) and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California's SIP and works closely with the federal government and the local air districts.

3. Southern California Association of Governments

The Southern California Association of Governments (SCAG) is a council of governments for Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura counties. It is a regional planning agency and serves as a forum for regional issues relating to transportation, the economy, community development and the environment.

Although SCAG is not an air quality management agency, it is responsible for developing transportation, land use and energy conservation measures that affect air quality. SCAG's Regional Comprehensive Plan and Guide (RCPG) provide growth forecasts that are used in the development of air quality related land use and transportation control strategies by the SCAQMD. The RCPG is a framework for decision-making for local governments, assisting them in meeting federal and state mandates for growth management, mobility and environmental standards, while maintaining consistency with regional goals regarding growth and changes through the year 2015 and beyond. Policies within the RCPG address air quality, land use, transportation and economic relationships at all levels of government. SCAG is also charged with developing and implementing Senate Bill 375 (SB 375) with participation from Riverside County and the other local cities and counties of SCAG. See Section 4.7 for further information on SB 375.

B. Regional Air Quality Management

The three air basins that cover parts of Riverside County are managed by the following two air quality management districts pursuant to State of California regulations.

1. South Coast Air Quality Management District

The SCAQMD is the agency responsible for comprehensive air pollution control in the South Coast Air Basin, as well as the Coachella Valley portion of the Salton Sea Air Basin. Towards that end, the SCAQMD works directly with SCAG, county transportation commissions and local governments and also cooperates actively with federal and state agencies. The SCAQMD develops rules and regulations, establishes permitting requirements, inspects emission sources and enforces such reductions though educational programs or fines when necessary.

The SCAQMD is directly responsible for reducing emissions from stationary (area and point), mobile and natural sources. To do so, it uses a series of Air Quality Management Plans (AQMPs). The most recent of which, AQMP 2007, was adopted by the Governing Board of SCAQMD on June 1, 2007. The 2007 AQMP was prepared to comply with the federal and state Clean Air Acts and to accommodate growth, reduce high pollutant levels, meet federal and state ambient air quality standards and to minimize the fiscal impact of pollution control measures on the local economy. It identifies the control measures to be implemented to reduce major sources of pollutants. These planning efforts have substantially decreased the population's exposure to unhealthful levels of pollutants, even while substantial population growth has occurred within the SCAQMD's jurisdictional boundaries.

The SCAQMD is principally responsible for comprehensive air pollution control in the South Coast Air Basin and the Coachella Valley portion of the Salton Sea Air Basin and recommends that projects should be evaluated in terms of air pollution control thresholds established by the SCAQMD and published in the CEQA Air Quality Handbook. These thresholds were developed by the SCAQMD to provide quantifiable significance levels for individual with projects. Future development proposals within the SCAB would be reviewed against the following SCAQMD thresholds. Future development within the Coachella Valley portion of the SSAB would be assessed similarly against the SSAB thresholds, which the SCAQMD has jurisdiction over. For the majority of the

Coachella Valley, the SCAQMD thresholds apply; however, for those thresholds that are different, they are distinguished within parentheses.

Construction Emissions Thresholds: The SCAQMD currently recommends that projects with construction-related emissions that exceed any of the following emissions thresholds should be considered potentially significant.

- 550 pounds per day of carbon monoxide (CO)
- 75 pounds per day of reactive organic gases (ROG)
- 100 pounds per day of nitrogen oxides (NO_X)
- 150 pounds per day of sulfur oxides (SO_X)
- 150 pounds per day of respirable particulate matter (PM_{10})
- 55 pounds per day of fine particulate matter ($PM_{2.5}$)

Operational Emissions Thresholds: The SCAQMD currently recommends that projects with operational emissions that exceed any of the following emissions thresholds should be considered potentially significant.

- 550 pounds per day of CO
- 55 pounds per day of ROG in the SCAB (75 pounds per day in the SSAB)
- 55 pounds per day of NO_x in the SCAB (100 pounds per day in the SSAB)
- 150 pounds per day of SO_X
- 150 pounds per day of PM_{10}
- 55 pounds per day of $PM_{2.5}$.

Localized Significance Thresholds: Localized Significance Thresholds (LSTs) were developed in response to the SCAQMD Governing Board's Environmental Justice Enhancement Initiative (I-4). LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard and are developed based on the ambient concentrations of that pollutant for each source receptor area and distance to the nearest sensitive receptor.

LSTs, which are voluntary, only apply to CO, NO_2, PM_{10} and $PM_{2.5}$ emissions during construction and operation at the discretion of the lead agency. Screening-level analysis of LSTs is only recommended for construction activities at project sites that are 5 acres or less and within the SCAQMD jurisdiction. The SCAQMD recommends that operational activities and construction for any project over 5 acres should perform air quality dispersion modeling to assess impacts to nearby sensitive receptors. Some of the individual projects accommodated in GPA No. 960 would cover areas greater than 5 acres. For future development proposals of more than 5 acres under SCAQMD jurisdiction, dispersion modeling would be required for CO_2, NO_X, PM_{10} and $PM_{2.5}$ emissions. NO_X to NO_2 conversion would be used to determine the maximum NO_2 concentrations at the nearest sensitive receptors. The following LSTs apply to new development:

- 20 ppm for 1-hour CO concentrations
- 9 ppm for 8-hour CO concentrations
- 0.18 ppm for 1-hour NO_2 concentrations
- 0.03 ppm for annual NO_2 concentrations

As the Basin is in nonattainment for PM_{10} and $PM_{2.5}$, the SCAQMD has established the following LSTs for PM_{10} and $PM_{2.5}$ concentrations during construction:

- 10.4 μg/m^3 for 24-hour PM_{10} concentrations
- 2.5 μg/m^3 for 24-hour $PM_{2.5}$ concentrations

In order to assess cumulative impacts, the SCAQMD recommends that projects be evaluated to determine whether they would be consistent with 2007 AQMP performance standards and project-specific emissions thresholds. In the case of the proposed project, air pollutant emissions would be considered to be cumulatively considerable if the new sources of emissions exceeded SCAQMD emissions thresholds.

2. Mojave Desert Air Quality Management District

The Mojave Desert Air Quality Management District (MDAQMD) has jurisdiction over the desert portions of San Bernardino County and the far eastern portion of Riverside County. MDAQMD jurisdiction includes the incorporated communities of Blythe in Riverside County, plus the cities of Adelanto, Apple Valley, Barstow, Hesperia, Needles, Twenty-nine Palms, Victorville and Yucca Valley in San Bernardino County.

Similar to the SCAQMD, the MDAQMD is responsible for reducing emissions within its jurisdictional boundaries. To that end, the MDAQMD has adopted the federal attainment plans for ozone and PM_{10}. The most recent such plan approved by the EPA is the Attainment Demonstration Plan adopted in 1994. The most recently adopted state plan is the 1996 Triennial Revision to the 1991 Air Quality Attainment Plan (AQAP). A number of plans are in place for the reduction of air pollutants in the MDAB, however only two are applicable to the Riverside County portion of the MDAQMD. The first is the 1996 MDAQMD Triennial Revision to the 1991 Air Quality Attainment Plan (AQAP) which indicates that the main source of O_3 in the MDAB is O_3 transported by the wind from the South Coast Air Basin to the MDAB.

The second plan is the 2004 Ozone Attainment Plan. The MDAQMD has experienced ambient ozone concentrations in excess of the one-hour ozone NAAQS and the ozone CAAQS. Thus, the plan was developed to demonstrate how the MDAQMD would meet required primary federal ozone planning milestones, including attainment of the ozone NAAQS by the end of 2007. It also outlines the progress the MDAQMD is making towards meeting all required state ozone planning milestones, including attainment of the ozone CAAQS. In addition, it discusses the 8-hour ozone NAAQS, preparatory to an expected non-attainment designation for the new NAAQS.

The MDAQMD is principally responsible for comprehensive air pollution control in the Mojave Desert Air Basin and recommends that projects should be evaluated in terms of the MDAQMD air pollution control thresholds published in the MDAQMD's California Environmental Quality Act and Federal Conformity Guidelines. These thresholds were developed by the MDAQMD to provide quantifiable significance levels for comparison with

projects and would apply to all future development projects in the MDAB. Under the MDAQMD, a project is considered significant if it does any of the following:

a. Generates total emissions (direct and indirect) in excess of:

- 548 lbs/day or 100 tons/year CO
- 137 lbs/day or 25 tons/year NO_X
- 137 lbs/day or 25 tons/year ROG
- 137 lbs/day or 25 tons/year SO_X
- 82 lbs/day or 15 tons/year PM_{10}
- 82 lbs/day or 15 tons/year $PM_{2.5}$

b. Generates a violation of any ambient air quality standard when added to the local background.

c. Does not conform with the applicable attainment or maintenance plan(s).

d. Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index greater than or equal to 1. This threshold is applicable to projects that are within the following specified distances from existing or zoned sensitive receptor lands:

- Any industrial project within 1,000 feet.
- A distribution center (40 or more trucks per day) within 1,000 feet.
- A major transportation project (50,000 or more vehicles per day) within 1,000 feet.
- A dry cleaner using perchloroethylene within 500 feet.
- A gasoline dispensing facility within 300 feet.

C. Riverside County Regulations

Within Riverside County, local pollution controls are exerted in a variety of ways. The following County of Riverside ordinances address air quality.

Ordinance No. 706 - Mobile Source Air Pollution Reduction Programs (Funding): This ordinance supports the SCAQMD's imposition of the vehicle registration fee and brings the County of Riverside into compliance with requirements of the California Health and Safety Code in order to receive fee revenues for the purpose of implementing programs to reduce air pollution from motor vehicles.

Ordinance No. 726 - Transportation Demand Management for New Development: This ordinance sets the following goals related to efficiently utilizing the existing and planned transportation system and reducing vehicle emissions:

- Reduce vehicle trips generated by new development by 12% commencing in 1994, by 20% commencing in 2000 and by 30% commencing in 2006.
- Reduce overall projected 1994 vehicle trips emanating from Riverside County by 7%.
- Relieve traffic congestion in an effort to improve air quality.
- Produce an efficient transportation demand management system which utilizes the existing system to its best potential.
- Maintain or achieve minimum Level of Service of "C" for all new development projects.

The ordinance further requires that proposed projects prepare a traffic impact analysis, which must include a Transportation Demand Management Plan describing proposed trip levels and outlining proposed transportation demand management measures for new development projects to achieve the trip level proposed.

Ordinance No. 748 - Mitigation of Traffic Congestion Through Signalization: This ordinance sets policies, regulations and fees related to the funding and installation of traffic signals to mitigate the cumulative environmental impacts (traffic congestion) generated by new development. This ordinance aims to reduce idling time of vehicles, which in turn reduces fuel consumption of vehicles and reduces pollutant emissions.

Ordinance No. 782 - Golf Cart Transportation Plan: This ordinance establishes a golf cart transportation program within Riverside County. The golf cart transportation plan, authorized by the Streets and Highways Code of the State of California, extends the use of golf carts for transportation beyond access to golf courses. Utilizing golf carts reduces automobile trips and vehicular emissions because golf carts are typically electric-powered and thus do not emit criteria pollutants through the direct combustion of fossil fuel.

Ordinance No. 824 - Western Riverside County Traffic Uniform Mitigation Fee (TUMF) Program: This ordinance authorizes Riverside County's participation in the Western Riverside Council of Government (WRCOG) Transportation Uniform Mitigation Fee (TUMF) Program. The purpose of the TUMF Program is to fund certain improvements to the regional system of highways and arterials of western Riverside County. WRCOG studies have shown that future development within western Riverside County and its cities will result in traffic volumes exceeding the capacity of the regional system as it presently exists. The TUMF program works to reduce traffic congestion by funding improvements to the regional system. Increased traffic flow and decreased idling time that result will decrease vehicle fuel consumption and the emissions associated with its combustion.

Ordinance No. 659 - Development Impact Fee Program for Residential Development: This ordinance establishes a development impact fee (DIF) that is paid for each new residential unit, development project or portion constructed. The fees provide revenue to acquire or construct public facilities, purchase regional parkland and preserve habitat and open space. Constructing public facilities and preserving open space is necessary to promote public health, safety, comfort and welfare. Specifically, air pollutant emissions are mitigated by preserving open space and locating public facilities in close proximity to new developments. This reduces vehicle travel required to reach recreational areas and also maintains existing trees and provides for additional trees, both of which sequester some air pollutants (e.g., carbon dioxide).

D. Existing Riverside County General Plan Policies

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies help ensure potential environmental effects are avoided, reduced or minimized through their

application on a case-by-case basis. The County of Riverside has existing programs in place to impose applicable policies once a development proposal triggers the need. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion in project Conditions of Approval. The following existing General Plan polices address air quality issues.

1. Land Use (LU) Element

Policy LU 2.1: Accommodate land use development in accordance with the patterns and distribution of use and density depicted on the General Plan Land Use Map (Figure LU-1) and the Area Plan Land Use Maps, in accordance with the following:

a. Provide a land use mix at the countywide and area plan levels based on projected need and supported by evaluation of impacts to the environment, economy, infrastructure and services.

b. Accommodate a range of community types and character, from agricultural and rural enclaves to urban and suburban communities.

c. Provide for a broad range of land uses, intensities and densities, including a range of residential, commercial, business, industry, open space, recreation and public facilities uses.

d. Concentrate growth near community centers that provide a mixture of commercial, employment, entertainment, recreation, civic and cultural uses to the greatest extent possible.

e. Concentrate growth near or within existing urban and suburban areas to maintain the rural and open space character of Riverside County to the greatest extent possible.

f. Site development to capitalize upon multi-modal transportation opportunities and promote compatible land use arrangements that reduce reliance on the automobile.

g. Prevent inappropriate development in areas that are environmentally sensitive or subject to severe natural hazards.

Policy LU *8.12* (Previously LU 7.12): Improve the relationship and ratio between jobs and housing so that residents have an opportunity to live and work within the county.

Policy LU *11.1* (Previously LU 10.1): Provide sufficient commercial and industrial development opportunities in order to increase local employment levels and thereby minimize long-distance commuting.

Policy LU *11.3* (Previously LU 10.3): Accommodate the development of community centers and concentrations of development to reduce reliance on the automobile and help improve air quality.

Policy LU *11.4* (Previously LU 10.4): Provide options to the automobile in communities, such as transit, bicycle and pedestrian trails, to help improve air quality.

Policy LU *13.1* (Previously LU 12.1): Provide land use arrangements that reduce reliance on the automobile and improve opportunities for pedestrian, bicycle and transit use in order to minimize congestion and air pollution.

Policy LU *13.2* (Previously LU 12.2): Locate employment and service uses in areas that are easily accessible to existing or planned transportation facilities.

Policy LU *13.3* (Previously LU 12.3): Locate transit stations in community centers and at places of public, employment, entertainment, recreation and residential concentrations.

Policy LU *13.4* (Previously LU 12.4): Incorporate safe and direct multi-modal linkages in the design and development of projects, as appropriate.

2. Circulation (C) Element

Policy C 1.2: Support development of a variety of transportation options for major employment and activity centers including direct access to transit routes, primary arterial highways, bikeways, park-and-ride facilities and pedestrian facilities.

Policy C 1.7: Encourage and support the development of projects that facilitate and enhance the use of alternative modes of transportation, including pedestrian-oriented retail and activity centers, dedicated bicycle lanes and paths and mixed-use community

Policy C 4.1: Provide facilities for the safe movement of pedestrians within developments, as specified in the County ordinance regulating the division of land of the County of Riverside.

Policy C 11.2: Incorporate the potential for public transit service in the design of developments that are identified as major trip attractions (i.e., community centers, tourist and employment centers), as indicated in ordinances regulating the division of land of the County of Riverside.

Policy C 11.4: Offer incentives to new development to encourage it to locate in a transit-oriented area such as a community center or along a designated transit corridor near a station.

Policy C 11.5: Accommodate transit through higher densities, innovative design and right-of-way dedication.

Policy C *11.6* (Previously C 11.7): Promote development of transit centers and park-n-rides for use by all transit operators, including development of multi-modal facilities.

Policy C 12.1: Support the development and implementation of the Transit Oasis concept in conjunction with RCTC, local transit operators and cities.

Policy C 12.3: Establish a system of transit priority treatments or dedicated travel lanes to facilitate movement by the Transit Oasis vehicles within community centers and other major nodes of activity, where feasible.

Policy C 13.1: Support continued development and implementation of the Riverside County Transportation Commission Rail Program including new rail lines and stations, the proposed California High Speed Rail System with at least two stations in Riverside County, the Coachella Valley Commuter Rail Service and the proposed Intercity Rail Corridor between Calexico and Los Angeles.

Policy C 13.2: Support continued improvements to AMTRAK and MetroLink rail passenger service within Riverside County and throughout the Southern California region.

Policy C *20.14* (Previously C 20.12): Encourage the use of alternative non-motorized transportation and the use of non-polluting vehicles.

Policy C *21.7* (Previously C 21.9): Encourage development of bus-only lanes and signal synchronization so that transit can help to alleviate congestion.

3. Multipurpose Open Space (OS) Element

Policy OS 12.1: Allow for the development of non-electrical, direct heat uses of geothermal heat and fluids for space, agricultural and industrial heating in situations and localities where naturally occurring hydrothermal features will not be degraded.

Policy OS 16.2: Specify energy efficient materials and systems, including shade design technologies, for County buildings.

Policy OS 16.3: Implement public transportation systems that utilize alternative fuels when possible, as well as associated urban design measures that support alternatives to private automobile use.

Policy OS 16.4: Undertake proper maintenance of County physical facilities to ensure that optimum energy conservation is achieved.

Policy OS 16.5: Utilize federal, State and utility company programs that encourage energy conservation.

Policy OS 16.6: Assist public buildings and institutions in converting asphalt to greenspace to address the heat island effect.

Policy OS 16.8: Promote coordination of new public facilities with mass transit service and other alternative transportation services, including bicycles and design structures to enhance mass transit, bicycle and pedestrian use.

4. Air Quality (AQ) Element

Policy AQ 1.1: Promote and participate with regional and local agencies, both public and private, to protect and improve air quality.

Policy AQ 1.2: Support the Southern California Association of Government's (SCAG) Regional Growth Management Plan by developing intergovernmental agreements with appropriate governmental entities such as the Western Riverside Council of Governments (WRCOG), the Coachella Valley Association of Governments (CVAG), sanitation districts, water districts and those subregional entities identified in the Regional Growth Management Plan.

Policy AQ 1.3: Participate in development and update of those regional air quality management plans required under federal and State law and meet all standards established for clean air in these plans.

Policy AQ 1.4: Coordinate with the SCAQMD and MDAQMD to ensure that all elements of air quality plans regarding reduction of air pollutant emissions are being enforced.

Policy AQ 1.5: Establish and implement air quality, land use and circulation measures that improve not only the county's environment but the entire region.

Policy AQ 1.6: Establish a level playing field by working with local jurisdictions to simultaneously adopt policies similar to those in this Air Quality Element.

Policy AQ 1.7: Support legislation which promotes cleaner industry, clean fuel vehicles and more efficient burning engines and fuels.

Policy AQ 1.8: Support the introduction of federal, State or regional enabling legislation to permit the County to promote inventive air quality programs, which otherwise could not be implemented.

Policy AQ 1.9: Encourage, publicly recognize and reward innovative approaches that improve air quality.

Policy AQ 1.10 Work with regional and local agencies to evaluate the feasibility of implementing a system of charges (e.g., pollution charges, user fees, congestion pricing and toll roads) that requires individuals who undertake polluting activities to bear the economic cost of their actions where possible.

Policy AQ 1.11 Involve environmental groups, the business community, special interests, and the general public in the formulation and implementation of programs that effectively reduce airborne pollutants.

Policy AQ 2.1: The County land use planning efforts shall assure that sensitive receptors are separated and protected from polluting point sources to the greatest extent possible.

Policy AQ 2.2: Require site plan designs to protect people and land uses sensitive to air pollution through the use of barriers and/or distance from emissions sources when possible.

Policy AQ 2.3: Encourage the use of pollution control measures such as landscaping, vegetation and other materials, which trap particulate matter or control pollution.

Policy AQ 2.4 Consider creating a program to plant urban trees on an Area Plan basis that removes pollutants from the air, provides shade and decreases the negative impacts of heat on the air.

Policy AQ 3.1 Allow the market place, as much as possible, to determine the most economical approach to relieve congestion and cut emissions.

Policy AQ 3.2: Seek new cooperative relationships between employers and employees to reduce vehicle miles traveled.

Policy AQ 3.3: Encourage large employers and commercial/industrial complexes to create Transportation Management Associations.

Policy AQ 3.4: Encourage employee rideshares and transit incentives for employers with more than 25 employees at a single location.

Policy AQ 4.5: Require stationary pollution sources to minimize the release of toxic pollutants through:

- Design features;

- Operating procedures;
- Preventive maintenance;
- Operator training; and
- Emergency response planning.

Policy AQ 4.6: Require stationary air pollution sources to comply with applicable air district rules and control measures.

Policy AQ 4.8: Expand, as appropriate, measures contained in the County's Fugitive Dust Reduction Program for the Coachella Valley to the entire county.

Policy AQ 4.9: Require compliance with SCAQMD Rules 403 and 403.1, and support appropriate future measures to reduce fugitive dust emanating from construction sites.

Policy AQ 4.10: Coordinate with the SCAQMD and MDAQMD to create a communications plan to alert those conducting grading operations in the county of first, second and third stage smog alerts and when wind speeds exceed 25 miles per hour. During these instances, all grading operations should be suspended.

Policy AQ 5.1: Utilize source reduction, recycling and other appropriate measures to reduce the amount of solid waste disposed of in landfills.

Policy AQ 5.2: Adopt incentives and/or regulations to enact energy conservation requirements for private and public developments.

Policy AQ 5.3: Update, when necessary, the County's Policy Manual for Energy Conservation to reflect revisions to the County Energy Conservation Program.

Policy AQ 5.4: Encourage the incorporation of energy-efficient design elements, including appropriate site orientation and the use of shade and wind-break trees to reduce fuel consumption for heating and cooling.

Policy AQ 6.1 Assist small business by developing education and job training programs, especially in job-poor areas.

Policy AQ 6.2 Collaborate with local colleges and universities to develop appropriate education programs to assist residents in obtaining job skills to meet market demands.

Policy AQ 7.1: Provide incentives to encourage new firms to locate within the county and existing firms to expand operations.

Policy AQ 7.2: Work with the SCAQMD and the MDAQMD to develop a means to encourage the location of new commercial and industrial development in those localities where jobs are most needed.

Policy AQ 7.3 Create a loan program to encourage small businesses to locate within the County.

Policy AQ 7.4: Offer incentives to businesses to control emissions and implement the AQMP.

Policy AQ 7.5: Reduce regulations on small businesses wherever possible and thereby encourage small business development and job creation. The County shall set performance standards as well as design standards, thus giving small business owners as many options as possible to comply with County regulations.

Policy AQ 7.6: Adopt policies freeing small businesses from unnecessary and duplicative paperwork.

Policy AQ 7.7: Assemble information collected from County agencies and departments concerning the business community to develop programs that better serve their needs.

Policy AQ 8.1: Locate new public facilities in job-poor areas of the county.

Policy AQ 8.2: Emphasize job creation and reductions in vehicle miles traveled in job poor areas to improve air quality over other less efficient methods.

Policy AQ 8.3: Time and locate public facilities and services so that they further enhance job creation opportunities.

Policy AQ 8.4: Support new mixed-use land use patterns and community centers which encourage community self-sufficiency and containment and discourage automobile dependency.

Policy AQ 8.5: Develop community centers in conformance with policies contained in the Land Use Element.

Policy AQ 8.6: Encourage employment centers in close proximity to residential uses.

Policy AQ 8.7: Implement zoning code provisions which encourage community centers, telecommuting and home-based businesses.

Policy AQ 8.8: Promote land use patterns which reduce the number and length of motor vehicle trips.

Policy AQ 8.9: Promote land use patterns that promote alternative modes of travel.

Policy AQ 9.1: Cooperate with local, regional, State and federal jurisdictions to reduce vehicle miles traveled and motor vehicle emissions through job creation.

Policy AQ 9.2: Attain performance goals and/or VMT (vehicle miles traveled) reductions which are consistent with SCAG's Growth Management Plan.

Policy AQ 10.1: Encourage trip reduction plans to promote alternative work schedules, ridesharing, tele-commuting and work-at-home programs, employee education and preferential parking.

Policy AQ 10.2: Use incentives, regulations and Transportation Demand Management in cooperation with surrounding jurisdictions when possible to eliminate vehicle trips which would otherwise be made.

Policy AQ 10.3: Assist merchants in encouraging their customers to shift from single-occupancy vehicles to transit, carpools, bicycles or foot.

Policy AQ 10.4: Continue to enforce the County's Transportation Demand Management Ordinance and update as necessary.

Policy AQ 11.1: Establish requirements for special event centers to provide off-site parking and park-n-ride facilities at remote locations. Remote parking should be as close to practicable to the event site, and the operator should supply shuttle services.

Policy AQ 11.2 Promote the use of peripheral parking by increasing on-site parking rates and offering reduced rates to peripheral parking with tickets sold for non-ridesharing patrons.

Policy AQ 11.3: Encourage special event center operators to advertise and offer discounted transit passes with event tickets.

Policy AQ 11.4: Encourage special event center operators to advertise and offer discount parking incentives to carpooling patrons, with two or more persons per vehicle, for on-site parking facilities.

Policy AQ 12.1: Manage traffic flow through signal synchronization, while coordinating with and permitting the free flow of mass transit vehicles, when possible.

Policy AQ 12.2: Synchronize signals throughout the County with those of its cities, adjoining counties and the California Department of Transportation.

Policy AQ 12.3: Construct and improve traffic signals with channelization and Automated Traffic Surveillance and Control systems at appropriate intersections.

Policy AQ 12.4: Eliminate traffic hazards and delays through highway maintenance, rapid emergency response, debris removal and elimination of at-grade railroad crossings, when possible.

Policy AQ 12.5 Encourage business owners to schedule deliveries at off-peak traffic periods.

Policy AQ 13.1: Manage the County of Riverside transportation fleet fueling standards to achieve an appropriate alternate fuel fleet mix.

Policy AQ 13.2: Cooperate with local, regional, State and federal jurisdictions to better manage transportation facilities and fleets.

Policy AQ 13.3: Encourage the construction of high-occupancy-vehicle (HOV) lanes whenever possible to relieve congestion, safety hazards and air pollution as described in the AQMP.

Policy AQ 14.1: Emphasize the use of high occupancy vehicle lanes, light rail and bus routes and pedestrian and bicycle facilities when using transportation facility development to improve mobility and air quality.

Policy AQ 14.2: When developing new capital facility improvement plans, also consider measures such as Transportation Demand Management, Transportation Systems Management, or job/housing balance strategies.

Policy AQ 14.3: Monitor traffic and congestion to determine when and where the county needs new transportation facilities to achieve increased mobility efficiency.

Policy AQ 14.4: Preserve transportation corridors with high demand potential or regional significance for future expansion to meet project demand.

Policy AQ 15.1: Identify and monitor sources, enforce existing regulations and promote stronger controls to reduce particulate matter.

Policy AQ 16.1: Cooperate with local, regional, State and federal jurisdictions to better control particulate matter.

Policy AQ 16.2 Encourage stricter state and federal legislation on bias belted tires, smoking vehicles that spill debris on streets and highways, to better control particulate matter.

Policy AQ 16.3: Collaborate with the SCAQMD and the MDAQMD to require and/or encourage the adoption of regulations or incentives to limit the amount of time trucks may idle.

Policy AQ 16.4: Collaborate with the EPA, SCAQMD, MDAQMD and warehouse owners and operators to create regulations and programs to reduce the amount of diesel fumes released due to warehousing operations.

Policy AQ 17.1: Reduce particulate matter from agriculture, construction, demolition, debris hauling, street cleaning, utility maintenance, railroad rights-of-way and off-road vehicles to the extent possible.

Policy AQ 17.2 Enforce regulations against illegal fires.

Policy AQ 17.3: Identify and create a control plan for areas within the county prone to wind erosion of soil.

Policy AQ 17.4: Adopt incentives, regulations and/or procedures to manage paved and unpaved roads and parking lots so they produce the minimum practicable level of particulates.

Policy AQ 17.5: Adopt incentives and/or procedures to limit dust from agricultural lands and operations, where applicable.

Policy AQ 17.6: Reduce emissions from building materials and methods that generate excessive pollutants, through incentives and/or regulations.

Policy AQ 17.7: Separate trucks from other vehicles in industrial areas of the county with the creation of truck-only access lanes to promote the free flow of traffic.

Policy AQ 17.8: Adopt regulations and programs necessary to meet State and federal guidelines for diesel emissions.

Policy AQ 17.9: Encourage the installation and use of electric service units at truck stops and distribution centers for heating and cooling truck cabs and particularly for powering refrigeration trucks in lieu of idling of engines for power.

Policy AQ 17.10: Promote and encourage the use of natural gas and electric vehicles in distribution centers.

Policy AQ 17.11: Create and implement street-sweeping plans, as appropriate, in areas of the county disproportionately affected by particulate matter pollution.

E. Proposed New or Revised Riverside County General Plan Policies

The incorporation of these policies would reduce vehicle miles traveled, improve energy efficiency, reduce energy consumption and increase renewable energy generation. While some of these proposed policies were introduced

to specifically address greenhouse gas emissions, they would also provide a reduction in criteria pollutant emissions.

1. Land Use (LU) Element

Policy LU 1.5: The County shall participate in regional efforts to address issues of mobility, transportation, traffic congestion, economic development, air and water quality, ~~and~~ watershed and habitat management**,** ~~child care~~ with cities, local and regional agencies, stakeholders, Indian nations and surrounding jurisdictions.

Policy LU 4.1: Require that new developments be located and designed to visually enhance, not degrade the character of the surrounding area through consideration of the following concepts:

a. Compliance with the design standards of the appropriate area plan land use category.

b. Require that structures be constructed in accordance with the requirements of the County's zoning, building and other pertinent codes and regulations.

c. Require that an appropriate landscape plan be submitted and implemented for development projects subject to discretionary review.

d. Require that new development utilize drought-tolerant landscaping and incorporate adequate drought-conscious irrigation systems.

e. Pursue energy efficiency through street configuration, building orientation and landscaping to capitalize on shading and facilitate solar energy, as provided for in Title 24*, Part 6 and/or Part 11,* of the California ~~Administrative~~ Code *of Regulations (CCR)*.

f. Incorporate water conservation techniques, such as groundwater recharge basins, use of porous pavement, drought-tolerant landscaping and water recycling, as appropriate.

g. Encourage innovative and creative design concepts.

h. Encourage the provision of public art *that enhances the community's identity, which may include elements of historical significance and creative use of children's art.*

i. Include consistent and well-designed signage that is integrated with the building's architectural character.

j. Provide safe and convenient vehicular access and reciprocal access between adjacent commercial uses.

k. Locate site entries and storage bays to minimize conflicts with adjacent residential neighborhoods.

l. Mitigate noise, odor, lighting and other impacts on surrounding properties.

m. Provide and maintain landscaping in open spaces and parking lots.

n. Include extensive landscaping.

o. Preserve natural features, such as unique natural terrain, *arroyos, canyons and other* drainage ways and native vegetation, wherever possible, particularly where they provide continuity with more extensive regional systems.

p. Require that new development be designed to provide adequate space for pedestrian connectivity and access, recreational trails, vehicular access and parking, supporting functions, open space and other pertinent elements.

q. Design parking lots and structures to be functionally and visually integrated and connected.

r. Site buildings access points along sidewalks, pedestrian areas and bicycle routes and include amenities that encourage pedestrian activity.

s. Establish safe and frequent pedestrian crossings.

t. Create a human-scale ground floor environment that includes public open areas that separate pedestrian space from auto traffic or where mixed, it does so with special regard to pedestrian safety.

u. Recognize open space, including hillsides, arroyos, riparian areas and other natural features, as amenities that add community identity, beauty, recreational opportunities and monetary value to adjacent developed areas.

v. Manage wild land fire hazards in the design of development proposals located adjacent to natural open space.

2. Circulation (C) Element

Policy C *4.8* (Previously C 4.9): Coordinate with all transit operators to ensure that *ADA compliant* pedestrian facilities are provided along and/or near all transit routes, whenever feasible. New land developments may be required to provide pedestrian facilities due to existing or future planned transit routes even if demand for pedestrian facility ~~is~~*may* not *be* otherwise warranted.

Policy C 9.2: Support *the expansion and enhancement of Metrolink service and* transit operators' programs to ~~foster~~ *increase* transit usage *to implement bus rapid transit (BRT) services, and to make other express and local bus service improvements*.

Policy C 12.2: Support the development of high-speed transit linkages, *bus rapid transit (BRT)* or express routes, between community centers and other major nodes of activity.

Policy C 13.3: Support implementation of the San Jacinto Branch Line to serve ~~planned industrial development~~ *commuter uses*.

Policy C 17.3: Ensure that the bikeway system incorporates the following:

a. Interconnection *throughout and between* ~~of~~ cities and unincorporated communities.

b. ~~Provision of~~ *Appropriate* lanes to specific destinations such as state or county parks.~~;~~

c. ~~Provision for~~ *Appropriate opportunities for recreational bicycle riding and* bicycle touring.~~; and~~

d. ~~Encouragement of~~ *Opportunities for* bicycle commuting~~.~~ *and golf cart commuting within a community, as appropriate for the terrain, traffic levels and proximity to surrounding destinations.*

e. Bikeways connecting to all urban transit centers and systems (bus stops and Metrolink stations) in the vicinity.

f. Bicycle parking at transit stops and park-and-ride lots.

Policy C 17.4: Ensure that alternative modes of motorized transportation, such as buses, trains, *taxi cabs,* etc., plan and provide for transportation of recreational and commuting bicyclists and bicycles on public transportation systems. *Coordinate with all transit operators to ensure that bicycle facilities are provided along and/or near all transit routes, whenever feasible. New land developments shall be required to provide bicycle facilities due to existing or future planned transit routes.*

Policy C 21.1: Encourage the installation and use of HOV lanes. Such lanes should be continuous, linking major population centers with employment centers. If HOV lanes are used, consider making them available for mixed-flow traffic during non-peak periods when warranted and feasible. *Consider and implement, where feasible and needed, direct HOV connections between freeways and arterial to freeway exclusive HOV ingress/egress ramps.*

3. Multipurpose Open Space (OS) Element

Policy OS 16.1: Continue to implement Title 24 of the ~~State Building Code~~ *California Code of Regulations (the "California Building Standards Code"), particularly Part 6 (the California Energy Code) and Part 11 (the California Green Building Standards Code), as amended and adopted pursuant to County ordinance.* Establish mechanisms and incentives to encourage architects and builders to exceed the energy efficiency standards ~~of~~ *within CCR* Title 24.

4. Air Quality (AQ) Element

Policy AQ 4.1: *Require* ~~Encourage~~ the use of *all feasible* building materials/methods which reduce emissions.

Policy AQ 4.2: *Require* ~~Encourage~~ the use of *all feasible* efficient heating equipment and other appliances, such as water heaters, swimming pool heaters, cooking equipment, refrigerators, furnaces and boiler units.

Policy AQ 4.3: *Require* ~~Encourage~~ centrally heated facilities to utilize automated time clocks or occupant sensors to control heating *where feasible.*

Policy AQ 4.4: Require residential building construction to comply with energy use guidelines detailed in *Part 6 (California Energy Code) and/or Part 11 (California Green Building Standards Code) of* Title 24 of the California ~~Administrative~~ Code *of Regulations.*

Policy AQ 4.7: To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, MDAQMD, ~~SOCAB~~ *SCAB*, the Environmental Protection Agency and the California Air Resources Board.

NEW **Policy AQ 18.1:** *Baseline emissions inventory and forecast. Riverside County CAP has included baseline emissions inventory with data from the County's CO2e emissions for specific sectors and specific years. The carbon inventory greatly aids the process of determining the type, scope and number of GHG reduction policies needed. It also facilitates the tracking of policy implementation and effectiveness. The carbon inventory for the county consists of two distinct components; one inventory is for the county as a whole, as defined by its geographical borders and the other inventory is for the emissions resulting from the County's municipal operations.*

NEW **Policy AQ 18.2:** *Adopt GHG emissions reduction targets. Pursuant to the results of the Carbon Inventory and Greenhouse Gas Analysis for Riverside County, future development proposed as a discretionary project pursuant to the General Plan*

shall achieve a greenhouse gas emissions reduction of 25% compared to Business As Usual (BAU) project in order to be found consistent with the County's Climate Action Plan (CAP).

NEW **Policy AQ 18.3:** *Develop a Climate Action Plan for reducing GHG emissions. The Riverside County CAP has been developed to formalize the measures necessary to achieve county GHG emissions reduction targets. The CAP includes both the policies necessary to meet stated targets and objectives. These targets, objectives and Implementation Measures may be refined, superseded or supplemented as warranted in the future.*

NEW **Policy AQ 18.4:** *Implement policies and measures to achieve reduction targets. The County shall implement the greenhouse gas reduction policies and measures established under the County Climate Action Plan for all new discretionary development proposals.*

NEW **Policy AQ 18.5:** *Monitor and verify results. The County shall monitor and verify the progress and results of the CAP periodically. When necessary, the CAP's "feedback" provisions shall be used to ensure that any changes needed to stay "on target" with stated goals are accomplished.*

NEW **Policy AQ 19.1:** *Continue to coordinate with CARB, SCAQMD and the State Attorney General's office to ensure that the milestones and reduction strategies presented in the General Plan and the CAP adequately address the county's greenhouse gas emissions.*

NEW **Policy AQ 19.2:** *Utilize the County's CAP as the guiding document for determining the County's greenhouse gas reduction thresholds and implementation programs. Implementation of the CAP and its monitoring program shall include the ability to expand upon or, where appropriate, update or replace the Implementation Measures established herein so that the implementation of the CAP accomplishes the greenhouse gas reduction targets.*

NEW **Policy AQ 19.3:** *Require new development projects subject to County discretionary approval to achieve the greenhouse gas reduction targets established in the CAP either through:*

a. Garnishing 100 points through the Implementation Measures found the County's CAP; or

b. Requiring quantification of project-specific GHG emissions and reduction of GHG emissions to, at minimum, the applicable GHG reduction threshold established in the CAP.

NEW **Policy AQ 19.4:** *All discretionary project proposals shall analyze their project-specific GHG reduction targets in comparison to the "business as usual" (BAU) scenario for the development's operational life, and the "operational life" of a new development shall be defined as a 30-year span. Other methods for calculating BAU and showing GHG emissions reductions may be used provided such methods are both scientifically defensible and show actual emission reduction measures incorporated into project design, mitigation or alternative selection. Alternatively, a project may use the CAP Screening Tables to show the attainment of the applicable number of points needed to ensure adequate GHG reductions and CAP compliance.*

NEW **Policy AQ 20.1:** *Reduce VMT by requiring expanded multi-modal facilities and services that provide transportation alternatives, such as transit, bicycle and pedestrian modes. Improve connectivity of the multi-modal facilities by providing linkages between various uses in the developments.*

NEW **Policy AQ 20.2:** *Reduce VMT by facilitating an increase in transit options. In particular, coordinate with adjacent municipalities, transit providers and regional transportation planning agencies to develop mutual policies and funding mechanisms to increase the use of alternative transportation.*

NEW **Policy AQ 20.3:** *Reduce VMT and GHG emissions by improving circulation network efficiency.*

NEW **Policy AQ 20.4:** *Reduce VMT and traffic through programs that increase carpooling and public transit use, decrease trips and commute times, and increase use of alternative-fuel vehicles.*

NEW **Policy AQ 20.5:** *Reduce emissions from standard gasoline vehicles, through VMT, by requiring all new residential units to install circuits and provide capacity for electric vehicle charging stations.*

NEW **Policy AQ 20.6:** *Reduce emissions from commercial vehicles through VMT, by requiring all new commercial buildings, in excess of 162,000 square feet, to install circuits and provide capacity for electric vehicle charging stations.*

NEW **Policy AQ 20.7:** *Reduce VMT through increased densities in urban centers and encouraging emphasis on mixed use to provide residential, commercial and employment opportunities in closer proximity to each other. Such measures will also support achieving the appropriate jobs-housing balance within the communities.*

NEW **Policy AQ 20.8:** *Reduce VMT by increasing options for non-vehicular access through urban design principles that promotes higher residential densities with easily accessible parks and recreation opportunities nearby.*

NEW **Policy AQ 20.9:** *Reduce urban sprawl in order to minimize energy costs associated with infrastructure construction and transmission to distant locations, and to maximize protection of open space.*

NEW **Policy AQ 20.10:** *Reduce energy consumption of the new developments (residential, commercial and industrial) through efficient site design that takes into consideration solar orientation and shading as well as passive solar design.*

NEW **Policy AQ 20.11:** *Increase energy efficiency of the new developments through efficient use of utilities (water, electricity, natural gas) and infrastructure design. Also, increase energy efficiency through use of energy-efficient mechanical systems and equipment.*

NEW **Policy AQ 20.12:** *Support programs to assist the energy-efficient retrofitting of older affordable housing units, particularly residential units built prior to 1978 when Title 24 energy requirements went into effect.*

NEW **Policy AQ 20.13:** *Reduce water use and wastewater generation in both new and existing housing, commercial and industrial uses. Encourage increased efficiency of water use for agricultural activities.*

NEW **Policy AQ 20.14:** *Reduce the amount of water used for landscaping irrigation through implementation of County Ordinance 859 and increase use of non-potable water.*

NEW **Policy AQ 20.15:** *Decrease energy costs associated with treatment of urban runoff water through greater use of bioswales and other biological systems.*

NEW **Policy AQ 20.16:** *Preserve and promote forest lands and other suitable natural and artificial vegetation areas to maintain and increase the carbon sequestration capacity of such areas within the County. Artificial vegetation could include urban forestry and reforestation, development of parks and recreation areas and preserving unique farmlands that provide additional carbon sequestration potential.*

NEW **Policy AQ 20.17:** *Protect vegetation from increased fire risk associated with drought conditions to ensure biological carbon remains sequestered in vegetation and not released to the atmosphere through wildfires.*

NEW **Policy AQ 20.18:** *Encourage the installation of solar panels and other energy-efficient improvements and facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc.).*

NEW **Policy AQ 20.19:** *Facilitate development of siting of renewable energy facilities and transmission lines in appropriate locations.*

NEW **Policy AQ 20.20:** *Reduce the amount of solid waste generation by increasing solid waste recycle, maximizing waste diversion, and composting for residential and commercial generators. Reduction in decomposable organic solid waste will reduce the methane emissions at County landfills.*

NEW **Policy AQ 20.21:** *Provide homeowner education programs on the various voluntary ways in which they may reduce their homes' GHG emissions, e.g. improving home insulation, adding solar energy capabilities, and providing information on energy-saving landscaping techniques.*

NEW **Policy AQ 20.22:** *Develop motorist education programs on reducing VMT, idling and vehicle maintenance, while increasing carpooling and public transit usage.*

NEW **Policy AQ 20.23:** *Develop education programs about green purchasing and waste reduction measures, e.g., use of sustainable materials, recycling, and composting.*

NEW **Policy AQ 20.24:** *Develop programs to improve job-housing balances, such as through small business development, for areas that are housing rich but jobs poor.*

NEW **Policy AQ 20.25:** *Coordinate County GHG emissions reduction efforts with those of other regional agencies and plans, i.e., SCAG's Compass Blueprint, Regional Transportation Plan (RTP) and SCAQMD's Air Quality Management Plans. In addition, coordinate with cities and sub-regional planning agencies, particularly WRCOG and CVAG, on efforts that jointly affect the County and the cities. Also, coordinate with utility and service providers to develop programs to improve energy efficiency, water efficiency and delivery or structural improvements to reduce demand or better coordinate infrastructure development, as appropriate.*

NEW **Policy AQ 20.26:** *Voluntary GHG reduction objectives for the community sector shall be achieved through development and implementation of specific implementation measures, as determined appropriate and feasible by the County.*

NEW **Policy AQ 20.27:** *Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel through fleet transitioning programs. Also, reduce total vehicle miles travel by County employees, both community to work sites and travel for the conduction of County activities.*

NEW **Policy AQ 20.28:** *Increase the energy efficiency of all existing and new County buildings and infrastructure operations (roads, water, waste disposal and treatment, buildings, etc.). Also, decrease energy use through incorporating renewable energy facilities (such as solar array installations, individual wind energy generators, geothermal heat sources) on County facilities where feasible and appropriate.*

NEW **Policy AQ 20.29:** *Establish purchasing and procurement policies that support the use of green products and services, minimize waste, and promote sustainability.*

NEW **Policy AQ 20.30:** *Reduce potable water use, wastewater and solid generation, and urban runoff at both new and existing County facilities and operations. Also, increase the amount of materials recycled from County facilities.*

NEW **Policy AQ 21.1:** *The County shall require new development projects subject to County discretionary approval to incorporate measures to achieve 100 points through incorporation of the Implementation Measures (IMs) found in the Screening Tables within the Riverside County Climate Action Plan. One hundred points represent a project's fair-share of reduction in operational emissions associated with the developed use needed to reduce emissions down to the CAP Reduction Target.*

a. *This reduction shall be measured in comparison to the "business as usual" (BAU) scenario for the development's operational life. The BAU scenario shall be consistent with the General Plan build out assumptions detailed in Appendix E-1 of the General Plan.*

b. *For the purposes of this policy, the "operational life" of a new development shall be defined as a 30-year span with construction emissions amortized over the 30 years.*

c. *For the purposes of this policy, "new development" refers to private development occurring pursuant to a discretionary land use approval issued by the County of Riverside and subject to binding Conditions of Approval. This definition generally corresponds to projects found non-exempt pursuant to the California Environmental Quality Act (CEQA), but is nevertheless subject to the sole discretion of the County of Riverside as lead agency.*

d. *Other methods for calculating BAU and showing GHG emissions reductions may be used provided such methods are both scientifically defensible and show actual emission reduction measures incorporated into project design, mitigation or alternative selection. That is, reductions must not be illusory "paper" reductions achieved merely through baseline manipulation.*

e. *Nothing in this policy shall be construed as accepting any proposed discretionary project from any legally applicable CEQA requirements or explicitly limiting the scope any analyses required to show CEQA compliance.*

NEW **Policy AQ 21.2:** *Implementation Measures found necessary for a given project pursuant to the CAP Screening Tables shall be incorporated into a project's Conditions of Approval issued by the County to ensure the measures are implemented appropriately.*

NEW **Policy AQ 21.3:** *Discretionary Measures - Because of the varied nature of the private development proposals reviewed by the County, in some cases, the Implementing Measures in the CAP may not provide the most appropriate means for achieving the required Interim GHG reductions. In such cases, the following alternate measures may be utilized, at the County's discretion:*

a. *For large-scale developments, such as specific plans, business parks, industrial centers and those triggering a full environmental impact report, a custom GHG analysis may be warranted to both assure compliance with the applicable targets herein and to provide a customized array of appropriate reduction measures.*

b. *In such cases, the resultant GHG analysis may be used to develop customized GHG reduction measures in place of the CAP's Implementing Measures provided they achieve the stated targets or implement all feasible mitigation short of achieving the applicable targets.*

c. *Project-specific analysis may be particularly valuable when assessing large-scale mixed use developments. In such developments, significant energy efficiencies and VMT reductions can result from smart growth design features, such as provision of housing, jobs, services and recreation within a 5- to 10-minute walking radius. Project-specific analysis in these cases may result in the need for fewer add-on Implementing Measures and potentially yield substantial savings on construction costs.*

NEW **Policy AQ 21.4:** *Implementation of the Climate Action Plan (CAP) and monitoring progress toward the CAP reduction targets shall include the ability to expand upon or, where appropriate, update or replace the Implementation Measures established herein such that the implementation of the CAP accomplishes the county's GHG reduction targets.*

NEW **Policy AQ 22.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions associated with transportation:*

a. Reduce vehicle miles traveled by providing or requiring expanded multi-modal facilities and services that provide transportation alternatives, such as transit, bicycle and pedestrian modes.

b. Reduce vehicle miles traveled by facilitating an increase in transit options. In particular, coordinate with adjacent municipalities, transit providers and regional transportation planning agencies to develop mutual policies and funding mechanisms to increase the use of alternative transportation.

c. Improve connectivity by requiring pedestrian linkages between developments and transportation facilities, as well as between residential and commercial, recreational and other adjacent land uses.

d. Reduce air pollution and greenhouse gas emissions by improving circulation network efficiency.

e. Reduce traffic through programs that increase carpooling and public transit use, decrease trips and commute times and increase use of alternative-fuel vehicles.

f. Preserve transportation corridors for renewable energy transmission lines and for new transit lines, where appropriate.

NEW **Policy AQ 23.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions associated with land use patterns:*

a. Reduce vehicle miles traveled (VMT) through increased densities in urban centers and emphasis on mixed use to provide localized residential, commercial and employment opportunities in closer proximity to each other.

b. Prevent urban sprawl in order to minimize energy costs associated with infrastructure construction and transmission to distant locations and to maximize protection of open space, particularly forests, which provide carbon sequestration potential.

c. Conserve energy by increasing the efficiency of delivery of services through the adoption and implementation of smart growth principles and policies.

d. Reduce vehicle miles traveled by commuters through implementation of planning measures that provide appropriate jobs-housing balances within communities.

e. Reduce vehicle miles traveled by increasing options for non-vehicular access through urban design principles that promote higher residential densities in attractive forms with easily accessible parks and recreation opportunities nearby.

f. Improve energy efficiency through implementation of standards for new residential and commercial buildings that achieve energy efficiencies beyond that required under Title 24 of the California Code of Regulations.

g. Reduce vehicle miles traveled by identifying sites for affordable housing for workers close to employment centers and encouraging development of such sites.

NEW **Policy AQ 23.2:** *For discretionary actions, land use-related greenhouse gas reduction objectives shall be achieved through development and implementation of the appropriate Implementation Measures of the Climate Action Plan for individual future projects. County programs shall also be developed and implemented to address land use-related reductions for County operations and voluntary community efforts.*

NEW **Policy AQ 24.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions achieved through improving energy efficiency and increasing energy conservation:*

a. *Require new development (residential, commercial and industrial) to reduce energy consumption through efficient site design that takes into consideration solar orientation and shading, as well as passive solar design. Passive solar design addressed the innate heating and cooling effects achieved through building design, such as selective use of deep eaves for shading, operable windows for cross-ventilation, reflective surfaces for heat reduction and expanses of brick for thermal mass (passive radiant heating).*

b. *Require new development (residential, commercial and industrial) to design energy efficiency into the project through efficient use of utilities (water, electricity, natural gas) and infrastructure design.*

c. *Require new development (residential, commercial and industrial) to reduce energy consumption through use of energy-efficient mechanical systems and equipment.*

d. *Establish or support programs to assist in the retrofitting of older affordable housing units to improve energy efficiency.*

e. *Actively seek out existing or develop new programs to achieve energy efficiency for existing structures, particularly residential units built prior to 1978 when CCR Title 24 energy efficiency requirements went into effect.*

f. *Balance additional upfront costs for energy efficiency and affordable housing economic considerations by providing or supporting programs to finance energy-efficient housing.*

NEW **Policy AQ 24.2:** *For discretionary actions, energy efficiency and conservation objectives shall be achieved through development and implementation of the appropriate Implementation Measures of the Climate Action Plan for all new development approvals. County programs shall also be developed and implemented to address energy efficiency and conservation efforts for County operations and the community.*

NEW **Policy AQ 25.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions through water conservation:*

a. *Reduce water use in both new and existing housing, commercial and industrial uses.*

b. *Reduce wastewater generation in both new and existing housing, commercial and industrial uses.*

c. *Reduce the amount of water used for landscaping irrigation through implementation of County Ordinance No. 859.*

d. *Increase use of non-potable water where appropriate, such as for landscaping and agricultural uses.*

e. *Encourage increased efficiency of water use for agricultural activities.*

f. *Decrease energy costs associated with treatment of urban runoff water through greater use of bioswales and other biological systems.*

NEW **Policy AQ 25.2:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions through biota conservation:*

a. *Conserve biota that provides carbon sequestration through implementation of the Multiple Species Habitat Conservation Plans for western and eastern Riverside County.*

b. *Preserve forest lands and other suitable natural vegetation areas to maintain the carbon sequestration capacity of such areas within the county.*

c. *Promote establishment of vegetated recreational uses, such as local and regional parks, that provide carbon sequestration potential in addition to opportunities for healthy recreation.*

d. *Promote urban forestry and reforestation, as feasible, to provide additional carbon sequestration potential.*

e. *Promote the voluntary preservation of farmlands for carbon sequestration purposes. In particular, protect important farmlands and open space from conversion and encroachment by urban uses. Also, seek to retain large parcels of agricultural lands to enhance the viability of local agriculture and prevent the encroachment of sprawl into rural areas.*

f. *Promote the voluntary preservation of areas of native vegetation that may contribute to biological carbon sequestration functions.*

g. *Protect vegetation from increased fire risks associated with drought conditions to ensure biological carbon remains sequestered in vegetation and not released to the atmosphere through wildfires. In particular, prevent unnecessary intrusion of people, vehicles and development into natural open space areas to lessen risk of wildfire from human activities.*

NEW **Policy AQ 25.3:** *For discretionary actions, greenhouse gas reduction objectives related to water and biota conservation shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan. County programs shall also be developed and implemented to address conservation issues related to County operations and voluntary community efforts.*

NEW **Policy AQ 26.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions derived from energy generation:*

a. *Encourage the installation of solar panels and other energy-efficient improvements.*

b. *Facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc.).*

c. *Facilitate development of renewable energy facilities and transmission lines in appropriate locations.*

d. *Facilitate renewable energy facilities and transmission line siting.*

e. *Provide incentives for development of local green technology businesses and locally produced green products.*

f. *Provide incentives for investment in residential and commercial energy efficiency improvements.*

g. *Identify lands suitable for wind power generation or geothermal production and encourage development of these alternative energy sources.*

NEW **Policy AQ 26.2:** *For discretionary actions, the objectives for greenhouse gas reduction through increased use of alternative energy sources shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan. County programs shall also be developed and implemented to address use of alternative energy for County operations and within the community.*

NEW **Policy AQ 27.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions associated with wastes:*

a. *Reduce the amount of solid waste generated.*

b. *Increase the amount of solid waste recycled by maximizing waste diversion, composting and recycling for residential and commercial generators.*

c. *Promote reductions in material consumption.*

d. *Decrease wastewater generation.*

e. *Reduce fugitive methane emissions and increase methane conversion to alternative energies at County landfills.*

NEW **Policy AQ 27.2:** *Greenhouse gas reduction through the above waste reduction objectives shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan for new development. County programs shall also be developed and implemented to address waste reductions for County operations and voluntary community efforts.*

NEW **Policy AQ 28.1:** *The County shall implement programs and requirements to achieve voluntary greenhouse gas emissions reductions through the following public education and outreach objectives:*

a. *Provide homeowner education programs on the various voluntary ways in which they may reduce their homes' GHG emissions.*

b. *Develop and implement motorist education programs on reducing vehicle miles traveled (VMT), idling, vehicle maintenance, etc.*

c. *Develop and implement incentive programs for increasing carpooling, public transit use and other similar means.*

d. *Develop and implement incentive programs for residential energy conservation, such as through retrofitting to improve insulation values, adding solar energy capabilities, planting deciduous trees to provide summer shade, etc.*

e. *Develop and implement programs designed to decrease transportation emissions, such as hybrid vehicle rebates, alternate fuel discounts, carpooling incentives, van pools, etc.*

f. *Develop and implement education programs about green purchasing and waste reduction measures, consistent with the County's Climate Action Plan e.g., use of sustainable materials, composting and such.*

g. *Develop and implement programs to improve job-housing balances, such as through small business development, for areas that are housing rich but jobs poor.*

h. *Develop and implement programs, consistent with the County's Climate Action Plan to incentive recycling and other waste reduction programs.*

NEW **Policy AQ 28.2:** *The County shall implement programs and requirements to achieve greenhouse gas emissions reductions through the following interagency coordination objectives:*

a. *Coordinate County regional GHG reduction efforts with those of other regional agencies and plans, i.e.:*

- *SCAG Regional Blueprint Plan*
- *SCAG Regional Transportation Plan (which will address SB 375)*

- *SCAQMD Air Quality Management Plans*
- *SB 375 Coordination and "Sustainable Communities Strategies"*

b. *Coordinate with constituent cities and sub-regional planning agencies, particularly WRCOG and CVAG, on GHG reduction efforts that jointly affect the county and these cities.*

c. *Coordinate with utility and service providers serving the county to develop programs to improve energy efficiency, water efficiency and delivery or structural improvements to reduce demand or better coordinate infrastructure development, as appropriate.*

d. *Coordinate with regional agencies responsible for developing utility corridors, particularly for electricity transmission, to ensure alternate energy sources available to the county are used to their fullest extent.*

NEW **Policy AQ 28.3:** *Voluntary greenhouse gas reduction objectives for the community sector shall be achieved through development and implementation of specific implementation measures, as determined appropriate and feasible by the County.*

NEW **Policy AQ 29.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions from County transportation, such as fleet composition, construction equipment, employee commuting and travel on County business:*

a. *Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel.*

b. *Increase use of alternative and lower carbon fuels in the County vehicle fleet.*

c. *Reduce total vehicle miles traveled by County employees, both commuting to work sites and traveling for the conduction of County activities.*

NEW **Policy AQ 29.2:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions through improving energy efficiency for County facilities and operations:*

a. *Improve the energy efficiency of all existing and new County buildings.*

b. *Improve the energy efficiency of County infrastructure operation (roads, water, waste disposal and treatment, buildings, etc.).*

c. *Decrease energy use through incorporating renewable energy facilities (such as, solar array installations, individual wind energy generators, geothermal heat sources) on County facilities where feasible and appropriate.*

NEW **Policy AQ 29.3:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions through achieving waste reduction and resource efficiency for County facilities and operations:*

a. *Establish purchasing and procurement policies that support the use of green products and services, minimize waste and promote sustainability.*

b. *Reduce potable water use at both new and existing County facilities and operations.*

c. *Reduce wastewater generation and urban runoff in both new and existing County facilities and operations.*

d. Increase the amount of materials recycled from County facilities while decreasing the amount of solid waste generated by County facilities that requires landfill disposal.

***NEW* Policy AQ 29.4:** *Greenhouse gas emissions reduction objectives for County operations and facilities shall be achieved through development and implementation of enforceable and binding internal County policies, programs or similar means.*

4.6.4 Thresholds of Significance for Air Quality

The project would result in a significant air quality resource impact if it would:

A. Conflict with or obstruct implementation of the applicable air quality plan.

B. Violate any air quality standard or contribute substantially to an existing or projected air quality violation. (See below.)

C. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

D. Expose sensitive receptors to substantial pollutant concentrations.

E. Create objectionable odors affecting a substantial number of people.

In regards to Threshold B, above, the SCAQMD and MDAQMD emission levels outlined in Table 4.6-C (Emission Thresholds for Air Basins in Riverside County), below, were used to gauge the significance of potential emissions within the three air basins of Riverside County. Emissions standards for each air basin are discussed by air district in Section 4.6.3 (Policies and Regulations Addressing Air Quality).

Table 4.6-C: Emission Thresholds for Air Basins in Riverside County

Air Basin / Units	CO	ROG	NO_X[1]	SO_X	PM_{10}	$PM_{2.5}$
Construction						
SCAB [2] (lbs/day)	550	75	100	150	150	55
SSAB [2] (lbs/day)	550	75	100	150	150	55
MDAB[4] (lbs/day)/(tons/year)	548/100	137/25	137/25	137/25	82/15	82/15
Operational						
SCAB [2] (lbs/day)	550	55	55	150	150	55
SSAB [2] (lbs/day)	550	75	100	150	150	55
MDAB [4] (lbs/day)/(tons/year)	548/100	137/25	137/25	137/25	82/15	82/15
Localized Significance[3]						
SCAB [2] and SSAB [2]	20 ppm [5] / 9 ppm [6]	---	0.18 ppm [5] / 0.03 ppm [8]	---	10.4 [7] µg/m^3	2.5 [7] µg/m^3

Footnotes:
1. NO_2 for the localized standards (in ppm); NO_X for the rest.
2. Regulated by the SCAQMD.
3. Voluntary standards; only appropriate for sites 5 acres or smaller.
4. Regulated by the MDAQMD.
5. One-hour standard.
6. Eight-hour standard.
7. 24-hour standard.
8. Annual standard.

4.6.5 Effect of GPA No. 960 on the General Plan and on Air Quality

In this section, the air quality-related changes to the General Plan are outlined and the effects of these proposed changes relative to air quality are discussed. For this resource, air quality modeling was used to estimate both baseline and build out conditions (with and without the project) for air pollutants in Riverside County, as discussed further below. Specific impacts and mitigation are then evaluated according to identified significance thresholds in the subsequent section (4.6.6).

A. Proposed Changes to the General Plan Related to Air Quality

As part of the project review process, land use and demographic data in the General Plan were updated and policies reviewed and revised where necessary. The existing General Plan addresses air quality mainly through the Air Quality (AQ) Element. GPA No. 960 includes revised air quality standards and policies related to pollution control. For full texts of the General Plan policies cited here, see Section 4.6.3.D.

Air Quality Standards: Text was added to address changes in the State of California and federal standards since the adoption of the 2003 General Plan. Further, modifications were included that would address the specific requirements of SB 375, AB 32 and Governor Schwarzenegger's Executive Order of June 2005 (relating to green-house gases; see Section 4.7 for more details).

GHG Emission Reduction: GPA No. 960 introduces Riverside County's first GHG Emission Reduction Strategy and includes Table AQ-7, 2008 Baseline GHG Emissions Inventory for Unincorporated Riverside County. The new table presents a baseline inventory of GHG emissions currently being produced by Riverside County residents, businesses and government (County of Riverside) operations. The GHG Emission Reduction Strategy identifies GHG reduction categories and objectives, references a new Climate Action Plan (CAP) and adds new policies to the AQ Element to achieve the greenhouse gas reduction objectives.

A variety of LUD and policy area changes proposed as per the descriptions in Section 3.0 (Project Description) of the EIR and associated Figure 3-1 (and corresponding maps within each Area Plan) may indirectly affect air quality. Such changes would lead to either an increase or decrease in development potential (density or intensity). Introducing new people and property into areas would incrementally affect air quality in the region as well. GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies and others, as described in EIR Section 3.0.

Infrastructure and utilities, such as roads, power transmission lines, water and sewer lines, are developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need. Accordingly, specific locations and timing of future infrastructure, including power and natural gas transmission lines, water and sewer lines and pumps, as well as roads, schools and other public services, are not presently foreseeable beyond the master countywide level (as addressed previously in EIR No. 441). These improvements would require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the project and the General Plan build out. As such, future impacts and mitigation must be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed at the later individual project stage. Nevertheless, this chapter presents theoretical air emission estimates for both existing and build out conditions. Each of these scenarios is outlined separately, below.

B. Analysis of the Effect of GPA No. 960 on Air Quality

The proposed project would have spatial effects where it involves a variety of specific General Plan Land Use Designation (LUD) corrections and changes, several Policy Area, Study Area and overlay changes, proposals for new trail and road alignments and standards, and an incidental commercial policy for rural areas. In addition, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County.

Accordingly, air quality effects are most often determined on the basis traffic patterns, including those resulting from land use, population and employment sources. Air quality effects are also based on growth projections and patterns. Predictive modeling tools such as URBEMIS2007 are used to calculate emissions based off these projections. As a result, future air quality impacts can be modeled (estimated) for a variety of future scenarios, such as the "build out scenario," which is a theoretical point in time when all of the land uses planned would have been built. As detailed in Section 4.1 (Environmental Assumptions and Methodology), the theoretical build out point used in this EIR for the General Plan and GPA No. 960 is approximately 2060. The theoretical build out for GPA No. 960 occurs at such a time when unincorporated Riverside County has developed land uses to the point that they are "built out" to the density for each land use type designated in GPA No. 960. The year 2060 was based upon the estimated time needed to achieve "build out" using the population and growth projections for the unincorporated area of Riverside County.

It should be noted, however, that build out is a *theoretical* point in time, fixed in order to allow comparison between two differing outcomes. The ultimate outcome, that is, what actually gets built in the real world, is subject to many complex and varying factors over time. Hence, the theoretical approximation is more of a likely best (or worst) case scenario, rather than a precise acre-by-acre prediction. Also, these calculations do not take into account any potential future annexations of unincorporated Riverside County areas into existing (or new) cities or public facility districts, which could lead to other agencies being responsible for provision of the public services. This is appropriate because doing so means the public service needs of the unincorporated county are, at worst, over-estimated so that, in an abundance of caution, mitigation needs are similarly over-estimated.

These build out projections are valuable because they provide a snapshot of how the County of Riverside might look if all of the land uses mapped in the existing (2008) General Plan were built as planned. And, they enable a comparison of the possible outcome of the changes proposed by the project. In each of the subsections that follow details are provided on how the specific projections were developed, as well as the data sources and methods uses.

1. Future Development Construction Emissions

Air pollutant emissions are generally associated with two types of activities: construction and operation. Construction activities include the clearing and grading of land, building of structures and the installation of utilities and road, painting and paving as well as the vehicle trips associated with the site's workers, deliveries of build materials, etc., associated with individual developments. Accordingly, the emissions associated with construction tend to be site specific and depend upon the type of construction and development proposed, as well as the location, time of year and duration, among other things. Because these factors can vary so widely (and would occur over a roughly 50-year time span), estimating all of the construction emissions or impacts for future development expected as the County of Riverside builds out according to the General Plan (existing or proposed) is infeasible. Nevertheless, to provide a reference of the types of air quality emissions associated with "typical"

individual construction activities, several hypothetical scenarios were modeled for three types of residential development. See Table 4.6-D (Typical Project Construction Emission Estimates), below.

Table 4.6-D: Typical Project Construction Emission Estimates

Pollutant	Example Development Projects			AQ Construction Thresholds	
	5 Acres with 190 MFR	25 Acres with 75 SFR	50 Acres with 150 SFR	South Coast and Salton Sea Air Basins[1]	Mojave Desert Air Basin[2]
ROG	66.01	55.51	*108.25*	75	137
NO_X	22.00	29.68	29.68	100	137
CO	26.69	22.22	34.70	550	548
PM_{10}	26.08	*156.55*	*255.55*	150	82
$PM_{2.5}$	6.21	27.53	53.63	55	82

Key: lbs/day = pounds per day MFR = Multi-family residential units SFR = Single-family residential units
Footnotes:
1. Thresholds for these basins from SCAQMD.
2. Thresholds for this basin from MDAQMD.
Source: Atkins, Air Quality Study for General Plan Update, 2011. (See Appendix EIR-5)

Residential development acreages can range from less than an acre to well over a hundred in some cases. Keeping in mind that a variety of projects would be undertaken, examples of construction of residential development on 5, 25 and 50 acres were modeled. These construction emission estimates were based on the default construction phase lengths and equipment usage included in the URBEMIS2007 model. Construction estimates for commercial and industrial uses were not modeled as such uses vary too widely to be accurately typified.

For the residential examples analyzed above, emissions would result from onsite grading activities, transport of materials to and from the site and the actual building construction, painting and paving associated with the individual developments. Table 4.6-D shows that the SCAQMD and MDAQMD thresholds for PM_{10} are exceeded with the disturbance of between 25 and 50 acres. In addition, the construction of 150 single family residential units or more is anticipated to exceed the SCAQMD threshold for ROG. Because the residential examples analyzed above demonstrate that the thresholds are exceeded, construction air quality impacts would be considered significant for such individual projects. And, for GPA No. 960, since the precise timing of future development cannot be controlled to avoid multiple projects below the thresholds from occurring simultaneously, construction air quality impacts are also considered cumulatively considerable. See Section 5.5 (Cumulative Impacts) for more details.

Further, because construction impacts are modeled from a myriad of variables unique to each project, it is impossible to develop a reasonably foreseeable forecast of construction-related air quality impacts resulting from future development accommodated by GPA No. 960. Thus air quality impacts as a result of construction must be addressed on a case-by-case basis for each development project.

2. Future Development Operational Emissions

Operational emissions based on future conditions were calculated using URBEMIS for stationary and mobile source emissions. Project-specific data for the types and amounts of various land use development planned were entered into URBEMIS to determine the pollutant emissions anticipated at full build out. This data includes the number of residential dwelling units, square footage of non-residential land uses, average daily trips, vehicle miles traveled and average trip lengths. Where project-specific data was not available, URBEMIS defaults provided for the County of Riverside were used. *The specific land use and mobile source assumptions included ~~I~~ in the modeling are detailed in Appendix EIR-5 Air Quality Data Section A—Modeling Assumptions.*

Baseline conditions for operational emissions are the pollutant levels associated with the existing development and land uses. Because there are changes in land use type and density, a simple calculation of new development emissions would not accurately assess the changes in pollutant emissions being proposed. Therefore, in order to determine pollutant concentrations anticipated from project implementation, the emissions from the baseline condition are subtracted from the total anticipated emissions at project build out under the proposed General Plan. It should be noted the existing and future levels depicted in Tables 4.6-E, 4.6-F, 4.6-G and 4.6-H represent emissions for lands reasonably foreseeable as being spatially affected by GPA No. 960 changes only; not countywide General Plan build out scenarios. (See Section 4.7 for countywide scenarios.)

Table 4.6-E (Comparison of Unmitigated Project Operational Emissions – SCAQMD) and Table 4.6-F (Comparison of Unmitigated Project Operational Emissions – MDAQMD) show the anticipated unmitigated emissions under the proposed GPA No. 960 respectively according to the portions of Riverside County under jurisdiction of the SCAQMD and MDAQMD. As shown, the project would result in net emissions that would exceed SCAQMD and MDAQMD thresholds of significance for CO, ROG, SO_X, PM_{10} and $PM_{2.5}$ but would be less than significant for NO_X emissions. The negative net emissions associated with NO_X is due to the substantial decrease in anticipated emissions from vehicles mandated by increased efficiency requirements in current federal and California State law that have been implemented and will continue to affect the motor vehicle fleet between the existing year and 2040.

Although build out is anticipated to be well beyond 2040, the URBEMIS model does not have emission factors beyond 2040. Thus, these analyses represent a conservative prediction of emissions for build out. Note that the NO_X negative net emissions are due to the substantial decrease in anticipated vehicle emissions due to increased State of California efficiency requirements between the existing year and 2040.

Tables 4.6-E and 4.6-F show that although future development accommodated under the proposed project is designed for decreased density/intensity overall, its implementation would still result in daily emissions above both the SCAQMD and MDAQMD thresholds. While some of the individual development may be able to incorporate project designs and reduction features that would reduce emissions to below the regulatory threshold, the project must be considered in total for significance consideration. Because emissions of the majority of the criteria pollutants exceed the regulatory thresholds, impacts with respect to stationary and mobile sources are considered potentially significant before the implementation of regulations, policies and mitigation.

Table 4.6-E: Comparison of Unmitigated Project Operational Emissions – SCAQMD

Source[1, 6]	CO (lbs/day)[1]	NO_X (lbs/day)[1]	ROG (lbs/day)[1]	SO_X (lbs/day)[1]	PM_{10} (lbs/day)[1]	$PM_{2.5}$ (lbs/day)[1]

Significant Impact?	**YES**	**NO**	**YES**	**YES**	**YES**	**YES**

Footnotes:
1. Net emissions are those attributed to the growth anticipated between existing year and full project build out.
2. Net emissions are gross emissions minus existing emissions, which equals the project increment. Note that for NOX the negative net emissions is due to the substantial decrease in anticipated vehicle emissions due to increasing State of California efficiency requirements between existing year and 2040. Although build out is anticipated for 2060, the air quality model's emission factors only go to 2040, so build out is conservatively estimated to occur by the earlier year.

Source: Atkins, Air Quality Study for General Plan Update, 2011. (See Appendix EIR-5)

The existing General Plan policies and mitigation along with new General Plan policies and mitigation measures would reduce emissions from operational activities. Table 4.6-G (Mitigated Net Project Operational Emissions – SCAQMD) and Table 4.6-H (Mitigated Net Project Operational Emissions – MDAQMD) show the anticipated project build out emissions after reductions are implemented. However, because the exact nature and location of the build out of the proposed project is unknown, the extent of reductions available from all measures is not fully known and therefore is not included in the calculated reductions.

Reductions included in Tables 4.6-G and 4.6-H are associated with low VOC paint requirements, increased energy efficiencies and transportation reductions. As can be seen, even with these reductions, emissions are anticipated to be above thresholds for all criteria pollutants except CO (SCAQMD only) and NO_X (SCAQMD and MDAQMD). While some of the emissions reductions could not be quantified, it is not anticipated that their reductions would be sufficient to reduce emissions by the 50% to 99% required to achieve the regulatory thresholds.

It can be assumed that various sizes and types of project would be developed, however. And, because of the increased density seen for the land uses and desired proximity of residential land uses to both transit and

commercial centers, it can be assumed that both construction and operation of commercial and potentially industrial sources would be developed relatively close to sensitive receptors such as residences or schools. Each individual future commercial or industrial development would require an environmental analysis because the emissions with respect to countywide sensitive receptors cannot be determined. For projects within SCAQMD's jurisdiction, the analysis shall include an LST evaluation using the screening level analysis for projects at or under 5 acres in size and a more detailed analysis for projects over 5 acres. (See Impact 4.6.D.)

3. Localized Significance Thresholds (LSTs)

Due to the programmatic nature of the General Plan and the proposed project, detailed construction phasing, equipment and intensities are not available for the development area. Further, the exact size and location of future development within Riverside County is unknown at this time. Therefore, project-level analysis for impacts to sensitive receptors and population groups cannot be accurately determined using LST analysis and would be inappropriate under the SCAQMD's LST methodology, because specific acreages, uses and distances to

sensitive receptors are required in order to calculate localized pollutant concentrations at sensitive receptors. Sensitive population groups include children, the elderly, the acutely ill and the chronically ill, especially those with cardio-respiratory diseases. Sensitive receptors are those areas where sensitive populations may be for extended periods of time, resulting in sustained exposure to any pollutants present.

Localized significance thresholds (LSTs) were developed by the SCAQMD to determine maximum allowable concentrations of criteria air pollutants during construction or operation for individual developments. Methodology for determining significance of project impacts with respect to sensitive receptors provides screening levels for those projects of less than 5 acres but requires more in-depth dispersion modeling for project sites greater than 5 acres. The screening process results in a conservative estimate of emissions due to the general information that is used to determine emissions. While dispersion modeling is more time intensive, it provides for a project-specific analysis which takes into account not only the size of the project, but also can account for wind direction, topography and additional barriers, such as buildings.

To provide a reference of the types of emissions associated with "typical" construction and operation activities, a hypothetical 5-acre analysis is presented in Table 4.6-I (Localized Significant Analysis for 5-Acre Site – Construction) and Table 4.6-J (Localized Significant Analysis for 5-Acre Site – Operational) below. For projects less than 5 acres in size, screening analyses would occur using the concentrations identified in the LST lookup tables developed by the SCAQMD. Each source receptor area (SRA) within the SCAB has a unique LST for CO, NO_X, PM_{10} and $PM_{2.5}$. While the project's build out area is much greater than 5 acres, it is possible that some of the individual developments that occur would disturb less than 5 acres. For an assumed 5-acre development project located within SRA 24 (Perris Valley area), the lookup tables can be used to determine what the allowable emission concentrations would be at various distances from the construction site. Table 4.6-I shows the LST thresholds for a 5-acre site in SRA 24 in comparison to the emissions estimates detailed previously in Table 4.6-D, above.

Table 4.6-I: Localized Significant Analysis for 5-Acre Site – Construction

Distance from Site	CO	NO_X	PM_{10}	$PM_{2.5}$
25 meters Threshold	1,577	270	13	8
50 meters Threshold	2,178	302	40	10
100 meters Threshold	3,437	378	59	16

The same methodology would also apply to operational emissions from the project site. Assuming that the same 5-acre development was for 190 multi-family residential units and the URBEMIS defaults were used, the site's operational emissions could be compared to the LST lookup tables for operational emissions. Table 4.6-J shows the operational LST thresholds in comparison with the anticipated emissions from the theoretical project. The

theoretical 5-acre site project is below all the applicable LST thresholds during construction and operation using the SCAQMD screening level analysis.

These thresholds do not include the mobile sources associated with offsite traffic. However, onsite traffic must also be considered, especially where diesel particulate matter is concerned such as with the operation of a warehouse with numerous loading docks and large volumes of truck traffic. In addition to criteria pollutant analysis, localized emissions of toxic air contaminants (TAC) are also of concern with respect to sensitive receptors. Sources of TACs include diesel particulate matter from railroads, emissions from the combustion of airplane fuel, benzene emissions in close proximity to gasoline dispensing stations, dry cleaners and film processing services that use perchloroethylene, auto body shops due to various solvents, furniture manufacturers and repair facilities that use methylene chloride and print shops that use various solvents.

The primary source of TACs within Riverside County is diesel-fueled trucks and other vehicles traveling the freeways and major roadways. In 2005, CARB published the "Air Quality and Land Use Handbook – A Community Health Perspective," to provide guidance on how to analyze these TAC emission sources in a general plan update and how to apply program-level mitigation. In particular, the CARB Guidance uses buffer zones to insulate sensitive receptors from sources of TACs.

Due to the programmatic nature of the General Plan and GPA No. 960, detailed construction phasing, equipment and intensities are not available. Further, the exact size and location of future development within Riverside County and, in particular, its timing, is unknown at this time. Therefore, project-level analysis for impacts to sensitive receptors cannot be accurately determined. It can, however, be assumed that various sizes and types of projects will be developed and, because of the increased density seen for the land uses and desired proximity of residential land uses to both transit and commercial centers, it can be assumed that both construction and operation of commercial and potentially industrial sources would be developed relatively close to sensitive receptors such as residences or schools.

4.6.6 Air Quality - Impacts and Mitigation

A. Air Quality Plan Conflicts: Would the project conflict with or obstruct implementation of the applicable air quality plan?

Impact 4.6.A – Cause Inconsistency With Air Quality Plans: As outlined in Section 4.3 (Population and Housing), future development associated with GPA No. 960 represents a reduction in Riverside County capacity and yields lower population growth forecasts, both compared to the existing General Plan and to current SCAG (2008 RTP) projections. Since air quality management plans (AQMPs) are developed using growth forecasts issued by the applicable regional association of governments (SCAG, etc.), a project that is consistent with the applicable growth forecast would generally be consistent with the AQMP. This is the case for GPA No. 960. Further, it includes a number of new policies and programs related to greenhouse gas reductions that would also improve air quality for a variety of criteria pollutants addressed in AQMPs. Compliance with existing regulatory programs, Riverside County ordinances and General Plan policies, as well as new ones included in GPA No. 960, would further reduce this impact by reducing conflicts with or obstruction of the AQMP. However, while the existing General Plan policies and new ones included in GPA No. 960 may reduce conflicts and obstruction of any AQMP, the combined emissions from all proposed General Plan development would exceed the SCAQMD and MDAQMD significance thresholds for criteria pollutants. Exceeding these thresholds has the potential to hinder the region's compliance with each AQMP. Therefore, this impact is significant and unavoidable.

1. Analysis of Impact 4.6.A

As outlined in Section 4.3, in terms of direct growth, GPA No. 960's land use changes would serve to limit and slightly reduce the development capacity of Riverside County, yielding 1.4% less population growth than that projected for the existing General Plan, 2.0% fewer dwelling units and 5.6% fewer jobs. Similarly, traffic volumes also decrease proportionally.

Air quality management plans (AQMPs) are developed using growth forecasts issued by the applicable regional association of governments (SCAG, etc.). Thus, a project that is consistent with the applicable growth forecast would generally be consistent with the AQMP. Thus, overall GPA No. 960 represents a reduction in county capacity and yields lower population growth forecasts, both compared to the existing General Plan and to current SCAG (2008 RTP) projections.

SCAG's Regional Comprehensive Plan and Guide (RCP) includes growth forecasts that are used in the development of air quality-related land use and transportation control strategies. In Southern California, a reduction in vehicle miles traveled correlates with a reduction in emissions of criteria pollutants (and greenhouse gases). As stated earlier, the project's effect on the build out of Riverside County would be to lessen its ultimate density and intensity. For example, the SCAG-projected population for Riverside County in 2035 is 1,243,632. The projected 2035 population resulting from implementation of GPA No. 960 would be 909,072. Similar reductions are seen for housing and employment as well. Thus, Riverside County projections would fall within SCAG projections for 2035.

The 2007 Air Quality Management Plan (AQMP) discussed in Section 4.6.3 was prepared to accommodate growth, to reduce the high levels of pollutants within areas under the jurisdiction of SCAQMD, to return clean air to the region and to minimize the impact of reduced air quality on the economy. Projects that are considered to be consistent with the AQMP would not interfere with attainment because this growth is included in the projections used during the preparation of the AQMP. Therefore, projects, uses and activities that are consistent with the applicable assumptions used in the development of the AQMP would not jeopardize attainment of the air quality levels identified in the AQMP, even if they exceed the SCAQMD's recommended daily emissions thresholds.

The MDAQMD states that a General Plan amendment or similar land use plan change which does not increase dwelling unit density, vehicle trips or vehicle miles traveled would be considered to conform with attainment of the Air Quality Attainment and Ozone Attainment Plans. GPA No. 960 represents a population reduction of 1.4% by 2035 and an approximate 18% reduction in VMT by 2035 (extrapolated from the 35% reduction anticipated by 2060 as part of the Climate Action Plan requirements).

Projects that are consistent with the employment, population, housing and VMT projections identified in the Growth Management chapter of the Regional Comprehensive Plan and Guide (RCPG) prepared by the Southern California Association of Governments are considered consistent with the growth projections used by the Air Districts to anticipate future pollutant concentrations and determine reductions needed to reach federal and state ambient air quality standards.

Additionally, GPA No. 960 is consistent with SCAG's Regional Growth Management Plan and the rate of growth and vehicle miles traveled for build out of the General Plan as modified by the project is also consistent with SCAG's projected population growth. In addition, because of other traffic and vehicle-related changes associated with the proposed Climate Action Plan and Circulation Element revisions, it is anticipated that GPA No. 960 would also be consistent with SCAG's Regional Mobility Plan, the locally adopted Congestion Management Plan, as well as the Coachella Valley PM_{10} Plan.

Thus, through implementation of the project's proposed changes to the General Plan, including reductions in population, housing, employment and vehicle miles traveled, GPA No. 960 would be consistent with all of the applicable air quality plans. Further, compliance with existing regulatory programs, Riverside County ordinances and General Plan policies, as well as new ones included in GPA No. 960, would ensure that the project reduces conflicts with or obstruction of any AQMP.

However, while the existing General Plan policies and new ones included in GPA No. 960 may reduce conflicts and obstruction of any AQMP, the combined emissions from all proposed General Plan development would exceed both the SCAQMD and MDAQMD significance thresholds for criteria pollutants. These exceedances have the potential to hinder the region's compliance with each AQMP. Therefore, without mitigation this impact is significant.

2. Regulatory Compliance for Impact 4.6.A

Consistency with applicable air quality plans would be further ensured or enhanced through the following regulations, programs and policies.

a. Compliance With Federal, State and County Regulations

Riverside County Ordinance No. 706 and Ordinance No. 726, as detailed in Section 4.6.3, above, would help reduce motor vehicle emissions of criteria pollutants through reduction of vehicle miles traveled. This would also ensure consistency with the SCAQMD and MDAQMD's pollution reduction goals.

b. Compliance with Existing General Plan Policies

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project Conditions of Approval. See Section 4.6.3.D for full text of each of these policies.

Policy LU 2.1: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations. These policies limit emissions from operation through site placement and design.

Policies LU 8.12, 11.1-11.4 and 13.1-13.4: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies C 1.2, 1.7, 4.1, 4.8, 9.2, 11.2, 11.4, 11.5, 11.7, 13.1 and 20.14: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies AQ 1.1-1.9, 2.3, 2.4, 4.6, 7.4, 10.4, 15.1, 16.1-16.4, 17.1-17.5, 17.8 and 17.11: These policies promote the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions, encourage the use of alternate sources and increased efficiencies, and enhanced community involvement.

Policy AQ 5.1: This policy encourages the use of building operations to use and reuse materials to reduce the amount of energy used and waste generated during daily operations.

Policies AQ 3.2-3.4, 4.5, 10.1, 10.2 and 10.3: These policies promote the reduction of mobile source emissions through employer and employee education and implementation of transportation demand measures that would reduce vehicle miles traveled.

Policies AQ 4.4, 5.2-5.4, 17.9 and 17.10: These policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policies AQ 7.1-7.3, 8.2, 8.4, 8.6-8.9, 9.1, 9.2, 11.3 and 11.4: These policies promote the reduction in vehicle miles traveled through the location of new employment centers, residential land uses and transit centers in close proximity. Further reductions are encouraged through public event incentives such as reduced transit pass costs.

Policies AQ 13.1-13.3, 14.1, 14.2 and 14.4: These policies encourage the County of Riverside to reduce vehicle miles traveled through enhancement of transportation fleet mixes, planning for new transportation/land use balance and enhancing and preserving existing transit corridors.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed policies of the Riverside County General Plan would also further ensure that impacts with respect to air quality plan compliance are less than significant. While these proposed air quality policies were introduced to specifically address greenhouse gas emissions, these policies would also provide a reduction in criteria pollutant emissions and so are included herein. See Section 4.6.3.D for full text of each General Plan policy mentioned.

Policy LU 1.5: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations. These policies limit emissions from operation through site placement and design.

Policies C 12.2 and 17.4: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies AQ 4.2 and 4.3: Together, these policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policy AQ 4.7: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions, encourage the use of alternate sources and increased efficiencies, and enhanced community involvement.

Policies AQ 22.1 and 29.1: These policies implement requirements to reduce greenhouse gases emissions associated with transportation through the reduction in vehicle miles traveled.

Policies AQ 23.1 and 28.1: These policies help reduce GHG emissions through land use planning.

Policies AQ 24.1, 25.1, 26.1, 27.1, 28.1, 29.2 and 29.3: These policies implement programs and requirements to reduce greenhouse gas emissions through increased energy efficiency, resource conservation and waste reduction.

3. Additional Project-Specific Mitigation for Impact 4.6.A

Additional project-specific mitigation measures are necessary to further avoid, reduce or minimize impacts from operational pollutant emissions. The following mitigation measures from EIR Section 4.7 would also reduce air pollution by reducing energy use and vehicle miles traveled and ensure county compliance with applicable air quality management and attainment plans.

NEW Mitigation Measure 4.7.A-N1: To ensure GHG emissions resulting from new development are reduced to levels necessary to meet California State targets, the County of Riverside shall require all new discretionary development to comply with the Implementation Measures of the Riverside County Climate Action Plan or provide comparable custom measure backed by a project GHG study (for example, using CalEEMod modeling) demonstrating achievement of the same target. The target to be met is a GHG emissions reduction of 25% below emissions for the adjusted BAU scenario for residential, commercial, industrial, institutional and mixed-use projects. The adjusted BAU is based upon the 2020 BAU found in the Final Supplement to the AB 32 Scoping Plan (CARB 2011).

NEW Mitigation Measure 4.7.A-N2: In lieu of a project-specific GHG analysis per Mitigation Measures 4.7.A-N1, a future discretionary project pursuant to the Riverside County General Plan shall incorporate into the project design, operational features and/or Implementing Measures from the County Climate Action Plan, in such a manner as to garnish at least 100 points. The point values within the CAP's Screening Tables constitute GHG emission reductions.

4. Finding on Significance for Impact 4.6.A

With implementation of and compliance with the above-listed regulatory programs, Riverside County ordinances, existing and proposed General Plan policies, as well as proposed new Mitigation Measures 4.7.A-N1 and N2, air pollutant emissions from future development accommodated by GPA No. 960 would be reduced but still exceed regulatory thresholds for the SCAB, SSAB and MDAB. Exceedance of regulatory thresholds would conflict with the implementation of the applicable air quality plans. Implementation of greenhouse gas reduction measures would afford additional reductions in criteria air pollutants; however, it would not reduce criteria pollutant impacts to below regulatory thresholds. Thus, impacts associated with implementation of the proposed project would remain significant and unavoidable with respect to regional air quality plans.

B. Significant Air Emissions: Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Impact 4.6.B(1) – Cause Significant Construction (Short-Term) Air Emissions: Future development accommodated by the proposed project, GPA No. 960, would result in construction activities generating air quality emissions that may be quantified based on the level of daily disturbance. However, since GPA No. 960 would be implemented through many (perhaps thousands) of individual projects occurring throughout Riverside County over next roughly 50 years, the level of daily disturbance for GPA No. 960 cannot be calculated and, therefore, the associated construction emissions cannot be quantified. Although implementing projects may be individually consistent with air quality standards, because of the cumulative nature of air emissions, such projects may nonetheless cumulatively exceed an air quality standard. Thus, even with implementation of the regulations, existing policies and mitigation measures outlined herein that reduce emissions, it cannot be guaranteed that they would be cumulatively reduced to below applicable thresholds. Thus, this impact would be significant and unavoidable with respect to violations of air quality standards for construction activities.

1. Analysis of Impact 4.6.B(1)

Construction activities typically result in temporary air emissions (and air quality impacts) due to onsite grading activities, transport of materials to and from the site and construction of the actual building(s), including emissions from the gluing, painting and paving associated with them.

As discussed in detail in Section 4.6.2 (Existing Environmental Setting – Air Quality), the air districts have developed thresholds by which project impacts can be compared to determine significance. These thresholds are summarized in Table 4.6-C in Section 4.6.3. Thus, while the exact nature of future development is unknown, estimates of emissions and impacts associated with specific sizes of individual development activities can be predicted. Accordingly, as shown in Table 4.6-D, the MDAQMD construction emissions threshold for PM_{10} would be exceeded with the disturbance of as little as 5 acres and between 25 and 50 acres for the SCAQMD thresholds. Similarly, construction of between 75 and 150 single-family residential units would exceed the SCAQMD threshold for ROG. Thus, some projects could be large enough on their own to generate emissions that exceed these thresholds.

The project would result in future development occurring via numerous individual actions scattered across the entirety of Riverside County and at various unforeseeable intervals over the next roughly 50 years. Although the revisions proposed to the General Plan would lower the build out capacity of Riverside County, there would still be development on lands that are currently vacant or under-utilized. Such development would result in new temporary construction emissions being generated. Unlike an individual project for which project-specific construction information available, it is infeasible to quantify all of the individual projects that would contribute incrementally to construction emissions across Riverside County. However, generally speaking, construction equipment emit both criteria pollutants and diesel particulate matter (DPM), which is a Toxic Air Contaminant (TAC), and construction activities such as grading generate fugitive dust emissions including PM_{10} and $PM_{2.5}$. The cumulative emissions of criteria pollutants and DPM resulting from all construction activities throughout Riverside County will potentially affect the health of residents within Riverside County. In the absence of data to prove otherwise, it is therefore assumed that future development accommodated by the proposed project would result in varying amounts of construction on a daily and annual basis through build out that would be cumulatively significant, even if individually consistent with applicable construction thresholds.

2. Regulatory Compliance for Impact 4.6.B(1)

The adverse effects associated with criteria pollutant emissions from future development would be reduced or minimized through adherence to or compliance with the following regulations and policies.

a. Compliance With Federal, State and County Regulations

The 2007 Air Quality Management Plan (AQMP) is intended to accommodate growth within the region while introducing enforceable strategies to reduce the high levels of pollutants within areas under the jurisdiction of SCAQMD. In order to help reduce pollutant levels as required in the AQMP, the SCAQMD has implemented regulatory thresholds for the criteria air pollutants. These thresholds were established to provide for future development while reducing regional concentrations of air pollutants.

MDAQMD Attainment Plans are intended to accommodate growth within the Mojave Desert Air Basin while introducing enforceable strategies to attain the national air quality standards for the MDAQMD jurisdictional areas. As with the SCAQMD, the MDAQMD has implemented regulatory thresholds for the criteria air

pollutants to provide for future development while reducing concentrations of air pollutants consistent with their regional attainment plans.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would also contribute to reducing construction-related pollutant emissions. See Section 4.6.3.D for full text of each.

Policies AQ 1.1-1.4, 1.10, 2.1, 4.8-4.10, 15.1, 16.1, 16.3, 17.1, 17.3, 17.4, 17.6, 17.8 and 17.11: These policies promote the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions from construction-related activities, or limit the level of construction activities that can be undertaken on a daily or annual basis.

Policy AQ 5.1: This policy encourages the use of building methods and use/reuse of materials to reduce the amount of emissions generated during the use or disposal of construction materials.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed policies of the Riverside County General Plan would ensure that impacts with respect to construction emissions are less than significant. Implementation of these policies would provide for a reduction in criteria pollutant emissions. See Section 4.6.3.D for full text of each.

Policy AQ 4.7: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions from construction-related activities, or limit the level of construction activities that can be undertaken on a daily or annual basis.

Policy AQ 4.1: This policy requires the use of building methods and use/reuse of materials to reduce the amount of emissions generated during the use or disposal of construction materials.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.5.1A, 4.5.1B and 4.5.1C were imposed to reduce impacts to air quality. These measures remain applicable to this project and would lessen impacts to air quality by minimizing fugitive dust during construction and reducing pollution resulting from construction equipment.

Existing Mitigation Measure 4.5.1A: Applicable Rule 403 Measures: Apply nontoxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more).

- Water active sites at least twice daily. (Locations where grading is to occur will be thoroughly watered prior to earthmoving.)
- All trucks hauling dirt, sand, soil, or other loose materials are to be covered, or should maintain at least two feet of freeboard in accordance with the requirements of California Vehicle Code (CVC) Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).

- Pave construction access roads at least 100 feet onto the site from main road.
- Traffic speeds on all unpaved roads shall be reduced to 15 mph or less.

Existing Mitigation Measure 4.5.1B: [Implement the following] additional SCAQMD CEQA Air Quality Handbook dust measures:

- Revegetate disturbed areas as quickly as possible.
- All excavating and grading operations shall be suspended when wind speeds (as instantaneous gusts) exceed 25 mph.
- All streets shall be swept once a day if visible soil materials are carried to adjacent streets (recommend water sweepers with reclaimed water).
- Install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash trucks and any equipment leaving the site each trip.

Existing Mitigation Measure 4.5.1C: [Implement the following] mitigation measures for construction equipment and vehicles exhaust emissions:

- The construction contractor shall select the construction equipment used on site based on low emission factors and high energy efficiency.
- The construction contractor shall ensure that construction grading plans include a statement that all construction equipment will be tuned and maintained in accordance with the manufacturer's specifications.
- The construction contractor shall utilize electric- or diesel-powered equipment, in lieu of gasoline-powered engines, where feasible.
- The construction contractor shall ensure that construction grading plans include a statement that work crews will shut off equipment when not in use. During smog season (May through October), the overall length of the construction period will be extended, thereby decreasing the size of the area prepared each day, to minimize vehicles and equipment operating at the same time.
- The construction contractor shall time the construction activities so as to not interfere with peak hour traffic and minimize obstruction of through traffic lanes adjacent to the site; if necessary, a flagperson shall be retained to maintain safety adjacent to existing roadways.
- The construction contractor shall support and encourage ridesharing and transit incentives for the construction crew.
- Dust generated by the development activities shall be retained on-site and kept to a minimum by following the dust control measures listed below.

    a. During clearing, grading, earthmoving, excavation, or transportation of cut or fill materials, water trucks or sprinkler systems shall be used to prevent dust from leaving the site and to create a crust after each day's activities cease.

b. During construction, water trucks or sprinkler systems shall be used to keep all areas of vehicle movement damp enough to prevent dust from leaving the site. At a minimum, this would include wetting down such areas in the late morning, after work is completed for the day and whenever wind exceeds 15 miles per hour.

c. Immediately after clearing, grading, earthmoving, or excavation is completed, the entire area of disturbed soil shall be treated until the area is paved or otherwise developed so that dust generation will not occur.

d. Soil stockpiled for more than two days shall be covered, kept moist, or treated with soil binders to prevent dust generation.

e. Trucks transporting soil, sand, cut or fill materials and/or construction debris to or from the site shall be tarped from the point of origin.

3. Additional Project-Specific Mitigation for Impact 4.6.B(1)

Despite all of the above measures that lessen impacts from construction, additional project-specific mitigation measures would be necessary to ensure that impacts are less than significant. New Mitigation Measure 4.6.B-N1 would lessen the impact by reducing fugitive emissions of particulate matter. New Mitigation Measures 4.6.B-N2 and 4.6.B-N3 would reduce impacts by limiting the amount of emissions generated by internal combustion engines. Implementation of these additional mitigation measures would further reduce project impacts, although it would not be guaranteed that the impacts would be cumulatively reduced to below threshold levels (even if individual emissions were reduced). Therefore, impacts from construction activities would still be significant and unavoidable.

NEW Mitigation Measure 4.6.B-N1: The construction contractor shall ensure that all disturbed areas and stock piles are watered at least three times per day or soil stabilizers are applied as necessary to prevent visible dust plumes from these areas. Stock piles not in use may be covered with a tarp to eliminate the need for watering or other stabilizers.

NEW Mitigation Measure 4.6.B-N2: All construction equipment shall have EPA rated engines of Tier 3 or better.

NEW Mitigation Measure 4.6.B-N3: As soon as electric utilities are available at construction sites, the construction site shall be supplied with electricity from the local utility and all equipment that can be electrically operated shall use the electric utility rather than portable generators.

4. Finding on Significance for Impact 4.6.B(1)

In addition to site-specific mitigation that would be determined on a project-by-project basis, existing Riverside County practices, SCAQMD and MDAQMD rules, would reduce construction-related impacts by reducing air pollutant emissions from construction activities. However, even where such measures would reduce an individual project's emissions to less-than-significant levels, none of the measures herein serve to prevent individual actions from being constructed concurrently and thus resulting in be cumulatively significant impacts. Additionally, neither the amount of construction occurring nor the exact location within the county is foreseeable, thus, it cannot be determined if the resultant construction emissions could be adequately controlled or reduced to below regulatory thresholds. Without such information, it is not possible to conclude that air pollutant emissions

resulting from construction activities would be adequately reduced and, therefore, this impact must be assumed to remain significant and unavoidable.

Impact 4.6.B(2) – Cause Significant Operational (Long-Term) Air Emissions: Stationary and mobile sources would emit criteria pollutants based on the level of daily operation. Modeling results indicate that such emissions would be large, both for individual future projects and cumulatively due to the countywide scale of GPA No. 960. Even with the implementation of regulations, ordinances and existing and proposed General Plan policies, in addition to new mitigation measures, criteria pollutant emissions would not be reduced below regulatory thresholds. Thus, this impact would remain significant and unavoidable with respect to violations of air quality standards for operational activities.

1. Analysis of Impact 4.6.B(2)

Air emissions associated with the project would occur as a result of operation of new developed uses. Operational emissions generated by both stationary and mobile sources would result from normal day-to-day activities within the proposed plan area. Stationary source emissions would be generated by the consumption of natural gas for space and water heating devices, the operation of landscape maintenance equipment and the general operation of industrial and agricultural land uses. Mobile emissions would be generated by the motor vehicles traveling to, within and from land uses unincorporated Riverside County.

Both the SCAQMD and MDAQMD have developed thresholds by which the operational emissions of criteria pollutant impacts can be compared to determine significance. These thresholds are detailed in Section 4.6.2 and summarized in Table 4.6-C in Section 4.6.3. While the exact nature and location of future development is unknown, emission estimates can be made with respect to the amount of development currently existing and at project build out.

As shown in Tables 4.6-E, 4.6-F, 4.6-G and 4.6-H, operational emissions were calculated for existing baseline (2008) and build out (2060) conditions using URBEMIS for stationary and mobile source emissions. The tables show modeled emissions for each of the air basins within Riverside County; SCAB and SSAB under the SCAQMD and the MDAB for MDAQMD. Tables 4.6-E and 4.6-F show emissions without proposed mitigation measures; the remaining two tables show emissions with mitigation.

The tables indicate that GPA No. 960 would result in net emissions that would exceed SCAQMD and MDAQMD thresholds of significance for CO, ROG, SO_X, PM_{10} and $PM_{2.5}$, but would be less than significant for NO_X emissions. The negative net emissions associated with NO_X are due to the substantial decrease in anticipated emissions from vehicles due to increased State of California efficiency requirements that have been or will be implemented between the existing year and 2040.

Tables 4.6-E and 4.6-F show that although development under the proposed General Plan is designed for increased density, its implementation would still result in daily emissions above both the SCAQMD and MDAQMD thresholds. While some of the individual development may be able to incorporate project designs and reduction features that would reduce emissions to below the regulatory threshold, the project must be taken in total for significance consideration. Because the majority of the criteria pollutants' emissions exceed regulatory thresholds, impacts from stationary and mobile sources are considered potentially significant before the implementation of regulations, policies and mitigation.

The existing General Plan policies and mitigation along with new General Plan policies and mitigation measures would reduce emissions from operational activities. Tables 4.6-G and 4.6-H show the anticipated emissions after reductions are implemented. However, because the exact nature and location of the build out of the proposed

project is unknown, the extent of reductions available from all measures is not fully known and therefore is not included in the calculated reductions. Reductions included in Tables 4.6-G and 4.6-H are associated with low VOC paint requirements, increased energy efficiencies and transportation reductions. As can be seen, even with these reductions emissions are anticipated to be above the SCAQMD and MDAQMD thresholds for all criteria pollutants except CO (SCAQMD only) and NO_X (SCAQMD and MDAQMD). While some of the emissions reductions could not be quantified, it is not anticipated that their reductions would be sufficient to reduce emissions by the 50-99% required to get below the regulatory thresholds. Because operational emissions of ROG, an ozone precursor, SOx, PM_{10} and $PM_{2.5}$ are all above the thresholds for both air basins and CO emissions are above the thresholds in the MDAB, these emissions will continue to contribute toward violations of the ambient air quality standards, which will adversely affect the residents within Riverside County.

2. Regulatory Compliance for Impact 4.6.B(2)

As detailed below, compliance with the following existing laws, regulatory programs, General Plan Policies and existing mitigation measures would lessen the adverse effects associated with emissions from the operation of future development accommodated by GPA No. 960.

a. Compliance With Federal, State and County Regulations

Through the implementation of criteria pollutant thresholds, the SCAQMD can accommodate growth within the region while reducing air quality impacts and thereby comply with the 2007 Air Quality Management Plan (AQMP). While it is anticipated that the operation of individual developments under the proposed General Plan may meet or exceed the SCAQMD thresholds, the combined emissions from all proposed General Plan development within the SCAQMD's jurisdiction would exceed these thresholds. This exceedance has the potential to hinder the region's compliance with the AQMP.

Similar to the SCAQMD, the MDAQMD has implemented thresholds for criteria pollutants through which it can reach and maintain pollutant levels anticipated in the Attainment Plans. While the plans are intended to accommodate growth within the Mojave Desert Air Basin, the operation of the entire General Plan area would exceed these regulatory thresholds and may hinder the region's ability to comply with the MDAQMD attainment plans.

Riverside County Ordinances No. 706, 726, 782 and 824 are detailed in the regulatory section above. They would minimize impacts to air quality by reducing motor vehicle emissions through the reduction of vehicle miles traveled, vehicle idling times and by increasing vehicle fuel efficiencies.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would further contribute to reducing air quality impacts through compliance with applicable air quality plans. See Section 4.6.3.D for full text of these policies.

Policy LU 2.1: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations. These policies limit emissions from operation through site placement and design.

Policies LU 8.12, 11.1, 11.3, 11.4 and 13.1-13.4: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies C 1.2, 1.7, 4.1, 11.2, 11.4-11.7, 12.1, 12.3, 13.1, 13.2 and 20.14: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policy OS 12.1: This policy promotes the reduction in emissions through the use of renewable energy sources such as geothermal for heating.

Policies OS 16.2 and 16.4-16.6: These policies enhance the reduction in criteria pollutant emissions by promoting the use of energy efficient products and resources.

Policies OS 16.3 and 16.8: These policies promote the reduction in mobile source emissions by encouraging the use of alternative fuels and locating land uses close to transit centers.

Policies AQ 1.1-1.11, 2.1, 2.3, 2.4, 4.6, 4.8, 7.4, 10.4, 15.1, 16.1-16.4, 17.1-17.5, 17.8 and 17.11: These policies promote the reduction of criteria pollutant emissions through the development and enforcement of plans, policies, regulations and fees. These policies limit allowable levels of emissions, encourage use of alternate sources, increased efficiencies and enhanced community involvement.

Policy AQ 5.1: This policy encourages the use of building operations to use and reuse materials to reduce the amount of energy used and waste generated during daily operations.

Policies AQ 3.1-3.4, 4.5 and 10.1-10.3: These policies promote the reduction of mobile source emissions through employer and employee education and implementation of transportation demand measures that would reduce vehicle miles traveled.

Policies AQ 5.2-5.4, 17.9 and 17.10: These policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policies AQ 7.1-7.3, 8.2, 8.4, 8.6-8.9, 9.1, 9.2, 11.3 and 11.4: These policies promote the reduction in vehicle miles traveled through the location of new employment centers, residential land uses and transit centers in close proximity. Further reductions are encouraged through public event incentives such as reduced transit pass costs.

Policies AQ 13.1-13.3, 14.1, 14.2 and 14.4: These policies encourage the County of Riverside to reduce vehicle miles traveled through enhancement of transportation fleet mixes, planning for new transportation/land use balance and enhancing and preserving existing transit corridors.

c. Compliance with Proposed New or Revised General Plan Policies

The following revised or proposed policies of the Riverside County General Plan would contribute to the reduction of impacts from operational pollutant emissions. While these proposed air quality policies were introduced to specifically address greenhouse gas emissions, these policies would also provide criteria pollutant reductions and so are included herein. See Section 4.6.3.D for full text of each.

Policies LU 1.5 and 4.1: These policies promote the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations. These policies limit emissions from operation through site placement and design.

Policies C 4.8, 9.2 and 13.3: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies C 12.2, 17.3, 17.4 and 21.1: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies OS 16.1: This policy enhances the reduction in criteria pollutant emissions by promoting the use of energy efficient products and resources.

Policies AQ 4.2 and 4.3: These policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policies AQ 4.4: This policy promotes the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policy AQ 4.7: This policy promotes the reduction of criteria pollutant emissions through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions, encourage the use of alternate sources and increased efficiencies, and enhanced community involvement.

Policies AQ 19.1, 25.1 and 26.1: These policies implement programs and requirements to reduce GHG emissions associated with transportation through the reduction in vehicle miles traveled.

Policies AQ 20.1 and 25.1: These policies implement programs and requirements to reduce greenhouse gas emissions through land use planning.

Policies AQ 22.1, 23.1, 24.1, 25.1 and 26.2: These policies implement programs and requirements to reduce greenhouse gas emissions through increased energy efficiency, resource conservation and waste reduction.

Policy AQ 22.1: This policy implements programs and requirements for reducing greenhouse gas emissions through land use planning.

3. Additional Project-Specific Mitigation for Impact 4.6.B(2)

Additional project-specific mitigation measures, found in the climate change section (Section 4.7) of this document, will also reduce air pollutants and further avoid, reduce or minimize impacts from operational pollutant emissions. Mitigation Measure 4.7.A-N1 would lessen the impact by requiring new development projects to reduce their individual project emissions. Mitigation Measure 4.7.A-N2 would lessen the impact by allowing projects to demonstrate compliance with the Implementation Measures of the CAP by utilizing the Screening Tables. In addition, Mitigation Measures 4.6.B-N4 and 4.6.B-N5 would contribute to the reduction of impacts from operational pollutant emissions.

NEW Mitigation Measure 4.7.A-N1: To ensure GHG emissions resulting from new development are reduced to levels necessary to meet State of California targets, the County of Riverside shall require all new discretionary development to comply with the Implementation Measures of the Riverside County Climate Action Plan or provide comparable custom measures backed by a project GHG study (for example, using CalEEMod modeling) demonstrating achievement of the same target. The target to be met is a GHG emissions reduction of 25% below emissions for the adjusted BAU scenario for residential, commercial, industrial, institutional and mixed-use projects. The adjusted BAU is based upon the 2020 BAU found in the Final Supplement to the AB 32 Scoping Plan (CARB 2011).

NEW ***Mitigation Measure 4.7.A-N2:*** In lieu of a project-specific analysis per Mitigation Measure 4.7.A-N1, a future discretionary project proposed pursuant to the Riverside County General Plan shall incorporate into the project design, operational features and/or Implementing Measures from the Riverside County Climate Action Plan, in such a manner as to garnish at least 100 points. The point values within the CAP's Screening Tables constitute GHG emission reductions.

NEW ***Mitigation Measure 4.6.B-N4:*** All new development shall ensure that all interior and exterior architectural coatings used are low in reactive organic gases.

NEW ***Mitigation Measure 4.6.B-N5:*** If hearths are included in new residential developments, they shall be energy-efficient natural gas appliances. No wood-burning hearths or stoves shall be permitted in new residential developments.

4. Finding on Significance for Impact 4.6.B(2)

Existing regulations and ordinances would reduce operation-related impacts by reducing air pollutant emissions from stationary and mobile sources. Even with the implementation of new mitigation measures, the operational emissions under the proposed project would likely exceed both SCAQMD and MDAQMD thresholds. Therefore, the implementation of proposed GPA No. 960 would result in significant and unavoidable impacts with respect to the emission of criteria pollutants.

C. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable federal or state ambient air quality standard?

Impact 4.6.C – Cause Cumulatively Significant Project Air Quality Impacts: Future development accommodated by GPA No. 960 would result in the emission of criteria pollutants for which the project is in non-attainment during both construction and operation of the new development. However, the exact location and level of activity for development projects under proposed GPA No. 960 is unknown and therefore cumulatively considerable increases to criteria pollutant levels cannot be quantified. Even with compliance with existing regulations and policies and the implementation of existing and new mitigation measures, the proposed project would result in significant and unavoidable cumulative impacts.

1. Analysis of Impact 4.6.C

The cumulative context for consideration of most air pollutants is the basin in which the project is located because the air basin is the natural limit for most air pollutants. Air basins are defined based upon the topographic and meteorological conditions that limit further dispersion of air pollution. For the reasons discussed under Impact 4.6.B(1) and (2), above, the future development accommodated by the project would contribute incrementally to potentially significant air quality pollutant levels in Riverside County.

As outlined in Section 4.6.1 (Introduction), the South Coast Air Basin, Salton Sea Air Basin and Mojave Desert Air Basin are in non-attainment for ozone and PM_{10}. In addition, the SCAB is in nonattainment for $PM_{2.5}$. Neither air basin has a set numerical threshold, nor do they provide methodology or qualitative thresholds to be used to assess cumulative significance. Therefore, as recommended by the SCAQMD, significance for cumulative impacts would be assessed using the same significance criteria as the project-specific analysis. A cumulative significant is indicated for Riverside County if the project would add a cumulatively considerable contribution of a federal or State of California nonattainment pollutant.

As discussed in Impact 4.6.B, even when individual projects can mitigate construction or operational impacts to below regional thresholds, when emissions from all of the individual developments are considered together as one project, the regional thresholds would be exceeded as shown in Tables 4.6-E and 4.6-F. The measures outlined in Impact 4.6.B would aid in reducing cumulative project impacts. However, mitigated emissions shown in Tables 4.6-G and 4.6-H clearly demonstrate that combined emissions associated with GPA No. 960 are above the thresholds of significance and even with the implementation of reductions, emissions of criteria pollutants are not reduced to below regulatory thresholds due to the level of residential and non-residential growth. Therefore, impacts associated with future development accommodated by the project would be cumulatively considerable and result in a significant and unavoidable impact.

2. Regulatory Compliance for Impact 4.6.C

As detailed and explained below, compliance with the following existing laws, regulatory programs, General Plan policies and existing mitigation measures would lessen a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable federal or State of California ambient air quality standard.

a. Compliance With Federal, State and County Regulations

Through the implementation of criteria pollutant thresholds, the SCAQMD can accommodate growth within the region while continuing to reduce air quality impacts and thereby comply with the 2007 AQMP. While it is anticipated that individual developments under the proposed General Plan may meet or exceed the SCAQMD thresholds, the combined emissions from all proposed General Plan development within the SCAQMD's jurisdiction would exceed these thresholds. This exceedance has the potential to hinder the region's compliance with the AQMP.

Similar to the SCAQMD, the MDAQMD has implemented thresholds for criteria pollutants through which it can reach and maintain pollutant levels anticipated in the Attainment Plans. While the plans are intended to accommodate growth within the Mojave Desert Air Basin, the build out of the entire General Plan area would exceed these regulatory thresholds and may hinder the region's ability to comply with the MDAQMD attainment plans.

Riverside County Ordinances No. 706, 726, 782 and 824, as detailed in the regulatory section above, are intended to reduce motor vehicle emissions of criteria pollutants through the reduction of vehicle miles traveled, vehicle idling times and by increasing vehicle fuel efficiencies. Because motor vehicles represent the largest source of criteria pollutant emissions, a reduction in motor vehicle emissions would reduce cumulative impacts.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would further contribute to compliance with applicable air quality plans. See Section 4.6.3.D for full text of each.

Policy LU 2.1: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations. These policies limit emissions from operation through site placement and design.

Policies LU 8.12, 11.1, 11.3, 11.4 and 13.1-13.4: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies C 1.2, 1.7, 4.1, 11.2, 11.4-11.7, 12.1, 12.3, 13.1, 13.2 and 20.14: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policy OS 12.1: This policy promotes the reduction in emissions through the use of renewable energy sources such as geothermal for heating.

Policies OS 16.1, 16.2 and 16.4-16.6: These policies promote the reduction in criteria pollutant emissions by promoting the use of energy efficient products and resources.

Policies OS 16.3 and 16.8: These policies promote the reduction in mobile source emissions by encouraging the use of alternative fuels and locating land uses close to transit centers.

Policies AQ 1.1-1.11, 2.1, 2.3, 2.4, 4.6, 4.8-4.10, 7.4, 10.4, 15.1, 16.1-16.4, 17.1, 17.5, 17.8 and 17.11: These policies promote the reduction of criteria pollutant emission through development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions, encourage use of alternate sources, increase efficiencies and enhance community involvement.

Policies AQ 4.1, 5.1 and 17.6: These policies encourage the use of building operations to use and reuse materials to reduce the amount of energy used and waste generated during daily operations.

Policies AQ 3.1-3.4, 4.5 and 10.1-10.3: These policies promote the reduction of mobile source emissions through employer and employee education and implementation of transportation demand measures that would reduce vehicle miles traveled.

Policies AQ 4.4, 5.2, 5.3, 5.4, 17.9 and 17.10: These policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policies AQ 7.1-7.3, 8.2, 8.4, 8.6-8.9, 9.1, 9.2, 11.3 and 11.4: These policies promote the reduction in vehicle miles traveled through the location of new employment centers, residential land uses and transit centers in close proximity. Further reductions are encouraged through public event incentives such as reduced transit pass costs.

Policies AQ 13.1-13.3, 14.1, 14.2 and 14.4: These policies encourage the County of Riverside to reduce vehicle miles traveled through enhancement of transportation fleet mixes, planning for new transportation/land use balance and enhancing and preserving existing transit corridors.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed policies of the Riverside County General Plan would contribute to the reduction of criteria pollutant emissions. While these proposed air quality policies were introduced to specifically address greenhouse gas emissions, these policies would also provide a reduction in criteria pollutant emissions and so are included herein. See Section 4.6.3.D for full text of each.

Policies LU 1.5 and 4.1: These policies promote the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations. These policies limit emissions from operation through site placement and design.

Policies C 4.8, 9.2 and 13.3: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies C 12.2, 17.3, 17.4 and 21.1: These policies promote the reduction in mobile source emissions by shortening commute distances and encouraging the use of alternate modes of transportation.

Policies AQ 4.2 and 4.3: These policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

Policy AQ 4.7: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions, encourage the use of alternate sources and increased efficiencies, and enhanced community involvement.

Policies AQ 19.1, 25.1 and 26.1: These policies implement programs and requirements to reduce greenhouse gases emissions associated with transportation through the reduction in vehicle miles traveled.

Policies AQ 20.10 and 25.1: These policies implement programs and requirements to reduce greenhouse gas emissions through land use planning.

Policies AQ 22.1, 23.1, 24.1, 25.1 and 26.2: These policies implement programs and requirements to reduce greenhouse gas emissions through increased energy efficiency, resource conservation and waste reduction.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.5.1A, 4.5.1B and 4.5.1C were imposed to reduce impacts to air quality. These measures remain applicable to this project and would lessen impacts to air quality by minimizing fugitive dust during construction and reducing pollution resulting from construction equipment. The measures read as follows:

Existing Mitigation Measure 4.5.1A: Applicable [SCAQMD] Rule 403 Measures: Apply nontoxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more).

- Water active sites at least twice daily. (Locations where grading is to occur will be thoroughly watered prior to earthmoving.)
- All trucks hauling dirt, sand, soil, or other loose materials are to be covered, or should maintain at least two feet of freeboard in accordance with the requirements of California Vehicle Code (CVC) Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).
- Pave construction access roads at least 100 feet onto the site from main road.
- Traffic speeds on all unpaved roads shall be reduced to 15 mph or less.

Existing Mitigation Measure 4.5.1B: [Implement the following] additional SCAQMD CEQA Air Quality Handbook dust measures:

- Revegetate disturbed areas as quickly as possible.

- All excavating and grading operations shall be suspended when wind speeds (as instantaneous gusts) exceed 25 mph.
- All streets shall be swept once a day if visible soil materials are carried to adjacent streets (recommend water sweepers with reclaimed water).
- Install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash trucks and any equipment leaving the site each trip.

Existing Mitigation Measure 4.5.1C: [Implement the following] mitigation measures for construction equipment and vehicles exhaust emissions:

- The construction contractor shall select the construction equipment used on site based on low emission factors and high energy efficiency.
- The construction contractor shall ensure that construction grading plans include a statement that all construction equipment will be tuned and maintained in accordance with the manufacturer's specifications.
- The construction contractor shall utilize electric- or diesel-powered equipment, in lieu of gasoline-powered engines, where feasible.
- The construction contractor shall ensure that construction grading plans include a statement that work crews will shut off equipment when not in use. During smog season (May through October), the overall length of the construction period will be extended, thereby decreasing the size of the area prepared each day, to minimize vehicles and equipment operating at the same time.
- The construction contractor shall time the construction activities so as to not interfere with peak hour traffic and minimize obstruction of through traffic lanes adjacent to the site; if necessary, a flagperson shall be retained to maintain safety adjacent to existing roadways.
- The construction contractor shall support and encourage ridesharing and transit incentives for the construction crew.
- Dust generated by the development activities shall be retained on-site and kept to a minimum by following the dust control measures listed below.

    a. During clearing, grading, earthmoving, excavation, or transportation of cut or fill materials, water trucks or sprinkler systems shall be used to prevent dust from leaving the site and to create a crust after each day's activities cease.

    b. During construction, water trucks or sprinkler systems shall be used to keep all areas of vehicle movement damp enough to prevent dust from leaving the site. At a minimum, this would include wetting down such areas in the late morning, after work is completed for the day and whenever wind exceeds 15 miles per hour.

    c. Immediately after clearing, grading, earthmoving, or excavation is completed, the entire area of disturbed soil shall be treated until the area is paved or otherwise developed so that dust generation will not occur.

d. Soil stockpiled for more than two days shall be covered, kept moist, or treated with soil binders to prevent dust generation.

e. Trucks transporting soil, sand, cut or fill materials and/or construction debris to or from the site shall be tarped from the point of origin.

3. Additional Project-Specific Mitigation for Impact 4.6.C

Where future development accommodated by GPA No. 960 would exceed regulatory thresholds for construction emissions, new Mitigation Measures 4.6.B-N1, 4.6B-N2 and 4.6.B-N3 (as listed under Impact 4.6.B) would be implemented to further reduce construction emissions. In addition, new Mitigation Measures 4.7.A-N1 and 4.7.A-N2, as well as 4.6.B-N4 and 4.6.B-N5 (as listed under Impact 4.6.B) would also be implemented for future development to further reduce criteria pollutant emissions from operational activities. Because these mitigation measures reduce emissions associated with all future development projects within the unincorporated Riverside County area, the mitigation measures will also reduce the cumulative air quality impacts associated with all future development projects within the unincorporated Riverside County area, but not to a level of less than significant.

4. Finding on Significance for Impact 4.6.C

For the reasons presented above, implementation and compliance with the above-listed existing regulations, General Plan policies and existing Mitigation Measures 4.5.1A, 4.5.1B and 4.5.1C from EIR No. 441, as well as new Mitigation Measures 4.6.B-N1, 4.6.B-N2, 4.6.B-N3, 4.7.A-N1, 4.7.A-N2, 4.6.B-N4 and 4.6.B-N5 would reduce construction and operation-related air quality impacts. However, even with these mitigation measures, future construction and operational emissions would likely exceed SCAQMD and MDAQMD thresholds. As a result, the project would result in significant and unavoidable cumulative impacts with respect to the emission of criteria pollutants.

D. Would the project expose sensitive receptors to substantial pollutant concentrations?

Impact 4.6.D – Expose Sensitive Receptors to Air Pollutants: Future development accommodated by GPA No. 960 would expose sensitive receptors to pollutant emissions from both construction and operational activities. The degree of impact would depend on the type of operation, distance from sensitive receptors and the level of activity at each site. However, as the exact location, timing and level of future development activities arising from GPA No. 960 is unforeseeable, specific impacts to sensitive receptors cannot be quantified. Thus, even after complying with regulations, existing policies and mitigation measures, as well as specific new mitigation measures, impacts cannot be guaranteed to be reduced to below applicable agency thresholds. Thus, this impact would be significant and unavoidable with respect to exposure of sensitive receptors.

1. Analysis of Impact 4.6.D

Sensitive population groups include children, the elderly, the acutely ill and the chronically ill, especially those with cardio-respiratory diseases. Sensitive receptors are those areas where sensitive populations may be for extended periods of time, resulting in sustained exposure to any pollutants present. As mentioned in Section 4.6.4 (Thresholds of Significance for Air Quality), localized significance thresholds (LSTs) have been developed by the SCAQMD to determine maximum allowable concentrations of criteria air pollutants during construction and operation of a project. Table 4.6-I shows the LST thresholds for a 5-acre site in SRA 24 in comparison to the

emissions estimates detailed under Impact 4.6.2 above. As can be seen from the table, this individual project would be less than significant for CO, NO_X and $PM_{2.5}$ regardless of the distance from the sensitive receptor, however for PM_{10} the construction activities would need to be a minimum of 50 meters from the nearest sensitive receptor in order to be less than significant.

Table 4.6-J shows the operational LST thresholds in comparison with the anticipated emissions from the theoretical project. As can be seen from the table, this individual project would be less than significant for all criteria pollutants regardless of the distance from the sensitive receptor. This is typical for residential land uses where onsite area sources do not emit substantial criteria pollutants. Industrial land uses where there are large stationary sources are more likely to emit levels of criteria pollutants above these thresholds.

As indicated previously, the thresholds identified in Table 4.6-J do not include the mobile sources associated with offsite traffic. However, onsite traffic must be considered, especially where diesel particulate matter is concerned such as with the operation of a warehouse with numerous loading docks and large volumes of truck traffic. In addition to criteria pollutants, localized emissions of toxic air contaminants (TAC) are also of concern with respect to sensitive receptors. Sources of TACs include diesel particulate matter from railroads, emissions from the combustion of airplane fuel, benzene emissions in close proximity to gasoline dispensing stations, dry cleaners and film processing services that use perchloroethylene, auto body shops due to various solvents, furniture manufacturers and repair facilities that use methylene chloride and print shops that use various solvents.

The primary source of TACs within the County of Riverside is from diesel-fueled trucks and other vehicles using the freeways and major roadways throughout the county. The CARB Guidance uses buffer zones to insulate sensitive receptors from sources of TACs. Through compliance with new Mitigation Measures 4.6.D-N1 and 4.6.D-N2, impacts from TACs on sensitive receptors would be minimized to the extent feasible, although residual impacts would remain significant and unavoidable.

Due to the programmatic nature of the project, detailed construction phasing, equipment and intensities cannot be foreseen with reasonable accuracy at this time. Further, the expected future development would occur across the entirety of Riverside County over roughly 50 years' time, making exact sizes and locations similarly unknowable at this time. Thus, site-specific impacts to sensitive receptors cannot be determined at present. It can, however, be assumed that various sizes and types of project would be developed. And, because of the increased density seen for the land uses and desired proximity of residential land uses to both transit and commercial centers, it can be assumed that both construction and operation of commercial and potentially industrial sources would be developed relatively close to sensitive receptors such as residences or schools. Thus, effects of project emissions on sensitive receptors throughout the county must be considered significant and unavoidable.

While this analysis cannot determine the concentration of air pollutants that sensitive receptors will be exposed to as a result of land use development within GPA No. 960, Tables 4.6-E and 4.6-F demonstrate that emissions of criteria pollutants substantially exceed the regulatory thresholds and because the regulatory thresholds are meant to protect the air quality within the project area, the exceedance of these thresholds demonstrates that substantial concentrations of air pollution may occur. In particular, ROG emissions, an ozone precursor, above the threshold may result in substantial concentrations of ozone which could affect sensitive receptors. The impact of ozone on sensitive receptors include breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of lung tissue and immunological changes. Elevated ozone levels are associated with increased school absences. In recent years, a correlation between elevated ambient ozone levels and increased daily hospital admission rates, as well as mortality have been reported. Also an increased risk for asthma has been found in children who participate in multiple sports and live in communities with high ozone levels.

In addition, Tables 4.6-E and 4.6-F demonstrate that build out of GPA No. 960 will result in exceeding the regulatory thresholds for particulate matter (both PM_{10} and $PM_{2.5}$). Particulate matter exceeding the regulatory threshold may expose sensitive receptors to high concentrations of these pollutants. The impact of elevated concentrations of particulate matter on sensitive receptors include an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions. Daily fluctuations in $PM_{2.5}$ concentrations have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long-term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease and children appear to be more susceptible to the effects of high levels of PM_{10} and $PM_{2.5}$.

2. Regulatory Compliance for Impact 4.6.D

As detailed and explained below, compliance with the following existing laws, regulatory programs, General Plan policies and existing mitigation measures would lessen the adverse effects associated with emissions from future development.

a. Compliance With Federal, State and County Regulations

The California Air Resources Board has determined that exposure to toxic air contaminants can have significant health effects on sensitive receptors. CARB has recommended various buffer zones which are intended to reduce the potential exposure of sensitive receptors to safe levels. By implementing the proposed mitigation, the General Plan would be in compliance with the CARB regulations, at least on the individual project basis. Further, SCAQMD has implemented thresholds for criteria pollutants in order to minimize the exposure of sensitive receptors to impacts from construction and operational activities of new development. However, while individual developments may be able to successfully reduce emissions below these thresholds, they would also contribute incrementally to emissions within Riverside County as a whole. In the absence of site-specific analysis, such emissions must be assumed to be significant and avoidable.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would help reduce emission exposures to sensitive receptors. See Section 4.6.3.D for full text of each.

Policies AQ 1.1, 1.3, 1.4, 1.7, 1.10, 2.1-2.4, 4.6, 4.8-4.10, 15.1, 16.1, 16.3, 17.1, 17.3, 17.4, 17.6, 17.8 and 17.11: These policies promote the reduction of criteria pollutant emission through the development and enforcement of plans, policies, regulations and fees. These policies limit the allowable levels of emissions, encourage the use of alternate sources and increased efficiencies and enhanced community involvement.

Policy AQ 5.1: This policy encourages the use of building operations to use and reuse materials and reduce the amount of energy used and waste generated during daily operations.

Policy AQ 4.5: This policy promotes the reduction of mobile source emissions through employer and employee education and implementation of transportation demand measures that would reduce vehicle miles traveled.

Policies AQ 17.9 and 17.10: These policies promote the reduction of criteria pollutants through the use of energy efficiency measures and site design, including use of alternate energy sources for vehicles, heating and cooling.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed policies of the Riverside County General Plan would help reduce pollutant concentrations near sensitive receptors. While these proposed air quality policies were introduced to specifically address greenhouse gas emissions, these policies would also provide a reduction in criteria pollutant emissions and so are included herein. See Section 4.6.3.D for full text of each.

Policy AQ 4.1: This policy encourages the use of building operations to use and reuse materials and reduce the amount of energy used and waste generated during daily operations.

Policy AQ 4.7: This policy promotes the reduction of criteria pollutant emission through the development and enforcement of plans, policies and regulations and fees. These policies limit the allowable levels of emissions, encourage the use of alternate sources and increased efficiencies and enhanced community involvement.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.5.1A, 4.5.1B and 4.5.1C were imposed to reduce impacts to air quality. These measures, as listed under Impact 4.6.B, above, are also applicable to this impact. They would lessen impacts to air quality by minimizing fugitive dust during construction and reducing pollution resulting from construction equipment.

3. Additional Project-Specific Mitigation for Impact 4.6.D

Despite all of the above measures to lessen impacts to air quality, additional project-specific mitigation measures would be necessary to further avoid, reduce or minimize impacts. For future development accommodated by GPA No. 960 that exceeds regulatory thresholds for construction or operational emissions (even after the inclusion of existing policies and regulations), the following new Mitigation Measures 4.6.D-N1 and 4.6.D-N2 shall be implemented. Additionally, implementation of new Mitigation Measures 4.6.B-N1, 4.6.B-N2 and 4.6.B-N3 (as listed under impact 4.6.B) would further reduce construction or operational emissions, which in turn will reduce the concentration of air pollutants sensitive receptors will be exposed to within the county.

NEW Mitigation Measure 4.6.D-N1: New developments shall include the following requirements to reduce emissions associated with toxic air contaminants (TACs):

a. Electrical outlets shall be included in the building design of any loading docks to allow use by refrigerated delivery trucks. Signage shall also be installed, instructing commercial vehicles to limit idling times to five minutes or less. If loading and/or unloading of perishable goods would occur for more than five minutes and continual refrigeration is required, all refrigerated delivery trucks shall use the electrical outlets to continue powering the truck refrigeration units when the delivery truck engine is turned off.

b. Electrical outlets shall be installed on the exterior of new structures for use with electrical landscaping equipment. Further, the property owner(s) shall ensure that the hired landscape companies use electric-powered equipment where available to a minimum of 20% of the equipment used.

NEW Mitigation Measure 4.6.D-N2: The County of Riverside shall require minimum distances between potentially incompatible land uses, as described below, unless a project-specific evaluation of human health risks defines, quantifies and reduces the potential incremental health risks through site design or the implementation of additional reduction measures to levels below applicable standards. (e.g., standards recommended or required by CARB, SCAQMD or MDAQMD).

SCAQMD Jurisdiction:

a. Proposed dry cleaners and film processing services that use perchloroethylene must be sited at least 500 feet from existing sensitive land uses including residential, schools, day care facilities, congregate care facilities, hospitals or other places of long-term residency for people.

b. Proposed auto body repair services shall be sited at least 500 feet from existing sensitive land uses.

c. Proposed gasoline dispensing stations with an annual throughout of less than 3.6 million gallons shall be sited at least 50 feet from existing sensitive land uses. Proposed gasoline dispensing stations with an annual throughput at or above 3.6 million gallons shall be sited at least 300 feet from existing sensitive land uses.

d. Other proposed sources of TACs including furniture manufacturing and repair services that use methylene chloride or other solvents identified as a TAC shall be sited at least 300 feet from existing sensitive land uses.

e. Avoid siting distribution centers that accommodate more than 100 truck trips per day (or more than 40 truck trips operating transport refrigeration units per day, or where transportation refrigeration units operate more than 300 hours per week) within 1,000 feet of existing sensitive land uses.

f. Proposed sensitive land uses shall be sited at least 500 feet from existing freeways, major urban roadways with 100,000 vehicles per day or more and major rural roadways with 50,000 vehicles per day or more.

g. Proposed sensitive land uses shall be sited at least 500 feet from existing dry cleaners and film processing services that use perchloroethylene.

h. Proposed sensitive land uses shall be sited at least 500 feet from existing auto body repair services.

i. Proposed sensitive land uses shall be sited at least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons.

j. Proposed sensitive land uses shall be sited at least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC.

k. Proposed sensitive land uses shall be sited at least 1,000 feet from existing distribution centers that accommodate more than 100 trucks per day, accommodate more than 40 trucks per day with transportation refrigeration units, or where transportation refrigeration units operate more than 300 hours per week.

MDAQMD Jurisdiction:

a. Proposed industrial projects must be sited at least 1,000 feet from existing sensitive land uses.

b. Proposed distribution centers with 40 or more truck per day shall be sited at least 1,000 feet from existing sensitive land uses.

c. Proposed dry cleaner using perchloroethylene shall be sited at least 500 feet from existing sensitive land uses.

d. Proposed gasoline dispensing facility shall be sited at least 300 feet from existing sensitive land uses.

e. Proposed sensitive land uses shall be sited at least 500 feet from existing freeways, major urban roadways with 100,000 vehicles per day or more and major rural roadways with 50,000 vehicles per day or more.

f. Proposed sensitive land uses shall be sited at least 1,000 feet from existing industrial facilities or distribution centers with more than 40 trucks per day.

g. Proposed sensitive land uses shall be sited at least 500 feet from existing dry cleaners using perchloroethylene.

h. Proposed sensitive land uses shall be sited at least 300 feet from existing gasoline dispensing stations.

4. Finding on Significance for Impact 4.6.D

The existing Riverside County ordinances, policies and programs to implement and comply with SCAQMD and MDAQMD rules would reduce construction and operation related impacts. However, the project would result in the future development of numerous projects each contributing incrementally to air emissions affecting sensitive receptors. Thus, it is possible that the project would result in cumulatively significant impacts to sensitive receptors, even if individual projects were each less than significant. This is particularly likely since none of the measures herein would prevent multiple development projects from being constructed concurrently within close proximity to sensitive receptors in such a manner as to cause substantial concentrations within the area. Further, neither the amount of construction occurring nor the exact location within the county is foreseeable and, as such, it cannot be determined if the resultant construction emissions could be adequately controlled or reduced to below regulatory thresholds. Without such information, it is not possible to conclude that air pollutant emissions resulting from construction activities would be adequately reduced to the point that sensitive receptors are not exposed to substantial concentrations of air pollutants, and thus a significant and unavoidable impact may result.

Existing regulations and ordinances would reduce operation-related impacts by reducing air pollutant emissions from stationary and mobile sources. Even with the implementation of new project-specific mitigation measures, cumulative operational emissions resulting from future development would likely exceed both the SCAQMD and MDAQMD thresholds. Therefore, the implementation of GPA No. 960 would result in significant and unavoidable impacts to sensitive receptors.

E. Would the project create objectionable odors affecting a substantial number of people?

Impact 4.6.E – Cause or Expose People to Objectionable Odors: Future development accommodated by the proposed project would not create objectionable odors that would affect a substantial number of people. Additionally, compliance with existing regulatory programs and General Plan policies, as well as new Mitigation Measures 4.6.E-N1, 4.6.E-N2 and 4.6.E-N3 would further reduce objectionable odors. For these reasons odor impacts are less than significant.

1. Analysis of Impact 4.6.E

Odors emanate from trace substances within the air that can be perceived by the sense of smell. This analysis focuses on objectionable odors. Although almost any land use has the potential to emit odors, some land uses are more likely to produce odors because of their operations. Land uses known to have odor-emitting potential

include: agriculture, chemical plants, composting operations, dairies, fiberglass-molding operations, landfills, refineries, rendering plants, rail yards and wastewater treatment plants.

Construction activities associated with project implementation would generate airborne odors as a result of operation of construction vehicles (i.e., diesel exhaust), paving with hot asphalt and the application of architectural coatings. Because of the volatile nature of odor compounds, they either react quickly in the atmosphere or are diluted as they are carried away from the odor source. Therefore, construction odors are generally isolated and limited to the duration of construction and its immediate site vicinity. As such, they would not affect a substantial number of people as impacts related to these odors are limited to the number of people living and working nearby the source. While some components of asphalt and diesel emissions are considered toxic air contaminants, construction activities do not generally cause significant odor impacts because of the duration of exposure.

Because of the specific uses that would be accommodated by GPA No. 960, there is the potential for odor emissions from new development operations. While none of the land uses known to emit odors are specifically planned as part of GPA No. 960, neither are they specifically prohibited or restricted. For example, as development occurs through the county it is reasonable to assume that additional wastewater treatment facilities would be needed.

Likewise, although new agricultural land uses are not specifically planned as part of GPA No. 960, the conversion of existing agricultural land uses to other types of land use (for example, the Northeast Business Park Overlay) would result in the development of vacant agricultural lands; possibly including those in the vicinity of operating dairies. In such locations, there would be a substantial potential for airborne odors to emanate from the existing dairies. Likewise, other agricultural odors, up to and including from manures or other fertilizers could also result in odors that affect the newly developed areas. And, while agricultural odors typically do not pose a health risk, they can be still be strong enough to prove a nuisance. Because there is the potential for development of odor-emitting uses as a result of GPA No. 960, each individual development project proposed would be required to evaluate impacts to their surroundings with respect to odors. By evaluating potential odor impacts early in the development process, odor sources can be situated away from sensitive receptors or reduced to a level where odors are not objectionable through similar such site-design measures. (See new mitigation measures, below).

2. Regulatory Compliance for Impact 4.6.E

Compliance with existing regulatory requirements and General Plan policies would reduce odor impacts to less than significant levels with respect to sensitive receptors.

a. Compliance With Federal, State and County Regulations

SCAQMD Rule 402 (Nuisance), Rule 410 (odors from transfer stations and material recovery stations) and Rule 1179 (Public owned treatment works operations) place conditions and compliance measures for odor emissions from the identified sources in order to reduce exposure to the surrounding area.

Riverside County Ordinance No. 706, as detailed under Section 4.6.3, would reduce motor vehicle emissions of criteria pollutants through the reduction of vehicle miles traveled. A reduction in motor vehicle emissions would proportionally result in a reduction in emissions from diesel combustion engines, which are responsible for the most noticeable of the mobile source odors.

b. Compliance with Existing General Plan Policies

The implementation following existing policies of the Riverside County General Plan would further contribute to complying with applicable air quality plans, however the anticipated contribution of each policy is not quantifiable. See Section 4.6.3.D for full text of each of these policies.

Policies AQ 1.5, 1.7, 16.3 and 17.7-17.10: These policies would reduce potential odor impacts from vehicles by reducing operating time or switching from diesel combustion to alternative fuels.

Policies AQ 2.1-2.4: These policies would reduce potential odor impacts through the use of distance, site design and barriers between sources and receptors.

Policy AQ 4.6: This policy would reduce the potential for odor impacts on surrounding uses by requiring compliance with air district regulations on siting odor-emitting uses.

Policy AQ 5.1: This policy would reduce potential odor impacts from landfills by emphasizing recycling. Less waste being sent to landfills, would mean less decomposition and less associated odors.

3. Additional Project-Specific Mitigation for Impact 4.6.E

Additional project-specific mitigation measures would further avoid, reduce or minimize odor impacts. New Mitigation Measures 4.6.E-N1, 4.6.E-N2 and 4.6.E-N3 would lessen potential odor impacts by affecting the location and design of odor-generating uses. Implementation of these mitigation measures would ensure that project impacts from odor sources are mitigated to less than significant.

NEW Mitigation Measure 4.6.E-N1: Locate potential new odor sources predominantly down- or cross-wind from existing sensitive receptors and potential new sensitive receptors predominantly upwind from existing odor sources. As indicated by the "Right-to-Farm" ordinance, agricultural uses that have been operated for more than three years cannot be re-classified as a public or private nuisance by new development.

NEW Mitigation Measure 4.6.E-N2: Maintain an adequate buffer between potential new odor sources and receptors such that emitted odors are dissipated before reaching the receptors (minimum of 500 feet depending on odor source). As indicated by the "right-to-farm" ordinance, agricultural uses that have been operated for more than three years cannot be re-classified as a public or private nuisance by new development.

NEW Mitigation Measure 4.6.E-N3: Design odor-emitting facilities such that odor emitters are located as far from potential receptors as possible. Also, balance stack heights to provide the maximum dispersion of odor between the stack and the nearest sensitive receptor.

4. Finding on Significance for Impact 4.6.E

As discussed above, implementation of and compliance with the above-listed regulatory programs, as well as new Mitigation Measures 4.6.E-N1, 4.6.E-N2 and 4.6.E-N3, would ensure that future development accommodated by GPA No. 960 would have less than significant odor impacts.

4.6.7 Significance After Mitigation for Air Quality

Implementation of, and compliance with, the above regulations, policies and mitigation measures (existing and proposed) would ensure that future development accommodated by the proposed project, GPA No. 960, would reduce obstructions to and increase compliance with applicable air quality management plans. Compliance with existing mitigation measures from EIR No. 441 would also ensure that future development activities minimize or avoid significant impacts to sensitive receptors from toxic air contaminants and odors. However, even with all of the above measures, future development would likely result in significant and unavoidable air quality impacts, particularly due to cumulatively significant emissions. Significant impacts would result from construction and operational emissions of criteria pollutants, associated violations of air quality standards or thresholds and effects to sensitive receptors, both locally and regionally. Even where individual future development projects were successfully mitigated to less than significant levels, they would still be liable to contribute incrementally to cumulatively significant air quality impacts. Because there is no feasible mechanism for the County of Riverside to control individual projects with respect to their incremental pollutant contributions, impacts to air quality would remain significant and unavoidable.

Health Impacts from Significant Emissions of Criteria Pollutants

Air quality impacts occur at a cumulative level, meaning that the concentration of air pollution in the air is the result of emissions from many sources and continued exposure to air pollution over many years. Therefore, health effects are linked to the cumulative emissions of existing and future criteria pollutant sources. Regional criteria pollutant modeling cannot accurately capture the project-level effects on ambient pollutant concentrations beyond the uncertainty level of the modeling because the emissions from typical projects analyzed under CEQA are relatively small and are localized rather than spread out over the entire region. The following table shows a comparison of project related emissions to regional emissions for each of the air basins. As shown, even a project of this size is a relatively low percentage of the total emissions within the current air basin. NO_X emissions are reduced in both air basins, as is CO in the SCAB.

	CO	NO_X	ROG	SO_X	PM_{10}	$PM_{2.5}$
South Coast Air Basin (tons/day)						
GPA	-3.17	-4.83	7.115	0.18	27.21	5.285
SCAB	2271.8	512	466.4	174.6	153.6	68.4
% of basin	-0.14%	-0.94%	1.53%	0.10%	17.71%	7.73%
Mojave Desert Air Basin (tons/day)						
GPA	3.10	-2.25	5.80	0.11	18.27	3.76
MDAB	309.2	173.8	65.5	7.7	131.2	36.1
% of basin	1.00%	-1.30%	8.85%	1.43%	13.92%	10.43%

Source: California Air Resources Board, Estimated Emissions Almanac Emissions Projections Data. Accessed 9/15/2014 from http://www.arb.ca.gov/app/emsinv/2013/emssumcat.php

As is shown, there will be an increase in some criteria pollutants and while more criteria pollutant emissions will contribute to greater health effects regionally, specifically attributing the projects emissions to a defined quantitative or geographic health effect is beyond the ability of the current modeling tools. The following is a qualitative discussion correlating each air pollutant emissions level resulting from GPA No. 960 with potential health impacts that may occur from exposure to increased regional levels of these air pollutants.

Ozone: *Ozone is the result of a chemical reaction between precursors such as NO_X and ROGs. Short-term exposure (lasting for a few hours) can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of*

lung tissue and immunological changes. Elevated ozone levels are associated with increased school absences. In recent years, a correlation between elevated ambient ozone levels and increased daily hospital admission rates, as well as mortality have been reported. Also an increased risk for asthma has been found in children who participate in multiple sports and live in communities with high ozone levels.

Buildout of GPA No. 960 will not directly emit ozone. However, buildout of GPA No. 960 will ad significant concentrations of ROGs to the atmosphere, which when combined in the presence of sunlight can result in increased ozone concentrations. Currently all three air basins are in severe non attainment for ozone. Buildout of GPA No. 960 has the potential to indirectly result in increased concentrations of Ozone and may result in helath impacts including breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of lung tissue and immunological changes. Elevated ozone levels are associated with increased school absences. Because this impact may adversely affect the health of individuals, the impact is considered Significant and Unavoidable.

Reactive Organic Gases: *Health effects resulting from exposure to the various forms of ROGs range from minor and temporary irritation of the mucous membranes to death. As an example, formaldehyde is an ROG and many building materials such as paints, adhesives, wall boards, and ceiling tiles slowly emit formaldehyde, which irritates the mucous membranes and can make a person irritated and uncomfortable when indoor concentrations of formaldehyde build up. By contrast, brief exposure (as little as ten minutes) to high concentrations of benzene (another form of ROG) can cause death. Short-term exposure to lower concentrations of benzene can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion and unconsciousness; in most cases people will stop feeling these effects when they are no longer exposed. People who inhale benzene for long periods of time (months or years) at high enough levels may experience harmful effects in the tissues that form blood cells, especially the bone marrow. Long-term exposure to benzene can cause various forms a cancer.*

Emissions of ROGs resulting from buildout of GPA No. 960 exceed the thresholds established by the SCAQMD and the MDAQMD. Those thresholds are based upon the definition of a major source in the Federal Clean Air Act. Major sources of ROGs have the potential to adversely impact the air basin with higher concentrations of this pollutant. The amount of ROGs emitted per day may potentially contribute to long term exposure of benzene and other ROGs which is known to cause cancer. Because this impact may adversely affect the health of individuals, the impact is considered Significant and Unavoidable.

Nitrogen Dioxide: *Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis or emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups*

With the mitigation measures in place implementation of GPA No. 960 will reduce nitrogen dioxide emissions compared to the no project condition and, therefore, modestly improve ambient air quality with regard to this air pollutant. Therefore, GPA No. 960 will not impact the health of individuals through emissions of nitrogen dioxide. Impacts are less than significant for this pollutant.

Carbon Monoxide: *Inhaled CO has no direct toxic effect on the lungs but effects tissues by interfering with oxygen transport and by competing with oxygen in combining with hemoglobin. Hence, individuals that have conditions that restrict oxygen intake can be adversely affected by exposure to CO. Individuals most at risk include fetuses, patients with diseases involving heart and blood vessels and patients with chronic hypoxemia (oxygen deficiency), such as that seen at high altitudes. Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects of CO inhalation include earlier onset of chest pain with exercise and electrocardiograph changes indicative of worsening oxygen supply to the heart.*

Emissions of CO resulting from buildout of GPA No. 960 exceed the thresholds established by the MDAQMD for the Mojave Air Basin. The threshold is based upon the definition of a major source in the Federal Clean Air Act. Major sources of CO have the potential to adversely impact the air basin with higher concentrations of this pollutant. A CO Hotspot analysis determined that the concentration of CO will not exceed the ambient air quality standards within the three air basins. Therefore, the impact will not

adversely affect the health of individuals. However, because the emissions exceed the thresholds for the Mojave Air Basin the impact is considered Significant and Unavoidable.

Particulate Matter: *A consistent correlation between elevated ambient fine particulate matter (PM_{10} and $PM_{2.5}$) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. In recent years, some studies have reported an association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in life span and an increased mortality from lung cancer.*

Daily fluctuations in $PM_{2.5}$ concentrations have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long-term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease and children appear to be more susceptible to the effects of high levels of PM_{10} and $PM_{2.5}$.

Emissions of PM_{10} and $PM_{2.5}$ resulting from buildout of GPA No. 960 exceed the thresholds established by the SCAQMD and the MDAQMD. Those thresholds are based upon the definition of a major source in the Federal Clean Air Act. Major sources of particulates have the potential to adversely impact the air basin with higher concentrations of this pollutant. All three air basins are in non attainment for both PM_{10} and $PM_{2.5}$. The amount of both PM_{10} and $PM_{2.5}$ emitted per day may potentially cause respiratory infections, number and severity of asthma attacks, and number of hospital admissions. Because this impact may contribute to the non attainment status of all three air basins and adversely affect the health of individuals, the impact is considered Significant and Unavoidable.

Sulfur Dioxide: *The effects of sulfate exposure at levels above the standard include the aggravation of asthmatic symptoms, an increased risk of cardio-pulmonary disease and a decrease in respiratory function. A few minutes of exposure to low levels of SO_2 can result in airway constriction in some asthmatics. In asthmatics, increased lung resistance as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO_2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO_2. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage and sloughing off of cells lining the respiratory tract.*

Emissions of Sulfur Dioxide resulting from buildout of GPA No. 960 exceed the thresholds established by the SCAQMD and the MDAQMD. Those thresholds are based upon the definition of a major source in the Federal Clean Air Act. Major sources of Sulfur Dioxide have the potential to adversely impact the air basin with higher concentrations of this pollutant. The amount of Sulfur Dioxide emitted per day may potentially cause aggravation of asthmatic symptoms including airway constriction, but given the current very low concentrations of Sulfur Dioxide in the atmosphere, future concentrations as a result of GPA No. 960 are unlikely to exceed the ambient air quality standards set of this pollutant. The ambient air quality standard is set to protect health. As such exposure levels in all three air basins will remain low and impacts to health will be restricted to mild symptoms of asthmatics and other individuals extremely sensitive to air quality impacts. Because this impact may adversely affect the health of some individuals, the impact is considered Significant and Unavoidable.

Section 4.7

Greenhouse Gases

Section 4.7 Greenhouse Gases

4.7.1 Introduction

The State of California recognizes that anthropogenic (human-caused) greenhouse gas (GHG) emissions are contributing to changes in the global climate and that such changes are having and will have adverse effects on the environment, the economy and public health. These are cumulative effects of past, present and future actions worldwide. While worldwide contributions of GHG emissions are expected to have widespread consequences, it is not possible to link particular changes to the environment of California or elsewhere to GHGs emitted from a particular source or location. Thus, when considering a project's contribution to impacts from climate change, it is possible to examine the quantity of GHG emissions that would be emitted either directly from project sources or indirectly from other sources, such as production of electricity as a result of activities or land use development in the county. This section assesses the potential impacts of GHG emissions that could result from new land use development within unincorporated Riverside County as authorized pursuant to the plans and policies of the General Plan, as updated per this project, proposed GPA No. 960. The updates proposed in GPA No. 960 include extensive revisions to the existing General Plan Air Quality Element to address GHGs in Riverside County.

GHGs trap heat in the atmosphere, which in turn heats the surface of the Earth. Some GHGs occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities, primarily through the combustion of fossil fuels. The State of California has been at the forefront of developing solutions to address global climate change and reduce anthropogenic GHG emissions.

State law defines GHGs to include the following compounds: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride (SF_6) (State CEQA Guidelines, Section 15364.5 and Health and Safety Code, Section 38505(g)). The most common GHG that results from human activity is carbon dioxide, followed by methane and nitrous oxide. Because GHGs have variable potencies, a common metric of "carbon dioxide equivalents" (CO_2e) is used to report their combined potency. The potency each GHG has in the atmosphere is measured as a combination of the volume of its emissions and its 'global warming potential' (GWP). GWP is the potential of a gas or aerosol to trap heat in the atmosphere and is expressed as a function of the potency with respect to the same mass of CO_2. Methane, for example has a GWP of 21, while nitrous oxide has a GWP of 310. By multiplying the amount in metric tons of each individual gas by their respective GWP, all GHGs can be reported in the common unit of metric tons of CO_2e (MT CO_2e). Note, one metric ton (MT) equals 1,000 kilograms or 2,204 pounds; one 'short ton' is 2,000 pounds.

Due to the successful global bans on chlorofluorocarbons (primarily used as refrigerants, aerosol propellants and cleaning solvents), Riverside County does not generate significant emissions of these GHGs. The same has occurred for other synthesized gases, such as HFCs and carbon tetrafluoride (CF_4), which have been banned and

are no longer available on the market. Because of the ban, Riverside County will not generate additional emissions of these GHGs and therefore, they are not considered any further in this document. SF_6 is another GHG with a high GWP (23,900 times that of CO_2); it is mainly used in the electric switchgear of high voltage electric transmission lines and medical use in retinal detachment surgery and ultrasound imaging. These are the only two uses of SF_6 in Riverside County. According to the Local Government Operations Protocol (LGOP) published jointly by the California Air Resources Board (CARB), the California Climate Action Registry (CCAR) and The Climate Registry (TCR) for quantification and reporting of GHG emissions inventories by local governments, the sources of SF_6 in Riverside County are defined as a Scope 3 emission source not directly or indirectly attributable to the Riverside County operations or the community within Riverside County. This means that the County of Riverside has little control over the emission source and is not considered necessary within Riverside County's community-wide GHG emissions inventory. Therefore, it is not considered further in this document.

4.7.2 Existing Environmental Setting – Greenhouse Gases

A. Data Types and Sources

Before establishing policies to reduce GHGs, it was necessary to determine the full extent of the issue's effects within Riverside County. Thus, in order to establish a GHG emissions baseline that is currently being emitted into the environment, an inventory of GHG emissions within unincorporated Riverside County and the county government operations was conducted. Note that the GHG emission inventories for Riverside County include emissions sources within unincorporated Riverside County and activities that the County of Riverside has direct or indirect jurisdictional control. The GHG emissions inventories do not include sources within the incorporated cities because these emission sources are under the jurisdictional control of the respective municipal government that those emissions sources reside within. The following GHG emissions inventory identifies and categorizes the major sources and quantities of GHG emissions being produced by Riverside County residents, businesses and government (County of Riverside) operations currently in Riverside County. Using historic emissions and business-as-usual (BAU) practices as the basis, the inventory includes GHG emissions from 2008 (baseline) and projected for 2020 and beyond. The year 2008 was used as the baseline to inventory emissions for existing conditions as it was the most recent year with complete data. The methodology and data sources used to estimate the various types of existing (2008) GHG emissions are described here. The results of modeled estimates for 2035, including projected emissions for the year 2020 (both BAU and reduced scenarios), are described under "Effects" (Section 4.7.4).

In terms of land use, GHG emissions are predicted based on the types of activities associated with the given use and may span a number of sectors. For example, a single-family home would be associated with GHG emissions from transportation (commuting to work, say), waste generation (trash and lawn clippings) and energy consumption (electricity to run appliances and lights, natural gas to heat the house and cook, etc.). Accordingly, the following subsection describes the 2008 existing GHG emissions inventory for Riverside County and the methodology used to calculate emissions from the following categories: electricity, natural gas, solid waste, area sources, water-related emissions, agriculture and transportation.

1. Energy

The two main energy sources used to provide power on most developed sites are electricity and natural gas. Both these energy sources can result in greenhouse gas emissions. Because natural gas use involves combustion within

the equipment itself, it is a direct source of greenhouse gas emissions on a site. Electricity is sometimes generated directly on a site through alternative means, such as solar or wind turbines. Most commonly, however, it is generated offsite by a utility provider and when that generation involves the combustion of a fossil fuel (such as coal or natural gas, for example, which is burned to generate steam to run turbines), the result is the indirect production of greenhouse gases. Estimates for Riverside County usage of these two resources are as follows below. It should be noted that these values are countywide estimates obtained directly from major utility providers. They are not meant to be synonymous with the data used in Section 4.10 (Energy) later in this document.

Electricity: Emissions of CO_2, CH_4 and N_2O within Riverside County result from the use of electricity. Annual electricity usage in 2008, obtained from Southern California Edison (SCE) and the Imperial Irrigation District (IID), the two major commercial electricity providers serving Riverside County territory, was used in determining community-wide electricity consumption and generation emission estimates for the existing inventory.

SCE and IID provide electricity generated via a variety of sources, including combustion of natural gas and coal, nuclear, large hydroelectric and renewable sources (solar, wind, etc.). Each of these sources of electricity emits different amounts of GHGs. Therefore, emissions from electricity were determined by multiplying annual usage in megawatt hours per year (MWh/year) by the SCE emission factors appropriate to the inventory year for CO_2, CH_4 and N_2O as reported in the EPA's Emissions and Generation Resource Integrated Database (eGRID) (U.S. EPA 2007).

Two gas-to-energy facilities are located in unincorporated Riverside County, one at the Badlands Landfill and one at the El Sobrante Landfill. These facilities take the methane collected from the decomposition of solid waste and convert it to electricity. The generation of electricity from these alternative generation sources results in emission reductions. Therefore, the operation of these facilities offset electrical consumption within the inventory by approximately 13,016 megawatt hours to account for the electricity generated by these facilities in 2008. Concerning the El Sobrante Landfill, the County of Riverside cannot claim all of the benefits associated with the gas-to-energy facility at the landfill. The El Sobrante landfill is privately owned and operated. The majority of the waste disposed of at the landfill is generated from outside of Riverside County boundaries. The County of Riverside collects fees and has indirect control over the waste collected from within Riverside County at the El Sobrante Landfill; however, the County of Riverside does not have control over the landfill waste collected by the private operator from outside Riverside County boundaries. Therefore, the benefits from cogeneration are limited to the portion of methane associated with waste collected within Riverside County. As of the end of 2008, approximately 49 percent of the total waste deposited in the El Sobrante landfill originated within Riverside County with the remaining 51 percent originating outside of Riverside County. The 2008 baseline inventory calculates the benefit of the El Sobrante cogeneration based on the portion of waste collected within Riverside County. The contractual split of waste at El Sobrante Landfill was updated after 2008 such that 40 percent of the waste will come from within Riverside County with the remaining 60 percent coming from outside Riverside County. Cogeneration benefits at the El Sobrante Landfill for years 2020 and 2035 reflect the contractual split of waste.

Natural Gas: The residents and businesses of Riverside County emit GHGs from the combustion of natural gas, most often used for space heating and cooling. To determine annual GHG emissions from natural gas combustion, the annual natural gas usage for the unincorporated areas of Riverside County in million British Thermal Units (MMBTUs) was multiplied by the respective emissions factors for CO2, CH4 and N2O. Existing inventory consumption levels were obtained from the Southern California Gas Company, which serves all of the fixed-line connections and mains within unincorporated Riverside County.

2. Solid Waste

Riverside County Waste Management Department is responsible for managing Riverside County's landfills, including both active and closed landfills. Table 4.7-A (Existing Riverside County Landfills), below, provides information on Riverside County's active landfills, including planned closure year, the year the landfill-gas system was installed, the in-place tonnage at the end of 2008 and the amount of waste disposed at each landfill in 2008. Table 4.7-B (Closed Riverside County Landfills) provides information for the closed landfills managed by Riverside County including closure year, the year the landfill-gas system was installed and the in-place tonnage. All of the listed landfills are managed by the County of Riverside with the exception of El Sobrante, which is privately owned and operated. As discussed under Electricity, the County of Riverside collects fees and has control over the portion of the El Sobrante landfill waste collected from within Riverside County. Therefore, the emissions associated with solid waste collected within Riverside County are calculated in Riverside County's baseline inventory of GHG emissions.

Emissions from solid waste result from three different waste-related sources of emissions: transportation from its source to the landfill, operation of the equipment used at the landfill and the fugitive emissions from waste decomposition. Emissions from the transportation of solid waste is determined based on the average number of miles traveled by each truck and the CO_2, CH_4 and N_2O emissions generated per mile traveled. Unlike the rest of these emissions, the transportation-related emissions are accounted for under "Transportation" in the inventory described below. The emissions from landfill equipment are dependent upon the type of equipment, fuel use and duration of use. Emissions from waste decomposition at both active and inactive landfills operated by Riverside County are included in the solid waste category of the Riverside County GHG inventory.

Table 4.7-A: Existing Riverside County Landfills

Landfill Name (Scheduled Closure Year[2])	Year LFG[1] System Installed	In-place Waste (At End of 2008) (in tons)[3]	Waste Disposed in 2008 (in tons)[3]
Badlands (2024)	2001	8,389,810	582,400
Blythe (2047)	1998	609,370	15,180
Desert Center (2018)	---	40,430	15
El Sobrante[4] (Private) (2045)	1989	22,127,560	960,360
Lamb Canyon (2021)	2001	6,376,350	688,140
Mecca II (2037)	---	228,090	10
Oasis (2021)	---	176,410	1,480

Footnotes:
1. LFG = landfill gas.
2. Estimated years per Riverside County Waste Management Dept.'s "Site Info Landfill Operation Database," 2010.
3. All values rounded to nearest 10.
4. Waste Disposed in 2008 associated with the El Sobrante landfill represents only the in-county portion (or approximately 49 percent) of the total waste disposed at this landfill.

Table 4.7-B: Closed Riverside County Landfills

Landfill Name (Closure Year)	Year LFG System Installed	In-place Tonnage*
Coachella (1997)	2001	3,237,850
Corona (1986)	1988	3,200,000
Double Butte (1994)	1997	1,977,460
Edom Hill (1997)	2008	7,323,780
Elsinore (1965)	1993	1,140,000
Highgrove (1998)	1998	3,496,430
Mead Valley (1997)	1995	2,312,840
West Riverside (1993)	1988	1,260,000

*All values rounded to nearest 10. LFG = landfill gas.

Source: Riverside County Waste Management Dept., Landfill Information, 2010.

Emissions from the equipment used at the landfills were calculated from total fuel use by the equipment and the emission factors for CO_2, CH_4 and N_2O, as determined from CARB off-road mobile source emission factors. Fugitive methane emissions from the decomposition of solid waste (typically buried) are calculated based on the annual waste generation multiplied by the applicable emission factors for waste production for CH_4. In Riverside County, all of the landfills have such landfill gas collection systems with the exception of Desert Center, Mecca II and Oasis landfills. These three landfills are the smallest in Riverside County with limited waste disposal and represent only 0.07% (444,923 tons) of the total in-place waste (61,896,358 tons) at the end of 2008. Although CO_2 is also a by-product of organic waste decomposition, the United States Environmental Protection Agency (U.S. EPA) considers these emissions to be natural and not anthropogenic; therefore they are not included in the emissions inventory. Therefore, CH_4 is the only fugitive GHG that is analyzed from the decomposition of organic waste in landfill operations. Organic waste includes yard and food waste while non-organic waste includes fossil fuel-derived products, such as plastic and rubber. Nitrous oxide is not a by-product of decomposition and therefore no fugitive emissions of nitrous oxide are anticipated or calculated from solid waste sources.

3. Area Source Emissions

The following two categories of emissions, landscaping equipment and woodburning emissions, are included in the "Area Source" category, as follows. The emissions associated with landscaping activities and woodburning were calculated using URBEMIS2007. URBEMIS2007 is a computer software package used for modeling projected emissions of air quality pollutants, including carbon dioxide.

Landscaping Emissions: Emissions of CO_2, CH_4 and N_2O are generated by the use of landscape equipment that runs on gasoline. CO_2 emissions were determined directly through URBEMIS2007 for the existing (2008) inventory. From the CO_2 emissions, the approximate number of gallons of gasoline consumed by landscape equipment use was calculated (CARB 2007e). This number was then multiplied by emission factors according to the General Reporting Protocol, version 3.1 (CCAR 2010) to derive both CH_4 and N_2O emissions.

Woodburning Emissions: Direct CO_2 emissions are produced from the burning of wood in wood stoves and fireplaces. Natural gas-fired stoves, barbecues and other heating devices are not included in this subcategory; they have already been accounted for under "Energy." CO_2, CH_4 and N_2O emissions from wood stoves and fireplaces are calculated based on the percentage of residential units using each type of hearth and the California average amount of wood burned per unit value provided by the EIA "2005 Residential Energy Consumption Survey." The emission coefficients used are taken from the EPA's AP-42 document (U.S. EPA 1985).

4. Water-Related Emissions

Water-related emissions included in this section are indirectly produced as a result of electrical consumption to pump and treat water imported from outside Riverside County. There are many water agencies that operate in Riverside County providing both potable and non-potable water to customers in the unincorporated areas. The six major water importers/wholesalers serving Riverside County are: Coachella Valley Water District, Desert Water Agency, Eastern Municipal Water District, Western Municipal Water District, Palo Verde Irrigation District and San Gorgonio Pass Water Agency. However, the Palo Verde Irrigation District does not serve potable water delivery.

Serving EMWD and WMWD, the Metropolitan Water District of Southern California (MWD) holds the rights to a large portion of the State Water Project supply (the system of aqueducts and canals that distributes water from the Sacramento Bay-San Joaquin Delta across the state) and is the largest water wholesaler in California. The San

Gorgonio Pass Water Agency also gets its water from the State Water Project. The water agencies in the eastern portion of Riverside County predominantly get their water from the Colorado River. See Section 4.19 (Water Resources) for full details.

Within Riverside County, each agency's water supply comes from a mixture of the following sources: the Bay-Delta via the State Water Project, the Colorado River via a system of regional canals local groundwater, recycled water and local surface water. The GHG emissions associated with water use come from the energy used to collect, treat, convey and distribute the water. Thus, water imported through the State Water Project and from the Colorado River have higher GHG emissions associated with them, when compared to local water sources, as these distant sources require more energy-intensive transport to reach Riverside County.

Water Supply: This category, "Water Supply," addresses the GHG emissions resulting from energy used to pump/transport these imported sources of water from their sources to Riverside County and to treat the water. This separate category is necessary, as the energy used is accrued across a varied of providers and is not included in the data collected from SCE and IID. For local water sources, the data collected from SCE and IID include associated electricity usage and, hence GHG emissions, are included under the "Electricity" category described above.

Wastewater Treatment: As with the local water supply described above, GHG emissions associated with wastewater (that is, pumping and treatment of sewage, urban runoff and, in some cases, industrial or manufacturing runoff) are based on the electricity needed to pump and treat the wastewater. The Riverside County GHG inventory measures the GHG emissions from the transport and treatment of the wastewater as a separate sub-category within the inventory analysis.

5. Agricultural Emissions

Riverside County encompasses a large amount of agricultural land with a variety of cultivation uses. The most prominent uses are field and seed crops, including primarily alfalfa and wheat, as well as irrigated pasturelands and rangelands (for grazing). Other uses include orchards, groves, vineyards, truck crops and livestock (including poultry). Agricultural procedures contribute directly to emissions of greenhouse gases through a variety of processes. Assessment of non-carbon-dioxide emissions are from the following source categories: enteric fermentation in domestic livestock, livestock manure management, crop cultivation and field burning of agricultural residues.

Livestock emissions are divided into two categories based on the emissions source: enteric fermentation and manure management. Enteric fermentation is defined as a fermentation process that takes place in the stomach of ruminant animals, such as cows, sheep and goats. This process produces methane that is released through belching and flatulence. Manure management is the process of gathering and disposing of manure generated by livestock. Management practices vary by type of livestock, but in the case of dairy cows, manure is often collected and stored in lagoons. As the manure breaks down, methane is released.

Methane (CH_4) and N_2O are the primary greenhouse gases emitted from crop cultivation and associated activities. Field burning of agricultural residues from corn and wheat is a minor source of CH_4 in Riverside County (U.S. EPA 2009b). Agricultural-related emissions for 2008 were based on data for the unincorporated areas of Riverside County from SCAG and the Riverside County Agricultural Commissioner.

6. Transportation Emissions

The transportation emissions include emissions from on-road vehicles as well as aviation-related fuel use. These two categories of emissions are described below:

On-Road Vehicles: Emissions from on-road vehicles include all generated from trips attributable to activities taking place in the unincorporated parts of Riverside County. Carbon dioxide emissions from vehicles were calculated utilizing EMFAC2007 emission factors for the existing inventory. The Emission Factors (EMFAC) model was developed by CARB and is used to calculate CO_2 emission rates for on-road motor vehicles, from light-duty passenger vehicles to heavy-duty trucks that operate on highways, freeways and local roads in California. Motor vehicle emissions of CH_4 and N_2O were calculated using U.S. EPA emission factors for on-road vehicles based on the total annual mileage driven (that is, vehicle miles traveled) multiplied by their respective emission factors by year.

Vehicle miles traveled (VMT) were provided by the Riverside County Transportation Department, which derived them from a transportation model count of the trips entering the unincorporated areas of Riverside County, trips leaving unincorporated Riverside County and trips occurring solely within unincorporated Riverside County. Pass-through traffic (that is, trips beginning and ending outside of unincorporated Riverside County) is not included in this analysis. Since trips entering or leaving unincorporated Riverside County have only one end in Riverside County, only half of these miles were included in the emissions analysis in order to reflect the split jurisdiction of these trips. The VMT associated with these trips are split equally between the two jurisdictions since both are equally responsible for the trips; one jurisdiction is home to the origin and the other is home to the destination. Due to the size of Riverside County and the complexity of its circulation network, using any other split ratio was technologically infeasible. See Section 4.18 (Circulation and Traffic), for further details on traffic modeling, data and results.

The transportation modeling (RIVTAM) assumed that all vehicles are either gasoline or diesel powered. The estimates therefore do not account for electrical, biodiesel (a blend of diesel and vegetable oil) or hydrogen-powered systems. Any electrically powered vehicle draws its power from a residential, commercial or industrial land use within Riverside County; however, the electricity would have been captured under the electrical usage category for the baseline year of 2008.

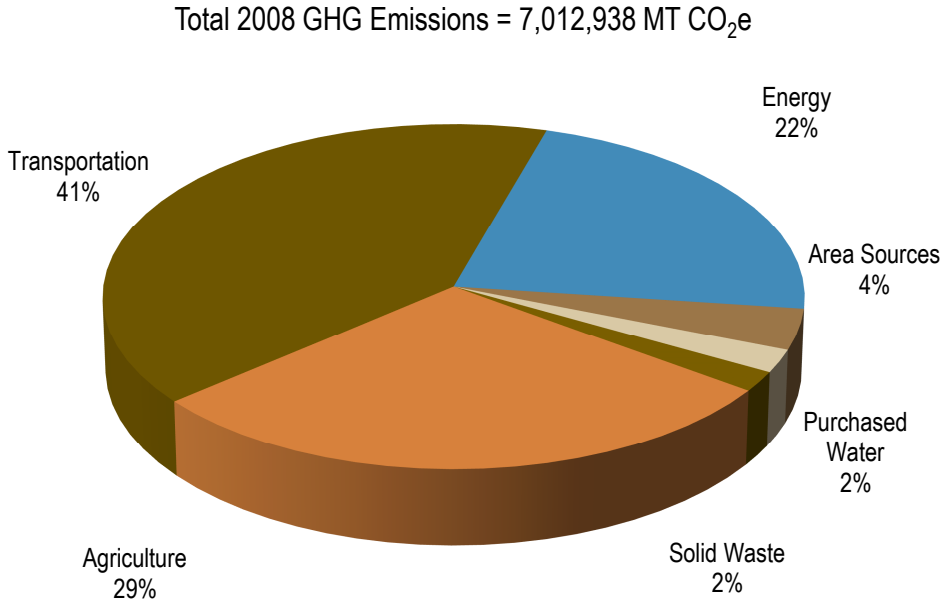
Aviation: Riverside County owns and operates five airports: Hemet-Ryan, French Valley, Chiriaco Summit, Desert Center and Jacqueline Cochran Regional Airport. The GHG emissions associated with aircraft trips within Riverside County were calculated based on annual fuel consumption (extrapolated from airport aviation fuel sales) and emission factors for jet fuel and aviation fuel for CO_2, CH_4 and N_2O. Fuel services are not provided at the Chiriaco Summit or Desert Center Airport, so all fuel consumption data was obtained from the three larger airports. March Air Reserve Base is not included here as flights occurring there are predominantly military and not under the jurisdiction of the County of Riverside.

B. Base Year (2008) Results

For 2008, activities within unincorporated Riverside County resulted in the emission of approximately 7.1 million metric tons (MMT) CO_2e. The categories included in this inventory are: transportation, energy, area source, water and wastewater, solid waste and agriculture. As shown in Figure 4.7.1 (2008 Greenhouse Gas Emissions in Unincorporated Riverside County) and Table 4.7-C (2008 Net Total GHG Emissions for Unincorporated Riverside County), energy-related emissions represent approximately 22% of the total GHG emissions generated by Riverside County in 2008. Solid waste-related emissions represent approximately 3% of the total GHG

emissions. Area source emissions represent approximately 4%. Indirect emissions from the purchasing of water from the State Water Project and the Colorado River represent approximately 2% of the total GHG emissions. Agricultural emissions represent approximately 29% of the total GHG emissions generated by Riverside County in 2008. Transportation emissions do not include pass-through traffic on the freeways within Riverside County and only account for vehicle trips with starting points and/or destinations related to land uses within unincorporated areas that are within the jurisdictional control of the County of Riverside. Transportation-related emissions represent the largest emission source; approximately 40% of the total GHG emissions generated within Riverside County.

Figure 4.7.1: 2008 Greenhouse Gas Emissions in Unincorporated Riverside County



Source: Atkins, Greenhouse Gas Study for General Plan Update, 2011. See Appendix EIR-6.

Table 4.7-C: 2008 Net Total GHG Emissions for Unincorporated Riverside County

Emissions Category & Sub-category	Metric Tons of CO_2e	Percent of Total
Transportation	***2,850,520***	***41%***
On-road Vehicles	2,819,456	
Airport Operations	21,162	
Energy	***1,577,667***	***22%***
Electricity [1]	1,067,418	
Natural Gas [2]	510,249	
Solid Waste	***132,666***	***2%***
Landfill Off-gassing [3]	150,639	
Onsite Equipment	4,816	
Area Sources	***269,181***	***4%***
Landscaping Equipment	128,043	
Wood Burning	118,543	
Water and Wastewater [4]	***152,473***	***2%***
Agriculture	***2,030,431***	***29%***
Enteric Fermentation	115,584	
Manure Management	199,873	
Agriculture Residue Burning	166	

Emissions Category & Sub-category	Metric Tons of CO_2e	Percent of Total
Crop Growth	1,233,081	
Animals and Runoff	235,565	
Fertilizer Use	246,162	
GRAND TOTAL	**7,012,938**	**100%**

Footnotes:
1. Includes electricity used for local water supply and wastewater treatment.
2. Includes natural gas-using stoves, grills, barbecues and other heating devices.
3. Per U.S. EPA standards, does not include landfill decomposition emissions.
4. Indirect (outside of county) electricity use for importation of water.

4.7.3 Policies and Regulations Addressing Greenhouse Gases

A. Federal Regulations

Kyoto Protocol: The United States participates in the United Nations Framework Convention on Climate Change (UNFCCC) signed on March 21, 1994. Specifically, the Kyoto Protocol is a treaty made under the UNFCCC and was the first international agreement to regulate GHG emissions. It has been estimated that if the commitments outlined in the Kyoto Protocol are met, global GHG emissions could be reduced by an estimated 5% from 1990 levels during the first commitment period of 2008-2012 (UNFCCC 1997). It should be noted that although the United States is a signatory to the Kyoto Protocol, Congress has not ratified the Protocol and the United States is not bound by the Protocol's commitments.

In December 2009, representatives from 170 countries met in Copenhagen to ratify an updated UNFCCC agreement known as the "Copenhagen Accord". This accord is a voluntary agreement between the United States, China, India and Brazil that recognizes the need to keep global temperature rise to below 2°C and obliges signatories to establish measures to reduce greenhouse gas emissions and to prepare to provide help to poorer countries in adapting to climate change. The countries met again in Cancun in December 2010 and adopted the Cancun Agreements, which reinforce and build upon the Copenhagen Accord. The nations agreed to recognize country targets, develop low-carbon development plans and strategies, and report inventories annually. In addition, agreements were made regarding financing for developing countries, as well as for technology support and coordination among all nations. The conference of the parties occurred again in December 2011 in South Africa. At the South Africa conference, China and Brazil agreed to unbinding Kyoto reduction targets through an informal memorandum. Two climate change conferences of the parties occurred in August 2012 in Bangkok, Thailand; and again in November/December 2012 in Doha, Qatar without major progress. The 2013 climate change conference occurred in Warsaw, Poland and the parties agreed to extend the Kyoto Protocol through 2015. The next climate change conference of the parties is scheduled for September 2014 in New York City.

Climate Change Technology Program: In lieu of the Kyoto Protocol's mandatory framework, the United States has opted for a voluntary and incentive-based approach toward emissions reductions. The Climate Change Technology Program is a multi-agency research and development coordination effort led by the Secretaries of Energy and Commerce and charged with carrying out the President's National Climate Change Technology Initiative.

United States Environmental Protection Agency: The United States Environmental Protection Agency (U.S. EPA) is responsible for implementing federal policy to address global climate change. The federal government administers a wide array of public-private partnerships to reduce GHG emissions generated by the United States.

These programs focus on energy efficiency, renewable energy, methane and other non-CO_2 gases, agricultural practices and implementation of technologies to achieve GHG reductions. The U.S. EPA implements several voluntary programs that help substantially reduce GHG emissions. These programs include: the State Climate and Energy Partner Network, which fosters the exchange of information between federal and state agencies regarding climate and energy; the Climate Leaders program for companies; the Energy Star® labeling system for energy-efficient products; and the Green Power Partnership for organizations interested in buying green power. All of these programs play a significant role in encouraging voluntary reductions from large corporations, consumers, industrial and commercial buildings, and many major industrial sectors.

It should be noted that in Massachusetts v. Environmental Protection Agency (Docket No. 05-1120), the U.S. Supreme Court held in April of 2007 that the U.S. EPA has authority to regulate greenhouse gases and that the U.S. EPA's reasons for not regulating this area did not fit the statutory requirements. As such, the Court ruled that the U.S. EPA should be required to regulate CO_2 and other greenhouse gases as pollutants pursuant to Section 202(a)(1) of the federal Clean Air Act (CAA).

Towards this aim, in 2009 the U.S. EPA issued a Final Rule for mandatory reporting of GHG emissions by fossil fuel suppliers, industrial gas suppliers, direct GHG emitters and manufactures of heavy-duty and off-road vehicles and vehicle engines. It also requires annual reporting of emissions. The first annual reports required by the Rule were due in March 2011. This rule does not regulate the emission of GHGs; it only requires the monitoring and reporting of greenhouse gas emissions for those sources above certain thresholds (U.S. EPA 2009). In addition, the U.S. EPA adopted a Final Endangerment Finding for the six defined GHGs in December 2009. This Endangerment Finding is required for the U.S. EPA to regulate GHG emissions under Section 202(a)(1) of the CAA.

On May 13, 2010, the U.S. EPA issued a Final Rule that establishes a common sense approach to addressing greenhouse gas emissions from stationary sources under the CAA permitting programs. The rule is in its second phase, which continues through June 2013. In this phase, new construction projects that exceed a CO_2e threshold of 100,000 tons per year and modifications of existing facilities that increase CO_2e emissions by at least 75,000 tons per year are subject to permitting requirements. Additionally, operating facilities that emit at least 100,000 tons per year are subject to Title V permitting requirements for GHGs (U.S. EPA 2010a). New and existing industrial facilities that meet or exceed that threshold require a permit under the New Source Review 'Prevention of Significant Deterioration' and Title V 'Operating Permit' programs.

B. State Regulations

California Air Resources Board: The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles air emission inventories, develops suggested control measures and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints and barbecue lighter fluid) and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of the State Implementation Plan (SIP), for which it works closely with the federal government and the local air districts. The SIP is required for the State of California to take over implementation of the federal Clean Air Act in California and consists of rules and technical documentation to support the State of California's plan for reducing emissions of criteria pollutants in areas that exceed EPA standards and are designated non-attainment.

Executive Order S-3-05: In June 2005, California Governor Arnold Schwarzenegger issued Executive Order S-3-05 establishing the following GHG emission reduction targets:

- By 2010, California shall reduce GHG emissions to 2000 levels.
- By 2020, California shall reduce GHG emissions to 1990 levels.
- By 2050, California shall reduce GHG emissions to 80% below 1990 levels.

The first California Climate Action Team (CCAT) Report to the Governor in 2006 contained recommendations and strategies to help meet these Executive Order targets. The 2010 CCAT Biennial Report expanded on the policy-oriented 2006 report. The information detailed in the 2010 CCAT Biennial Report included issuance of revised climate and sea level projections using newly available information and tools, and an evaluation of climate change within the context of broader social changes, such as land-use changes and demographic shifts. The action items in the report focus on the preparation of the Climate Change Adaptation Strategy, as required by Executive Order S-13-08 (and described later in this report).

Assembly Bill 32 - Global Warming Solutions Act of 2006: In 2006, the California legislature adopted Assembly Bill 32 (AB 32), the California Global Warming Solutions Act of 2006, focusing on reducing GHG emissions in California. GHGs as defined under AB 32 include CO_2, CH_4, N_2O, HFCH, PCH, SFX. AB 32 required CARB to adopt rules and regulations directing state actions that would reduce GHG emissions to 1990 statewide levels by 2020. CARB was also required to publish a list of "discrete early action" GHG emission reduction measures that would be made enforceable by 2010. The law further required that such measures achieve the maximum technologically feasible and cost-effective reductions in GHGs from sources or categories of sources to achieve the statewide greenhouse gas emissions limit for 2020.

Towards this aim, in October 2007, CARB published its "Final Report for Proposed Early Actions to Mitigate Climate Change in California." This report described recommendations for discrete early action measures to reduce GHG emissions. Resulting from this were three new regulations including: a low carbon fuel standard, reduction of HFC-134a (a refrigerant chemical) emissions from non-professional servicing of motor vehicle air conditioning systems and improved landfill methane capture. CARB estimated that by 2020, reductions from these three measures would reduce emissions by approximately 13-26 million metric tons CO_2e.

In 2007, CARB released a report, "California 1990 GHG Emissions Level and 2020 Emissions Limit," establishing that statewide levels of GHG emissions in 1990 were 427 MMT CO_2e. Additionally, in 2008, CARB adopted the "Climate Change Scoping Plan," outlining the State of California's strategy to achieve the 2020 GHG limit. The Scoping Plan proposes a comprehensive set of actions designed to reduce overall GHG emissions in California, improve the environment, reduce dependence on oil, diversify energy sources, save energy, create new jobs and enhance public health. The plan emphasizes a cap-and-trade program, but also includes the discrete early actions previously mentioned.

Senate Bill 97 – 2007 CEQA Guidelines and Climate Change: SB 97, enacted in 2007, amended the California Environmental Quality Act (CEQA) to clearly establish that GHG emissions and the effects of GHG emissions are appropriate subjects for CEQA analysis. It directed the California Office of Planning and Research (OPR) to develop revisions to the State CEQA Guidelines "for the mitigation of GHG emissions or the effects of GHG emissions" and directed the Natural Resources Agency to certify and adopt these revised State CEQA Guidelines by January 2010 (See PRC Section 21083.05). The revisions were codified into the California Code of Regulations (CCR) and became fully effective by July 2010. These revisions provide regulatory guidance for the analysis and mitigation of the potential effects of GHG emissions.

Among the changes resulting from SB 97 was the addition of criteria for climate action plans used in the tiering and streamlining of CEQA analysis of GHGs for subsequent development projects. Riverside County has updated the Air Quality Element of the General Plan to include specific policies to address GHG emissions. The implementation mechanisms for these GHG-related policies are the Screening Tables for New Development, included in the proposed Climate Action Plan (CAP). The Screening Tables allow new development projects a streamlined option for complying with the CEQA requirements for addressing GHG emissions. Additionally, Riverside County's CAP details policies to reduce emissions from municipal and community-wide sources, including existing buildings and new development. The addition to the State CEQA Guidelines addressing tiering reads as follows:

15183.5. Tiering and Streamlining the Analysis of Greenhouse Gas Emissions.

(a) Lead agencies may analyze and mitigate the significant effects of greenhouse gas emissions at a programmatic level, such as in a general plan, a long range development plan or a separate plan to reduce greenhouse gas emissions. Later project-specific environmental documents may tier from and/or incorporate by reference that existing programmatic review. Project-specific environmental documents may rely on an EIR containing a programmatic analysis of greenhouse gas emissions as provided in section 15152 (tiering), 15167 (staged EIRs) 15168 (program EIRs), 15175-15179.5 (Master EIRs), 15182 (EIRs Prepared for Specific Plans) and 15183 (EIRs Prepared for General Plans, Community Plans or Zoning).

*(b) **Plans for the Reduction of Greenhouse Gas Emissions.** Public agencies may choose to analyze and mitigate significant greenhouse gas emissions in a plan for the reduction of greenhouse gas emissions or similar document. A plan to reduce greenhouse gas emissions may be used in a cumulative impacts analysis as set forth below. Pursuant to sections 15064(h)(3) and 15130(d), a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project complies with the requirements in a previously adopted plan or mitigation program under specified circumstances.*

*(1) **Plan Elements.** A plan for the reduction of greenhouse gas emissions should:*

(A) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;

(B) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;

(C) Identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area;

(D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;

(E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels;

(F) Be adopted in a public process following environmental review.

> (2) ***Use with Later Activities.*** *A plan for the reduction of greenhouse gas emissions, once adopted following certification of an EIR or adoption of an environmental document, may be used in the cumulative impacts analysis of later projects. An environmental document that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project. If there is substantial evidence that the effects of a particular project may be cumulatively considerable notwithstanding the project's compliance with the specified requirements in the plan for the reduction of greenhouse gas emissions, an EIR must be prepared for the project.*

Senate Bill 375 – 2008 Sustainable Communities and Climate Protection Act: SB 375 established mechanisms for the development of regional targets for reducing passenger vehicle greenhouse gas emissions and was adopted by the State of California in September 2008. In response, in 2010, CARB adopted vehicular GHG emissions reduction targets developed in consultation with the State of California's metropolitan planning organizations (MPOs), which included the Southern California Association of Governments (SCAG), to which Riverside County belongs. The targets require a 7-8% reduction by 2020 and 13-16% reduction by 2035 for each MPO. The objective of these targets is to induce cities and counties to change their land use patterns and improve their transportation alternatives. Through the SB 375 process, MPOs, such as SCAG, are to work with local jurisdictions in the development of "Sustainable Communities Strategies" (SCS) designed to integrate development patterns and the transportation network in a way that reduces greenhouse gas emissions while meeting housing needs and other regional planning objectives. In particular, SCAG's reduction target for per-capita vehicular emissions is 8% by 2020 and 13% by 2035 (CARB 2010b). SCAG is in the process of preparing its SCS according to its 2012 Regional Transportation Plan (RTP) update schedule. To date, different regions remain in different states regarding the completion and adoption of their SCSs.

Pertinent to Riverside County, the Southern California Association of Governments (SCAG) adopted the 2012 RTP including the SCS for the region on April 4, 2012; Riverside County is within the SCAG area and the SCAG 2012 RTP and SCS applies to Riverside County.

Executive Order S-13-08: On November 14, 2008, Governor Schwarzenegger issued Executive Order S-13-08, the Climate Adaptation and Sea Level Rise Planning Directive, to provide clear direction on how the State of California should plan for future climate impacts. Executive Order S-13-08 outlines four key actions to reduce the vulnerability of California to climate change:

- Initiate California's first statewide Climate Change Adaptation Strategy (CAS) to assess the state's expected climate change impacts, identify where California is most vulnerable and recommend climate adaptation policies.
- Request that the National Academy of Sciences establish an expert panel to report on sea level rise impacts in California in order to inform State of California planning and development efforts.
- Issue interim guidance to state agencies for how to plan for sea level rise in designated coastal and floodplain areas for new and existing projects.
- Initiate studies on critical infrastructure projects and land-use policies vulnerable to sea level rise.

The resultant 2009 "CAS Report" summarizes the best known science on climate change impacts in the state to assess vulnerability and outlines possible solutions that can be implemented within and across state agencies to

promote resiliency. This is the first step in an ongoing, evolving process to reduce California's vulnerability to climate impacts.

California Energy Code (CCR Title 24, Part 6): CCR Title 24, Part 6, the California Energy Code (also known as "Energy Efficiency Standards for Residential and Non-Residential Buildings"), commonly referred to simply as "Title 24," were first established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically incorporate new energy efficiency technologies and methods as they become available. Since use of fossil fuels to produce energy results in GHG emissions, energy-efficient buildings that use less energy result in less GHG emissions as well. The State also enacted the "California Green Building Standards Code" under CCR Title 24, Part 11, to address other "holistic" aspects of green building, energy and resource conservation. See section 4.10 for more details on this and other energy conservation issues.

In 2013, the California Energy Commission (CEC) adopted updated Title 24 (Parts 1 and 6) standards ~~which will go into~~ effect*ive* on July 1, 2014. These changes are intended to:

- Provide California with an adequate, reasonably priced and environmentally sound supply of energy.
- Respond to the AB 32 mandate for California to reduce its GHG emissions to 1990 levels by 2020.
- Pursue California energy policy, which states that energy efficiency is the resource of first choice for meeting California's energy needs.
- Act on the findings of California's Integrated Energy Policy Report which concluded that the standards are the most cost-effective means to achieve energy efficiency, reduce electricity and peak demand, and reduce energy used in meeting California's water needs and reduce California's GHG emissions.
- Meet the West Coast Governors' Global Warming Initiative commitment to include aggressive energy efficiency measures into updates of the California Building Standards Code.
- Meet the energy efficiency goals of Executive Order S-20-04, which established California's Green Building Initiative to improve the energy efficiency of nonresidential buildings by 20% by the year 2015.

C. Regional Regulations – Air Quality Management Districts

As outlined in Section 4.6 (Air Quality), Riverside County spans three different air basins: South Coast, Salton Sea and Mojave Desert. The portions of Riverside County within the South Coast and Salton Sea air basins are regulated by the South Coast Air Quality Management District (SCAQMD), which also governs Los Angeles and Orange counties, plus a small portion of San Bernardino County. The easternmost third of Riverside County, that within the Mojave Desert Air Basin, is under the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD), which also governs most of San Bernardino County. The AQMDs are charged by CARB and the State of California with promoting and improving the air quality of their jurisdictions' basins. This is accomplished though air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations and by supporting and implementing measures to reduce emissions from motor vehicles.

After AB 32 was passed, SCAQMD formed a Climate Change Committee along with a Greenhouse Gases CEQA Significance Thresholds Working Group and the SoCal Climate Solutions Exchange Technical Advisory Group.

In September 2008, the SCAQMD Board or Directors approved the "SCAQMD Climate Change Policy," which outlines actions the SCAQMD will take to assist businesses and local governments in implementing climate change measures, decrease the agency's carbon emissions and provide information to the public regarding climate change. Also in 2008, the SCAQMD Board approved interim CEQA GHG significance thresholds for stationary sources of GHG emissions and related rules and plans. SCAQMD also adopted a tiered approach for determining significance of projects' impacts relative to GHGs. Projects that are exempt from CEQA or consistent with an approved local GHG reduction plan can be found to be less than significant. Other threshold "tiers" capture various levels of GHG emissions. The adopted interim CEQA GHG significance thresholds for stationary sources were adopted by the SCAQMD Governing Board on December 5, 2008, and can be found on the SCAQMD website: www.aqmd.gov/hb/2008/December/081231a.htm.

D. Riverside County Regulations

The following Riverside County ordinances and County Board of Supervisors (BOS) policies address impacts related to global climate change and related issues, such as energy efficiency.

Ordinance No. 706 - Mobile Source Air Pollution Reduction Programs (Funding): This ordinance supports the SCAQMD's imposition of the vehicle registration fee and brings the County into compliance with the requirements of the California Health and Safety Code in order to receive fee revenues for the purpose of implementing programs to reduce air pollution from motor vehicles. Motor vehicles are a large source of both air pollution and GHG emissions, and programs that reduce the use or increase the efficiency of motor vehicles reduce both air pollution and GHG emissions.

Ordinance No. 726 - Transportation Demand Management for New Development: This ordinance sets the following goals for efficiently utilizing Riverside County's existing and planned transportation system and reducing vehicle emissions:

- Reduce vehicle trips generated by new development by 12% commencing in 1994, by 20% commencing in 2000 and by 30% commencing in 2006.
- Reduce overall projected 1994 vehicle trips emanating from the County of Riverside by 7%.
- Relieve traffic congestion in an effort to improve air quality.
- Produce an efficient transportation demand management (TDM) system which utilizes the existing system to its best potential.
- Maintain or achieve minimum level of service of "C" for all new development projects.

The ordinance further requires proposed projects prepare a traffic impact analysis, which must include a Transportation Demand Management Plan describing proposed trip levels and outlining proposed TDM measures for the project to achieve the necessary reductions. Since 40% of Riverside County's GHG emissions come from vehicular sources, these traffic-reducing measures will also reduce GHG levels.

Ordinance No. 748 - Mitigation of Traffic Congestion through Signalization: This ordinance adopts and sets forth policies, regulations and fees for the funding and installation of traffic signals for mitigation of cumulative environmental impacts due to traffic congestion generated by new developments and land use changes. By aiding in reducing traffic, this ordinance also serves to help reduce GHG emissions in Riverside County.

Ordinance No. 782 - Golf Cart Transportation Plan: This ordinance establishes a golf cart transportation program within the County of Riverside. The golf cart transportation plan, authorized by California's Streets and Highways Code, extends the use of golf carts for transportation beyond access to golf courses. Utilizing golf carts can reduce automobile trips and associated vehicular emissions, thus improving air quality and reducing GHG emissions.

Ordinance No. 824 - Western Riverside County Traffic Uniform Mitigation Fee (TUMF) Program: This ordinance authorizes Riverside County's participation in the Western Riverside Council of Government (WRCOG) Transportation Uniform Mitigation Fee (TUMF) program. The purpose of the TUMF program is to fund scheduled improvements to the regional system of highways and arterials in western Riverside County. WRCOG studies show that future development within western Riverside County and its cities will result in traffic volumes exceeding the capacity of the regional system as it presently exists. Thus, TUMF is needed to provide improvements to the regional system to reduce traffic congestion. Increased traffic flow and decreased idling time as a result of the traffic improvements will decrease vehicle fuel consumption and reduce GHG emissions.

Ordinance No. 659 - Development Impact Fee (DIF) Program for Residential Development: The Development Impact Fee (DIF) established by this ordinance is collected by Riverside County for each residential unit, development project or portion thereof to be constructed in order to assist in providing revenue to acquire or construct public facilities, purchase regional parkland and preserve habitat and open space. Constructing public facilities and preserving open space associated with new developments is necessary to prevent adverse impacts and promote public health and safety. Specifically, air pollutants and GHG emissions are reduced by the convenient location of public facilities in close proximity to new developments, thus reducing vehicle travel. Preservation of open space both helps improve air quality and prevent urban sprawl into natural areas.

Ordinance No. 655 - Regulating Light Pollution: This ordinance limits the use of lights within the vicinity of the Palomar Observatory. Although the primary intent of the ordinance is to limit light pollution in order to avoid interference with astronomical observation and research, the ordinance also limits the amount of time lights can be on. This conserves electricity and indirectly reduces greenhouse gases emissions.

Ordinance No. 859 - Establishing Water-Efficient Landscaping Standards: This ordinance establishes provisions for water management practices and water waste prevention and creates a structure for planning, designing, installing, maintaining and managing water-efficient landscapes in new rehabilitated projects. It was adopted to implement the requirements of the 2006 California Water Conservation in Landscaping Act and CCR Title 23, Division 2, Chapter 2.7. It generally requires new development landscaping to not exceed a maximum water demand of 70% (or lower as may be required by state legislation). It also includes provisions to eliminate water waste from overspray and runoff and raise public awareness of the need to conserve water through education and motivation. Increasing water efficiency works towards reducing GHG emissions by reducing electricity associated with water use and, thus, the associated GHG emissions.

Ordinance No. 559 - Regulating the Removal of Trees: This ordinance states that "no person shall remove any living native tree on any parcel or property greater than one-half acre in size, located in an area above 5,000 feet in elevation and within the unincorporated area of the County of Riverside, without first obtaining a permit to do so." Trees, as they grow, provide carbon storage; keeping trees in their place retains this storage of GHGs.

Ordinance No. 695 - Requiring the Abatement of Hazardous Vegetation: The main purpose of this ordinance is to product Riverside County residents and homes from wildfires. The policy requires all owners or occupants to remove all combustible material and hazardous vegetation. This ordinance help reduce fire risks; wildfires release large amounts of air pollutants, such as soot, and also naturally occurring GHGs.

Ordinance No. 810 - Establishing an Interim Open Space Mitigation Fee: This ordinance implements the Western Riverside County Multiple Species Habitat Conservation Plan (WRC-MSHCP) and mitigates impacts of new development in western Riverside County. It establishes a development mitigation fee in order to help finance the acquisition of lands containing species protected by the WRC-MSHCP. By preserving these habitats and assessing a fee to develop in these open space areas, the ordinance helps to limit sprawl and encourage concentrated development, thereby reducing GHG emissions that would arise from trips between wider-flung land uses.

Ordinance No. 875 - Establishing Mitigation Fees for Coachella Valley Multi-Species Habitat Conservation Plan: This ordinance helps to enable Riverside County to achieve the conservation goals set forth in the Coachella Valley Multiple Species Habitat Conservation Plan/Natural Community Conservation Plan (CV-MSHCP). Similar to Ordinance No. 810, this ordinance establishes a fee to help finance the acquisition of lands supporting species protected by the CV-MSHCP.

Board of Supervisors (BOS) Policy A-64 - Environmental Purchasing: This policy directs Riverside County's departments to purchase environmentally friendly materials whenever possible. These can include energy-efficient light bulbs, low emissions vehicles and items made from recycled content. By choosing energy-efficient technologies and recycled materials, GHG emissions from electricity and waste are reduced.

BOS Policy H-4 - Energy Conservation: Policy H-4 states that all County of Riverside departments are responsible for conserving energy. It also directs the Riverside County Economic Development Agency to oversee energy conservation efforts with regard to building heating and cooling systems, lighting, building controls and water conservation by county facilities. It also focuses on energy conservation and rebate/ incentive programs as well as energy conservation education and awareness. Other Riverside County agencies and departments are instructed to appoint an energy conservation representative to enforce energy conservation measures.

BOS Policy H-25 - Water Efficient Landscaping: This policy provides for the design, installation and maintenance of water-efficient landscapes for county-owned or county-maintained facilities. This policy will help reduce public facility water consumption and prevent water waste. Transporting water to Southern California is energy-intensive and efforts to reduce water use translates to reduced electricity use to pump the water from Northern California and reduces GHG emissions associated with electricity use in Riverside County.

BOS Policy H-29 - Sustainable Building: This policy establishes the use of sustainable building practices in the design of Riverside County capital improvement projects in order to reduce pollution, protect natural resources, enhance asset value, optimize building performance and create healthier workplaces for Riverside County employees. In addition to reducing operating costs, the use of sustainable building design reduces GHG emissions associated with electricity use, natural gas use, water use and solid waste generation.

E. Existing County General Plan Policies

The following policies are already part of the General Plan and are not part of the project, GPA No. 960. Rather, these policies are considered to play a role in ensuring any potential environmental effects related to GHGs are avoided, reduced or minimized through their application on a case-by-case basis. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project conditions of approval.

1. Land Use (LU) Element

Policy LU 2.1: Accommodate land use development in accordance with the patterns and distribution of use and density depicted on the General Plan Land Use Map (Figure LU-1) and the Area Plan land use maps, in accordance with the following:

a. Provide a land use mix at the countywide and area plan levels based on projected need and supported by evaluation of impacts to the environment, economy, infrastructure and services.

b. Accommodate a range of community types and character, from agricultural and rural enclaves to urban and suburban communities.

c. Provide for a broad range of land uses, intensities and densities, including a range of residential, commercial, business, industry, open space, recreation and public facilities uses.

d. Concentrate growth near community centers that provide a mixture of commercial, employment, entertainment, recreation, civic and cultural uses to the greatest extent possible.

e. Concentrate growth near or within existing urban and suburban areas to maintain the rural and open space character of Riverside County to the greatest extent possible.

f. Site development to capitalize upon multi-modal transportation opportunities and promote compatible land use arrangements that reduce reliance on the automobile.

g. Prevent inappropriate development in areas that are environmentally sensitive or subject to severe natural hazards.

Policy LU *8.12* (Previously LU 7.12): Improve the relationship and ratio between jobs and housing so that residents have an opportunity to live and work within the county.

Policy LU *11.1* (Previously LU 10.1): Provide sufficient commercial and industrial development opportunities in order to increase local employment levels and thereby minimize long-distance commuting.

Policy LU *11.3* (Previously LU 10.3): Accommodate the development of community centers and concentrations of development to reduce reliance on the automobile and help improve air quality.

Policy LU *11.4* (Previously LU 10.4): Provide options to the automobile in communities, such as transit, bicycle and pedestrian trails, to help improve air quality.

Policy LU *13.1* (Previously LU 12.1): Provide land use arrangements that reduce reliance on the automobile and improve opportunities for pedestrian, bicycle and transit use in order to minimize congestion and air pollution.

Policy LU *13.2* (Previously LU 12.2): Locate employment and service uses in areas that are easily accessible to existing or planned transportation facilities.

Policy LU *13.3* (Previously LU 12.3): Locate transit stations in community centers and at places of public, employment, entertainment, recreation and residential concentrations.

Policy LU *13.4* (Previously LU 12.4): Incorporate safe and direct multi-modal linkages in the design and development of projects, as appropriate.

2. Circulation (C) Element

Policy C 1.2: Support development of a variety of transportation options for major employment and activity centers including direct access to transit routes, primary arterial highways, bikeways, park-n-ride facilities and pedestrian facilities.

Policy C 1.7: Encourage and support the development of projects that facilitate and enhance the use of alternative modes of transportation, including pedestrian-oriented retail and activity centers, dedicated bicycle lanes and paths, and mixed-use community centers.

Policy C 4.1: Provide facilities for the safe movement of pedestrians within developments, as specified in the County Ordinance regulating the division of land of the County of Riverside.

Policy C 5.2: Encourage the use of drought-tolerant native plants and the use of recycled water for roadway landscaping.

Policy C 11.2: Incorporate the potential for public transit service in the design of developments that are identified as major trip attractions (i.e., community centers, tourist and employment centers), as indicated in ordinances regulating the division of land of the County of Riverside.

Policy C 11.4: Offer incentives to new development to encourage it to locate in a transit-oriented area such as a community center or along a designated transit corridor near a station.

Policy C 11.5: Accommodate transit through higher densities, innovative design and right-of-way dedication.

Policy C *11.6* (Previously C 11.7): Promote development of transit centers and park-n-rides for use by all transit operators, including development of multi-modal facilities.

Policy C 12.1: Support the development and implementation of the Transit Oasis concept in conjunction with RCTC [Riverside County Transportation Commission], local transit operators and cities.

Policy C 13.1: Support continued development and implementation of the Riverside County Transportation Commission Rail Program including new rail lines and stations, the proposed California High Speed Rail System with at least two stations in Riverside County, the Coachella Valley Commuter Rail Service and the proposed Intercity Rail Corridor between Calexico and Los Angeles.

Policy C 13.2: Support continued improvements to AMTRAK and MetroLink rail passenger service within Riverside County and throughout the Southern California region.

Policy C *20.14* (Previously C 20.12): Encourage the use of alternative non-motorized transportation and the use of non-polluting vehicles.

Policy C *21.7* (Previously C 21.9): Encourage development of bus-only lanes and signal synchronization so that transit can help to alleviate congestion.

3. Multipurpose Open Space (OS) Element

Policy OS *2.2* (Previously OS 2.1): Encourage the installation of water-conserving systems such as dry wells and graywater systems, where feasible, especially in new developments. The installation of cisterns or infiltrators shall also be encouraged to capture rainwater from roofs for irrigation in the dry season and flood control during heavy storms.

Policy OS 2.5: Encourage continued agricultural water conservation and recommend the following practices where appropriate and feasible: lining canals, recovering tail water at the end of irrigated fields and appropriate scheduling of water deliveries.

Policy OS 10.1: Provide for orderly and efficient wind energy development in a manner that maximizes beneficial uses of the wind resource and minimizes detrimental effects to the residents and the environment of the county.

Policy OS 11.1: Enforce the state Solar Shade Control Act, which promotes all feasible means of energy conservation and all feasible uses of alternative energy supply sources.

Policy OS 11.2: Support and encourage voluntary efforts to provide active and passive solar access opportunities in new developments.

Policy OS 11.3: Permit and encourage the use of passive solar devices and other state-of-the-art energy resources.

Policy OS 12.1: Allow for the development of non-electrical, direct heat uses of geothermal heat and fluids for space, agricultural and industrial heating in situations and localities where naturally occurring hydrothermal features will not be degraded.

Policy OS 16.2: Specify energy efficient materials and systems, including shade design technologies, for county buildings.

Policy OS 16.3: Implement public transportation systems that utilize alternative fuels when possible, as well as associated urban design measures that support alternatives to private automobile use.

Policy OS 16.4: Undertake proper maintenance of County physical facilities to ensure that optimum energy conservation is achieved.

Policy OS 16.5: Utilize federal, State and utility company programs that encourage energy conservation.

Policy OS 16.6: Assist public buildings and institutions in converting asphalt to greenspace to address the heat island effect.

Policy OS 16.7: Promote purchasing of energy-efficient equipment based on a fair return on investment and use energy-savings estimates as one basis for making purchasing decisions regarding major energy-using devices.

Policy OS 16.8: Promote coordination of new public facilities with mass transit service and other alternative transportation services, including bicycles, and design structures to enhance mass transit, bicycle and pedestrian use.

Policy OS 16.9: Encourage increased use of passive, solar design and day-lighting in existing and new structures.

Policy OS 16.10: Encourage installation and use of cogenerating systems where they are cost-effective and appropriate.

4. Air Quality (AQ) Element

Policy AQ 1.1: Promote and participate with regional and local agencies, both public and private, to protect and improve air quality.

Policy AQ 1.2: Support the Southern California Association of Government's (SCAG) Regional Growth Management Plan by developing intergovernmental agreements with appropriate governmental entities such as the Western Riverside Council of Governments (WRCOG), the Coachella Valley Association of Governments (CVAG), sanitation districts, water districts and those subregional entities identified in the Regional Growth Management Plan.

Policy AQ 1.3: Participate in the development and update of those regional air quality management plans required under federal and State law, and meet all standards established for clean air in these plans.

Policy AQ 1.4: Coordinate with the SCAQMD and MDAQMD to ensure that all elements of air quality plans regarding reduction of air pollutant emissions are being enforced.

Policy AQ 1.5: Establish and implement air quality, land use and circulation measures that improve not only the County's environment but the entire regions.

Policy AQ 1.6: Establish a level field by working with local jurisdictions to simultaneously adopt policies similar to those in this Air Quality Element.

Policy AQ 1.7: Support legislation which promotes cleaner industry, clean fuel vehicles and more efficiently-burning engines and fuels.

Policy AQ 1.8: Support the introduction of federal, state or regional enabling legislation to permit the County to promote inventive air quality programs, which otherwise could not be implemented.

Policy AQ 1.9: Encourage publicly recognized and reward innovative approaches that improve air quality.

Policy AQ 1.10: Work with regional and local agencies to evaluate the feasibility of implementing a system of charges (e.g., pollution charges, user fees, congestion pricing and toll roads) that requires individuals who undertake polluting activities to bear the economic cost of their actions where possible.

Policy AQ 1.11: Involve environmental groups, the business community, special interests, and the general public in the formation and implementation of programs that effectively reduce airborne pollutants.

Policy AQ 2.1: The County land use planning efforts shall assure that sensitive receptors are separated and protected from polluting point sources to the greatest extent possible.

Policy AQ 2.2: Require site plan designs to protect people and land uses sensitive to air pollution through the use of barriers and/or distance from emissions sources when possible.

Policy AQ 2.3: Encourage the use of pollution control measures such as landscaping, vegetation and other materials, which trap particulate matter or control pollution.

Policy AQ 2.4: Consider creating a program to plant urban trees to an Area Plan basis that removes pollutants from the air provides shade and decreases the negative impacts on the air.

Policy AQ 3.1: Allow the market place, as much as possible, to determine the most economical approach to relieve congestion and cut emissions.

Policy AQ 3.2: Seek new cooperative relationships between employers and employees to reduce vehicle miles traveled.

Policy AQ 3.4: Encourage employee rideshare and transit incentives for employers with more than 25 employees at a single location.

Policy AQ 4.5: Require stationary pollution sources to minimize the release of toxic pollutants through:

- Design features;
- Operating procedures
- Preventive maintenance;
- Operator training; and,
- Emergency response planning

Policy AQ 4.6: Require stationary air pollution sources to comply with applicable air district rules and control measures.

Policy AQ 4.8: Expand, as appropriate, measures contained in the County's Fugitive Dust Reduction Program for the Coachella Valley to the entire County.

Policy AQ 4.9: Require compliance with SCAQMD Rules 403 and 403.1, and support appropriate future measures to reduce fugitive dust emanating from construction sites.

Policy AQ 4.10: Coordinate with the SCAQMD and MDAQMD to create a communications plan to alert those conducting grading operations in the County of first, second, and third stage smog alerts, and when wind speeds exceed 25 miles per hour. During these instances all grading operations should be suspended.

Policy AQ 5.1: Utilize source reduction, recycling and other appropriate measures to reduce the amount of solid waste disposed of in landfills.

Policy AQ 5.2: Adopt incentives and/or regulations to enact energy conservation requirements for private and public developments.

Policy AQ 5.4: Encourage the incorporation of energy-efficient design elements, including appropriate site orientation and the use of shade and windbreak trees to reduce fuel consumption for heating and cooling.

Policy AQ 6.1: Assist small business by developing education and job training programs, especially in job-poor areas.

Policy AQ 6.2: Collaborate with local colleges and universities to develop appropriate education programs to assist residents in obtaining job skills to meet market demands.

Policy AQ 7.1: Provide incentives to encourage new firms to locate within the County and existing firms to expand operations.

Policy AQ 7.2: Work with SCAQMD and MDAQMD to develop a means to encourage the location of new commercial and industrial development in those localities where jobs are most needed.

Policy AQ 7.3: Create a loan program to encourage small business to located within the County.

Policy AQ 7.4: Offer incentives to businesses to control emissions and implement the AQMP.

Policy AQ 7.5: Reduce regulations on small businesses wherever possible and thereby encourage small business development and job creation. The County shall set performance standards as well as design standards, thus giving small business owners as many options as possible to comply with County regulations.

Policy AQ 7.6: Adopt policies freeing small businesses from unnecessary and duplicative paperwork.

Policy AQ 7.7: Assemble information collected from County agencies and departments concerning the business community to develop programs that better serve their needs.

Policy AQ 8.1: Locate new public facilities in job-poor areas of the County.

Policy AQ 8.2: Emphasize job creation and reductions in vehicle miles traveled in job-poor areas to improve air quality over other less efficient methods.

Policy AQ 8.3: Time and locate facilities and services so that they further enhance job creation opportunities.

Policy AQ 8.4: Support new mixed-use land use patterns and community centers which encourage community self-sufficiency and containment, and discourage automobile dependency.

Policy AQ 8.5: Develop community centers in conformance with policies contained in the Land Use Element.

Policy AQ 8.6: Encourage employment centers in close proximity to residential uses.

Policy AQ 8.7: Implement zoning code provisions which encourage community centers, telecommuting and home-based businesses.

Policy AQ 8.8: Promote land use patterns which reduce the number and length of motor vehicle trips.

Policy AQ 8.9: Promote land use patterns that promote alternative modes of travel.

Policy AQ 9.1: Cooperate with local, regional, state and federal jurisdictions to reduce vehicle miles traveled and motor vehicle emissions through job creation.

Policy AQ 9.2: Attain performance goals and/or VMT reductions which are consistent with SCAG's Growth Management Plan.

Policy AQ 10.1: Encourage trip reduction plans to promote alternative work schedules, ridesharing, tele-commuting and work-at-home programs, employee education and preferential parking.

Policy AQ 10.2: Use incentives, regulations and Transportation Demand Management in cooperation with surrounding jurisdictions when possible to eliminate vehicle trips which would otherwise be made.

Policy AQ 10.3: Assist merchants in encouraging their customers to shift from single occupancy vehicles to transit, carpools, bicycles or foot.

Policy AQ 10.4: Continue to enforce the County's Transportation Demand Management Ordinance and update as necessary.

Policy AQ 11.1: Establish requirements for special event centers to provide off-site parking and park-n-ride facilities at remote locations. Remote parking should be as close to practicable to the event site and the operator should supply shuttle services.

Policy AQ 11.2: Promote the use of peripheral parking by increasing on-site parking rates and offering reduced rates to peripheral parking with tickets sold for non-ridesharing patrons.

Policy AQ 11.3: Encourage special event center operators to advertise and offer discounted transit passes with event tickets.

Policy AQ 11.4: Encourage special event center operators to advertise and offer discount parking incentives to carpooling patrons, with two or more persons per vehicle, for on-site facilities.

Policy AQ 12.1: Manage traffic flow through signal synchronization, while coordinating with and permitted the free flow of mass transit vehicles, when possible.

Policy AQ 12.2: Synchronize signals through the County with those of its cities, adjoining counties and the California Department of Transportation.

Policy AQ 12.3: Construction and improve traffic signals with channelization and Automated Traffic Surveil-lance and Control systems at appropriate intersections.

Policy AQ 12.4: Eliminate traffic hazards and delays through highway maintenance, rapid emergency response, debris removal, and elimination of at-grade railroad crossings, when possible.

Policy AQ 12.5: Encourage business owners to schedule deliveries at off-peak traffic periods.

Policy AQ 13.1: Manage the County of Riverside transportation fleet fueling standards to achieve an appropriate alternate fuel fleet mix.

Policy AQ 13.2: Cooperate with local, regional state, and federal jurisdictions to better manage transportation facilities and fleets.

Policy AQ 13.3: Encourage the construction of high-occupancy-vehicle (HOV) lanes whenever possible to relieve congestion, safety hazards and air pollution described in the AQMP

Policy AQ 14.1: Emphasize the use of high occupancy vehicle lanes, light rail and bus routes, and pedestrian and bicycle facilities when using transportation facility development to improve mobility and air quality.

Policy AQ 14.2: When developing new capital facility improvement plans, also consider measures such as Transportation Demand Management, Transportation Systems Management, and job/housing balance strategies.

Policy AQ 14.3: Monitor traffic and congestion to determine when and where the County needs new transportation facilities to achieve increased mobility efficiency.

Policy AQ 14.4: Preserve transportation corridors with high demand potential or regional significance for future expansion to meet project demand.

Policy AQ 15.1: Identify and monitor sources, enforce existing regulations, and promote stronger control to reduce particulate matter.

Policy AQ 16.1: Cooperate with, regional, state and federal jurisdictions to better control particulate matter.

Policy AQ 16.2: Encourage stricter state and federal legislation on bias belted tires, smoking vehicles, and vehicles that spill debris on streets and highways, to better control particulate matter.

Policy AQ 16.3: Collaborate with SCAQMD and MDAQMD to require and/or encourage the adoption of regulations or incentives to limit the amount of time trucks may idle.

Policy AQ 16.4: Collaborate with EPA, SCAQMD, MDAQMD, and warehouse owners and operators to create regulations and programs to reduce the amount of diesel fumes released due to warehousing operations.

Policy AQ 17.1: Reduce particulate matter from agriculture, construction, demolition, debris hauling, street cleaning, utility maintenance, railroad rights-of-way, and off-road vehicles to the extent possible.

Policy AQ 17.2: Enforce regulations against illegal fires.

Policy AQ 17.3: Identify and create a control plan for areas within the County prone to wind erosion of soil.

Policy AQ 17.4: Adopt incentives, regulations and/or procedures to manage paved and unpaved roads and parking lots so they produce the minimum practicable level of particulates.

Policy AQ 17.5: Adopt incentives and/or procedures to limit dust from agricultural lands and operations, where applicable.

Policy AQ 17.6: Reduce emissions from building materials and methods that generate excessive pollutants, through incentives and/or regulations.

Policy AQ 17.7: Separate trucks from other vehicles in industrial areas of the County with the creation of truck-only access lanes to promote the free flow of traffic.

Policy AQ 17.8: Adopt regulations and programs necessary to meet state and federal guidelines for diesel emissions.

Policy AQ 17.9: Encourage the installation and use of electric service units at truck stops and distribution centers for heating and cooling truck cabs, and particularly for powering refrigeration trucks in lieu of idling of engines for power.

Policy AQ 17.10: Promote and encourage the use of natural gas and electric vehicles in distribution centers.

Policy AQ 17.11: Create and implement street-sweeping plans, as appropriate, in areas of the County disproportionately affected by particulate matter pollution.

F. Proposed New or Revised County General Plan Policies

The following revisions, deletions and additions are proposed for the General Plan as part of GPA No. 960 to address greenhouse gases.

1. Land Use (LU) Element

Policy LU 1.5: The County shall participate in regional efforts to address issues of mobility, transportation, traffic congestion, economic development, air and water quality**,** watershed ~~and~~ habitat management~~, child care~~ with cities, local and regional agencies, stakeholders, Indian nations and surrounding jurisdictions.

Policy LU 4.1: Require that new developments be located and designed to visually enhance, not degrade the character of the surrounding area through consideration of the following concepts:

a. Compliance with the design standards of the appropriate area plan land use category.

b. Require that structures be constructed in accordance with the requirements of the County's zoning, building and other pertinent codes and regulations.

c. Require that an appropriate landscape plan be submitted and implemented for development projects subject to discretionary review.

d. Require that new development utilize drought tolerant landscaping and incorporate adequate drought-conscious irrigation systems.

e. Pursue energy efficiency through street configuration, building orientation and landscaping to capitalize on shading and facilitate solar energy, as provided for in Title 24*, Part 6 and/or Part 11,* of the California ~~Administrative~~ Code *of Regulations (CCR)*.

f. Incorporate water conservation techniques, such as groundwater recharge basins, use of porous pavement, drought-tolerant landscaping and water recycling, as appropriate.

g. Encourage innovative and creative design concepts.

h. Encourage the provision of public art *that enhances the community's identity, which may include elements of historical significance and creative use of children's art*.

i. Include consistent and well-designed signage that is integrated with the building's architectural character.

j. Provide safe and convenient vehicular access and reciprocal access between adjacent commercial uses.

k. Locate site entries and storage bays to minimize conflicts with adjacent residential neighborhoods.

l. Mitigate noise, odor, lighting and other impacts on surrounding properties.

m. Provide and maintain landscaping in open spaces and parking lots.

n. Include extensive landscaping.

o. Preserve natural features, such as unique natural terrain, *arroyos, canyons and other* drainage ways, and native vegetation, wherever possible, particularly where they provide continuity with more extensive regional systems.

p. Require that new development be designed to provide adequate space for pedestrian connectivity and access, recreational trails, vehicular access and parking, supporting functions, open space and other pertinent elements.

q. Design parking lots and structures to be functionally and visually integrated and connected.

r. Site buildings access points along sidewalks, pedestrian areas and bicycle routes, and include amenities that encourage pedestrian activity.

s. Establish safe and frequent pedestrian crossings.

t. Create a human-scale ground floor environment that includes public open areas that separate pedestrian space from auto traffic or where mixed, it does so with special regard to pedestrian safety.

u. Recognize open space, including hillsides, arroyos, riparian areas and other natural features as amenities that add community identity, beauty, recreational opportunities and monetary value to adjacent developed areas.

v. Manage wild land fire hazards in the design of development proposals located adjacent to natural open space.

Policy LU *9.1* (Previously LU 8.1): Provide for permanent preservation of open space lands that contain important natural resources, *cultural resources,* hazards, water features, watercourses *including arroyos and canyons* and scenic and recreational values.

2. Circulation (C) Element

Policy C *4.8* (Previously C 4.9): Coordinate with all transit operators to ensure that *ADA compliant* pedestrian facilities are provided along and/or near all transit routes, whenever feasible. New land developments may be required to provide pedestrian facilities due to existing or future planned transit routes even if demand for pedestrian facility ~~is~~ *may* not *be* otherwise warranted.

Policy C 9.2: Support *the expansion of Metrolink service and* transit operators' programs to ~~foster~~ *increase* transit usage *to implement bus rapid transit (BRT) services, and make other express and local bus service improvements.*

Policy C 12.2: Support the development of high-speed transit linkages*, bus rapid transit (BRT)* or express routes between community centers and other major nodes of activity.

Policy C 13.3: Support implementation of the San Jacinto Branch Line to serve ~~planned industrial development~~ *commuter uses*.

Policy C 17.3: Ensure that the bikeway system incorporates the following:

a. Interconnection *throughout and between* ~~of~~ cities and unincorporated communities.

b. ~~Provision of~~ *Appropriate* lanes to specific destinations such as state or county parks.~~;~~

c. ~~Provision for~~ *Appropriate opportunities for recreational bicycle riding and* bicycle touring.~~; and~~

d. ~~Encouragement of~~ *Opportunities for* bicycle commuting~~.~~ *and golf cart commuting within a community, as appropriate for the terrain, traffic levels and proximity to surrounding destinations.*

e. Bikeways connecting to all urban transit centers and systems (bus stops and Metrolink stations) in the vicinity.

f. Bicycle parking at transit stops and park-and-ride lots.

Policy C 17.4: Ensure that alternative modes of motorized transportation, such as buses, trains, *taxi cabs,* etc., plan and provide for transportation of recreational and commuting bicyclists and bicycles on public transportation systems. *Coordinate with all transit operators to ensure that bicycle facilities are provided along and/or near all transit routes, whenever feasible. New land developments shall be required to provide bicycle facilities due to existing or future planned transit routes.*

Policy C 21.1: Encourage the installation and use of HOV lanes. Such lanes should be continuous, linking major population centers with employment centers. If HOV lanes are used, consider making them available for mixed flow traffic during non-peak periods where warranted and feasible. *Consider and implement, where feasible and needed, direct HOV connections between freeways and arterial-to-freeway exclusive HOV ingress/egress ramps.*

3. Air Quality (AQ) Element

Policy AQ 4.1: *Require* ~~Encourage~~ the use of *all feasible* building materials/methods which reduce emissions.

Policy AQ 4.2: *Require* ~~Encourage~~ the use of *all feasible* efficient heating equipment and other appliances, such as water heaters, swimming pool heaters, cooking equipment, refrigerators, furnaces and boiler units.

Policy AQ 4.3: *Require* ~~Encourage~~ centrally heated facilities to utilize automated time clocks or occupant sensors to control heating *where feasible*.

Policy AQ 4.4: Require residential building construction to comply with energy use guidelines detailed in *Part 6 (California Energy Code) and/or Part 11 (California Green Building Standards Code) of* Title 24 of the California ~~Administrative~~ Code *of Regulations*.

Policy AQ 4.7 To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, MDAQMD, ~~SOCAB~~ *SCAB*, the Environmental Protection Agency and the California Air Resources Board.

NEW **Policy AQ 18.1:** *Baseline emissions inventory and forecast. Riverside County CAP has included baseline emissions inventory with data from the County's CO2e emissions for specific sectors and specific years. The carbon inventory greatly aids the process of determining the type, scope and number of greenhouse gas reduction policies needed. It also facilitates the tracking of policy*

implementation and effectiveness. The carbon inventory for the county consists of two distinct components; one inventory is for the county as a whole, as defined by its geographical borders and the other inventory is for the emissions resulting from the County's municipal operations.

NEW **Policy AQ 18.2:** *Adopt GHG emissions reduction targets. Pursuant to the results of the Carbon Inventory and Greenhouse Gas Analysis for Riverside County, future development proposed as a discretionary project pursuant to the General Plan shall achieve a greenhouse gas emissions reduction of 25% compared to Business As Usual (BAU) project in order to be found consistent with the County's Climate Action Plan (CAP).*

NEW **Policy AQ 18.3:** *Develop a Climate Action Plan (CAP) for reducing GHG emissions. The Riverside County CAP has been developed to formalize the measures necessary to achieve county greenhouse gas emissions reduction targets. The CAP includes both the policies necessary to meet stated targets and objectives are met. These targets, objectives and Implementation Measures may be refined, superseded or supplemented as warranted in the future.*

NEW **Policy AQ 18.4:** *Implement policies and measures to achieve reduction targets. The County shall implement the greenhouse gas reduction policies and measures established under the County Climate Action Plan for all new discretionary development proposals.*

NEW **Policy AQ 18.5:** *Monitor and verify results. The County shall monitor and verify the progress and results of the CAP periodically. When necessary the CAP's "feedback" provisions shall be used to ensure that any changes needed to stay "on target" with stated goals are accomplished.*

NEW **Policy AQ 19.1:** *Continue to coordinate with CARB, SCAQMD and the State Attorney General's office to ensure that the milestones and reduction strategies presented in the General Plan and the CAP adequately address the county's greenhouse gas emissions.*

NEW **Policy AQ 19.2:** *Utilize the County's CAP as the guiding document for determining the County's greenhouse gas reduction thresholds and implementation programs. Implementation of the CAP and its monitoring program shall include the ability to expand upon or, where appropriate, update or replace the Implementation Measures established herein so that the implementation of the CAP accomplishes the greenhouse gas reduction targets.*

NEW **Policy AQ 19.3:** *Require new development projects subject to County discretionary approval to achieve the ~~greenhouse gas~~ GHG reduction targets established in the CAP either through:*

a. Garnishing 100 points through the Implementation Measures found the County's CAP; or

b. Requiring quantification of project-specific GHG emissions and reduction of GHG emissions to, at minimum, the applicable GHG reduction threshold established in the CAP.

NEW **Policy AQ 19.4:** *All discretionary project proposals shall analyze their project-specific GHG reduction targets in comparison to the "business as usual" (BAU) scenario for the development's operational life and the "operational life" of a new development shall be defined as a 30-year span. Other methods for calculating BAU and showing GHG emissions reductions may be used provided such methods are both scientifically defensible and show actual emission reduction measures incorporated into project design, mitigation or alternative selection. Alternatively, a project may use the CAP Screening Tables to show the attainment of the applicable number of points needed to ensure adequate GHG reductions and CAP compliance.*

NEW **Policy AQ 20.1:** *Reduce VMT by requiring expanded multi-modal facilities and services that provide transportation alternatives, such as transit, bicycle and pedestrian modes. Improve connectivity of the multi-modal facilities by providing linkages between various uses in the developments.*

NEW **Policy AQ 20.2:** *Reduce VMT by facilitating an increase in transit options. In particular, coordinate with adjacent municipalities, transit providers and regional transportation planning agencies to develop mutual policies and funding mechanisms to increase the use of alternative transportation.*

NEW **Policy AQ 20.3:** *Reduce VMT and GHG emissions by improving circulation network efficiency.*

NEW **Policy AQ 20.4:** *Reduce VMT and traffic through programs that increase carpooling and public transit use, decrease trips and commute times, and increase use of alternative-fuel vehicles.*

NEW **Policy AQ 20.5:** *Reduce emissions from standard gasoline vehicles, through VMT, by requiring all new residential units to install circuits and provide capacity for electric vehicle charging stations.*

NEW **Policy AQ 20.6:** *Reduce emissions from commercial vehicles, through VMT, by requiring all new commercial buildings, in excess of 162,000 square feet, to install circuits and provide capacity for electric vehicle charging stations.*

NEW **Policy AQ 20.7:** *Reduce VMT through increased densities in urban centers and encouraging emphasis on mixed use to provide residential, commercial and employment opportunities in closer proximity to each other. Such measures will also support achieving the appropriate jobs-housing balance within the communities.*

NEW **Policy AQ 20.8:** *Reduce VMT by increasing options for non-vehicular access through urban design principles that promotes higher residential densities with easily accessible parks and recreation opportunities nearby.*

NEW **Policy AQ 20.9:** *Reduce urban sprawl in order to minimize energy costs associated with infrastructure construction and transmission to distant locations, and to maximize protection of open space.*

NEW **Policy AQ 20.10:** *Reduce energy consumption of the new developments (residential, commercial and industrial) through efficient site design that takes into consideration solar orientation and shading as well as passive solar design.*

NEW **Policy AQ 20.11:** *Increase energy efficiency of the new developments through efficient use of utilities (water, electricity, natural gas) and infrastructure design. Also, increase energy efficiency through use of energy efficient mechanical systems and equipment.*

NEW **Policy AQ 20.12:** *Support programs to assist the energy-efficient retrofitting of older affordable housing units, particularly residential units built prior to 1978 when Title 24 energy requirements went into effect.*

NEW **Policy AQ 20.13:** *Reduce water use and wastewater generation in both new and existing housing, commercial and industrial uses. Encourage increased efficiency of water use for agricultural activities.*

NEW **Policy AQ 20.14:** *Reduce the amount of water used for landscaping irrigation through implementation of County Ordinance 859 and increase use of non-potable water.*

NEW **Policy AQ 20.15:** *Decrease energy costs associated with treatment of urban runoff water through greater use of bioswales and other biological systems.*

NEW **Policy AQ 20.16:** *Preserve and promote forest lands and other suitable natural and artificial vegetation areas to maintain and increase the carbon sequestration capacity of such areas within the County. Artificial vegetation could include urban forestry and reforestation, development of parks and recreation areas, and preserving unique farmlands that provide additional carbon sequestration potential.*

NEW **Policy AQ 20.17:** *Protect vegetation from increased fire risk associated with drought conditions to ensure biological carbon remains sequestered in vegetation and not released to the atmosphere through wildfires.*

NEW **Policy AQ 20.18:** *Encourage the installation of solar panels and other energy-efficient improvements and facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc.)*

NEW **Policy AQ 20.19:** *Facilitate development of sitting of renewable energy facilities and transmission lines in appropriate locations.*

NEW **Policy AQ 20.20:** *Reduce the amount of solid waste generation by increasing solid waste recycle, maximizing waste diversion, and composting for residential and commercial generators. Reduction in decomposable organic solid waste will reduce the methane emissions at County landfills.*

NEW **Policy AQ 20.21:** *Provide homeowner education programs on the various voluntary ways in which they may reduce their homes' GHG emissions, e.g. improving home insulation, adding solar energy capabilities, and providing information on energy saving landscaping techniques.*

NEW **Policy AQ 20.22:** *Develop motorist education programs on reducing VMT, idling and vehicle maintenance, while increasing carpooling and public transit usage.*

NEW **Policy AQ 20.23:** *Development education programs about green purchasing and waste reduction measures, e.g., use of sustainable materials, recycling, and composting.*

NEW **Policy AQ 20.24:** *Develop programs to improve job-housing balances, such as through small business development, for areas that are housing rich but jobs poor.*

NEW **Policy AQ 20.25:** *Coordinate County GHG emissions reduction efforts with those of other regional agencies and plans, i.e., SCAG's Compass Blueprint, Regional Transportation Plan (RTP) and SCAQMD's Air Quality Management Plans. In addition, coordinate with cities and sub-regional planning agencies, particularly WRCOG and CVAG, on efforts that jointly affect the County and the cities. Also, coordinate with utility and service providers to develop programs to improve energy efficiency, water efficiency and delivery or structural improvements to reduce demand or better coordinate infrastructure development, as appropriate.*

NEW **Policy AQ 20.26:** *Voluntary GHG reduction objectives for the community sector shall be achieved through development and implementation of specific implementation measures, as determined appropriate and feasible by the County.*

NEW **Policy AQ 20.27:** *Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel through fleet transitioning programs. Also, reduce total vehicle miles travel by County employees, both community to work sites and travel for the conduction of County activities.*

NEW **Policy AQ 20.28:** *Increase the energy efficiency of all existing and new County buildings and infrastructure operations (roads, water, waste disposal and treatment, buildings, etc.) Also, decrease energy use through incorporating renewable energy facilities (such as, solar array installations, individual wind energy generators, geothermal heat sources) on County facilities where feasible and appropriate.*

NEW **Policy AQ 20.29:** *Establish purchasing and procurement policies that support the use of green products and services, minimize waste, and promote sustainability.*

NEW **Policy AQ 20.30:** *Reduce potable water use, wastewater and solid generation, and urban runoff at both new and existing County facilities and operations. Also, increase the amount of materials recycled from County facilities.*

NEW **Policy AQ 21.1:** *The County shall require new development projects subject to County discretionary approval to incurporate measures to achieve 100 points through incorporation of the Implementation Measures (IMs) found in the Screening Tables within the Riverside County Climate Action Plan. One hundred points represent a project's fare-share of reduction in operational emissions associated with the developed use needed to reduce emissions down to the CAP Reduction Target.*

a. *This reduction shall be measured in comparison to the "business as usual" (BAU) scenario for the development's operational life. The BAU scenario shall be consistent with the General Plan build out assumptions detailed in Appendix E-1 of the General Plan.*

b. *For the purposes of this policy, the "operational life" of a new development shall be defined as a 30-year span with construction emissions amortized over the 30 years.*

c. *For the purposes of this policy, "new development" refers to private development occurring pursuant to a discretionary land use approval issued by the County of Riverside and subject to binding Conditions of Approval. This definition generally corresponds to projects found non-exempt pursuant to the California Environmental Quality Act (CEQA), but is nevertheless subject to the sole discretion of the County of Riverside as lead agency.*

d. *Other methods for calculating BAU and showing GHG emissions reductions may be used provided such methods are both scientifically defensible and show actual emission reduction measures incorporated into project design, mitigation or alternative selection. That is, reductions must not be illusory "paper" reductions achieved merely through baseline manipulation.*

e. *Nothing in this policy shall be construed as accepting any proposed discretionary project from any legally applicable CEQA requirements or explicitly limiting the scope any analyses required to show CEQA compliance.*

NEW **Policy AQ 21.2:** *Implementation Measures found necessary for a given project pursuant to the CAP Screening Tables shall be incorporated into a project's Conditions of Approval issued by the County to ensure the measures are implemented appropriately.*

NEW **Policy AQ 21.3:** *Discretionary Measures - Because of the varied nature of the private development proposals reviewed by the County, in some cases, the Implementing Measures in the CAP may not provide the most appropriate means for achieving the required Interim GHG reductions. In such cases, the following alternate measures may be utilized, at the County's discretion:*

a. *For large-scale developments, such as specific plans, business parks, industrial centers and those triggering a full environmental impact report, a custom GHG analyses may be warranted to both assure compliance with the applicable targets herein and to provide a customized array of appropriate reduction measures.*

b. *In such cases, the resultant GHG analysis may be used to develop customized GHG reduction measures in place of the CAP's Implementing Measures provided they achieve the stated targets or implement all feasible mitigation short of achieving the applicable targets.*

c. *Project-specific analysis may be particularly valuable when assessing large-scale mixed use developments. In such developments, significant energy efficiencies and VMT reductions can result from smart growth design features, such as provision of housing, jobs, services and recreation within a 5- to 10-minute walking radius. Project-specific analysis in these cases may result in the need for fewer add-on Implementing Measures and potentially yield substantial savings on construction costs.*

NEW **Policy AQ 21.4:** *Implementation of the Climate Action Plan (CAP) and monitoring progress toward the CAP reduction targets shall include the ability to expand upon or, where appropriate, update or replace the Implementation Measures established herein such that the implementation of the CAP accomplishes the county's GHG reduction targets.*

NEW **Policy AQ 22.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions associated with transportation:*

a. *Reduce vehicle miles traveled by providing or requiring expanded multi-modal facilities and services that provide transportation alternatives, such as transit, bicycle and pedestrian modes.*

b. *Reduce vehicle miles traveled by facilitating an increase in transit options. In particular, coordinate with adjacent municipalities, transit providers and regional transportation planning agencies to develop mutual policies and funding mechanisms to increase the use of alternative transportation.*

c. *Improve connectivity by requiring pedestrian linkages between developments and transportation facilities, as well as between residential and commercial, recreational and other adjacent land uses.*

d. *Reduce air pollution and greenhouse gas emissions by improving circulation network efficiency.*

e. *Reduce traffic through programs that increase carpooling and public transit use, decrease trips and commute times and increase use of alternative-fuel vehicles.*

f. *Preserve transportation corridors for renewable energy transmission lines and for new transit lines, where appropriate.*

NEW **Policy AQ 23.1:** *The County shall implement programs and requirements to achieve the following objective related to reducing greenhouse gas emissions associated with land use patterns:*

a. *Reduce vehicle miles travelled (VMT) through increased densities in urban centers and emphasis on mixed use to provide localized residential, commercial and employment opportunities in closer proximity to each other.*

b. *Prevent urban sprawl in order to minimize energy costs associated with infrastructure construction and transmission to distant locations and to maximize protection of open space, particularly forests, which provide carbon sequestration potential.*

c. *Conserve energy by increasing the efficiency of delivery of services through the adoption and implementation of smart growth principles and policies.*

d. *Reduce vehicle miles travelled by commuters through implementation of planning measures that provide appropriate jobs-housing balances within communities.*

e. *Reduce vehicle miles travelled by increasing options for non-vehicular access through urban design principles that promote higher residential densities in attractive forms with easily accessible parks and recreation opportunities nearby.*

f. *Improve energy efficiency through implementation of standards for new residential and commercial buildings that achieve energy efficiencies beyond that required under Title 24 of the California Code of Regulations.*

g. *Reduce vehicle miles travelled by identifying sites for affordable housing for workers close to employment centers and encouraging development of such sites.*

NEW **Policy AQ 23.2:** *For discretionary actions, land use-related greenhouse gas reduction objectives shall be achieved through development and implementation of the appropriate Implementation Measures of the Climate Action Plan for individual future projects. County programs shall also be developed and implemented to address land use-related reductions for County operations and voluntary community efforts.*

NEW **Policy AQ 24.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions achieved through improving energy efficiency and increasing energy conservation:*

a. Require new development (residential, commercial and industrial) to reduce energy consumption through efficient site design that takes into consideration solar orientation and shading, as well as passive solar design. Passive solar design addressed the innate heating and cooling effects achieved through building design, such as selective use of deep eaves for shading, operable windows for cross-ventilation, reflective surfaces for heat reduction and expanses of brick for thermal mass (passive radiant heating).

b. Require new development (residential, commercial and industrial) to design energy efficiency into the project through efficient use of utilities (water, electricity, natural gas) and infrastructure design.

c. Require new development (residential, commercial and industrial) to reduce energy consumption through use of energy efficient mechanical systems and equipment.

d. Establish or support programs to assist in the energy-efficient retrofitting of older affordable housing units.

e. Actively seek out existing or develop new programs to achieve energy efficiency for existing structures, particularly residential units built prior to 1978 when CCR Title 24 energy efficiency requirements went into effect.

f. Balance additional upfront costs for energy efficiency and affordable housing economic considerations by providing or supporting programs to finance energy-efficient housing.

NEW **Policy AQ 24.2:** *For discretionary actions, energy efficiency and conservation objectives shall be achieved through development and implementation of the appropriate Implementation Measures of the Climate Action Plan for all new development approvals. County programs shall also be developed and implemented to address energy efficiency and conservation efforts for County operations and the community.*

NEW **Policy AQ 25.1:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions through water conservation:*

a. Reduce water use in both new and existing housing, commercial and industrial uses.

b. Reduce wastewater generation in both new and existing housing, commercial and industrial uses.

c. Reduce the amount of water used for landscaping irrigation through implementation of County Ordinance No. 859.

d. Increase use of non-potable water where appropriate, such as for landscaping and agricultural uses.

e. Encourage increased efficiency of water use for agricultural activities.

f. Decrease energy costs associated with treatment of urban runoff water through greater use of bioswales and other biological systems.

NEW **Policy AQ 25.2:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions through biota conservation:*

a. Conserve biota that provides carbon sequestration through implementation of the Multiple Species Habitat Conservation Plans for western and eastern Riverside County.

b. Preserve forest lands and other suitable natural vegetation areas to maintain the carbon sequestration capacity of such areas within the county.

c. Promote establishment of vegetated recreational uses, such as local and regional parks, that provide carbon sequestration potential in addition to opportunities for healthy recreation.

d. Promote urban forestry and reforestation, as feasible, to provide additional carbon sequestration potential.

e. Promote the voluntary preservation of farmlands for carbon sequestration purposes. In particular, protect important farmlands and open space from conversion and encroachment by urban uses. Also, seek to retain large parcels of agricultural lands to enhance the viability of local agriculture and prevent the encroachment of sprawl into rural areas.

f. Promote the voluntary preservation of areas of native vegetation that may contribute to biological carbon sequestration functions.

g. Protect vegetation from increased fire risks associated with drought conditions to ensure biological carbon remains sequestered in vegetation and not released to the atmosphere through wildfires. In particular, prevent unnecessary intrusion of people, vehicles and development into natural open space areas to lessen risk of wildfire from human activities.

NEW **Policy AQ 25.3:** *For discretionary actions, greenhouse gas reduction objectives related to water and biota conservation shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan. County programs shall also be developed and implemented to address conservation issues related to County operations and voluntary community efforts.*

NEW **Policy AQ 26.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions derived from energy generation:*

a. Encourage the installation of solar panels and other energy-efficient improvements.

b. Facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc.).

c. Facilitate development of renewable energy facilities and transmission lines in appropriate locations.

d. Facilitate renewable energy facilities and transmission line siting.

e. Provide incentives for development of local green technology businesses and locally produced green products.

f. Provide incentives for investment in residential and commercial energy efficiency improvements.

g. Identify lands suitable for wind power generation or geothermal production and encourage development of these alternative energy sources.

NEW **Policy AQ 26.2:** *For discretionary actions, the objectives for greenhouse gas reduction through increased use of alternative energy sources shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan. County programs shall also be developed and implemented to address use of alternative energy for County operations and within the community.*

NEW **Policy AQ 27.1:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions associated with wastes:*

a. Reduce the amount of solid waste generated.

b. Increase the amount of solid waste recycled by maximizing waste diversion, composting and recycling for residential and commercial generators.

c. Promote reductions in material consumption.

d. Decrease wastewater generation.

e. Reduce fugitive methane emissions and increase methane conversion to alternative energies at County landfills.

NEW **Policy AQ 27.2:** *Greenhouse gas reduction through the above waste reduction objectives shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan for new development. County programs shall also be developed and implemented to address waste reductions for County operations and voluntary community efforts.*

NEW **Policy AQ 28.1:** *The County shall implement programs and requirements to achieve voluntary greenhouse gas emissions reductions through the following public education and outreach objectives:*

a. Provide homeowner education programs on the various voluntary ways in which they may reduce their homes' GHG emissions.

b. Develop and implement motorist education programs on reducing vehicle miles travelled (VMT), idling, vehicle maintenance, etc.

c. Develop and implement incentive programs for increasing carpooling, public transit use and other similar means.

d. Develop and implement incentive programs for residential energy conservation, such as through retrofitting to improve insulation values, adding solar energy capabilities, planting deciduous trees to provide summer shade, etc.

e. Develop and implement programs designed to decrease transportation emissions, such as hybrid vehicle rebates, alternate fuel discounts, carpooling incentives, van pools, etc.

f. Develop and implement education programs about green purchasing and waste reduction measures, consistent with the County's Climate Action Plan e.g., use of sustainable materials, composting and such.

g. Develop and implement programs to improve job-housing balances, such as through small business development, for areas that are housing rich but jobs poor.

h. Develop and implement programs, consistent with the County's Climate Action Plan to incentive recycling and other waste reduction programs.

NEW **Policy AQ 28.2:** *The County shall implement programs and requirements to achieve greenhouse gas emissions reductions through the following interagency coordination Objectives:*

a. Coordinate County regional GHG reduction efforts with those of other regional agencies and plans, i.e.:

- *SCAG Regional Blueprint Plan*

- *SCAG Regional Transportation Plan (which will address SB 375)*
- *SCAQMD Air Quality Management Plans*
- *SB 375 Coordination and "Sustainable Communities Strategies"*

b. *Coordinate with constituent cities and sub-regional planning agencies, particularly WRCOG and CVAG, on GHG reduction efforts that jointly affect the county and these cities.*

c. *Coordinate with utility and service providers serving the county to develop programs to improve energy efficiency, water efficiency and delivery or structural improvements to reduce demand or better coordinate infrastructure development, as appropriate.*

d. *Coordinate with regional agencies responsible for developing utility corridors, particularly for electricity transmission, to ensure alternate energy sources available to the county are used to their fullest extent.*

NEW **Policy AQ 28.3:** *Voluntary greenhouse gas reduction objectives for the community sector shall be achieved through development and implementation of specific implementation measures, as determined appropriate and feasible by the County.*

NEW **Policy AQ 29.1:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions from County transportation, such as fleet composition, construction equipment, employee commuting and travel on County business:*

a. *Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel.*

b. *Increase use of alternative and lower carbon fuels in the County vehicle fleet.*

c. *Reduce total vehicle miles traveled by County employees, both commuting to work sites and traveling for the conduction of County activities.*

NEW **Policy AQ 29.2:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions through improving energy efficiency for County facilities and operations:*

a. *Improve the energy efficiency of all existing and new County buildings.*

b. *Improve the energy efficiency of County infrastructure operation (roads, water, waste disposal and treatment, buildings, etc.)*

c. *Decrease energy use through incorporating renewable energy facilities (such as, solar array installations, individual wind energy generators, geothermal heat sources) on County facilities where feasible and appropriate.*

NEW **Policy AQ 29.3:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions through achieving waste reduction and resource efficiency for County facilities and operations:*

a. *Establish purchasing and procurement policies that support the use of green products and services, minimize waste and promote sustainability.*

b. *Reduce potable water use at both new and existing County facilities and operations.*

c. *Reduce wastewater generation and urban runoff in both new and existing County facilities and operations.*

d. Increase the amount of materials recycled from County facilities while decreasing the amount of solid waste generated by County facilities that requires landfill disposal.

NEW **Policy AQ 29.4:** *Greenhouse gas emissions reduction objectives for County operations and facilities shall be achieved through development and implementation of enforceable and binding internal County policies, programs or similar means.*

4. Multipurpose Open Space (OS) Element

Policy OS 16.1: Continue to implement Title 24 of the ~~State Building Code~~ *California Code of Regulations (the California Building Standards Code), particularly Part 6 (the California Energy Code) and Part 11 (the California Green Building Standards Code), as amended and adopted pursuant to County ordinance*. Establish mechanisms and incentives to encourage architects and builders to exceed the energy efficiency standards ~~of~~ *within CCR* Title 24.

4.7.4 Thresholds of Significance for Greenhouse Gases

The proposed project would result in a significant greenhouse gas emissions impact if it would:

A. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

B. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

4.7.5 Effect of GPA No. 960 on the General Plan and on Greenhouse Gases

As the GHG threshold for determining if emissions would be significant, this EIR uses compliance with AB 32. AB 32, the California Global Warming Solutions Act of 2006, requires that greenhouse gases emitted in California be reduced to 1990 levels by the year 2020. Per its Scoping Plan, CARB recommends to local governments that they adopt a 2020 reduction target that requires a decrease of approximately 15% below current GHG emissions to reach 1990 GHG levels (CARB AB 32 Scoping Plan, page 3). Thus, analysis for this EIR focused on two areas: a) determining the GHG reductions necessary to be found less than significant pursuant to AB 32, and b) developing a program that accomplishes the necessary reductions to ensure future development authorized pursuant to the General Plan is consistent with both AB 32 and the County's Climate Action Plan.

The baseline (2008) Riverside County scenario was calculated as presented in Section 4.7.2. The proposed project's future GHG emissions were analyzed for three different timelines: 2020, 2035 and 2060. For each of these years, emissions were calculated under a BAU scenario and a reduced scenario. The BAU scenarios follow the growth projections in the General Plan update for the various land uses in Riverside County but does not include implementation of the policies to reduce GHG emissions. The inclusion of BAU scenarios allows for evaluation of the growth of emissions from various sectors and sources over time, which provides additional insight into where attention should focus in regard to reducing emissions through policies and implementation measures. The reduced scenarios provide an estimate of Riverside County's emissions with the implementation of the GHG-reducing policies in the General Plan and CAP's Implementation Measures.

Each year was analyzed for a different reason. The 2020 scenarios align with the AB 32 Global Warming Solutions Act and are used to assess consistency with the 2020 target established under AB 32. Both the 2020 (reduced scenario) and the 2035 emissions analyses are used to assess consistency with the targets established under SB 375 for the reduction of GHG emissions from passenger vehicles. The 2060 analysis presents emissions estimate for the build out of the proposed General Plan; to date, targets have not been established to reduce emissions at the year 2060.

A. Future Development Construction Emissions

Air pollutant emissions, including GHGs, are generally associated with two types of activities: construction and operation. Since the bulk of a project's emissions come from operations, the various scenarios presented in this chapter all focus on operational emissions. Nevertheless, examination of construction emissions was also made where feasible to elucidate the scope of this type of emissions.

Construction activities include the clearing and grading of land, building of structures and the installation of utilities and road, as well as the vehicle trips associated with the site's workers, deliveries of build materials, etc. Accordingly, the emissions associated with construction tend to be site specific and depend upon the type of construction and development proposed, as well as the location, time of year and duration, among other things. Because these factors can vary so widely, estimating construction emissions or impacts for future development expected as Riverside County builds out according to the plans in the General Plan (existing or proposed) is infeasible. Nevertheless, to provide a reference of the types of GHG emissions associated with "typical" construction activities, several hypothetical scenarios were modeled for three types of residential development. See Table 4.7-D (Construction GHG Emissions – Residential Examples), below. Construction estimates for commercial and industrial uses were not modeled as such uses vary too widely to be accurately typified. Generally, speaking emissions from construction of commercial and industrial uses can be roughly equivalent to the emissions shown for residential construction to three times higher than the emissions from similarly sized residential construction sites. Within that general range there are exceptions where some types of commercial construction may be much lower than or significantly higher than this approximate range.

Table 4.7-D: Construction GHG Emissions – Residential Examples

Construction Activity	Construction Emissions (Metric Tons CO_2)		
	5 Acre (190 MFR)	25 Acre (75 SFR)	50 Acre (150 SFR)
2012	303.48	303.65	386.36
2013	218.22	171.85	267.39
Project Total	521.7	475.5	653.75
Annual Total, Amortized Over 30 Years	17.39	15.85	21.79
CUMULATIVE* TOTAL	**55.03 MT CO_2**		

* Total if all three [of the example] projects undergoing construction simultaneously.
Source: Atkins, Greenhouse Gas Study for General Plan Update, 2011. See Appendix EIR-6.

For the residential examples analyzed, GHG emissions would result from onsite grading activities, transport of materials to and from the site and the actual building construction, painting and paving associated with the individual developments. Residential development acreages can range from less than an acre to well over a hundred in some cases. Keeping in mind that a variety of projects would be undertaken, examples of construction of residential development on 5, 25 and 50 acres are presented herein. These construction emission estimates are based on the default construction phase lengths and equipment usage provided in the URBEMIS2007 model. Table 4.7-D summarizes the annual CO_2 emissions for each project example. Following SCAQMD methodology found in the 2008 "SCAQMD Draft Guidance: Interim CEQA Greenhouse Gas Significance Thresholds," the

construction emissions were amortized over a 30-year economic lifetime of the project. If all three development projects presented were occurring at the same time, the total amortized residential construction emissions would be 55.03 MT CO_2e per year.

Generalizing for both residential and commercial construction, total amortized construction emissions could be approximately 1.38 MT CO_2e per acre of construction per year. This value was approximated by taking the 55.03 MT CO_2e per year for 80 acres of residential construction, multiplying that value by 3 to approximate 80 acres of commercial/industrial construction (165.09 MT CO_2e) adding the two together, then dividing by the total acreage (160 acres). This value is an approximation for informational purposes and can vary widely depending upon the type and intensity of construction occurring at any given time.

B. Future 2020 Operational Emissions

GHG emissions are primarily important in the context of other statewide and global emissions, which on an aggregate basis have and will affect global climate. While the evaluation presented below is focused on and specific to the updated General Plan, it is also considered cumulative because it is only cumulative contributions of GHGs that have environmental consequences at the global scale. Therefore, the 2020 analysis below addresses both the project and cumulative impacts for GHGs.

1. 2020 Business as Usual (BAU) Scenario Emissions

For 2020, emissions estimates were based on the anticipated growth in population, housing and employment for Riverside County. The 2020 growth projections were interpolated from General Plan build out conditions as updated to reflect current trends and statistics pursuant to General Plan Appendix E-1 (Methods and Assumptions). Predicted 2020 BAU vehicle trips were estimated by using the given build out (2060) conditions for the updated Riverside County General Plan and interpolating back to year 2020.

The BAU emissions inventory for Riverside County represents the emissions expected in the year 2020 based on the General Plan build out conditions. These emissions do not include the proposed General Plan policies and Implementation Measures directed toward reducing emissions. In 2020, Riverside County is projected to emit a total of 10.27 MMT of CO_2e; this projection is based on existing emissions plus Riverside County's anticipated growth, as projected by the updated General Plan. As per state guidelines, reduction initiatives coming from the state or other agencies are not included in the BAU scenario. Such reduction measures and their anticipated emission reductions in Riverside County are included in the reduced emissions inventory discussed in the subsequent section, Section 4.7.6. Table 4.7-E (2020 BAU – Operational GHG Emissions Inventory), below, describes the forecasted BAU emissions for Riverside County in the year 2020. Figure 4.7.2 (2020 BAU Greenhouse Gas Emissions) provides a graphical representation of the same data.

Table 4.7-E: 2020 BAU - Operational GHG Emissions Inventory

Emissions Category & Sub-category	Metric Tons of CO_2e	Percent of Total
Transportation	**6,977,331**	**58%**
On-road Vehicles	6,956,170	
Airport Operations	21,161	
Energy	**2,830,246**	**23%**
Electricity [1]	1,923,508	
Natural Gas [2]	906,738	

Emissions Category & Sub-category	Metric Tons of CO_2e	Percent of Total
Solid Waste	**181,728**	**1%**
Landfill Offgassing [3]	176,584	
Onsite Equipment	5,145	
Area Sources	**442,0024**	**4%**
Landscaping Equipment	250,422	
Wood Burning	191,603	
Purchased Water [4]	**175,344**	**2%**
Agriculture	**1,522,823**	**13%**
Enteric Fermentation	86,688	
Manure Management	149,905	
Agriculture Residue Burning	124	
Crop Growth	924,811	
Animals and Runoff	176,674	
Fertilizer Use	184,621	
GRAND TOTAL	**12,129,497**	**100%**

Footnotes:
1. Includes electricity used for local water supply and wastewater treatment.
2. Includes natural gas-using stoves, grills, barbecues and other heating devices.
3. Per U.S. EPA standards, does not include landfill decomposition emissions.
4. Indirect (outside of county) electricity use for importation of water.

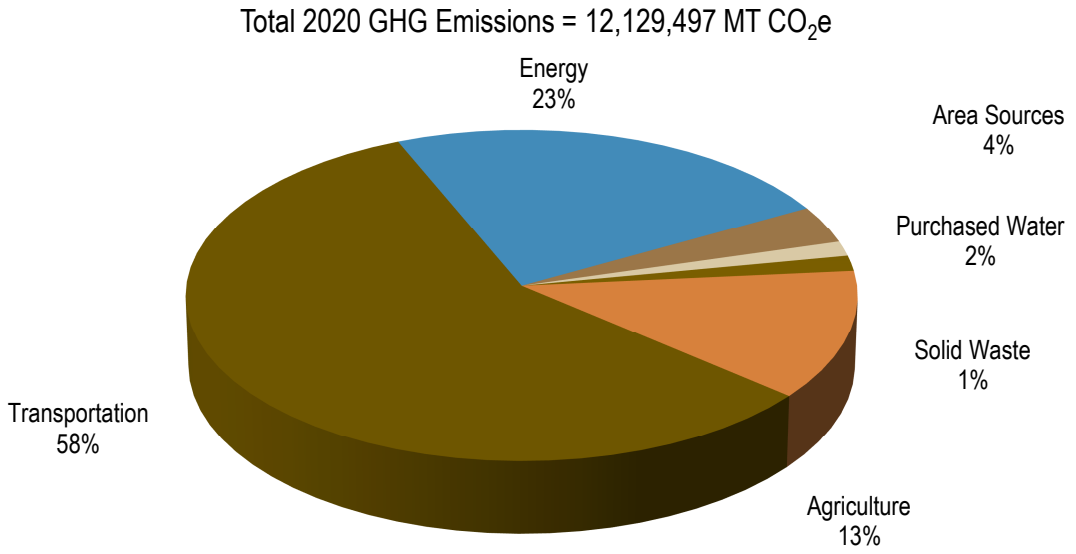
Source: Atkins, Greenhouse Gas Study for General Plan Update, 2011. See Appendix EIR-6.

2020 Adjusted BAU

As noted earlier, AB 32 calls for state reductions of GHGs by roughly 15% from current levels by the year 2020. With Riverside County's BAU scenario for 2020 GHG emissions calculated, it is now possible to establish the GHG reduction measures necessary to reduce 2020 emissions. To accomplish this, Riverside County has prepared a Climate Action Plan (CAP) that details a variety of actions necessary to reduce GHGs across a number of sectors. Key to these measures are a series of IMs that may be used by new development proposals to demonstrate consistency with Riverside County's CAP (and, hence, AB 32). Alternatively, individual future developments that wish to model and mitigate their projects directly may also do so. Such analyses would also have to show consistency with Riverside County's CAP by demonstrating a 25% reduction in GHG emissions as compared to the adjusted BAU scenario for residential, commercial, industrial, institutional and mixed-use projects and by including all measures necessary to achieve such reductions in the project's design (i.e., site plans), Riverside County Conditions of Approval or project-specific CEQA mitigation measures, as applicable. The adjusted BAU is based upon the 2020 adjusted BAU found in the Final Supplement to the AB 32 Scoping Plan (CARB 2011). See the mitigation measures outlined in Section 4.7.6 for additional details.

Riverside County Climate Action Plan (CAP) Implementation Measures Program: The CAP includes a series of IMs that address various steps to reduce GHGs in Riverside County. It also includes two sets of Screening Tables. These Screening Tables assign a point value to each IM in the CAP. They also assign points for each option incorporated into a project as mitigation or a project design feature (collectively referred to as "feature"). The point values correspond to the minimum emissions reduction expected from each feature. The menu of features allows maximum flexibility and options for how development projects can implement the GHG mitigation measures. Projects that garner at least 100 points would be consistent with the reduction quantities anticipated in Riverside County's GHG analysis described below. As such, those projects that garner a total of 100 points or greater would not require quantification of project-specific GHG emissions and a GHG Reduction Plan. Consistent with the State CEQA Guidelines (Section 15183.5), such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

Figure 4.7.2: 2020 BAU Greenhouse Gas Emissions



Source: Atkins, Greenhouse Gas Study for General Plan Update, 2011. See Appendix EIR-6.

The total emission reductions offered by each measure is based on both changes in existing land use activities as well as how new development is designed and built. The points were proportioned by residential unit or square feet of commercial/industrial uses. This was accomplished by taking the predicted growth in households and commercial/industrial uses by the year 2020 and proportioning the appropriate IM reduction quantities for new development to the residential and commercial/industrial land use sectors within the Screening Tables. These calculations result in point values that are allocated by residential unit or commercial/industrial square footage. Because of this, the size of the project is not relevant to the Screening Tables. Regardless of size, each project needs to garnish 100 points to demonstrate consistency with the CAP. If development projects each garnish a minimum of 100 points in GHG emissions reductions, then Riverside County would be able to achieve the 2020 reduced scenario inventory shown in Table 4.7-F (2020 Reduced GHG Emissions Inventory) and Table 4.7-G (2020 Operational GHG Emissions – Scenario Comparisons), below, and achieve the reduction target. Therefore, the 100 points constitute a Project's "fair share" of GHG emissions reductions within the County of Riverside.

2. 2020 Reduced Scenario Emissions

In 2020, total emissions from Riverside County are projected to total 10.27 MMT CO_2e, without the incorporation of any reduction measures. With the incorporation of both the state reduction measures and Riverside County's Implementation Measures detailed in the CAP, Riverside County emissions for 2020 would be reduced to an estimated 6.03 MMT CO_2e. Emission reductions estimated for year 2020 were based on the efforts likely to be achieved pursuant to the Implementation Measures detailed in the CAP.

With the incorporation of the CAP's IMs as mitigation for new development, Riverside County is predicted to reduce emissions by 4.23 MMT CO_2e from the BAU 2020 emissions. As this represents a 25% decrease from emissions from new development compared to the adjusted 2020 BAU and a 15% decrease from 2008 levels, Riverside County's 2020 emissions would be below the AB 32 reduction target. Table 4.7-F (2020 Reduced GHG Emissions Inventory) describes the predicted 2020 inventory with implementation of GPA 960. Figure 4.7.3

(2020 Reduced Scenario – Operational Greenhouse Gas Emissions) is a graphical representation of that same data.

Table 4.7-F: 2020 Reduced GHG Emissions Inventory

Emissions Categories	GHG Emissions (Metric Tons CO_2e)[1]	Percent of Total
Transportation	**2,454,032**	**44%**
On-road Vehicles	2,432,871	
Airport Operations	21,160	
Energy	**1,1,41,380**	**21%**
Electricity [2]	637,156	
Natural Gas [3]	504,224	
Solid Waste	**92,273**	**2%**
Landfill Off-gassing [4]	87,128	
Onsite Equipment	5,145	
Area Sources	**230,188**	**4%**
Landscaping Equipment	126,463	
Wood Burning	103,725	
Purchased Water [5]	**109,021**	**2%**
Agriculture	**1,507,220**	**27%**
Enteric Fermentation	80,050	
Manure Management	140,940	
Agriculture Residue Burning	120	
Crop Growth	924,810	
Animals and Runoff	176,670	
Fertilizer Use	184,620	
GRAND TOTAL	**5,534,113**	**100%**

Footnotes:
1. All values rounded to nearest 10. Thus, totals may not sum precisely. See Appendix EIR-6 for full data.
2. Includes electricity used for local water supply and wastewater treatment.
3. Includes natural gas-using stoves, grills, barbecues and other heating devices.
4. Per U.S. EPA standards, does not include landfill decomposition emissions.
5. Indirect (outside of county) electricity use for importation of water.

3. Emissions Comparison Summary

Table 4.7-G (2020 Operational GHG Emissions – Scenario Comparisons) summarizes existing 2008, BAU 2020 and reduced 2020 GHG emissions inventories. The reduced 2020 inventory describes Riverside County's GHG emissions for implementation of the updated General Plan *with* the incorporation of the CAP's Implementation Measures for new development.

Table 4.7-G: 2020 Operational GHG Emissions – Scenario Comparisons

Source Category	Net Total Emissions (Metric tons of CO_2e)[1]		
	2008	**BAU 2020**	**Reduced 2020**
Transportation	2,850,520	6,977,330	2,454,032
Energy	1,577,670	2,830,250	1,141,380
Area Sources	269,180	442,030	203,190
Water and Wastewater	152,470	175,340	109,020
Solid Waste	132,670	181,730	92,273
Agriculture	2,030,430	1,522,820	1,507,220
Totals	**7,012,940**	**12,129,823**	**5,534,113**
AB 32 Target[2]	5,960,998	5,960,998	5,960,998
Significant?	***Yes[3]***	***Yes[3]***	***No***

Footnotes:
1. All values rounded to nearest 10. Thus, totals may not sum precisely. See study (Appendix EIR-6) for full results.
2. Target value based on necessary reductions from BAU per AB 32.
3. Result significant if no mitigation is applied. See Section 4.7.6 for mitigation discussion.

C. Consistency with Post 2020 Emissions Reduction Targets

1. SB 375 (Year 2035 Analysis)

In determining whether or not the project would "conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases," the County of Riverside qualitatively demonstrates how the proposed General Plan, as updated pursuant to GPA No. 960, would comply with the policies, programs and reduction measures set forth in AB 32 and SB 375. To that end, an analysis was performed to evaluate whether the proposed amended General Plan would appropriately incorporate and support the reduction measures found in the AB 32 Scoping Plan; shown as "R1" measures in the CAP and quantitatively evaluated by the 2020 analysis in the prior section. In addition, GHG analysis to 2035 was also required to demonstrate consistency with SB 375.

In accordance with SB 375, CARB and SCAG have collaboratively established a reduction target for passenger car emissions. This target consists of two parts: a reduction of 8% per capita by the year 2020 and a conditional target of 13% by the year 2035. SCAG is currently in the process of updating its Regional Transportation Plan (RTP) which will include the SCS. Table 4.7-~~1~~*H* (SB 375 Target Comparisons), below, summarizes the per-capita emissions from automobiles and light-duty trucks for the existing conditions, forecasted emissions for 2020 and 2035 based on General Plan Build out (2020, 2035 BAU) and the reduced emissions for 2020 and 2035 to be achieved through implementation of the proposed General Plan policies, mitigation measures and the CAP. As per the targets stated above, CARB (2010a) calculated that the SCAG region, including Riverside County, would need to achieve 3.07 $MTCO_2e$ per person per year for 2020 (8% reduction) and 2.90 $MTCO_2e$ per person per year for 2035 (13% reduction). As shown by the data in Table 4.7-~~1~~*H*, without the incorporation of this project's mitigation measures unincorporated Riverside County's per-capita emissions from passenger vehicles would be 3.86 $MTCO_2e$ per person in 2020 and 4.47 $MTCO_2e$ per person in 2035.

Table 4.7-~~1~~*H*: SB 375 Target Comparisons

Source Category	Per-Capita Passenger Vehicle Emissions (Metric Tons CO_2e)				
	2008	BAU 2020	Reduced 2020	BAU 2035	Reduced 2035
Autos and Light Duty Truck Emissions (MT CO_2e)*	2,512,800	6,150,727~~4,929,100~~	2,163,540 ~~2,702,400~~	9,100,000	2,800,400
Population (persons)*	553,500	880,600	880,600	969,100	969,100
Per Capita Emissions	***4.54***	***6.98 ~~5.60~~***	***2.45 ~~3.07~~***	***9.39***	***2.89***
SCAG SB 375 Target	---	3.07	3.07	2.90	2.90
Significant?	***---***	***Yes***	***No***	***Yes***	***No***

* Values in this category rounded to nearest 100. See study in Appendix EIR-6 for exact numbers.
Source: Atkins, Greenhouse Gas Study for General Plan Update, 2011. See Appendix EIR-6.

With the incorporation of the mitigation measures herein, per-capita emissions would be reduced to 2.46 $MTCO_2e$ per person in 2020, which achieves and is, in fact, below the SB 375 target. For 2035, it would be 2.85 $MTCO_2e$ per person, which is also below the 2035 target. Most of the mitigation measures enforced at the state level (e.g., Pavley fuel efficiency standards, etc.) have implementation plans only through 2020. Future fuel efficiency legislation at the state or federal level will likely contribute to further reductions in GHG emissions from passenger vehicles by 2035. The 2035 reduced scenario assumes the implementation of these state policies will continue at a similar rate after 2020.

2. Executive Order S-3-05 (Year 2060 analysis)

In June 2005, California Governor Arnold Schwarzenegger issued Executive Order S-3-05 establishing the following GHG emission reduction targets:

- *By 2010, California shall reduce GHG emissions to 2000 levels.*
- *By 2020, California shall reduce GHG emissions to 1990 levels.*
- *By 2050, California shall reduce GHG emissions to 80% below 1990 levels.*

The State has provided clear guidance to local governments on a 2020 year reduction target and through implementation of AB-32 provided rules and regulations focused on GHG reductions at a statewide level to meet the 2020 reduction target shown above. In the AB-32 Scoping Plan, the State also recognized the need for local governments such as the County of Riverside to provide reduction measures within their jurisdiction to assist the state in meeting the 2020 reduction target. To that end, the County of Riverside Draft Climate Action Plan has focused the reduction measures to achieve the 2020 reduction target within the unincorporated areas of the County.

However, Executive Order S-3-05 also contains a 2050 GHG emissions reduction target of 80 percent below 1990 levels of emissions by 2050. The following discussion reviews potential GHG emissions at ultimate buildout which the County currently estimates will occur in approximately forty-five years (2060) and compares that with potential reductions to achieve the ultimate 2050 reduction target provided in Executive Order S-3-05.

2060 BAU Scenario Emissions

Table 4.7-~~H~~*I* (2060 Operational GHG Emissions – Scenario Comparisons) summarizes the County of Riverside existing 2008, BAU 2060 and reduced 2060 GHG emissions inventories. The BAU 2060 inventory represents Riverside County's forecasted emissions for the year 2060, the General Plan build out year under GPA 960, without the addition of any of the emissions-reducing strategies or mitigation measures described herein. The Reduced 2060 inventory includes the IMs used to reduce the 2020 emissions to below the AB 32 target. Given the level of growth and the current limitations on technology to further reduce emissions, GHG emissions for the full build out scenario in 2060 would not meet the 1990 reduction threshold, even with the included mitigation. Future planning efforts, including the forthcoming CAP, further advances in technology and additional (future project-specific) environmental analyses would be necessary to address this additional growth and its implications.

Table 4.7-~~H~~: 2060 Operational GHG Emissions – Scenario Comparisons

Source Category	Net Total Emissions (Metric tons of CO_2e)[1]		
	2008	BAU 2060	Reduced 2060
Transportation	2,850,520	10,338,870	10,338,870
Energy	1,577,670	6,084,370	6,084,370
Area Sources	269,180	721,400	721,400
Water and Wastewater	152,470	382,870	382,870
Solid Waste	132,670	703,890	703,890
Agriculture	2,030,430	1,522,820	1,522,820
Totals	**7,012,940**	**19,754,220**	**10,819,060**
AB 32 Target[2]	**5,960,998**	**5,960,998**	**5,960,998**
2050 Target[3]	**1,192,200**	**1,192,200**	**1,192,200**

Footnotes:
1. All values rounded to nearest 10. Thus, totals may not sum precisely. See study (Appendix EIR-~~6~~10) for full results.
2. Target value based on ~~necessary reductions from BAU~~ 1990 levels of emissions per AB 32.
3. Target value based on 80% below 1990 levels of emissions per Executive Order S-3-05.

Source: Atkins, Greenhouse Gas Study for General Plan Update, 2011. (See Appendix EIR-~~6~~10).

To ensure that GHG emissions continue on a downward trajectory after 2020, The County of Riverside will commence planning for the post-2020 period starting at the approximate midway point between plan implementation and the reduction target and after development of key ordinances and implementation of cost-effective measures. At that point, Riverside County will have implemented the first two phases of this CAP and will have a better understanding of the effectiveness and efficiency of different reduction strategies and approaches. Further, the state's regulations under AB 32 would have been fully in force since 2012; federal programs and policies for the near term are likely to be well underway; market mechanisms like a cap and trade system are likely to be in force and will be influencing energy and fuel prices; and continuing technological change in the fields of energy efficiency, alternative energy generation, vehicles, fuels, methane capture and other areas will have occurred. Riverside County will then be able to take the local, regional, state and federal context into account. Further, starting at the approximate midway point between plan implementation and the reduction target will allow for development of the post-2020 plan so that it can be ready for full implementation, including potential new policies, revisions to the General Plan (as necessary), programs, ordinances, and financing by 2020. The new plan will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader State and federal reduction targets and with the scientific understanding of the needed reductions by 2050. The County of Riverside will adopt the new plan by January 1, 2020.

The new CAP adopted on or before January 1, 2020, will keep on track through 2035 to meet the 2050 goal by implementing the following:

- *Increase energy efficiency and green building efforts (for County municipal facilities as well as new private buildings within the unincorporated areas) so that the savings achieved in the 2020 to 2035 timeframe are approximately 69% those accomplished in 2020.*
- *Continue to implement land use and transportation measures to lower VMT and shift travel modes (assumed improvement of 8% compared to the unmitigated condition, which is within SCAG's assumed range of 8% to 12% of GHG reductions for 2035).*
- *Capture more methane from landfills receiving regional waste, move beyond 75% local waste diversion goal for 2020, and utilize landfill gas further as an energy source.*
- *Continue to improve local water efficiency and conservation.*
- *Continue to support and leverage incentive and rebate and other financing programs for residential and commercial energy efficiency and renewable energy installations to shorten payback period and costs and to develop programs that encourage increased use of small-scale renewable power as it becomes more economically feasible.*

The conceptual effects of these strategies are presented in Table 7-2 in the Climate Action Plan and would represent an approximate doubling of effort from that planned at the state and County level for 2020. In total, the measures described above would produce reductions to bring the region's GHG emissions to an estimated 3 MMTCO2e by 2035. While the potential mix of future GHG reduction measures presented in this section is preliminary, it serves to demonstrate that the current measures in the CARB Scoping Plan and the County's CAP can not only move the region to its 2020 goal, but can also provide an expandable framework for much greater long-term greenhouse gas emissions reductions toward the ultimate 2050 goal. Figure 4.7-4 below shows the trajectory of emissions within this Draft 2015 CAP that achieves an AB 32 compliant reduction target of 5.96 million metric tons (MMT) CO_2e and the conceptual 2035 and 2050 reductions in a post 2020 CAP needed to reduce emissions down to 80% below 1990 levels by 2050 outlined in Executive Order S-3-05. Riverside County will develop the post-2020 CAP so that it can be ready for full implementation, including potential new policies, revisions to the General Plan (as necessary), programs, ordinances, and financing by 2020. The Post 2020 CAP will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader state and federal reduction targets including Executive Order S-3-05 and with the scientific understanding of the needed reductions by 2050. The County of Riverside will adopt the new Post 2020 CAP by January 1, 2020.

4.7.6 Greenhouse Gases - Impacts and Mitigation

A. Would the project generate greenhouse gas emissions, either directly or indirectly, that in conjunction with other global greenhouse gas emissions may have a substantial adverse physical effect on the environment?

Impact 4.7.A – Generation of Greenhouse Gas Emissions: Implementation of the Riverside County General Plan, as updated pursuant to the proposed project, (GPA 960), and associated Climate Action Plan (CAP) would result in future construction and operational activities that generate GHGs. Either individually or collectively, these activities have the potential to result in substantial emissions of GHGs; for example, exceeding the 3,000-10,000 MTY thresholds proposed by the SCAQMD in Tier 3 of its 2008 Interim CEQA Greenhouse Gas Significance Thresholds. However, implementation of the proposed General Plan policies and particularly, the Implementation Measures of the CAP, as well as existing EIR No. 441 and proposed mitigation measures would ensure that GHG emissions within Riverside County would be less than significant.

1. Analysis of Impact 4.7.A

GHGs are generally tracked in two ways, as arising from either construction or operational activities. Because of their differences each of these areas of impact are analyzed separately, as follows.

a. Construction Emissions

Construction activities occurring as individual public and private projects are implemented would emit GHGs over the course of the planning horizon of the updated General Plan. The exact amount of emissions would be dependent on the particular construction equipment used, the length of the construction period for each individual project undertaken and the number of projects occurring at any given time. Because this information is unknowable at the General Plan level, it is impossible to calculate the exact emissions of GHGs from future construction activities in Riverside County. Table 4.7-D in Section 4.7.5 provides estimates of annual construction emissions for three project examples. Following SCAQMD methodology, the construction emissions are amortized over a 30-year lifetime of the project. The combined annual emissions from the three project examples described in Section 4.7.5 totals 55 MT CO_2e/per year or the combined average of residential and commercial projects construction of 1.38 MT CO_2e per acre of construction per year. This represents a fraction of one percent of Riverside County's total annual GHG emissions for 2020 and, thus, would not represent a substantial source of GHG emissions within Riverside County as a whole.

Climate change is cumulative in nature and is analyzed as tons of GHGs emitted per year in conjunction with operational emissions. Because construction activities result in limited, temporary emissions over a relatively short period of time, in respect to the average lifetime of the development impacts from construction activities are minor when compared to operational emissions. With current policies regarding construction waste diversion, ~~anticipated continued advancement in equipment technology~~, the implementation of the CAP and the mitigation measures included for Impact 4.6.2 in Air Quality, construction emissions would be less than significant with respect to GHG emissions. *Additionally, as advancements in equipment technology continue, GHG emissions from construction activities are anticipated to be further reduced.*

b. Operational Emissions

Riverside County's operational emissions are presented previously in Section 4.7.5 for three different horizon years: 2020, 2035 and 2060. The County of Riverside uses the GHG emissions reduction target of AB 32 in determining whether or not the proposed General Plan Update would "generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment." To that end, generated GHG emissions need to be at or below the 1990 emission levels for Riverside County, which is 6,036,971 metric tons of CO_2e, by the year 2020 in order to meet the AB 32 GHG reduction target. This quantitative threshold is Riverside County specific using the existing GHG inventory to estimate 1990 levels of emissions for Riverside County.

As shown in Section 4.7.5, Riverside County's annual GHG emissions with the proposed project would be 10,268,937 metric tons of CO_2e. This total exceeds the target for GHG reductions following AB 32 and would be potentially significant if not appropriately mitigated with General Plan policies, mitigation measures and the Riverside County CAP to reduce GHG emissions. The following discussion details the GHG reductions from various regulatory programs, General Plan Policies, mitigation measures and the CAP.

2. Regulatory Compliance for Impact 4.7.A

As detailed and explained below, compliance with the following existing laws, regulatory programs, General Plan policies and CAP would lessen significant impacts on GHG emissions within Riverside County.

a. Compliance with Federal, State, Regional and County Regulations

The following federal, state, regional and Riverside County regulations contribute to ensuring development impacts on greenhouse gas emissions are less than significant. See Section 4.7.3 for full text of each of these regulations.

Federal Regulations: The Climate Change Technology Program works to advance the development of renewable energy, energy efficiency and other technologies related to reducing GHG emissions. U.S. EPA regulations work to reduce GHG emissions from the largest emitters nationwide.

State Regulations: The California Ambient Air Quality Standards are intended to reduce emissions of criteria pollutants, however, sources of criteria pollutants often overlap with sources of GHGs. Therefore, by controlling criteria pollutants, the State of California is also indirectly reducing GHG emissions. Executive Order S-3-05 and Assembly Bill 32 set targets for California to reduce its emissions statewide. These targets motivate state policy action to reduce emissions particularly through vehicle fuel efficiency standards and energy efficiency requirements for buildings, such as CCR Title 24, Part 6. Senate Bill 97 updates the CEQA guidelines to require projects to address GHGs in their environmental analyses. Senate Bill 375 supports AB 32 and sets regional targets for the reduction of GHGs from passenger vehicles through coordinated land use and transportation planning. Executive Order S-13-08 led to the development of the Climate Adaption Strategy for the State of California to help the state prepare for impacts such as sea level rise and heat waves.

Regional Regulations: SCAQMD climate change policy works to establish project thresholds and guide the region in addressing climate change.

Riverside County Regulations: County Ordinance Nos. 706, 726, 748, 782 and 824 all work to relieve traffic and congestion on Riverside County roadways thereby reducing GHG emissions associated with transportation. Ordinance Nos. 659, 810 and 875 help to preserve open space and reduce urban sprawl. Ordinance No. 655 helps to conserve electricity from public lighting and indirectly reduces GHGs. The water-efficient landscaping

standards established by Ordinance No. 859 and Board of Supervisors Policy H-25 help to reduce GHGs associated with the electricity used to pump and treat water. Ordinance No. 559 preserves trees thereby preserving the natural carbon storage as trees grow. Ordinance No. 695 helps to reduce GHG emissions associated with wildfires. Board of Supervisors Policies A-64, H-4 and H-29 help reduce GHG emissions through environmental purchasing, energy conservation and sustainable building practices.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would contribute to ensuring development impacts to greenhouse gas emissions are less than significant. See Section 4.7.3.E for full text of each policy.

Land Use Policies: Policies LU 2.1, 8.12, 11.1, 11.3, 11.4 and 13.1-13.4 all work to help guide development in addressing regional transportation, concentrating growth near existing urban and suburban areas, designing energy- and water-efficient projects, providing opportunities for residents to live and work in the same area, preserving open space and increasing use of alternative transportation modes. Each of these works to directly and indirectly reduce GHG emissions in Riverside County.

Circulation Policies: Policies C 1.2, 1.7, 4.1, 4.8, 5.2, 11.2, 11.4, 11.5, 11.6, 12.1, 13.1-13.3, 17.3, 17.4, and 21.7 per CAP Table 4-1 work to reduce GHG emissions from transportation sources by supporting development of alternative transportation modes, providing for pedestrian facilities, developing transit centers, improving rail service, encouraging bicycle commuting and reducing congestion through the use of HOV and bus-only lanes.

Multipurpose Open Space Policies: Policies OS 2.2 and 2.5 help reduce GHG emissions associated with water use. Policies OS 10.1, 11.1-11.3 and 12.1 encourage the development of renewable energy. Policies OS 16.3-16.8 help reduce GHG emissions by conserving energy in buildings, utilizing alternative fuel vehicles and promoting the use of alternative transportation.

Air Quality Policies: Policies AQ 1.1-1.4 and 1.7 help to reduce GHG emissions by encouraging regional co-ordination on air quality management. Policies AQ 3.2, 3.4 and 10.1-10.4 promote the use of employer-based policies for encouraging carpooling and transit use. Policies AQ 5.2 and 5.4 encourage increased building efficiency in buildings. Policies AQ 5.1 and 8.4-8.9 encourage land use patterns that reduce single-occupancy vehicle trips. Policy AQ 13.1 encourages the expansion of Riverside County's alternative fuel fleet.

c. Compliance with Proposed New or Revised General Plan Policies

The following new or revised policies of the Riverside County General Plan, proposed as part of GPA No. 960, would contribute to ensuring development impacts to greenhouse gas emissions are less than significant. See Section 4.7.3.E for full text of each of these policies.

Policies LU 1.5 and 4.1: These policies help to guide development to address regional transportation issues, concentrate growth near existing urban and suburban areas, include energy and water-efficient design standards, provide opportunities for residents to live and work in the same area, preserve open space and increase the use of alternative modes of transportation. Each of these works to directly and indirectly reduce GHG emissions in Riverside County.

Circulation Policies: Policies C 9.2, 12.2, 17.3, 17.4, and 21.1 work to reduce GHG emissions from transportation sources by supporting development of alternative transportation modes, providing for pedestrian

facilities, developing transit centers, improving rail service, encouraging bicycle commuting and reducing congestion through the use of HOV and bus-only lanes.

Policies AQ 4.1, 4.2, 4.4, 5.2 and 5.4: These policies encourage increased energy efficiency for buildings.

Other AQ Policies: A number of policies were introduced as part of GPA No. 960 specifically to address greenhouse gas emissions, these include: AQ 21.1-21.4, 22.1, 23.1, 23.2, 24.1, 24.2, 25.1-25.3, 26.1, 26.2, 27.1, 27.2, 28.1, 28.2 and 29.1-29.4. These policies help reduce vehicle miles traveled, improve energy efficiency, reduce energy consumption and increase renewable energy generation.

d. Compliance with Existing Mitigation from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measure 4.5.1C was imposed to reduce construction vehicle and exhaust emissions. Although potential impacts would be reduced to less than significant through regulatory compliance, as per above, EIR No. 441 was programmatic and thus this measure remains applicable to future development accommodated by this project as well.

Existing Mitigation Measure 4.5.1C: Mitigation measures for construction equipment and vehicles exhaust emissions:

a. The construction contractor shall select the construction equipment used on site based on low emission factors and high energy efficiency.

b. The construction contractor shall ensure that construction grading plans include a statement that all construction equipment will be tuned and maintained in accordance with the manufacturer's specifications.

c. The construction contractor shall utilize electric- or diesel-powered equipment, in lieu of gasoline-powered engines, where feasible.

d. The construction contractor shall ensure that construction grading plans include a statement that work crews will shut off equipment when not in use. During smog season (May through October), the overall length of the construction period will be extended, thereby decreasing the size of the area prepared each day, to minimize vehicles and equipment operating at the same time.

e. The construction contractor shall time the construction activities so as to not interfere with peak hour traffic and minimize obstruction of through traffic lanes adjacent to the site; if necessary, a flag person shall be retained to maintain safety adjacent to existing roadways.

f. The construction contractor shall support and encourage ridesharing and transit incentives for the construction crew.

g. *[Item g, dust control measures omitted, since not applicable to GHGs].*

e. Additional Project-Specific Mitigation for Impact 4.7.A

Despite all of the above measures that lessen impacts on climate change and reduce GHG emissions, as indicated, additional project-specific mitigation measures are necessary to further avoid, reduce or minimize impacts. Mitigation Measure 4.7.A-N1 would lessen the impact by requiring new development projects to reduce their

individual project emissions. Mitigation Measure 4.7.A-N2 would lessen the impact by allowing projects to demonstrate compliance with the Implementation Measures of the CAP by utilizing the Screening Tables. *Mitigation Measure 4.7-N3 requires the County of Riverside to adopt an updated CAP on or before January 1, 2020 that will include 2035 and 2050 Reduction Targets and updated reduction measures designed to achieve the 2035 and 2050 Reduction Targets.* Implementation of these mitigation measures would ensure that project impacts on GHG emissions are mitigated to less than significant.

NEW Mitigation Measure 4.7.A-N1: To ensure GHG emissions resulting from new development are reduced to levels necessary to meet state targets, the County of Riverside shall require all new discretionary development to comply with the Implementation Measures of the Riverside County Climate Action Plan or provide comparable custom measures backed by a project GHG study (for example, using CalEEMod modeling) demonstrating achievement of the same target. The target to be met is a GHG emissions reduction of 25% below emissions for the adjusted BAU scenario for residential, commercial, industrial, institutional and mixed-use projects. The adjusted BAU is based upon the 2020 adjusted BAU found in the Final Supplement to the AB 32 Scoping Plan (CARB 2011).

NEW Mitigation Measure 4.7.A-N2: In lieu of a project-specific analysis per Mitigation Measure 4.7.A-N1, a future discretionary project proposed pursuant to the Riverside County General Plan shall incorporate into the project design, operational features and/or Implementing Measures from the County Climate Action Plan, in such a manner as to garnish at least 100 points. The point values within the CAP's Screening Tables constitute GHG emission reductions.

NEW Mitigation Measure 4.7.A-N3: *The County of Riverside will monitor implementation of the reduction measures and revise or amend the Climate Action Plan as needed based upon the results of monitoring to ensure achievement of the 2020 Reduction Target. In addition, the County of Riverside will start update process of the Climate Action Plan in 2017 to provide a post-2020 plan. The post-2020 Climate Action Plan update will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader state and federal reduction targets including Executive Order S-3-05 and with the scientific understanding of the needed reductions by 2050. The post-2020 Climate Action Plan update will include a set of updated reduction measures to achieve the 2035 and 2050 Reduction Targets and updated monitoring system to ensure that the updated targets are achieved. The County of Riverside will adopt the new post-2020 Climate Action Plan update by January 1, 2020.*

3. Finding on Significance for Impact 4.7.A

Before mitigation, Riverside County's GHG emissions for 2020 would be an estimated 10.27 MMT CO_2e; with implementation of the mitigation measures described above, Riverside County's emissions would be reduced to 6.03 MMT CO_2e. The AB 32 target for GHG emissions reductions is a return to 1990 levels by the year 2020. As calculated herein, that target "1990" level would be 6.03 MMT CO_2e per year, a reduction of 15% from the 2008 baseline, as per CARB's AB 32 Scoping Plan. As demonstrated by the results presented in Section 4.7.5, implementation of and compliance with the above listed existing regulatory programs, as well as the new project-specific mitigation measures described above, would ensure that development authorized pursuant to the proposed updated General Plan would be 6.03 MMT CO_2e; a 25% reduction from 2020 BAU. ~~As such, Riverside County GHG emissions as mitigated herein would be a less than significant impact on global climate change~~.

In addition, to ensure that GHG emissions continue on a downward trajectory, *The County of Riverside will commence planning for the post-2020 period starting at the approximate midway point between plan implementation and the reduction target and after development of key ordinances and implementation of cost-effective measures. The new plan will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader state and federal reduction targets and with the scientific understanding of the needed reductions by 2050. The County of Riverside will adopt the new plan by January 1, 2020.*

In Section 4.7C2 above, Figure 4.7-4 shows the trajectory of emissions within this Draft 2015 CAP that achieves an AB 32 compliant reduction target of 5.96 million metric tons (MMT) CO_2e and the conceptual 2035 and 2050 reductions in a post 2020 CAP needed to reduce emissions down to 80% below 1990 levels by 2050 outlined in Executive Order S-3-05. Riverside County will develop the post-2020 CAP so that it can be ready for full implementation, including potential new policies, revisions to the General Plan (as necessary), programs, ordinances, and financing by 2020. The Post 2020 CAP will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader state and federal reduction targets including Executive Order S-3-05 and with the scientific understanding of the needed reductions by 2050. The County of Riverside will adopt the new Post 2020 CAP by January 1, 2020.

Achievement of the 2050 reduction target (80% below 1990 levels of emissions by 2050) in Executive Order S-3-05 will require the State and the County to reduce emission by approximately 95 % below the 2008 baseline levels of GHG emissions by 2050 while also accommodating considerable population and economic growth within the unincorporated areas. Providing the post 2020 path forward for the County as shown in Table 7-2 of the Draft CAP and in Figure 4.7-3 above will require near carbon neutral energy and transportation by 2050. Carbon neutral (no emissions) of energy will require significant changes to the electric generating system in the United States where renewable energy and energy storage supply nearly all the electricity in the system and transportation eliminates fossil fueled trucks and passenger vehicles (electric vehicles or hydrogen fuel cell technology). This future system of carbon neutral energy and transportation sectors is technologically infeasible at this time. For this reason Executive Order S-3-05 provided a "stair-step" tiered approach (2010, 2020, and 2050 targets) to reducing GHG emissions. The "stair-step" approach allows the time needed to develop the technologies required to meet the 2050 goal in Executive Order S-3-05.

The State is currently working on post 2020 reductions to update the AB32 Scoping Plan and should have the proposed rules and regulations needed to achieve the post 2020 reductions within approximately two years. Because it is technologically infeasible to achieve the 2050 target at this time, the County provides Mitigation Measure 4.7.A-N3 that allows the County to work in sync with the State in providing post 2020 reductions and reduction targets. Measure 4.7.A-N3 requires the County to update the CAP by January 1, 2020 and including in that updated CAP reduction targets for 2035 and 2050, and post 2020 reduction measures designed to achieve the reduction targets and keep the County on the emissions reduction path shown in Figure 4.7-3.

Because achievement of the 2050 reduction target in Executive Order S-3-05 is technologically infeasible to achieve at this time, impacts on GHG emissions are considered significant and unavoidable.

B. Would the project conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

Impact 4.7.B – Conflict with GHG Reduction Plans, Policies or Regulations: Implementation of the Riverside County General Plan, as updated pursuant to the proposed project (GPA No. 960), would result in future construction and operational activities that generate GHGs. This generation of GHGs would potentially conflict with the implementation of AB 32 and SB 375, California policies for reducing GHG emissions. However, implementation of the proposed General Plan policies and particularly the Implementation Measures of the Riverside County CAP, plus proposed new Mitigation Measures 4.7.A-N1 and 4.7.A-N2, would ensure that build out of the General Plan, as amended by GPA No. 960, would be consistent with both AB 32 and SB 375 and have a less than significant impact on their implementation.

1. Analysis of Impact 4.7.B

Consistency With AB 32: Data presented in Section 4.7.5 (Table 4.7-E) indicates that without the GHG reduction policies proposed for the updated General Plan, Riverside County levels of GHG emissions in 2020 would be 10.27 MMT CO_2e. This is the 2020 BAU scenario level. With the mitigation proposed in this project, in

particular implementation of CAP IMs (as discussed under Impact 4.7.1), analysis indicates that Riverside County's 2020 GHG emissions would be at 6.03 MMT CO_2e. This value represents a reduction of 41.2% over the BAU scenario. Further, it represents a reduction of 15% compared to the baseline 2008 levels presented in Section 4.7.2. AB 32 sets forth the target of reducing statewide emissions to 80% below 1990 levels by 2050. Further, the State of California's AB 32 Scoping Plan established that to achieve such a goal, 2020 levels must generally be reduced to levels that are 15% below present values and at least 28% below 2020 BAU values. Thus, the data presented herein demonstrate that the CAP's proposed IMs and Screening Tables and other revisions to the General Plan included as part of the project would be sufficient to ensure that new development is consistent with AB 32. For these reasons, the project's consistency with AB 32 would be rendered less than significant with mitigation as outlined below.

Consistency With SB 375: Data presented in Section 4.7.5 (Table 4.7-I) indicates that without the GHG reduction policies proposed for the updated General Plan, per-capita GHG emissions from passenger vehicles would be 5.60 MT CO_2e in 2020 and 9.39 MT CO_2e in 2035. These emissions follow the 2020 and 2035 BAU scenarios. With the mitigation proposed in this project, in particular implementation of the CAP IMs and Screening Tables, analysis indicates that Riverside County's per-capita GHG emissions from passenger vehicles would be 3.06 MT CO_2e in 2020 and 2.89 MT CO_2e in 2035. Following SB 375, CARB set targets for the SCAG region to reduce emissions from passenger vehicles by 8% per capita by the year 2020 and 13% per capita by the year 2035. These percentages were calculated to be equivalent to 3.07 MT CO_2e per capita in 2020 and 2.90 MT CO_2e per capita in 2035. Thus, the data presented herein demonstrate that the proposed CAP Implementation Measures and other revisions to the General Plan included as part of the project would be sufficient to ensure that new development is consistent with SB 375. For these reasons, the project's consistency with SB 375 would be rendered less than significant with the mitigation outlined below.

Consistency With Executive Order S-3-05: *Executive Order S-3-05 provides state level reduction targets of achieving 1990 levels of emissions by 2020 and eighty percent below 1990 levels of emissions by 2050. Emission levels presented in Section 4.7.5 (Table 4.7-G) indicates that the Draft CAP will achieve the 2020 reduction target shown in Executive Order S-3-05. However, Table 4.7-H also indicates that without a post 2020 CAP to continue reducing emission after year 2020, emission levels associated with continued growth in the unincorporated areas of the County will begin rising after 2020 and not meet the 2050 reduction target within Executive Order S-3-05. Mitigation Measure 4.7.A-N3, requires the County to develop and adopt a post 2020 CAP by January 1, 2020, to continue reducing emissions post 2020. The Draft CAP (Table 7-2) shows the estimated reduction strategies needed to continue reducing after year 2020 and Figure 4.7-3 above provides the trend needed to achieve and maintain the ultimate 2050 reduction target in Executive Order S-3-05.*

Achievement of the 2050 reduction target (80% below 1990 levels of emissions by 2050) in Executive Order S-3-05 will require the State and the County to reduce emission by approximately 95 % below the 2008 baseline levels of GHG emissions by 2050 while also accommodating considerable population and economic growth within the unincorporated areas. Providing the post 2020 path forward for the County as shown in Table 7-2 of the Draft CAP and in Figure 4.7-3 above will require near carbon neutral energy and transportation by 2050. Carbon neutral (no emissions) of energy will require significant changes to the electric generating system in the United States where renewable energy and energy storage supply nearly all the electricity in the system and transportation eliminates fossil fueled trucks and passenger vehicles (electric vehicles or hydrogen fuel cell technology). This future system of carbon neutral energy and transportation sectors is technologically infeasible at this time. For this reason Executive Order S-3-05 provided a "stair-step" tiered approach (2010, 2020, and 2050 targets) to reducing GHG emissions. The "stair-step" approach allows the time needed to develop the technologies required to meet the 2050 goal in Executive Order S-3-05.

The State is currently working on post 2020 reductions to update the AB32 Scoping Plan and should have the proposed rules and regulations needed to achieve the post 2020 reductions within approximately two years. Because it is technologically infeasible to achieve the 2050 target at this time, the County provides Mitigation Measure 4.7.A-N3 that allows the County to work in sync with the State in providing post 2020 reductions and reduction targets. Measure 4.7.A-N3 requires the County to update the CAP by

January 1, 2020, and including in that updated CAP reduction targets for 2035 and 2050, and post 2020 reduction measures designed to achieve the reduction targets and keep the County on the emissions reduction path shown in Figure 4.7-3.

2. Regulatory Compliance for Impact 4.7.B

a. Compliance with Federal, State and Riverside County Regulations

The same federal, state, regional and Riverside County regulations described above for Impact 4.7.A also contribute to ensuring development impacts to greenhouse gas emissions are less than significant with respect to consistency with AB 32 and SB 375. See Section 4.7.2 for discussion of these regulations; their contribution to GHG emission reduction in Riverside County is discussed under Impact 4.7.A, above.

b. Compliance with Existing General Plan Policies

The same existing General Plan policies described above for Impact 4.7.A also contribute to ensuring development impacts to greenhouse gas emissions are less than significant with respect to consistency with AB 32 and SB 375. See the prior impact for a discussion of these policies and how they contribute to reducing GHG emissions in Riverside County.

c. Compliance with Proposed New or Revised General Plan Policies

The same proposed or revised General Plan policies described above for Impact 4.7.A also contribute to ensuring development impacts to greenhouse gas emissions are less than significant with respect to consistency with AB 32 and SB 375. See the prior impact for a discussion of these policies and how they contribute to reducing GHG emissions in Riverside County.

d. Additional Project-Specific Mitigation for Impact 4.7.B

Despite all of the above measures that lessen impacts on climate change and reduce GHG emissions, as indicated, additional project-specific mitigation measures are necessary to further avoid, reduce or minimize impacts. New Mitigation Measure 4.7.A-N1 would lessen the impact by requiring new development projects to reduce the individual project emissions. Mitigation Measure 4.7.A-N2 would lessen the impact by allowing projects to demonstrate compliance with the Implementation Measures of the CAP by utilizing the Screening Table. See Impact 4.7.A for the text of these measures. In total, implementation of these mitigation measures would ensure that project impacts on GHG emissions are mitigated to less than significant.

3. Finding on Significance for Impact 4.7.B

Implementation of, and compliance with, the existing regulatory programs, General Plan policies and Riverside County CAP, as well as new Mitigation Measures 4.7.A-N1 and 4.7.A-N2, as described above, would ensure that development authorized pursuant to the General Plan, as amended by the proposed project, GPA No. 960, would ~~have less than significant impacts on~~ *reduce* GHG emissions *achieving the AB32 and SB 375 reduction targets. However, implementation of, and compliance with, the existing regulatory programs General Plan policies and Riverside County CAP, as well as new Mitigation Measures 4.7.A-N1 and 4.7.A-N2, will not achieve the 2050 goal in Executive Order S-3-05 and achievement of that goal is technologically infeasible at this time. Mitigation Measure 4.7.A-N3 commits the County to develop a post 2020 CAP that demonstrates achievement of 2035 and 2050 reduction targets and that the post 2020 CAP is adopted by January 1,*

2020. This allows time for the development of new technology needed to achieve the 2050 goal and the County time to provide a post 2020 CAP in sync with the State goals and reductions.

Because achievement of the 2050 reduction target in Executive Order S-3-05 is technologically infeasible to achieve at this time, impacts on GHG emissions are considered significant and unavoidable.

4.7.7 Significance After Mitigation for Greenhouse Gases

Implementation of, and compliance with, the above regulations, policies and mitigation measures would ensure that impacts due to greenhouse gas emissions from future development within Riverside County are minimized to *the greatest extent feasible at this time.* ~~a level that is less than significant.~~ GHG emissions from construction and operational activities were determined to be reduced to a level consistent with the AB 32 target with the incorporation of mitigation. Following the 2020 emissions analysis, it was determined that future development authorized pursuant to the General Plan, as amended by the proposed project, would not conflict with the implementation of AB 32. Through an analysis of passenger vehicle emissions for 2020 and 2035, the amended General Plan was also determined to be consistent with the targets for the SCAG region under SB 375 with mitigation.

However, compliance with existing and proposed General Plan policies and, in particular, the Riverside County Climate Action Plan's Implementing Measures and Screening Tables, plus the mitigation measures herein, ~~would~~ *does not* ensure that any future development activities approved within Riverside County *will* reduce greenhouse gas emissions, fully mitigate or avoid any GHG impacts *consistent with the 2050 GHG emissions reduction target in Executive Order S-3-05. Achievement of the 2050 reduction target in Executive Order S-3-05 will require nearly carbon neutral (zero emissions) energy and transportation sectors making the 2050 reduction target technologically infeasible at this time. Mitigation Measure 4.7.A-N3 commits the County to develop a post 2020 CAP that demonstrates achievement of 2035 and 2050 reduction targets and that the post 2020 CAP is adopted by January 1, 2020. This allows the time needed to develop the technology required to achieve the 2050 reduction target.*

Because of this, implementation of the Riverside County General Plan, as updated pursuant to the proposed project (GPA No. 960), does not achieve all of the reduction targets within Executive Order S-3-05. This is considered a significant and unavoidable impact.

The County is committed toward the reduction of GHG emission. However, achievement of the 2050 reduction target in Executive Order S-3-05 is technologically infeasible to achieve at this time. Mitigation Measure 4.7.A-.N3 requires the County to provide by January 1, 2020, a post 2020 CAP that includes 2035 and 2050 reduction targets and reduction measures needed to achieve those targets. This allows technology, the State and the County the time needed to develop reduction measures able to achieve the 2050 reduction target. For these reasons the County is providing Overriding Consideration of this currently significant and unavoidable impact. ~~and are consistent with the State of California and Riverside County's greenhouse gas reduction polices and the Climate Action Plan~~.

Section 4.8

Biological Resources

Section 4.8 Biological Resources

4.8.1 Introduction

In Riverside County, variation in topography, elevation, soil and climate create conditions for a wide variety of natural communities, each with its own assemblage of native plant and animal species. This section focuses on the natural communities and species of greatest concern to regional, state and federal agencies, and on the impacts that could arise from implementation of GPA No. 960.

In EIR No. 441, certified for the original RCIP General Plan in December 2003, the biological resources chapter analyzed the "potential biological impacts that would occur in the absence of the western Riverside County and Coachella Valley MSHCPs." Since then, both Multi-Species Habitat Conservation Plans (MSHCPs) have been approved and are in full implementation. The impacts of GPA No. 960 within the respective coverage areas for the two MSHCPs are discussed below. Analysis is also provided for biological impacts and species that are not covered by the MSHCPs.

In 2000, a description of the existing biological setting of Riverside County was prepared as part of the RCIP process. The resultant portion of the 2000 Existing Setting Report, Chapter 4.2, is used as the baseline for descriptions of the biological resources within Riverside County, with the acres of natural community types updated per new data sources as cited. Information from the RCIP effort (which led to the adoption of the 2003 RCIP General Plan) and new vegetation coverage data derived from the Western Riverside County MSHCP (WRC-MSHCP), Coachella Valley Multiple Species Habitat Conservation Plan (CV-MSHCP), are used in the assessment of impacts. Although no new field studies were conducted for this biological resources analysis, species tables were updated using information from the WRC-MSHCP, CV-MSHCP, California Natural Diversity Data Base (NDDB), California Native Plant Society (CNPS) data base and the U.S. Fish and Wildlife Service's Critical Habitat Portal. The following is a summary of the existing biological resources within Riverside County. Additional details are available in Chapter 4.2 of the 2000 Existing Setting Report.

4.8.2 Existing Environmental Setting – Biological Resources

Biological impacts for western Riverside County, roughly defined by the area west of the San Jacinto Mountains ridgeline, are addressed by the WRC-MSHCP. For the purposes of this section, western Riverside County is defined as synonymous with the WRC-MSHCP coverage area, as shown in Figure 4.8.1 (MSHCP Coverage Areas & Non-MSHCP Areas within Riverside County). Biological issues for the Coachella Valley, roughly defined as the central portion of Riverside County east of the San Jacinto Mountains ridgeline and west of Joshua Tree National Monument and the Little San Bernardino Mountains, are addressed by the CV-MSHCP. Similarly, the Coachella Valley is defined as synonymous with the CV-MSHCP coverage area, also as shown in Figure 4.8.1, for the

purposes of this section. The portions of Riverside County not covered by the WRC-MSHCP or CV-MSHCP are also shown in Figure 4.8.1. Collectively, these three types of areas are defined as the biological study area for the purposes of this EIR. In the following environmental setting discussion, the natural communities, species and existing conservation areas are addressed separately by region. More specifically, the regions are referred to as western Riverside County, Coachella Valley and the non-MSHCP areas.

A. Natural Communities

Riverside County is made up of a mosaic of diverse natural communities. The natural communities contained within each biological study area are more fully described below. Sensitive habitats that are subsets of these communities are described in greater detail separately in Section 4.8.2.B.

1. Western Riverside County

As discussed previously and for the purposes of this section, western Riverside County is defined as the region covered by the WRC-MSHCP. This portion of Riverside County encompasses approximately 1.26 million acres and contains most of Riverside County's non-desert areas and most of its urbanized areas. Although it comprises just under one-third of the county area, it accounts for approximately two-thirds of the developed area and approximately 80% of the countywide population. Approximately 920,730 acres are under Riverside County's jurisdiction. The rest are under the jurisdiction of cities, the state or the federal government (i.e., National Forest, BLM lands), Indian Tribes and other such entities.

Prior to modern urban development, most of western Riverside County was covered by chaparral and coastal sage scrub, with coniferous and oak woodlands at higher elevations. Elevations within western Riverside County range from about 755 feet above mean sea level along the Santa Ana River in the northwestern corner of Riverside County to about 10,800 feet at Mount San Jacinto, the highest point in Riverside County. This variation in topography, soil and climate creates habitats for a wide variety of animals and plants, including many that are rare or endemic to Southern California.

Figure 4.8.2 (Western Riverside County Natural Communities) presents the natural communities, also referred to as vegetation communities, found in western Riverside County. The natural communities shown represent the collapsed, or combined, classifications used in the WRC-MSHCP which are based on Holland's Preliminary Descriptions of the Terrestrial Natural Communities of California (1986). The total amount of each community found in western Riverside County is also provided. The collapsed and uncollapsed classifications are listed in Table 4.8-A (Western Riverside County Natural Communities). A brief description of each natural vegetation community (as delineated in the WRC-MSHCP) in western Riverside County is provided below.

Agriculture: Agricultural lands include areas occupied by dairies and livestock feed yards or areas that have been tilled for use as croplands or groves/orchards. The largest areas of dairy and livestock feed yards are located north of San Jacinto and north of Juniper Flats.

Chaparral Communities: Chaparral communities are the most abundant and widespread vegetation type in the western Riverside County unincorporated area. Large contiguous stands of chaparral occur along the Santa Ana Mountains in the western portion of western Riverside County and along the San Bernardino, San Jacinto and Agua Tibia Mountains in the eastern and southern portions of western Riverside County. Although chaparral is less common than other vegetation types in the central lowlands of Riverside County, three large chaparral-dominated areas occur on steeper lands near the Gavilan Hills/Gavilan Plateau/Meadowbrook region, the Lakeview Mountains/Double Butte area and the Sedco Hills/Hogbacks area.

1. Total aggregate countywide acreage. All values rounded to nearest 10 acres.
2. Habitat types tracked under WRC-MSHCP.
3. Included on CNPS lists: S or G, 1, 2, or 3 and/or included on CNDB tracking lists.
4. ~~Includes 241 acres of vernal pools.~~ *No habitat of this type recorded in Western Riverside County.*
5. *Included in "Riparian Scrub" sensitive habitat category. (See Table 4.8-I.)*
6. *These habitat categories fall within the greater Valley Foothill Riparian superclass.*
7. *Encompasses White Alder Alliance (Montane Riparian), 380 acres, and White Alder Sycamore Association (Valley Foothill Riparian), 49 acres.*

Source: California Native Plant Species Survey, 2005. CDFG Natural Diversity Data Base, 2011.

Chaparral is a shrub-dominated community composed largely of evergreen species that range from 8 to 15 feet in height. The most common and widespread species within chaparral is chamise (*Adenostoma fasciculatum*). Other common shrub species include manzanita (*Arctostaphylos* spp.), wild-lilac (*Ceanothus* spp.), oak (*Quercus* spp.), redberry (*Rhamnus* spp.), laurel sumac (*Malosma laurina*), mountain-mahogany (*Cercocarpus betuloides*), toyon (*Heteromeles arbutifolia*) and mission manzanita (*Xylococcus bicolor*). Soft-leaved sub-shrubs are less common in chaparral than in coastal sage scrub (see below) but occur within canopy gaps of mature stands. Common species include California buckwheat (*Eriogonum fasciculatum*), sages (*Salvia* spp.), California sagebrush (*Artemisia californica*) and monkeyflower (*Mimulus* spp.). In addition, herbaceous species, including deerweed (*Lotus scoparius*), nightshade (*Solanum* spp.), Spanish bayonet (*Yucca whipplei*), rock-rose (*Helianthemum scoparium*), onion (*Allium* spp.), soap plant (*Chlorogalum* spp.), bunch grasses (*Nassella* and *Melica* spp.), wild cucumber (*Marah* spp.), bedstraw (*Galium* spp.) and lupine (*Lupinus* spp.) are also present.

Coastal Sage Scrub Communities: Coastal sage scrub is distributed throughout western Riverside County. It occurs from the eastern slopes of the Santa Ana Mountains to elevations in the San Jacinto Mountains below 5,000 feet. Sage scrub often is distributed in patches throughout its range; over a scale of several miles, it can be found in diverse community mosaics with other plant communities, particularly grassland and chaparral, as well as oak/riparian woodland in wetter areas. In western Riverside County, coastal sage scrub is found both in large contiguous blocks scattered throughout the region as well as integrated (intermixed) with chaparral and grasslands. Coastal sage scrub is dominated by a characteristic suite of low-statured, aromatic, drought-deciduous shrubs and sub shrub species. Composition varies substantially depending on physical circumstances and the

successional status (age) of the community. However, characteristic species include California sagebrush, California buckwheat, laurel sumac (*Malosma laurina*), California encelia (*Encelia californica*) and several species of sage (e.g., *Salvia mellifera*, *S. apiana*). Other common species include brittlebush (*E. farinosa*), lemonadeberry (*Rhus integrifolia*), sugarbush (*R. ovata*), yellow bush penstemon (*Keckiella antirrhinoides*), Mexican elderberry (*Sambucus mexicana*), sweetbush (*Bebbia juncea*), box-thorn (*Lycium* spp.), shore cactus (*O. littoralis*), coastal cholla (*Opuntia prolifera*), tall prickly-pear (*O. oricola*) and species of *Dudleya.*

Desert Scrub Communities: Desert scrub, including big sagebrush scrub and Sonoran desert scrub, occurs mostly in the southeastern portion of western Riverside County. Large stretches occur north and south of SR-371 within Tule Valley, Culp Valley, Wilson Creek, Cahuilla, the Ramona Indian Reservation, the community of Anza and east of Aguanga and Lake Riverside.

Desert scrub is typically composed of shrubs such as big sagebrush (*Artemisia tridentata*), bitterbrush (*Purshia tridentata*), rubber rabbit-bush (*Chrysothamus nauseosus*), yellow rabbitbrush (*C. viscidiflorus*), black bush (*Coleogyne ramosissima*), Mormon-tea (*Ephedra viridis*), horsebrush (*Tetradymia canescens*), plateau gooseberry (*Ribes velutinum*), hopsage (*Grayia spinosa*), burro weed (*Ambrosia dumosa*), brittlebush (*E. farinosa*), crucifixion-thorn (*Canotia holacantha*), ocotillo (*Fouquieria splendens*) and creosote scrub (*Larrea tridentata*). The herbaceous cover generally is dominated by a mixture of perennial bunch grasses, such as ricegrass (*Achnatherum hymenoides*), needle-and-thread (*Stipa comata*), letterman's needlegrass (*S. lettermanii*), needlegrass (*S. occidentalis and S. thurberiana*), desert needlegrass (*S. speciosa*), one-sided bluegrass (*Poa secunda*), bluebunch wheatgrass (*Agropyron spicata*) and Great Basin wild rye (*Leymus cinereus*). Annual grasses and forbs may also occur within big sagebrush scrub. Cheatgrass (*Bromus tectorum*), an introduced annual grass, has become the dominant herbaceous species in many areas.

Developed or Disturbed Land: Developed or disturbed lands consist of areas that have been disked, cleared or otherwise altered. Developed lands may include roadways, existing buildings and structures as well as landscaped or groomed areas, such as parks and detention basins. The largest areas of developed land are in the cities (and surrounding unincorporated communities) of Temecula, Murrieta, Lake Elsinore, (Meadowbrook, Alberhill, El Cariso and Lakeland Village), Hemet (East Hemet and Valle Vista), Moreno Valley and along the SR-91 corridor from Riverside through Corona and Norco. More medium-sized tracts of developed land are located in the communities of Canyon Lake, (Quail Valley, Sun City, Homeland), in Perris along I-215, (Mead Valley, Gavilan Hills, Woodcrest), Beaumont, Banning (Cherry Valley) and Calimesa. Small pockets of scattered development occur in the southeast portion of Riverside County along SR-371 in the unincorporated communities of Terwilliger Valley, Sage, Aguanga and Anza and also within the Sedco Hills. Disturbed lands may include ornamental plantings for landscaping, escaped exotics or ruderal (weedy) vegetation dominated by non-native, weedy species such as mustard (*Brassica* sp.), fennel (*Foeniculum vulgare*), tocalote (*Centaurea melitensis*) and Russian thistle (*Salsola tragus*).

Grassland Communities: Grasslands occur throughout most of western Riverside County. Two general types of grasslands occur in Southern California. The first and most prevalent type by far is non-native dominated, primarily annual grassland ('nonnative grassland'). The second type is native-dominated, perennial grassland ('valley and foothill grassland'). The only valley and foothill grasslands mapped within western Riverside County are found on the Santa Rosa Plateau. Non-native grasslands occur throughout the majority of the region, usually within close proximity to urbanized or agricultural land uses. Large patches of non-native grasslands occur in the Riverside lowlands near March Air Reserve Base, Lake Mathews, Lake Perris, Lake Elsinore, Banning, Cahuilla and in the Terwilliger Valley south of Anza.

Valley and foothill grasslands typically contain the perennial bunch grasses *Nassella pulchra* and *N. lepida.* Lesser amounts of other native grasses, such as *Melica* spp., *Leymus* spp., *Muhlenbergia* spp. and beard grass (*Bothriochloa barbinodis*), may also be present. In addition, non-native grasses or forbs may be present to varying degrees.

Native herbaceous plants commonly found within valley and foothill grasslands include yellow fiddleneck (*Amsinckia menziesii*), common calyptridium (*Calyptridium monardum*), suncup (*Camissonia* spp.), Chinese houses (*Collinsia heterophylla*), California poppy (*Eschcholzia californica*), tarweed (*Hemizonia* spp.), coast goldfields (*Lasthenia californica*), common tidy-tips (*Layia platyglossa*), *Lupinus* spp., *Plagiobothrys* spp., blue dicks (*Dichelostemma capitata*), *Muilla* spp., blue-eyed grass (*Sisyrinchium bellum*) and *Dudleya* spp.

Non-native grasslands are typically dominated by several species of grasses that have evolved to persist in concert with human agricultural practices: slender oat (*Avena barbata*), wild oat (*A. fatua*), fox tail chess (*Bromus madritensis*), soft chess (*B. hordeaceus*), ripgut grass (*B. diandrus*), barley (*Hordeum* spp.), rye grass (*Lolium multiflorum*), English ryegrass *(L. perrene*), rat-tail fescue (*Vulpia myuros*) and Mediterranean schismus (*Schismus barbatus*).

Meadow and Marsh Communities: Meadow and marsh communities, including coastal and valley freshwater marsh, undifferentiated marsh and wet montane meadow, occur within the unincorporated area of western Riverside County. Occurrences of freshwater marshes have been mapped in the Prado Basin in the Santa Ana River Valley, on the Santa Ana River near Pedley, north of Lake Elsinore in Walker Canyon, near San Jacinto, along the shores of Lake Skinner and Vail Lake, and adjacent to the cismontane alkali marsh on Cahuilla Creek. Undifferentiated marsh was mapped in three locations, including the shore of Lake Mathews, near Mystic Lake and upstream from Vail Lake along Temecula Creek in the Aguanga Valley. Wet montane meadow was mapped in the San Jacinto Mountains in the San Bernardino National Forest, primarily within the vicinity of Hemet Lake.

Meadow and marsh communities occur in both flowing and still water and are associated with cattails (*Typha* spp.), bulrush (*Scirpus* spp.), sedges (*Carex* spp.), spike rushes (*Eleocharis* spp.), flatsedges (*Cyperus* spp.), smartweed (*Polygonum* spp.), watercress (*Rorippa* spp.), yerba mansa (*Anemopsis californica*), saltgrass (*Distichlis spicata*), alkali-heath (*Frankenia salina*), common pickleweed (*Salicornia virginica*), rushes (*Juncus* spp.) and marsh flea-bane (*Pluchea odorata*), as well as perennial and biennial herbs (e.g., *Oenothera* spp., *Polygonum* spp., *Lupinus* spp., *Potentilla* spp. and *Sidalcea* spp.) and grasses (e.g., *Agrostis* spp., *Deschampsia* spp. and *Muhlenbergia* spp.). Rooted aquatic plant species with floating stems and leaves also may be present, such as pennywort (*Hydrocotyle* spp.), water smartweed (*Polygonum amphibium*), pondweeds (*Potamogeton* spp.) and water-parsley (*Oenanthe sarmentosa*). Wet montane meadows that dry out by mid-summer have a higher percentage of perennial grasses than meadows that remain moist during the entire growing season.

Cismontane Alkali Marsh Community: Cismontane alkali marsh occurs within the unincorporated area of western Riverside County. The community is dominated by perennial, emergent, herbaceous monocots to 6 feet tall; cover is often complete and dense. Dominant species include cattail (*Typha latifolia, T. domingensis*), alkali bulrush (*Scirpus americanus*) and saw-grass (*Cladium californicum*). Iodine bush (*Allenrolfea occidentalis*) is also associated with these marshes. This marsh habitat occurs where standing water or saturated soil is present throughout most or all of the year. High evaporation and low input of freshwater render the marsh alkaline. This natural community occurs primarily within Cahuilla Indian lands east of Anza and within existing conservation lands east of Lake Perris in the Mystic Lake area. It is important habitat for the Yuma clapper rail and California black rail.

Montane Coniferous Forest Communities: These types of forest communities are generally distinguished from other woodlands and other forest types by their higher altitude and drier climate. Montane coniferous (cone-bearing) forest, including Jeffrey pine, lodgepole pine forest, lower montane coniferous forest, mixed evergreen forest, Southern California white fir forest and subalpine coniferous forest, occur within the San Jacinto Mountains, Agua Tibia, Cleveland National Forest and Santa Rosa Mountains. Montane coniferous forest is dominated by Jeffrey pine (*Pinus jeffreyi*), ponderosa pine (*P. ponderosa*), Coulter pine (*P. coulteri*), lodgepole pine (*P. contorta* subspecies [ssp.] *murrayanna*), limber pine (*P. flexilis*), bigcone Douglas-fir (*Pseudotsuga macrocarpa*), Pacific madrone (*Arbutus menziesii*), bigleaf maple (*Acer macrophyllum*), Rocky Mountain white fir (*Abies concolor* variety [var.]

concolor) and sugar pine (*P. lambertiana*). Common understory shrubs include manzanita (*Arctostaphylos* spp.), California lilac (*Ceanothus* spp.), chinquapin (*Chrysolepis* ssp.), currant (*Ribes* ssp.) and dwarf mistletoe (*Arceuthobium campylopodum*). The herbaceous layer is composed of morning-glory (*Calystegia occidentalis* ssp. *fulcrata*), sedge (*Carex multicaulis*), clarkia (*Clarkia rhomboidea*) and mountain-heather (*Phyllodoce breweri*).

Playa and Vernal Pool Communities: Within western Riverside County, playa and vernal pool communities are generally found in the San Jacinto Valley/Perris Basin and on the Santa Rosa Plateau. Vernal pools are ephemeral wetlands that form in shallow depressions underlain by a substrate near the surface that restricts the downward percolation of water. Depressions in the landscape with no outlets fill with rainwater and runoff enters from adjacent areas during the winter. The depressions may remain inundated until spring or early summer, sometimes drying more than once during the wet season. Smaller pools can fill and dry. Larger pools can hold water longer and may, in the deeper portions, support species more representative of freshwater marshes.

The term 'playa' is also loosely associated with vernal pool communities because of a similar morphology. Playas are usually dry and nearly level lake plains that occupy the lowest parts of closed depressions, such as those occurring on montane or intermontane basis floors. In them, temporary ponding occurs due to precipitation runoff events, leading to a succession of plant growth similar to that of vernal pools.

Vernal pools are well-known for their high level of endemism (occurring only in small areas) and abundance of rare, threatened or endangered species. Many vernal pools are characterized by concentric rings of plants that flower sequentially as the pools dry. Vernal pools are dominated by native annual plants with low to moderate levels of perennial herbaceous cover. Common vernal pool plant species in western Riverside County include woolly marbles (*Psilocarphus brevissimus*), toad rush (*Juncus bufonius*) and spike rush (*Eleocharis* spp.). In addition, the following sensitive or listed plant species are found in one or more of these pools: California Orcutt grass (*Orcuttia californica*), Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*), little mousetail (*Myosurus minimus* ssp. *apus*), spreading navarretia (*Navarretia fossalis*), low navarretia (*N. prostrata*), Orcutt's brodiaea (*Brodiaea orcuttii*), thread-leaved brodiaea (*B. filifolia*), Parish brittlescale (*Atriplex parishii*), Parish meadowfoam (*Limnanthes gracilis* ssp. *parishii*), San Diego button-celery (*Eryngium aristulatum* var. *parishii*), Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*), San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*) and smooth tarplant (*Hemizonia pungens* ssp. *laevis*). The Santa Rosa Plateau fairy shrimp (*Linderiella santarosae*) occurs only in western Riverside County. The vernal pools of the Santa Rosa Plateau also feature the southernmost record for the vernal pool fairy shrimp (*Branchinecta lynchi*).

Riparian Forest/Woodland/Scrub Communities: Riparian habitat is, by definition, associated with the presence of water as these communities generally occur near streams, rivers and similar sources of wet soils. Riparian vegetation, including forest, woodland and scrub subtypes, is distributed in waterways and drainages throughout much of western Riverside County. Southern cottonwood/willow forest makes up the largest proportion of the riparian vegetation in western Riverside County, comprising nearly one-half of the acreage. Most of this community occurs along the Santa Ana River drainage from Lake Evans to beyond the Prado Basin, along the San Gorgonio River north of Banning and along Temecula Creek east of Vail Lake. Additional types of riparian vegetation can also be found along these and other area drainages, including the San Gorgonio River north of Banning (montane riparian forest), Temescal Canyon Wash and its tributaries (riparian scrub and mulefat scrub), stream channels within the San Mateo Canyon watershed (riparian forest, southern sycamore/alder riparian woodland and riparian scrub) and Vail Lake (tamarisk scrub).

Riparian communities typically consist of one or more deciduous tree species with an assorted understory of shrubs and herbs. Depending on community type, a riparian community may be dominated by any of several trees or shrubs, including box elder (*Acer negundo*), big-leaf maple (*A. macrophyllum*), coast live oak (*Quercus agrifolia*), white alder (*Alnus rhombifolia*), sycamore (*Platanus racemosa*), Fremont's cottonwood (*Populus fremontii*), California

walnut (*Juglans californica*), Mexican elderberry (*Sambucus mexicana*), wild grape (*Vitis girdiana*), giant reed (*Arundo donax*), mulefat (*Baccharis salicifolia*), tamarisk (*Tamarix* spp.) or any of several species of willow (*Salix* spp.). In addition, various understory herbs may be present, such as salt grass (*Distichlis spicata*), wild cucumber (*Marah macrocarpus*), mugwort (*Artemisia douglasiana*), stinging nettle (*Urtica dioica*) and poison oak (*Toxicodendron diversilobum*).

Riversidean Alluvial Fan Sage Scrub Communities: Riversidean alluvial fan sage scrub also occurs in the region. Large areas of it occur on the Santa Ana River near Lake Evans in the City of Riverside; along the San Gorgonio River and its tributaries near Banning; on the San Jacinto River from the San Bernardino National Forest to the Soboba Indian Reservation; near Temecula along Temecula Creek; on drainage and washes throughout the Aguanga area; along Bautista Creek south of Hemet; and along the washes coming out of the mountain canyons in the Temescal Valley.

Riversidean alluvial fan sage scrub is a Mediterranean shrubland type that occurs in washes and on gently sloping alluvial fans. Alluvial scrub is made up predominantly of drought-deciduous soft-leaved shrubs, though it can also include significant cover of larger perennial species typically found in chaparral. Due to its ability to survive the scouring that occurs in alluvial washes, scalebroom (*Lepidospartum squamatum*) generally is regarded a prime indicator of Riversidian alluvial scrub. In addition to scalebroom, alluvial scrub typically features white sage (*Salvia apiana*), redberry (*Rhamnus crocea*), flat-top buckwheat (*Eriogonum fasciculatum*), our lord's candle (*Yucca whipplei*), California croton (*Croton californicus*), cholla (*Opuntia* spp.), tarragon (*Artemisia dracunculus*), yerba santa (*Eriodictyon* spp.), mulefat (*Baccharis salicifolia*) and mountain-mahogany (*Cercocarpus betuloides*). Annual species composition has not been studied but is probably similar to that found in understories of neighboring shrubland vegetation. Two sensitive annual species are endemic to alluvial scrub vegetation in western Riverside County: slender-horned spineflower (*Dodecahema leptocerus*) and Santa Ana River woollystar (*Eriastrum densifolium* ssp. *sanctorum*).

Water: A portion of western Riverside County consists of open water. Open water was mapped at Vail Lake, Lake Skinner, Diamond Valley Lake, Lake Perris, Mystic Lake, Canyon Lake, Lake Elsinore, Lee Lake, Lake Mathews, Hemet Lake, portions of the San Jacinto River and portions of the Santa Ana River, as well as various small ponds, private reservoirs and portions of stream channels.

Open water typically is unvegetated due to a lack of light penetration. However, it may contain suspended organisms such as filamentous green algae, phytoplankton (including diatoms) and desmids. Floating plants such as duckweed (*Lemna* spp.), water buttercup (*Ranunculus aquatilis*) and mosquito fern (*Azolla filiculoides*) also may be present. Open water includes inland depressions, ponds, lakes, reservoirs and stream channels with standing water and often occurs in conjunction with riparian and upland communities. Water depth may vary from hundreds of feet to a few inches.

Woodland and Forest Communities: Within the lowlands, hills and lower elevations of mountains, western Riverside County supports woodlands and forests featuring black oak forest, broad-leaved upland forest, oak woodlands and peninsular juniper woodland communities. Woodland and forest communities are dominated by Englemann oak (*Quercus englemannii*), coast live oak (*Q. agrifolia*), canyon live oak (*Q. chrysolepis*), interior live oak (*Q. wislizenii*) and black oak (*Q. kelloggii*). The canopy of these communities may be continuous to intermittent or savannah-like. Four-needle pinyon (*Pinus quadrifolia*), single-leaf pinyon pine (*P. monophylla*) and California juniper (*Juniperus californica*) are the canopy species most commonly associated with peninsular juniper woodland; they form a scattered canopy from 10 to 50 feet tall and generally occur on ridges and slopes slightly above the lowlands.

Many understory plants in these woodlands are shade tolerant and include wild blackberry (*Rubus ursinus*), snowberry (*Symphoricarpos mollis),* California walnut (*Juglans californica*), California-lilac (*Ceanothus* spp.), *Rhus* spp.,

currant (*Ribes* spp.), toyon (*Heteromeles arbutifolia*), California bay (*Umbellularia californica*), manzanita (*Arctostaphylos* spp.), laurel sumac (*Malosma laurina*), poison-oak (*Toxicodendron diversilobum*) and herbaceous plants including bracken fern (*Pteridium aquilinum*), polypody fern (*Polypodium californicum*), fiesta flower (*Pholistorma auritum*) and miner's lettuce (*Claytonia perfoliata*). A variety of grasses and soft shrubs also are commonly found in these communities. This natural community can occur in any part of Riverside County with proper conditions, such as stream sides, canyon bottoms and flat to very steep topography.

2. Coachella Valley

As discussed previously, for the purposes of this section, Coachella Valley is defined as the region covered by the CV-MSHCP. This area encompasses approximately 1.2 million acres and includes the Coachella Valley and the surrounding mountains up to the ridgelines. A little more than 1 million acres falls within the jurisdiction of Riverside County in the region. The Coachella Valley is located in the central portion of Riverside County and extends from Cabazon in the northwest to the ridgeline of the Little San Bernardino Mountains and San Bernardino County boundary to the northeast. At the southern end of the valley, the ridgeline of the San Jacinto and Santa Rosa Mountains and the boundary line with San Diego and Imperial Counties define its extent in Riverside County.

Coachella Valley proper is a broad, low elevation, northwest-southeast trending valley located along the westernmost edge of the Sonoran desert. As envisioned by the CV-MSHCP, the region was chosen to maximize the amount of Coachella Valley watershed encompassed. Portions of the watershed outside Riverside County or outside the jurisdictional boundaries of the Coachella Valley Association of Governments (CVAG) were omitted to avoid institutional and administrative complexity. For most of its length, the western boundary of the CV-MSHCP is coterminous with the eastern boundary of the WRC-MSHCP. However, there is a gap of approximately 60,300 acres between the two MSHCPs located near the San Diego border, south of SR-74 and west of the Santa Rosa Mountains. See "Non-MSHCP Areas" for additional information.

The desert floor of the Coachella Valley ranges in elevation from more than 150 feet below sea level at the southeast end to nearly 2,000 feet at the northwest end of the valley on the alluvial fans. The mountains surrounding the Coachella Valley range in elevation up to 10,800 feet at Mount San Jacinto, with elevations on the southern side of the valley substantially higher than those on the north. This range of elevations and accompanying differences in temperature, precipitation and other environmental variables are significant factors contributing to the area's high biological diversity.

Many canyons in the mountains support riparian areas not typical of a desert environment. Streams and seeps also support many desert fan palm oases, especially in the Santa Rosa Mountains. Desert dry wash woodlands occur where the water drains into the sands. The alluvial fans associated with the canyon mouths provide still another major land form and distinctive biological community. Also contributing to the region's biological diversity are the strong winds that funnel through the San Gorgonio Pass from the west that pass through areas of sand deposition from the San Gorgonio and Whitewater Rivers, creating an aeolian dune system. Historically, this dune system occupied much of the center of the valley.

The San Andreas Fault zone has created a unique corridor of desert fan palm oases stretching along the southern side of the Indio Hills where water is forced to or near the surface by the damming action of the fault. Mesquite hummocks and mesquite bosques are also associated with the fault in some areas. The Salton Sea also contributes to biological diversity through the creation of marsh, mudflat and other wetland habitats. The low elevation of the Salton Sea trough creates a hot arid environment which combines with the salinity of the soils to produce an uncommon desert sink scrub community.

Figure 4.8.3 (Coachella Valley Natural Communities) presents the natural communities, also referred to as vegetation communities, found in Coachella Valley. The communities shown represent the collapsed, or combined, classifications used in the CV-MSHCP as based on Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986) along with five additional natural community types developed to distinguish better among the blowsand communities in the region. Table 4.8-B (Coachella Valley Natural Communities), below, also lists the uncollapsed classifications that are associated with each collapsed category. A brief description of each collapsed natural vegetation community found in Coachella Valley, as defined in the Recirculated Final CV-MSHCP, is provided below.

Chaparral Communities: Coachella Valley supports chaparral communities, including chamise chaparral, interior live oak chaparral, mixed montane chaparral, northern mixed chaparral, red shank chaparral, scrub oak chaparral, semi-desert chaparral, upper Sonoran manzanita chaparral and upper Sonoran mixed chaparral. These communities occur on the lower slopes of the San Jacinto, Santa Rosa and Little San Bernardino Mountains.

Table 4.8-B: Coachella Valley Natural Communities

Collapsed Community Classifications	Acreage[1]	% of Habitat	Uncollapsed Classification[2]	Acreage
Chaparral	86,330	9%	Chamise Chaparral[3]	*4,440*
			Interior live oak chaparral[3]	*24,650*
			Mixed montane chaparral	*180*
			Northern mixed chaparral	*8,520*
			Red shank chaparral[3]	*16,560*
			Scrub oak chaparral	*2,530*
			Semi-desert chaparral[3]	*23,910*
			Upper Sonoran manzanita chaparral	*3*
			Upper Sonoran mixed chaparral	*2,540*
Desert Alkali Scrub	18,830	2%	Desert saltbush scrub[3]	*7,210*
			Desert sink scrub[3]	*11,630*
Desert Scrub	607,110	60%	Blackbush scrub	*8,490*
			Mojave mixed steppe	*420*
			Mojave mixed woody scrub[3]	*103,510*
			Riversidean desert scrub	*8,110*
			Sonoran creosote bush scrub[3]	*380,250*
			Sonoran mixed woody and succulent scrub[3]	*106,330*
Developed, Urban and Disturbed	147,070	15%	Agriculture	*71,470*
			Lake	*44,140*
			Landfill	*410*
			Quarry	*760*
			Reservoir	*90*
			Rural	*12,290*
			Urban	*14,630*
			Wind Energy	*3,280*
Dry Wash Woodland and Mesquite	38,690	4%	Desert dry wash woodland[3]	*37,430*
			Mesquite bosque[3]	*480*
			Mesquite hummocks[3]	*790*
Marsh	400	0%	Cismontane alkali marsh[3]	*320*
			Coastal and valley freshwater marsh[3]	*80*
Riparian	8,050	1%	Arrowweed scrub[3]	*280*
			Desert fan palm oasis woodland[3]	*1,590*
			Sonoran cottonwood-willow riparian forest	*690*
			Southern arroyo willow riparian forest[3]	*150*
			Southern sycamore-alder riparian woodland	*960*
			Tamarisk scrub	*4,390*

Collapsed Community Classifications	Acreage[1]	% of Habitat	Uncollapsed Classification[2]	Acreage
Sand Dunes and Sand Fields	8,990	1%	Active desert dunes[3]	*440*
			Active sand fields[3]	*4,710*
			Ephemeral sand fields[3]	*730*
			Stabilized desert dunes[3]	*250*
			Stabilized desert sand fields[3]	*840*
			Stabilized shielded sand fields[3]	*2,030*
Woodland and Forest	92,710	9%	Bigcone spruce-canyon oak forest	*2,660*
			Black oak forest	*3,390*
			Canyon live oak forest	*190*
			Coulter pine forest	*4,530*
			Jeffrey pine forest	*4,500*
			Jeffrey pine-fir forest	*3,200*
			Mojavean pinyon and juniper woodland[3]	*30,670*
			Peninsular juniper woodland and scrub[3]	*29,950*
			Sierran mixed coniferous forest	*3,320*
			Southern California subalpine forest	*1,820*
			Westside ponderosa pine forest	*8,490*
Total Acreage	**1,008,180**			

Footnotes:
1. Total aggregate acreage.
2. Habitat types tracked under CV-MSHCP.
3. Included on CNPS lists S or G, 1, 2, or 3 and/or included on CNDB tracking lists.

Source: Riverside County GIS Department, analysis of habitat data from CV-MSHCP, 2012.

These communities may contain chamise (*Adenostoma fasciculatum*), redshank (*Adenostoma sparsifolium*), interior live oak (*Quercus wislizenii*), scrub oak (*Q. berberidifolia*), sclerophylls, chaparral whitethorn (*Ceanothus leucodermis*), birch-leaf mountain mahogany (*Cercocarpus betuloides*), coffeeberry (*Rhamnus californica*), hollyleaf redberry (*R. ilicifolia*), California juniper (*Juniperus californica*), California buckwheat, *Opuntia* cactus species, manzanita (*Arctostaphylos* spp.) and sugar bush (*Rhus ovata*).

Desert and Alkali Scrub Communities: Coachella Valley supports desert and alkali scrub communities composed of desert saltbush scrub and desert sink scrub. These communities occur in the Willow Hole area, the Thousand Palms Preserve and in the higher-salinity soils in the area around the northern end of the Salton Sea and in the Dos Palmas/Salt Creek area east of the Sea.

One or more species of saltbush (*Atriplex* spp.) are found in these communities, including alkali salt-bush (*Atriplex polycarpa*) and four-winged saltbush (*A. canescens* var. *linearis*). Screwbean mesquite (*Prosopis glandulosa* var. *torreyana*) is a common associate. Alkali goldenbush (*Isocoma acradenia*) is common in areas where *P. glandulosa* is dominant. Pickleweed (*Salicornia virginica*), iodine bush, is also common.

Desert Scrub Communities: Coachella Valley supports various Mojavean and Sonoran desert scrub communities. Mojavean desert scrub is composed of blackbrush scrub, Mojave mixed steppe and Mojave mixed woody scrub communities. Sonoran desert scrub encompasses Sonoran creosote bush scrub, Sonoran mixed woody and succulent scrub communities. These communities are found in the alluvial plains that extend out toward the valley floor from the mouth of canyons emerging from the surrounding mountains. These alluvial habitats are formed by a variety of mountain drainages from large and small canyons including: Chino Canyon and Palm Canyon draining the San Jacinto Mountains; Big Morongo Canyon, Thousand Palms Canyon, Long Canyon, East Wide Canyon, West Wide Canyon and East Deception Canyon, which all drain to the Little San Bernardino Mountains; Mission Creek, Whitewater River and the San Gorgonio River draining the San Bernardino Mountains; and Dead Indian Canyon, Deep Canyon, Bear Creek and Martinez Canyon draining the Santa Rosas Mountains.

Desert scrub communities may include plant species such as creosote bush, burrobush (*Ambrosia dumosa*), Joshua tree (*Yucca brevifolia herbertii*), California buckwheat and bladderpod (*Isomeris arborea*), plus a variety of woody and herbaceous plants, including indigo bush, catclaw acacia, desert lavender, rock daisy and palo verde. Several species of cacti are also present, including fishhook cactus, hedgehog cactus, silver cholla (*Opuntia echinocarpa*), buckhorn cholla (*O. acanthocarpa*), pencil cholla (*O. ramosissima*), prickly pear (*O. engelmannii*), beavertail cactus (*O. basilaris*), barrel cactus (*Ferocactus acanthodes*) and ocotillo (*Fouquieria splendens*). Species of note known from this community include California ditaxis and glandular ditaxis.

Dry Wash Woodland and Mesquite Communities: This community includes desert washes which form a distinct habitat connection that links the mountains to the valley floor. Washes emerge from canyon mouths as high-banked watercourses that cut through to the alluvial plain. Vegetation consists of a low-growing, loosely formed woodland with a number of distinctive plants including Little San Bernardino Mountains linanthus (*Linanthus maculates*), Mecca aster (*Xylorhiza cognate*) and Orocopia sage (*Salvia greatae*), as well as common shrubs such as desert lavender (*Hyptis emoryi*), sandpaper plant (*Petalonyx thurberi*) and bladderpod (*Lesquerella* spp.*)*. These drainages can also support vegetation specialized to capitalize on a level of underground water that is closer to the surface.

As these washes descend down onto the plains, they broaden and the watercourses branch out. Farther from the canyons, washes become broader, shallower and less defined so that the physical differences between the washes and the alluvial plain are diminished. These washes are often used by wildlife as corridors through both the wash and the alluvial plain habitats. The washes are favored habitats of the desert tortoise (*Gopherus agassizii*), Peninsular bighorn sheep (*Ovis canadensis nelsoni*), Coachella Valley round-tailed ground squirrel (*Spermophilus tereticaudus chlorus*), Le Conte's thrasher (*Toxostoma lecontei*) and a variety of migratory riparian birds. The largest and most notable desert washes in the Coachella Valley include those associated with the San Gorgonio and Whitewater Rivers, Palm Canyon, Mission Creek, Big Morongo Creek, Deep Canyon, Thousand Palms and Bear Creek Wash, among others.

Marsh Communities: Coachella Valley supports a small amount of cismontane alkali marsh and coastal and valley freshwater marshes. These communities occur at the mouth of the Coachella Valley Stormwater Channel along the Salton Sea and at Los Dos Palmas, on the edge of some of the palm oases (e.g., Andreas Oasis) and along the margins of recently restored man-made ponds. Dominant species include cattail (*Typha latifolia* and *T. domingensis*), alkali bulrush (*Scirpus americanus*), tules (*Scirpus* spp.), rushes (*Juncus* spp.) and saw-grass (*Cladium californicum*). Iodine bush (*Allenrolfea occidentalis*) is also associated with these communities.

Sand Dunes and Sand Fields Communities: These communities are characterized by relatively flat and low-lying terrain with regions of shifting and blowing sands generally supporting only sparse vegetation. Within the Coachella Valley, blow sand communities can be divided into three sub-communities: active sand dunes, active sand fields, and stabilized and partially-stabilized desert sand fields. These blowsand habitats are characterized by low perennial plant diversity, very high annual ephemeral plant diversity and a very diverse array of invertebrates.

Active sand dunes are located in exposed areas on the valley floor where high winds convey sand and persistently shift the sand dunes, allowing for little or no vegetation to be supported on them. The term 'active' refers to the fact that windbreaks have not impaired the aeolian (wind-borne) processes that contribute to sand transport, accumulation and depletion in the sand fields. Because the dunes are continually shifting and accumulating sand, perennial plant cover is very low with much of the surface exposed or barren for most of the year. However, dunes do become covered with native annual plants (most visibly sand verbena and dune primrose) in years of high rainfall.

The second sand community subtype, active desert sand fields, is located within the Coachella Valley Preserve next to the dunes. While not in dune formation, sand within these fields is actively being deposited and depleted to form sheets of desert sand. Similar to the dunes, active desert sand fields are generally unable to support extensive vegetation due to the active aeolian processes. Sand may also pile up against creosote bush, mesquite and other perennials to create hummocks or mounds that can support other plants and wildlife.

The last community subtype, stabilized dunes and sand fields, is generally found on the valley floor where it is cut off from fresh sources of sand due to windbreaks, upwind development and construction of roads. The result is stabilized or partially-stabilized sand fields not undergoing active sand deposition or movement occurring just north of the Whitewater River and north of Interstate 10.

Woodland and Forest Communities: Coachella Valley supports oak woodlands and forests composed of black oak forest and canyon live oak forest communities. These communities are dominated by canyon live oak, interior live oak and black oak in the canopy, which may be continuous to intermittent or savannah-like. Four-needle pinyon, single-leaf pinyon pine and California juniper are the canopy species of peninsular juniper woodland which most commonly occur in Southern California, forming a scattered canopy from 10 to 50 feet tall.

Many understory plants in oak woodlands are shade tolerant and include wild blackberry, snowberry, California walnut, California-lilac, *Rhus* spp., currant, toyon, California bay, manzanita, laurel sumac, poisonoak and herbaceous plants including bracken fern, polypody fern, fiesta flower and miner's lettuce. A variety of grasses and soft shrubs also are commonly found in these communities. This natural community can occur in a variety of areas, including sides of streams, canyon bottoms and flat to very steep topography throughout the region.

Coachella Valley also supports coniferous woodland and forest communities, including bigcone spruce-canyon oak forest, Coulter pine forest, Jeffrey pine forest, Jeffrey pine-fir forest, Mojavean pinyon and juniper woodland, Peninsular juniper woodland and scrub, Sierran mixed coniferous forest, Southern California subalpine forest and Westside ponderosa pine forest communities. These communities occur in the San Bernardino, San Jacinto and Santa Rosa Mountain ranges.

These communities contain pinyon pine, California juniper, big sagebrush, desert scrub oak (*Quercus turbinella*), Mojave yucca (*Yucca schidigera*), birchleaf mountain mahogany (*Cercocarpus betuloides*), beargrass (*Nolina parryi*) and four-leaf pinyon pine. These communities include perennial plant species typical of a creosote bush scrub matrix, with perennial shrub species including creosote bush (*Larrea tridentata*), four-wing saltbush (*Atriplex canescens*), California croton (*Croton californicus*), sandpaper plant, indigo bush, desert willow (*Chilopsis linearis*) and honey mesquite (*Prosopis glandulosa*) shrubs.

Riparian Communities: Coachella Valley supports riparian communities that include arroweed scrub, desert fan palm oasis woodland, southern arroyo willow riparian forest and tamarisk scrub. These communities occur in canyon mouths and alluvial fans in the northwest portion of the region, south of Fingal, near Snow Canyon, southeast of Snow Canyon, in Wood Stubbe, Cottonwood, Whitewater, Mission, Big Morongo and Chino Canyons. The community also includes portions of Dry Morongo Creek, scattered locations in the Whitewater River channel east of Monroe Avenue, the Thousand Palms Preserve, Millard Canyon, Lion Canyon, Blaisdell Canyon and the Dos Palmas Preserve and washes along the San Andreas Fault.

These riparian communities consist of streamside vegetation, such as arroyo willow (*S. lasiolepis*), Fremont cottonwood, willow, sycamore, white alder, arrowweed, cattails, tule, rushes, saltgrass, fan palm (*Washingtonia filifera*), screwbean mesquite, saltbush, palo verde, ironwood, smoketree (*Psorothamnus spinosus*), desert lavender (*Hyptis emoryi*), cheesebush (*Hymenoclea salsola*), catclaw acacia (*Acacia greggii*) and desert willow.

Developed, Urban and Disturbed: This category includes areas where natural vegetation has been largely destroyed or substantially modified by human activity. Developed lands may include roadways, existing buildings and structures as well as landscaped or groomed areas, such as parks, golf courses, common areas and detention basins. For purposes of the CV-MSHCP, this category includes lakes, landfills, quarries, reservoirs, rural disturbed lands, urban land uses and lands devoted to wind energy. The largest areas of developed, urban and disturbed land occur on the valley floor itself.

While not categorized separately, Coachella Valley also supports areas of open water. Open water was mapped at the Salton Sea and portions of the Whitewater River as well as various small ponds, private reservoirs and portions of stream channels. Open water typically is unvegetated due to a lack of light penetration. However, open water may contain suspended organisms such as filamentous green algae, phytoplankton (including diatoms) and desmids. Floating plants such as duckweed, water buttercup and mosquito fern (*Azolla filiculoides*) also may be present. Open water includes inland depressions, ponds, lakes, reservoirs and stream channels containing standing water and often occur in conjunction with riparian and upland communities. Depths may vary from hundreds of feet to a few inches.

3. Non-MSHCP Areas

The portions of Riverside County encompassed by areas not covered by either the WRC-MSHCP or the CV-MSHCP collectively, the non-MSHCP areas, include the eastern-most third of the county east of the CV-MSHCP area, which stretches to the Arizona border. It also includes an area in the south-central portion of the county between the two MSHCP coverage areas bordered by San Diego County, roughly near the Anza-Borego area. The entire eastern portion of the non-MSHCP area is part of the Sonoran desert and is covered by desert scrub and woodlands/forests at higher elevations in the desert mountains. Other desert communities occur on the flatland. Elevation in the eastern Riverside County portion ranges from about 230 feet below mean sea level at the Salton Sea to about 8,320 feet in the mountains. The south-central portion of non-MSHCP area is characterized by mainly scrub and chaparral vegetation communities. In total, the non-MSHCP area encompasses nearly 2.2 million acres; approximately 60,330 acres for the smaller south-central area with the remainder in the far east portion.

Figure 4.8.4 (Non-MSHCP Areas Natural Communities) presents the natural communities found in the non-MSHCP areas. The natural communities shown in Figure 4.8.4 represent the collapsed, (combined) classifications used in the CV-MSHCP. Table 4.8-C (Non-MSHCP Areas Natural Communities), below, lists both the collapsed and the uncollapsed classifications, as well as the acreage totals. A brief description of each natural vegetation community found in the non-MSHCP area is provided below.

Agriculture: Agricultural lands currently exist within the non-MSHCP areas. This includes field croplands, orchards, groves, vineyards and dairy and livestock feed yards.

Chaparral Communities: Non-MSHCP areas support chaparral communities composed of red shank chaparral and semi-desert chaparral. These communities occur on the slopes of the desert mountains and in the south-central portion of Riverside County. These communities may contain chamise, redshank , interior live oak, scrub oak, sclerophylls, chaparral whitethorn, birchleaf mountain mahogany, coffeeberry, hollyleaf redberry, California juniper, California buckwheat, *Opuntia* cactus species, manzanita, sugar bush, hoaryleaf ceanothus and big pod mountain lilac (*C. megacarpus*).

Coniferous Woodland/Forest Communities: Non-MSHCP areas support coniferous woodland and forest communities including bigcone spruce-canyon oak forest, coulter pine forest, Jeffrey pine-fir forest, Mojavean pinyon and juniper woodland, Peninsular pinyon and juniper woodland and westside ponderosa pine forest.

These communities occur in the higher elevations of the desert mountains in south-central Riverside County in the non-MSHCP areas. These communities typically feature pinyon pine, California juniper, big sagebrush, desert scrub oak, Mojave yucca, birchleaf mountain mahogany, beargrass and four-leaf pinyon pine.

Table 4.8-C: Non-MSHCP Areas Natural Communities

Collapsed Classification	Acreage[1]	% of Habitat	Uncollapsed Classification[2]	Acreage
Agricultural Land[1]	96,110	4%	Agricultural fields, crops, groves & orchards	*96,110*
Chaparral	16,280	1%	Red shank chaparral[3]	*15,840*
			Semi-desert chaparral[3]	*450*
Woodland and Forest	15,490	1%	Coulter pine forest	*620*
			Jeffrey pine-fir forest	*1,060*
			Mojavean pinyon and juniper woodland[3]	*12,980*
			Peninsular pinyon and juniper woodland[3]	*790*
			Westside ponderosa pine forest	*40*
Desert Dune Communities	98,840	5%	Desert dune[3]	*62,150*
			Sandy area other than beach	*0*
Mojavean and Sonoran Desert Scrub	1,645,960	75%	Blackbush scrub	*36,690*
			Mojavean creosote bush scrub	*78,040*
			Mojave mixed steppe	*17,950*
			Mojave mixed woody scrub[3]	*157,290*
			Sonoran creosote bush scrub[3]	*1,230,680*
			Sonoran desert mixed scrub	*162,010*
Alkali Playa	13,110	1%	Alkali playa	*13,110*
Riparian and Bottomland	304,660	14%	Desert dry wash woodland[3]	*304,660*
Urban and Disturbed	350	0%	Urban/disturbed	*350*
Total Acreage	**2,190,790**			

Footnotes:
1. Total aggregate acreage.
2. Habitat types tracked under WRC-MSHCP and CV-MSHCP but occur in the Non-MSHCP areas of Riverside County.
3. Included on CNPS lists S or G, 1, 2 or 3 and/or included on CNDB tracking list.

Source: Riverside County GIS Department, analysis of habitat data for Non-MSHCP county areas, 2012.

Desert Dune Communities: Non-MSHCP areas support desert dune communities. These communities are found on valley floor areas in open and gently sloping land. These habitats are characterized by low perennial plant diversity, very high annual or ephemeral plant diversity and a very diverse array of invertebrates. The communities include perennial plant species typical of a creosote bush scrub matrix, with perennial shrub species including creosote bush, four-wing saltbush, California croton, sandpaper plant, indigo bush, desert willow and honey mesquite shrubs.

Mojavean and Sonoran Desert Scrub Communities: Non-MSHCP areas support both Mojavean and Sonoran desert scrub communities. Mojavean desert scrub communities include blackbush scrub, Mojave creosote bush scrub, Mojave-mixed steppe and Mojave-mixed woody scrub. Sonoran desert scrub communities include Sonoran creosote bush scrub and Sonoran desert mixed scrub communities. These communities are found in the alluvial plains that extend out toward the valley floors from the mouth of canyons emerging from the surrounding desert mountains, particularly in the eastern portion of the county.

These communities may include creosote bush, burrobush, Joshua tree, California buckwheat and bladderpod, plus a variety of woody and herbaceous plants, including indigo bush, catclaw acacia, desert lavender, rock daisy and palo verde. Several species of cacti are also present, including fishhook cactus, hedgehog cactus, silver cholla, buckhorn cholla, pencil cholla, prickly pear, beavertail cactus, barrel cactus and ocotillo. Species of note known to occur in this community include California ditaxis and glandular ditaxis.

Alkali Playa Communities: Non-MSHCP areas support playa natural communities composed of alkali playa habitat. The playas are found in the south-central area. As noted previously, playas consist of dry, level lake plains or depressions on montane or intermontane basin floors. Because of their closed hydrology, water flows into the playas as precipitation runoff, then ponds and dries mainly by evaporation, resulting in alkali conditions.

Riparian and Bottomland Communities: Non-MSHCP areas support riparian and bottomland communities, such as desert dry wash woodland. These communities occur in canyon mouths and alluvial fans throughout the far eastern desert regions of Riverside County.

These riparian communities feature streamside canopy vegetation such as arroyo willows, Fremont cottonwood, sycamore, white alder. Desert riparian habitats can also include arrowweed, cattail, tule, rushes, saltgrass, fan palm, screwbean mesquite, saltbush, palo verde, ironwood, smoketree, desert lavender, cheesebush, catclaw acacia and desert willow.

Urban and Disturbed: This category includes areas where natural vegetation has been largely destroyed or substantially modified by human activity. Developed lands may include roadways, existing buildings and structures, as well as landscaped or groomed areas, such as parks, golf courses and detention basins. For this section, this category also includes lakes, landfills, quarries, reservoirs, rural disturbed lands, urban land uses and wind energy lands. The largest areas of developed, urban and disturbed land occur within the Palo Verde Valley.

B. Sensitive Natural Communities

The California Department of Fish and Wildlife (CDFW; formerly the Department of Fish and Game), through NDDB, tracks the occurrence of natural communities which it considers to be the most sensitive in the State of California. These habitats are subsets occurring within the major natural communities just described in the prior section.

1. Western Riverside County

There are 60 uncollapsed (i.e., subset) natural community classifications within western Riverside County. According to NDDB, 18 are considered sensitive and are described below.

Alkali Playa: Alkali playas are vernal pool-like depressions that form in alkaline soils. Alkali playas are generally larger and contain a more diverse species composition than hardpan pools. Species common to this habitat type include fairy shrimp, spreading navarretia, the threatened thread-leaved brodiaea and the endangered San Jacinto Valley crownscale. For additional information, see vernal pool description below.

Canyon Live Oak Ravine Forest: This community consists of forests with continuous canopies dominated by canyon live oak (*Quercus chrysolepis*), but also potentially including pines, bigcone Douglas fir (*Pseudotsuga macrocarpa*), incense-cedar (*Calocedrus decurrens*), bigleaf maple (*Acer macrophyllum*), California black oak (*Quercus kelloggii*), California bay (*Umbellularia californica*), madrone (*Arbutus menziesii*), or white fir. Shrubs and herbs are infrequent due to the continuous tree canopy. This community occurs in canyons and near mountain streams in non-desert regions of California.

Desert Fan Palm Oasis Woodland: This community consists of woodlands dominated by California fan palm, but also potentially including willows, western sycamore canyon live oak, Fremont cottonwood or velvet ash (*Fraxinus velutina*). This community occurs on intermittently flooded or saturated soils in the Sonoran Desert portion of eastern Riverside County.

RIVERSIDE COUNTY PLANNING DEPARTMENT

NON-MSHCP AREA NATURAL COMMUNITIES

Path: \\agency\tmags\Projects\Planning\Cindys\PurpleMapGallery\Fig4.8.4-Vegetation_NonMSHCP.mxd

This page intentionally left blank

Engelmann Oak Woodland: Stands of *Quercus engelmannii,* Engelmann oaks, form an open to intermittent tree layer at 16-50 feet tall, an open to continuous shrub layer at 2-16 feet tall and an open to continuous herbaceous layer of up to 3-4 feet tall. The oaks dominate the tree layer or may occur with coast live oak and both species are sometimes regenerating in the shrub layer. Cottonwood and red willow occur infrequently as subdominant trees. Engelmann oak woodland is typically found in elevations between 1,200 and 2,100 feet on gentle to steep slopes within a variety of soils that range from moderately coarse sandy loam to fine clay. In western Riverside County, *Q. engelmannii* habitat can be found in or near the Santa Rosa Plateau, Tenaja and Temecula canyons.

Riversidean Alluvial Fan Sage Scrub: This community consists of shrublands with continuous or intermittent canopies less than five feet high, sometimes with grassy understories and scattered trees may also be present. This community occurs on rarely-flooded alluvial deposits along streams of Southern California. See description in prior section for additional details.

Sonoran Cottonwood Willow Riparian Forest: This community consists of winter-deciduous, broad-leafed streamside forests to about 60 feet tall, dominated by Fremont cottonwood with dense understories of several willow species, in deep, well-watered, loamy alluvial soils along the near-channel floodplains of perennial desert rivers and streams.

Southern California Arroyo Chub/Santa Ana Sucker Stream: This community consists of warm or cool water streams of the Los Angeles Basin that support communities of any of several sensitive fish species such as arroyo chub, Santa Ana sucker or speckled dace. This habitat occurs along the Santa Ana River and its tributaries in Riverside, San Bernardino and Orange Counties.

Southern Coast Live Oak Riparian Forest: This community consists of open to dense evergreen riparian woodlands dominated by coast live oak. This community appears to be richer in herbs and poorer in understory shrubs than other riparian communities. It occurs in bottomlands and outer floodplains along larger stream on fine-grained, rich alluvium in canyons and valleys of coastal Southern California, including western Riverside County.

Southern Cottonwood Willow Riparian: This community consists of tall, open, broad-leafed winter-deciduous riparian forests dominated by Fremont cottonwood, black cottonwood (*Populus balsamifera* ssp. *trichocarpa*) and several tree willows. Understories usually are shrubby willows. The dominant species require moist, bare mineral soil for germination and establishment. This is provided in floodplains after flood waters recede, leading to uniform-aged stands. This community occurs along sub-irrigated and frequently overflowed lands along perennially wet rivers and streams of the Transverse and Peninsular ranges, which include areas in western and central Riverside County.

Southern Interior Basalt Flow Vernal Pool: This community consists of seasonally flooded or saturated depressions on the Santa Rosa Plateau dominated by annual hairgrass (*Deschampsia danthonioides*), downingias (*Downingia* spp.), spreading navarretia (*Navarretia fossalis*), low navarretia (*Navarretia prostrata*), spikerush *(Eleocharis* spp.), California Orcutt grass (*Orcuttia californica*), quillwort (*Isoetes* spp.) or other amphibious herbs or grasses.

Southern Interior Cypress Forest: This community consists of fairly dense, fire-maintained, low forests dominated by either Piute cypress (*Cupressus arizonica* ssp. *nevadensis*), Tecate cypress (*C. forbesii*) or Cuyamaca cypress (*C. arizonica* ssp. *arizonica*). This forest often occurs as isolated groves within a matrix of chaparral or pinyon-juniper woodland. Many stands are even-aged due to past fire effects. This community is most often found on northern exposures in the Southern Sierra Nevada and Peninsular Ranges of California running south into Baja California.

Southern Riparian Forest and Mixed Riparian Forest: Southern riparian forest and mixed riparian forest are generic categories used by the NDDB for riparian forests of undocumented species composition, but most likely dominated by cottonwoods, willows, western sycamore or coast live oak. Southern riparian forests occur throughout non-desert Southern California along streams, floodplains and in bottomlands.

Riparian Scrub: This community consists of riparian scrub dominated by mulefat or shrub willows along rivers and streams in non-desert regions of Southern California. Southern riparian scrub requires frequent flooding to prevent succession to cottonwood or sycamore dominated woodlands.

Southern Sycamore Alder Riparian Woodland: This community consists of tall, open, broad-leafed, winter-deciduous streamside woodlands dominated by western sycamore and sometimes white alder. These stands seldom form closed canopy forests and even may appear as trees scattered in a thicket of evergreen and deciduous shrubs. This community occurs in very rocky streambeds subject to seasonal high-intensity flooding in the Transverse and Peninsular ranges from Point Conception south into Baja California Norte, including western and central Riverside County.

Southern Willow Scrub: This community consists of dense, broad-leafed, winter-deciduous riparian thickets dominated by several willow species with scattered emergent Fremont cottonwood and western sycamore. Most stands are too dense to allow much understory development. This community occurs on loose, sandy or fine gravelly alluvium deposited near stream channels during flood flows and requires repeated flooding to prevent succession. Southern willow scrub was formerly extensive along the major rivers of coastal Southern California, but now is much reduced by urban expansion, flood control and channelization projects.

Valley and Foothill Grassland: Valley and foothill grasslands typically contain the perennial bunch grasses *Nassella pulchra* and *N. lepida.* Lesser amounts of other native grasses, such as *Melica* spp., *Leymus* spp., *Muhlenbergia* spp. and beard grass (*Bothriochloa barbinodis*), may also be present. In addition, non-native grasses or forbs may be present to varying degrees. Native herbaceous plants commonly found within valley and foothill grasslands include yellow fiddleneck (*Amsinckia menziesii*), common calyptridium (*Calyptridium monardum*), suncup (*Camissonia* spp.), Chinese houses (*Collinsia heterophylla*), California poppy, tarweed (*Hemizonia* spp.), coast goldfields (*Lasthenia californica*), common tidy-tips (*Layia platyglossa*), *Lupinus* spp., *Plagiobothrys* spp., blue dicks, *Muilla* spp., blue-eyed grass (*Sisyrinchium bellum*) and *Dudleya* spp.

Valley Needlegrass Grassland: This community consists of midheight (to 2 feet) grasslands dominated by perennial, tussock-forming purple needlegrass (*Nassella pulchra*). Native and introduced annuals occur between the perennials, often actually exceeding the bunchgrasses in cover. It usually occurs on fine-textured (often clay) soils, moist or even waterlogged during winter, but very dry in summer, and often interdigitates with oak woodlands on moister, better-drained sites. This community was formerly extensive around the Sacramento, San Joaquin and Salinas Valleys, as well as the Los Angeles Basin, but is now much reduced.

Vernal Pool: Vernal pools are ephemeral wetlands that form in shallow depressions underlain by a substrate near the surface that restricts the downward percolation of water. Depressions in the landscape fill with rainwater and runoff from adjacent areas during the winter and may remain inundated until spring or early summer, sometimes drying more than once during the wet season. Smaller pools can fill and dry, and larger pools can hold water longer and may in the deeper portions support species that are more representative of freshwater marshes. Vernal pools are well known for their high level of endemism and abundance of rare, threatened, or endangered species. Many vernal pools are characterized by concentric rings of plants that flower sequentially as the pools dry. See the description provided in the previous section for more information.

2. Coachella Valley

There are 53 uncollapsed (i.e., subset) natural community classifications within the Coachella Valley. According to NDDB, 25 are considered sensitive. These are described in more detail below.

Active Desert Dunes: These dunes are essentially barren expanses of actively moving sand; their size and shape are determined by abiotic site factors rather than by stabilizing vegetation. The dunes may intergrade with stabilized and partially stabilized desert dunes. This community occurs within a creosote bush scrub matrix. However, the dunes are the defining feature for this natural community. Perennial shrub species are sparse but may include creosote bush (*Larrea tridentata*), four-wing saltbush, California croton, sandpaper plant and indigo bush. Perennial shrubs are not common on these active dunes in part because their slow-growing stems do not keep pace with the rate of burial by loose sand. In high rainfall years, annual wildflowers, including desert sand verbena and dune evening primrose, may carpet the dunes. In Coachella Valley, the active desert dunes are remnants of a once extensive dune system.

Active Sand Fields: These sand fields are areas of active sand movement with little or no vegetation where accumulated sand is not of sufficient depth to form the classic formations of dune systems. The distinction between this community and active desert sand dunes is sand fields, lack of prominent dune landforms. Sand fields may intergrade with active dunes and stabilized or partially stabilized dunes. They may also be characterized by hummocks of sand forming behind individual shrubs or clumps of vegetation. Vegetation varies from scant cover of widely scattered shrubs and annual wildflowers to denser shrub cover. This community typically occurs within a creosote bush scrub matrix.

Arrowweed Scrub: This community is composed of moderate to dense streamside thickets dominated by arrowweed. Cattails, tules, rushes and saltgrass may occur as scattered individuals, especially around the margins. Saltgrass is a common ground cover. Arrowweed scrub replaces willow and cottonwood riparian forests in areas where soils are more saline or alkaline. This natural community occurs around the Salton Sea and along the lower Colorado River.

Chamise Chaparral: Chamise chaparral is one of nine chaparral types in California. Chamise chaparral ranges in height from 3 to 10 feet and is overwhelmingly dominated by chamise (*Adenostoma fasciculatum*). It is adapted to repeated fires by stump sprouting. Mature stands are densely interwoven with very little herbaceous understory or litter and a nearly continuous canopy. This is a common community on the western slopes of the San Jacinto and Santa Rosa Mountains. It also occurs on the lower slopes of the San Bernardino Mountains west of Whitewater Canyon, near the western edge of Coachella Valley and in a band from the Whitewater River to Stubbe Creek.

Cismontane Alkali Marsh: This community is dominated by perennial, emergent, herbaceous monocots to 6 feet tall; cover is often complete and dense. Dominant species include cattail, alkali bulrush (*Scirpus americanus*) and saw-grass (*Cladium californicum*). Iodine bush is also associated with these marshes. This marsh habitat occurs where standing water or saturated soil is present throughout most or all of the year. High evaporation and low input of freshwater render the marsh alkaline. This natural community occurs in the Dos Palmas area, where about a third of it is on public or private conservation lands. It is important habitat for two sensitive marsh birds, the Yuma clapper rail and the California black rail.

Coastal and Valley Freshwater Marsh: This community is dominated by perennial, emergent monocots (reed-like plants), including cattails, bulrush, tules and rushes, often forming completely closed canopies. Sites lack significant currents and are permanently flooded with freshwater rather than brackish water. About 61 acres occurs in one location at the mouth of the Coachella Valley Stormwater Channel to the Salton Sea. Small stands

of freshwater marsh also occur at Dos Palmas, on the edge of some of the palm oases (e.g., Andreas Oasis) and along the margins of the recently restored man-made ponds. Because these stands are small, they are not visible on the natural communities maps in this section. This community type is also subject to invasion from tamarisk.

Desert Dry Wash Woodland: The desert dry wash woodland community is open to dense, drought-deciduous, small-leaved thorn scrub woodland to 30 to 60 feet tall, dominated by any of several members of the bean family including palo verde (*Cercidium floridum*), ironwood (*Olneya tesota*) and smoketree (*Psorothamnus spinosus*). Associated species include desert lavender (*Hyptis emoryi*), cheesebush, catclaw acacia (*Acacia greggii*) and desert willow. It occurs in washes subject to intermittent flooding, but without perennial water. These washes are associated with canyon mouths and alluvial fans in the Santa Rosa, San Bernardino, Little San Bernardino, Cottonwood, Eagle and Orocopia Mountains. The Mecca Hills Arroyo margins in the Colorado Desert also support a relatively dense growth of trees.

Desert Fan Palm Oasis Woodland: This community is composed of open to dense groves dominated by fan palm (*Washingtonia filifera*) of up to 75 to 100 feet tall. The understory is sparse, especially in alkaline areas or in dense groves, where the ground is mulched by fallen palm fronds. *Washingtonia* is a relict species and this community is restricted to areas with available water in and around the Salton Basin and south into Baja California. Washes along the San Andreas Fault are the site of emergence of underground water and, therefore, the location of many oases. Other oases are present in washes and on hillsides, where exposed strata or other geological structures produce permanent water.

Desert Saltbush Scrub: The desert saltbush scrub community can include various species of saltbush in a nearly uniform stand of shrubs forming a more complete cover than in creosote bush scrub. This community occurs in areas with fine-textured, poorly-drained soils with high salinity and/or alkalinity or habitats that are generally moist with a sandy loam soil and a total salinity in the range of 0.2-0.7%. The community is often composed of a nearly uniform stand of shrubs about three feet tall forming a more complete cover than in creosote bush scrub. One or more species of atriplex are dominant in this community, including alkali saltbush (*Atriplex polycarpa*) and four-winged saltbush (*A. canescens* var. *linearis*). Screwbean mesquite (*Prosopis glandulosa* var. *torreyana*) is a common associate. Four-wing saltbush shows greater dominance in dryer, coarser soils and occurs throughout the desert saltbush scrub community. Screwbean mesquite reaches greater development in lower-elevation areas with a shallow water table or capillary fringe. Alkali goldenbush (*Isocoma acradenia*) is common in areas where *P. glandulosa* is dominant. Once common in the Coachella Valley, this community now occurs only in small patches in the Willow Hole area, the Thousand Palms Preserve and in the higher salinity soils in the area around the northern portion of the Salton Sea.

Desert Sink Scrub: This community is similar to desert saltbush scrub, but plants are often more widely spaced and most species are succulent chenopods. Saltbush (*Atriplex* spp.) is a minor component. Pickleweed, iodine bush and bush seepweed (*Suaeda moquinii*) are characteristic of this community. It occurs at lower elevations on poorly-drained moist to wet soils with high alkalinity and/or salinity. Desert sink scrub appears to displace desert saltbush scrub in areas of a high water table with a salt crust at the surface. Some of the species, in particular iodine bush, can endure more alkaline or salty soils than most other desert plants. In some areas, such as at Dos Palmas, the plant cover is extremely low and this natural community grades into alkaline flats devoid of vegetation. Desert sink scrub is found in the vicinity of the Salton Sea, partially on Torres Martinez Reservation land and private land, and in the Dos Palmas/Salt Creek area east of the Salton Sea.

Ephemeral Sand Fields: These are desert sand accumulations lacking dune formations and characterized by irregular deposition of sand materials that are regularly blown away. Lost sand may not be replaced a major flood event or other movement process brings new sand. This community occurs primarily at the western end of the Coachella Valley where wind speeds are consistently at or above 15 mph and sands are routinely blown away.

This exposure to consistent winds tends to reduce vegetation cover. Where vegetation is present, it tends to be of a Sonoran creosote bush scrub matrix. Perennial shrubs are generally widely scattered and include creosote bush, indigo bush, desert willow and California croton.

Interior Live Oak Chaparral: The interior live oak chaparral community occurs as a dense, tall (to 20 feet) chaparral dominated by interior live oak and scrub oak with several other sparsely-leaved, woody species also in the canopy. Other associated species include chaparral whitethorn, birchleaf mountain mahogany, coffeeberry and hollyleaf redberry. This chaparral is fairly mesic (dry) and occurs in valley and foothills. In Southern California, stands are believed to be the result of frequent sprouting after fire as this community recovers rapidly after fire. There is typically very little understory due to the persistent leaf litter and dense canopy of these stands.

Mesquite Bosque: This community is an open to fairly dense, drought-deciduous streamside thorn forest dominated by screwbean mesquite with open, park-like interiors maintained by frequent flooding or fire. It occurs in dry washes. The understory is sparse but may include various species of saltbush, iodine bush and saltgrass. This community is found only in the Dos Palmas area.

Mesquite Hummocks: This community is composed of large clumps of low-growing honey mesquite (*Prosopis glandulosa*) shrubs. The mesquite shrubs form hummocks over sand dunes, such as at Willow Hole and the Thousand Palms Preserve. Hummocks also occur on level terrain, at the margins of palm oases or in the area south and east of Indio to the north end of the Salton Sea. Mesquite hummocks are typically associated with high soil moisture near fault areas or springs. This community occurs in the Coachella Valley at one location south of Cabazon, in the vicinity of Willow Hole, on the Thousand Palms Preserve and along the southern base of the Indio Hills in areas associated with the San Andreas Fault. They also occur around the northern end of the Salton Sea and at Dos Palmas. Mesquite hummocks were formerly widespread from the dune areas of Indian Wells, La Quinta and Indio south to the Salton Sea, but are now restricted to undeveloped lots amid urban or agricultural lands. Changes in soil moisture and water table declines may have reduced the occurrence of these hummocks. Unfortunately, remaining mesquite hummocks are highly fragmented and often senescent (dead or dying), perhaps due to lack of groundwater.

Mojavean Pinyon-Juniper Woodland: Mojavean pinyon-juniper woodland is an open woodland habitat dominated by pinyon pine and California juniper, with an open shrubby understory of species commonly found in adjacent non-forested stands. Understories are more diverse in shrubs than most pinyon-juniper habitat types and may actually exceed tree cover. Dominant shrubs include big sagebrush (*Artemisia tridentata*), desert scrub oak (*Quercus turbinella*), Mojave yucca (*Yucca schidigera*) and birchleaf mountain mahogany. This community typically occurs between 4,000 and 8,000 feet elevation in the desert mountain ranges and often intergrades with Mojavean juniper woodland and scrub.

Mojave Mixed Woody Scrub: Mojave mixed woody scrub is a complex scrub community, open enough to be passable and usually characterized by Joshua tree (*Yucca brevifolia herbertii*), California buckwheat and bladderpod (*Isomeris arborea*). Most of the constituent species also occur in other nearby communities. Sites where this community occurs typically have very shallow, overly-drained, often rolling to steep soils, usually derived from granitic parent materials. These sites have extremely low water-holding capacity, mild alkalinity and are not very saline. The typical elevation range is 2,000-5,000 feet.

Peninsular Juniper Woodland and Scrub: This is a somewhat dense woodland dominated by California juniper and pinyon pine. Litter layers are restricted to directly beneath trees. Other species include desert scrub oak, Mojave yucca, beargrass (*Nolina parryi*), four-leaf pinyon pine and big sagebrush. In the Coachella Valley, this community occurs on the desert slopes of the San Jacinto and Santa Rosa Mountains at elevations between 3,500

and 5,500 feet. Fire is not a typical element in this community as fuel loads are usually insufficient to carry a fire. Juniper and pinyon do not tolerate fire well, thus fires may result in a type conversion to semi-desert chaparral.

Redshank Chaparral: Redshank chaparral is similar to chamise chaparral, but it is typically taller (6-15 feet) and somewhat more open, often forming nearly pure stands of redshank (*Adenostoma sparsifolium*). Redshank itself is an open shrub or small tree with multiple branches from the base covered with rust-red, shaggy bark. Redshank chaparral is often adjacent to and may intergrade with chamise chaparral. Redshank chaparral is found in only four locations in Southern California and Baja California. Its center of distribution is in the San Jacinto and Santa Rosa Mountains and the interior valleys of Riverside and San Diego Counties. It ranges in elevation from 2,000 to 6,000 feet with both coastal and desert exposures on granitic soils. Considered by some to be at risk, this ranking is perhaps because this natural community is not widely distributed in California and occurs in areas of increasing pressure from urbanization.

Semi-Desert Chaparral: The semi-desert chaparral community consists mainly of woody evergreen shrubs 5-10 feet in height and is somewhat more open than most chaparrals. Some of the dominant plant species include California juniper, California buckwheat and *Opuntia* cactus species. Other associated species include manzanita, Ceanothus species, sugar bush and scrub oak. This community tends to occur on rockier soils or recently burned sites. Semi-desert chaparral is less fire-prone than other chaparrals because of the lower fuel loads. This community is distributed from on the interior slopes of the Transverse and Peninsular Ranges including mountains in central and eastern Riverside County. It is most common between 2,000 to 5,000 feet elevation.

Sonoran Creosote Bush Scrub: Sonoran creosote bush scrub is the most widespread vegetation type in the Colorado Desert. It is dominated by creosote bush (*Larrea tridentata*). It characterizes the vast intermountain bajadas, reaching greatest development on coarse, well-drained soil with a total salinity of less than 0.02%. Sonoran creosote bush scrub occurs in areas surrounding the Salton basin between the higher rocky hillsides and the lower-lying desert saltbush community. The transition to desert saltbush occurs as the soil becomes heavier and the salt content increases to approximately 0.2%. The physiognomy of the Sonoran creosote bush scrub community is simple because of low species diversity and the broad spacing of the shrubs, 1-10 feet tall, usually with bare ground between. The codominant species in the community is burrobush (*Ambrosia dumosa*), a much shorter shrub. Many species of ephemeral herbs may flower in late winter/early spring if winter rains are sufficient. It is widespread on the valley floor and in the northeastern portion of the Coachella Valley.

Sonoran Mixed Woody and Succulent Scrub: This is the only Sonoran desert community in the Coachella Valley with substantial dominance of cacti and other stem succulents. It is similar to creosote bush scrub, but more varied and usually with a higher plant density. In addition to creosote bush and other associated perennial shrubs, typical species include silver cholla (*Opuntia echinocarpa*), buckhorn cholla, pencil cholla, prickly pear, beavertail cactus, barrel cactus and ocotillo (*Fouquieria splendens*). This community occurs on alluvial fans and slopes of the Santa Rosa Mountains, in the Little San Bernardino Mountains and on the valley floor north of Interstate 10 to just east of the Thousand Palms Preserve.

Southern Arroyo Willow Riparian Forest: This community consists of streamside vegetation dominated by arroyo willow (*Salix lasiolepis*) often forming dense thickets. It has a continuous canopy up 10 to 35 feet with typically sparse to non-existent shrub and herb layers. These riparian forests are seasonally flooded, but water is present year-round. In the Coachella Valley, this community occurs in the northwest, south of Fingal, near Snow Canyon southeast of Snow Canyon and in Wood Canyon.

Stabilized Desert Dunes: Large portions of the Coachella Valley ~~on the valley~~ floor were originally ~~comprised of~~ *covered with* active sand dunes and sand fields. However, a variety of changing circumstances have cut off many of these areas from fresh sources of sand, including the construction of the Union Pacific Railroad lines, Inter-

state 10 and associated windbreaks, upwind development and roads. The result is stabilized or partially stabilized sand fields, which occur from just north of the Whitewater River to areas north of Interstate 10.

These sand dune accumulations are stabilized or partially stabilized by evergreen and/or deciduous shrubs, scattered low annuals and perennial grasses. They are characterized by prominent dune features with consistent cover of vegetation. This community may intergrade with active desert dunes in windier sites and with stabilized and partially stabilized desert sand fields or sandier phases of creosote bush scrub. This community includes perennial plant species typical of a creosote bush scrub matrix, with perennial shrub species including creosote bush, four-wing saltbush, California croton and indigo bush. However, the dune characteristics are the defining feature. The total cover of vegetation increases as the dunes are progressively stabilized. Stabilization varies based on input of sand, rainfall (which influences vegetative cover) and other factors.

Stabilized Desert Sand Fields: This community consists of desert sand accumulations stabilized by vegetation and lacking dune formations. A small patch occurs west of Fingal's Finger. The most extensive occurrence is north of Highway 111 from Windy Point to approximately Indian Avenue. Scattered patches occur in the Willow Hole and Edom Hill areas. This is also the primary sand community at the east end of the Indio Hills. This community occurs within a creosote bush scrub matrix. Perennial plants occurring on these sand fields are the same as those listed for stabilized and partially stabilized desert dunes.

Stabilized Shielded Sand Fields: This community is essentially similar to the stabilized and partially stabilized desert sand fields community, except that sand source and sand transport systems, which would supply sand to the sand fields, have been interrupted or shielded. This natural community occurs west of the existing Whitewater Floodplain Preserve, adjacent to the recharge ponds, which shield this dune area. It also includes most of the remaining sand fields that make up the Big Dune south of Interstate 10 and portions of the sand fields south of the Indio Hills and east of the Thousand Palms Preserve. The long-term persistence of stabilized shielded desert sand fields is compromised by the interruption of the sand source and sand transport system.

3. Non-MSHCP Areas

The non-MSHCP areas contain eight sensitive natural communities that provide habitat for covered species. Sonoran creosote bush scrub, as previously described under Coachella Valley, is by far the dominant community occurring within the non-MSHCP areas. It is widespread across the eastern desert floor. Other habitats that occur within the non-MSHCP areas include Mojave mixed woody scrub, redshank chaparral, semi-desert chaparral, desert dry wash woodland, Mojavean pinyon and juniper woodland and Peninsular pinyon-juniper woodland. See the previous section for descriptions of these. The following sensitive community also occurs in the non-MSHCP area.

Desert Dunes: These dunes are barren expanses of actively moving sand; their size and shape are determined by abiotic site factors rather than by stabilizing vegetation. The dunes may intergrade with stabilized and partially stabilized desert dunes. This community occurs within a creosote bush scrub matrix. However, the dunes are the defining feature for this natural community. Perennial shrub species are sparse but may include creosote bush, four-wing saltbush, California croton, sandpaper plant (*Petalonyx thurberi*) and indigo bush (*Psorothamnus arborescens*). These perennial shrubs are not common on these active dunes in part because their slow-growing stems do not keep pace with the rate of burial by loose sand. In high rainfall years, annual wildflowers, including desert sand verbena and dune evening primrose (*Oenothera deltoides*), may carpet the dunes. In the non-MSHCP areas, the active desert dunes are remnants of a once extensive dune system.

C. Candidate, Sensitive and Special Status Species

Approximately 349 species in Riverside County are considered candidate, sensitive or special status under the Federal Endangered Species Act (FESA), the California Endangered Species Act (CESA), or the California Native Plant Protection Act or by CDFW. These include species that are listed as endangered or threatened under FESA, proposed or candidates for such listing and species that are listed as endangered, threatened or rare under CESA or that have been petitioned (i.e., are candidates) for listing. Of these species, 146 are covered by the WRC-MSHCP and 27 are covered by the CV-MSHCP. Table 4.8-D (Sensitive Species of Riverside County Within the WRC-MSHCP or CV-MSHCP) lists species covered by an MSHCP along with their state and federal status, their CNPS status and the habitat type(s) in which they are most commonly found or are expected to occur. It should be noted that Table 4.8-D is provided as a quick reference summarization only. Details on the habitat and distributions of these species may be found in the June 2003 WRC-MSHCP or the September 2007 CV-MSHCP, respectively. ~~The WRC-MSHCP and the CV-MSHCP are herein incorporated by reference.~~

In addition to the above, Table 4.8-E (Additional Candidate, Sensitive and Special Status Species Potentially in Riverside County) encompasses the sensitive and protected species that are not explicitly covered by an MSHCP in Riverside County. Table 4.8-D and Table 4.8-E are composite lists derived from the NDDB and CNPS databases as well as the WRC-MSHCP and CV-MSHCP.

Table 4.8-D: Sensitive Species of Riverside County in the WRC-MSHCP or CV-MSHCP

Astragalus pachypus var. *jaegeri*[4]	Jaeger's milk-vetch	-	-	1B.1	Wa	Chaparral; Coastal Sage Scrub; Grassland; Woodland/Forest
Astragalus tricarinatus[4]	Tripple-ribbed milkvetch	E	-	1B.2	CV	Desert Scrub; Riparian; Mojavean and Sonoran Desert Scrub
Atriplex coronata var. *notatior*[4]	San Jacinto Valley crownscale	E	-	1B.1	We	Grassland; Alkali Playa; Playa and Vernal Pools
Atriplex parishii[4]	Parish's brittlescale	-	-	1B.1	We	Grassland; Playa and Vernal Pools
Atriplex serenana var. *davidsonii*[4]	Davidson's saltscale	-	-	1B.2	We	Grassland; Playa and Vernal Pools
Berberis nevinii[4,5]	Nevin's barberry	E	T	1B.1	We	Chaparral; Coastal Sage Scrub; Riversidean Alluvial Fan Sage Scrub
Brodiaea filifolia[4,5]	Thread-leaved brodiaea	T	E	1B.1	We	Grasslands; Playa and Vernal Pools; Alkali Playa
Brodiaea orcutti[4]	Orcutt's brodiaea	fss	-	1B.1	Wa	Playas and Vernal Pools; Meadow and Marshes
Calochortus palmeri var. *munzii*[4]	Munz's mariposa lily	-	-	1B.2	We	Chaparral; Meadow and Marshes; Cismontane Alkali Marsh; Montane Coniferous Forest

Species Scientific Name	Common Name	Protection Status				Natural Community Association
		Federal[1]	State[2]	CNPS[3]	MSHCP[4]	
Calochortus plummerae[4]	Plummer's mariposa lily	-	-	1B.2	We	Chaparral; Coastal Sage Scrub; Cismontane Alkali Marsh; Montane Coniferous Forest; Woodland/ Forest
Calochortus weedii var. *intermedus*[4]	Intermediate mariposa lily	-	-	1B.2	Wa	Chaparral; Coastal Sage Scrub
Caulanthus simulans[4]	Payson's jewel-flower	-	-	4.2	Wa	Chaparral; Coastal Sage Scrub; Woodland/Forest
Ceanothus ophiochilus[4,5]	Vail Lake ceanothus	E	T	1B.1	We	Chaparral
Centromadia pungens ssp. *laevis*[4]	Smooth tarplant	-	-	1B.1	We	Grassland; Playa and Vernal Pools
Chorizanthe leptotheca[4]	Peninsular spineflower	-	-	4.2	We	Chaparral; Coastal Sage Scrub; Montane Coniferous Forest
Chorizanthe parryi var. *parryi*[4]	Parry's spineflower	-	-	1B.1	We	Chaparral; Riversidean Alluvial Fan Sage Scrub
Chorizanthe polygonaoides var. *longispina*[4]	Long-spined spineflower	-	-	1B.2	Wa	Chaparral; Coastal Sage Scrub; Grassland
Chorizanthe procumbens[4]	Prostrate spineflower	-	-	4	Wa	Chaparral; Coastal Sage Scrub; Grassland
Convolvulus simulans[4]	Small-flowered morning glory	-	-	4.2	Wa	Coastal Sage Scrub; Grassland
Deinandra mohavensis[4]	Mojave tarplant	-	E	1B.3	We	Chaparral; Riparian Scrub, Woodland and Forest
Dodecahema leptoceras[4]	Slender-horned spineflower	E	E	1B.1	We	Chaparral; Coastal Sage Scrub; Riparian Scrub, Woodland and Forest; Riversidean Alluvial Fan Sage Scrub
Dudleya multicaulis[4]	Many-stemmed dudleya	-	-	1B.2	We	Chaparral; Coastal Sage Scrub; Grassland
Dudleya viscida[4]	Sticky-leaved dudleya	-	-	1B.2	Wf	Chaparral; Coastal Sage Scrub
Eriastrum densifolium ssp. *sanctorum*[4]	Santa Ana River woollystar	E	E	1B.1	Wa	Coastal Sage Scrub; Riparian Scrub, Woodland and Forest; Riversidean Alluvial Fan Scrub
Erodium macrophyllum[4]	Large-leaf filaree	-	-	2	We	Grassland; Woodland/Forest
Eryngium aristulatum var. *parishii*[4]	San Diego button-celery	E	E	1B.1	Wa	Playa and Vernal Pools
Galium angustifolium ssp. *jacinticum*[4]	San Jacinto Mnts. bedstraw	-	-	1B.3	We	Montane Coniferous Forest; Cismontane Alkali Marsh
Galium californicum ssp. *primum*[4]	California bedstraw	-	-	1B.2	Wf	Chaparral; Montane Coniferous Forest
Harpagonella palmeri var. *palmeri*[4]	Palmer's grapplinghook	-	-	4.2	Wa	Coastal Sage Scrub; Grassland; Chaparral
Heuchera hirsutissima[4]	Shaggy-haired alumroot	-	-	1B.3	Wf	Montane Coniferous Forest
Holocarpha virgata ssp. *elongata*[4]	Graceful tarplant	-	-	4.2	We	Chaparral; Coastal Sage Scrub; Grassland; Meadow and Marshes; Playas and Vernal Pools; Woodland/Forest
Hordeum intercedens[4]	Vernal barley	-	-	3.2	Wa	Grassland; Playas and Vernal Pools
Hulsea vestita ssp. *callicarpha*[4]	Beautiful hulsea	-	-	4.2	We	Chaparral; Montane Coniferous Forest
Juglans californica var. *californica*[4]	Southern Calif. black walnut	-	-	4.2	Wa	Woodland/Forest; Riparian Scrub, Woodland and Forest
Lasthenia glabrata ssp. *coulteri*[4]	Coulter's goldfields	-	-	1B.1	We	Grassland; Playas and Vernal Pools
Lepechinia cardiophylla[4]	Heart-leaved pitcher sage	-	-	1B.2	We	Chaparral, Woodland/Forest
Lilium humboldtii ssp. *ocellatum*[4]	Ocellated Humboldt lily	-	-	4.2	Wf	Cismontane Alkali Marsh; Montane Coniferous Forest; Woodland/Forest
Lilium parryi[4]	Lemon lily	-	-	1B.2	Wf	Cismontane Alkali Marsh; Riparian Scrub, Woodland and Forest; Woodland/Forest

Spermophilus tereticaudus chlorus[4]	Coachella Valley round-tailed ground squirrel	-	ssc	-	CV	Desert Scrub; Dry Wash Woodland and Mesquite; Desert Dune; Mojavean and Sonoran Desert Scrub; Riparian and Bottomland; Sand Dune/Sand Fields
Sylvilagus bachmani[4]	Brush rabbit	-	-	-	Wa	Chaparral; Coastal Sage Scrub; Riversidean Alluvial Fan Sage Scrub; Woodland/Forest

Footnotes:

1. Federal Listings:
   FESA: E = Endangered; T = Threatened; C = Candidate; FP= Fully Protected; fss = Forest Service sensitive (species considered sensitive by the USDA Forest Service because of declining populations); smc = Species of management concern (non-game migratory bird species of concern identified by the USFWS due to documented or apparent decline, small or restricted populations, or dependence on restricted or vulnerable habitats).
2. State Listings:
   CESA: E = Endangered; T = Threatened; C = Candidate; FP= Fully Protected; R = Rare; ssc = species of special concern (species considered by the CDFW as possibly facing extirpation in California due to declining populations or loss of habitat).
3. California Native Plant Society (CNPS) as accepted by the CDFW. Plant species categories by CNPS according to the following criteria:
   - 1A Presumed extinct in California (for the purposes of this table, these were not included)
   - 1B.1 Rare, threatened or endangered in California and elsewhere; seriously threatened in California
   - 1B.2 Rare, threatened or endangered in California and elsewhere; fairly threatened in California
   - 1B.3 Rare, threatened or endangered in California and elsewhere; not very threatened in California
   - 2.1 Rare, threatened or endangered in California, but more common elsewhere; seriously threatened in California
   - 2.2 Rare, threatened or endangered in California, but more common elsewhere; fairly threatened in California
   - 2.3 Rare, threatened or endangered in California, but more common elsewhere; not very threatened in California
   - 3.1 Plants about which we need more information; seriously threatened in California
   - 3.2 Plants about which we need more information; fairly threatened in California
   - 3.3 Plants about which we need more information; not very threatened in California
   - 4.1 Plants of limited distribution; seriously threatened in California

4.2 Plants of limited distribution; fairly threatened in California
4.3 Plants of limited distribution; not very threatened in California (not included for the purposes of this table)

4. Covered by WRC-MSHCP: Wa = Among the 118 'adequately covered' species addressed in WRC-MSHCP; We and Wf = Among the 28 additional species covered under WRC-MSHCP but subject to additional conservation objectives in order to be deemed covered (e = species subject to additional MSHCP conditions; f = species subject US Forest Svc. MOU).
Covered by CV-MSHCP: CV = Among the 27 species covered under the CV-MSHCP.

5. Species for which critical habitat has been designated by the USFWS.

Footnotes:

1. Federal Listings FESA: E = Endangered; T = Threatened; C = Candidate; FP= Fully Protected; fss = Forest Service sensitive (species considered sensitive by the USDA Forest Service because of declining populations); smc = Species of management concern (non-game migratory bird species of concern identified by the USFWS due to documented or apparent decline, small or restricted populations, or dependence on restricted or vulnerable habitats).
2. State Listings CESA: E = Endangered; T = Threatened; C = Candidate; R = Rare; ssc = species of special concern (species considered by the CDFW as possibly facing extirpation in California due to declining populations or loss of habitat).
3. California Native Plant Society (CNPS) as accepted by the CDFW: Plant species categories by CNPS according to the following criteria:
   - 1A Presumed extinct in California (for the purposes of this table, these were not included)
   - 1B.1 Rare, threatened or endangered in California and elsewhere; seriously threatened in California
   - 1B.2 Rare, threatened or endangered in California and elsewhere; fairly threatened in California
   - 1B.3 Rare, threatened or endangered in California and elsewhere; not very threatened in California
   - 2.1 Rare, threatened or endangered in California, but more common elsewhere; seriously threatened in California
   - 2.2 Rare, threatened or endangered in California, but more common elsewhere; fairly threatened in California
   - 2.3 Rare, threatened or endangered in California, but more common elsewhere; not very threatened in California
   - 3.1 Plants about which we need more information; seriously threatened in California
   - 3.2 Plants about which we need more information; fairly threatened in California
   - 3.3 Plants about which we need more information; not very threatened in California
   - 4.1 Plants of limited distribution; seriously threatened in California
   - 4.2 Plants of limited distribution; fairly threatened in California
   - 4.3 Plants of limited distribution; not very threatened in California (not included for the purposes of this table)
4. Covered by WRC-MSHCP: Wa = Among the 118 'adequately covered' species; We and Wf = Among the 28 additional species covered under the WRC-MSHCP but subject to additional conservation objectives to be deemed covered
   (e = species subject to additional MSHCP conditions; f = species subject US Forest Service MOU).
   Covered by CV-MSHCP: CV = Among the 27 species covered under the CV-MSHCP
5. Species for which critical habitat has been designated by the USFWS.

4.8.3 Policies and Regulations Addressing Biological Resources

A. State and Federal Regulations

Federal Endangered Species Act (FESA)

FESA was promulgated to protect any species of plant or animal which is endangered or threatened with extinction. 'Take' of endangered species is prohibited under Section 9 of FESA. Take as defined under FESA [16 U.S. Code Section 1532(19)] means to "harass, harm, pursue, hunt, wound, kill, trap, capture, collect, or attempt to engage in any such conduct." The U.S. Fish and Wildlife Service (USFWS) can issue a permit for incidental take of listed species as a result of otherwise lawful activities if that take is found not likely to jeopardize the continued existence of the species or modify the species' critical habitat. If take of a listed species is necessary to complete an otherwise lawful activity, a consultation and take authorization must be obtained pursuant to FESA Section 7 for federal agencies. For all others, a Habitat Conservation Plan (HCP) pursuant to Section 10 of FESA must be prepared and accepted by the USFWS.

Sections 7 and 10 of FESA include permitting processes that are used to determine if a project would jeopardize the continued existence of listed species and identify the mitigation measures necessary to avoid or minimize impacts to such species. Candidate species do not have the full protection of the FESA; however, since the USFWS advises applicants that candidate species could be elevated to listed species at any time, they are normally treated similarly under HCPs and Section 7 consultations. The following identifies the general steps required to apply for take of federally listed species:

- Qualified biologist performs a biological survey of a site to assess the likelihood of a protected species or their habitat occurring.
- If deemed suitable, a survey for the listed species is performed according to USFWS published survey protocols. Where no such USFWS protocol exists, the scientifically accepted protocol is used.
- If the species is detected, a Section 7 or Section 10 incidental take permit must be obtained from the USFWS.
- Pursuant to both Section 7 and Section 10 of FESA, application for an incidental take permit is subject to certain requirements, including the permit applicant preparing a conservation plan, generally known as a 'habitat conservation plan' (HCP).
- A take permit is issued if the Biological Opinion issued by the USFWS finds that the requested take would not jeopardize the continued existence of listed species or result in the destruction or adverse modification of its critical habitat (for Section 7) or that the statutory criteria for an incidental take permit have been met for Section 10.

The two MSHCPs address species take issues on a regional basis for western Riverside County and the Coachella Valley. The WRC-MSHCP provides for the take and mitigation of 146 species and the habitat on which they depend. Similarly, the CV-MSHCP provides for the take and mitigation of 27 species and their habitats. Both MSHCPs were issued Section 10 permits for the incidental take of covered species. As such, the plans allow for the issuance of take at the local level by MSHCP permitees, including the County of Riverside.

Clean Water Act, Section 401

In California, the Regional Water Quality Control Boards (RWQCBs) are responsible for the administration of Section 401 of the Clean Water Act. Riverside County falls within the jurisdiction of three RWQCBs: Santa Ana River Region, San Diego Region and the Colorado River Region. The areas subject to jurisdiction of the RWQCBs include those of the Corps (i.e., waters of the United States) but also include 'Waters of the State' as well. The RWQCBs ensure that the quality of downstream areas ('receiving waters') is not degraded. See Section 4.19, Water Resources, for more on water quality and the RWQCBs.

Clean Water Act, Section 404

The U.S. Army Corps of Engineers (Corps) regulates discharges of dredged or fill material into waters of the U.S. (see Section 4.19, Water Resources, for additional information). These waters include wetlands and non-wetland bodies of water that meet specific criteria. Corps regulatory jurisdiction pursuant to Section 404 of the Federal Clean Water Act is founded on a connection or nexus between the water body in question and interstate commerce. This connection may be direct, through a tributary system linking a stream channel with traditional navigable waters used in interstate or foreign commerce, or may be indirect, through a nexus identified in the Corps regulations. The following definition of waters of the U.S. is taken from 33 Code of Federal Regulations (CFR) Section 328.3:

The term 'waters of the U.S.' means:

a. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce;

b. All interstate waters including interstate wetlands;

c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), the use, degradation or destruction of which could affect interstate or foreign commerce;

d. All impoundments of waters otherwise defined as waters of the U.S. under the definition; and

e. Tributaries of waters defined in paragraphs (a) (1)-(4) of this section.

The Corps typically regulates as waters of the U.S. any body of water displaying an ordinary high water mark (OHWM). Corps jurisdiction over non-tidal waters of the U.S. extends laterally to the OHWM or beyond the OHWM to the limit of any adjacent wetlands, if present. The OHWM is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding area." Jurisdiction typically extends upstream to the point where the OHWM is no longer perceptible.

Executive Order 11990, Protection of Wetlands

This Executive Order from May 1977 establishes a national policy to avoid adverse impacts on wetlands whenever there is a practicable alternative. On projects with federal actions or approvals, impacts on wetlands must be identified in the environmental document. Alternatives that avoid wetlands must be considered. If wetland impacts cannot be avoided, then all practicable measures to minimize harm to those wetlands must be

included. This must be documented in a specific 'Wetlands Only Practicable Alternative Finding' in the final environmental document for the proposed project.

Migratory Bird Treaty Act (16 USC Section 703-711)

Disturbing or destroying active nests of any native bird is a violation of the federal Migratory Bird Treaty Act (MBTA) of 1918. Nests and eggs are also protected under Section 3503 of the California Fish and Game Code. As a result, special precautions must be taken to avoid disturbances to birds during their breeding seasons (most commonly between February and June). The MBTA, implemented by the USFWS, is an international treaty that makes it unlawful to take, possess, buy, sell, purchase, or barter, any migratory bird listed in 50 CFR Part 10, including feathers or other parts, nests, eggs or products, except as allowed by implementing regulations (under 50 CFR 21). The WRC-MSHCP and CV-MSHCP take permits constitute 'special purpose permits' pursuant to the MBTA. Specifically, the biological opinion for the WRC-MSHCP stipulates that covered activities must comply with the MBTA and that clearing of habitat would be avoided during the active breeding season within the plan's Criteria Areas and on public/ quasi-public lands.

The Biological Opinion issued for the CV-MSHCP also states that take of covered species listed under FESA which are also MBTA species is subject to the terms and conditions specified in the CV-MSHCP Section 10 permit. If compliant, such take is deemed to not violate the MBTA. For other birds protected by the MBTA and not listed under FESA, no take is authorized (including killing and wounding of any such birds, or take of eggs and active nests). Thus, standard MBTA compliance measures would still be required.

Federal Bald and Golden Eagle Protection Act (16 U.S.C. 668(a); 50 CFR 22)

This act was originally passed in 1940 and provides for the protection of the bald eagle and the golden eagle (as amended in 1962) by prohibiting the take, possession, sale, purchase, barter, offer to sell, purchase or barter, transport, export or import, of any bald or golden eagle, alive or dead, including any part, nest or egg, unless allowed by permit. 'Take' includes pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb. The 1972 amendments increased civil penalties for violating provisions of the Act to a maximum fine of $5,000 or one year imprisonment with $10,000 or not more than two years in prison for a second conviction. Felony convictions carry a maximum fine of $250,000 or two years of imprisonment. The fine doubles for an organization.

California Endangered Species Act (CESA)

The CESA is similar to FESA in that its intent is to protect species of fish, wildlife and plants that are in danger of, or threatened with, extinction because their habitats are threatened with destruction, adverse modification or severe curtailment, or because of overexploitation, disease, predation or other factors. CESA establishes California State policy to conserve, protect, restore and enhance threatened or endangered species and their habitats. CESA mandates that state agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy.

The threshold for take under the FESA is lower than that under CESA. 'Take' as defined under CESA means hunt, pursue, capture or kill, or attempt to do so. Under certain conditions, CESA has provisions to authorize take pursuant to a California Fish and Game Code (CFGC) Section 2081 permit or Memorandum of Understanding (MOU). Impacts of authorized take must be minimized and fully mitigated. No permit may be

issued if it would jeopardize the continued existence of the species. The CDFW is the primary regulatory agency for enforcement of California State species protection laws in the state, including CESA.

CDFW may designate a species as a 'species of special concern' (SSC) prior to considering the species for protected status under CESA if the CDFW has information indicating that the species is declining. This status applies to animals that, while not listed under FESA or CESA, are declining at a rate that could result in listing or historically occur in low numbers and known threats to their persistence currently exist. While SSC species do not receive the same protections as listed species, their identification is intended to focus attention on the species to help avert the need for costly listing under FESA or CESA. SSC species are often considered during the environmental review process and are a component of both the WRC-MSHCP and CV-MSHCP. See Tables 4.8-D and 4.8-E for SSCs.

Natural Community Conservation Planning Act (NCCP)

The Natural Communities Conservation Planning (NCCP) program of CDFW is an unprecedented effort by the State of California and numerous private and public partners that takes a broad-based ecosystem approach to planning for the protection and perpetuation of biological diversity. An NCCP identifies and provides for the regional or area wide protection of plants, animals and their habitats, while allowing compatible and appropriate economic activity.

The NCCP program is a cooperative effort to protect habitats and species. It began in 1991 under the state's NCCP Act, legislation broader in its orientation and objectives than the California and federal Endangered Species Acts. CESA and FESA were designed to identify and protect individual species that were already significantly declining in number. The primary objective of the NCCP program is to conserve natural communities at the ecosystem level while accommodating compatible land use.

The NCCP program seeks to anticipate and prevent the controversies and gridlock caused by species' listings through focusing on the long-term stability of wildlife and plant communities and including key interests in the process. Working with landowners, environmental organizations and other interested parties, a local agency oversees the numerous activities that compose the development of a conservation plan. CDFW and USFWS provide the necessary support, direction and guidance to NCCP participants.

Both the WRC-MSHCP and CV-MSHCP are NCCPs. As such, they were prepared to provide for the conservation of species and the natural communities on which they depend. The WRC-MSHCP and CV-MSHCP allow for the issuance of take at the local level by permittees such as the County of Riverside, thereby streamlining the take authorization process on a project-by-project basis.

California Fish and Game Code, Section 1600, et seq.

The CDFW, through provisions of the California Fish and Game Code (e.g., Section 1603), is empowered to issue agreements for any alteration of a river, stream or lake where fish or wildlife resources may be adversely affected. Streams (and rivers) are defined by the presence of a channel bed and banks, and at least an intermittent flow of water. CDFW regulates wetland areas only to the extent that those wetlands are a part of a river, stream or lake as meeting the CDFW definition. While seasonal ponds are within the CDFW definition of wetlands, they are not part of a river, stream or lake and are not subject to jurisdiction of CDFW under Section 1603.

Native Plant Protection Act (NPPA) of 1977

The NPPA (e.g., CFGC Sections 1900-1913) directs CDFW to carry out the legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." NPPA gives the California Fish and Game Commission the power to designate native plants as endangered or rare, since CESA does not explicitly cover rare plants. Accordingly, the CDFW's Wildlife and habitat Data Analysis Branch maintains a 'special plants' list of approximately 2,000 native plant species, subspecies or varieties that are tracked by the NDDB. The NPPA prohibits the taking of listed plants from the wild and requires notification of the CDFW at least 10 days in advance of any change in land use which would adversely impact listed plants. This requirement allows CDFW to salvage plants that would otherwise be destroyed. CDFW's Wildlife and Habitat Data Analysis Branch maintains a 'special plants' list consisting of approximately 2,000 native plant species, subspecies or varieties that are tracked by the CNDDB.

The California Native Plant Society (CNPS) publishes and maintains an Inventory of Rare and Endangered Vascular Plants of California. The inventory assigns a ranking status (see footnotes to Table 4.8-D). Plants on the 1A, 1B and 2 lists of the CNPS Inventory consist of plants that may qualify for listing and CDFW recommends they be addressed under CEQA.

Oak Woodlands Conservation Act 1360 (CFGC, Section 1360-1372)

A program to encourage and make possible the long-term conservation of oak woodlands as a necessary part of California State's wildlands protection policies and programs, and it is appropriate to expend money for that purpose. The Act is intended to work in concert with local planning and zoning strategies to conserve oak woodlands. Jurisdictions may prepare an Oak Woodlands Management Plan and thereby qualify for State of California financial incentives to protect the oak resources described therein. Through this Act, it is the State of California's intent to support and encourage voluntary, long-term private stewardship and conservation of California's oak woodlands by offering landowners financial incentives to protect and promote biologically functional oak woodlands over time and encourage local land use planning that is consistent with the preservation of oak woodlands, particularly special oak woodlands habitat elements. The Oak Woodlands Conservation Act also establishes a fund for oak woodlands conservation to which future appropriations for oak woodlands protection may be made.

Unlawful Take or Destruction of Nests or Eggs (CFGC Sections 3503.5-3513)

Section 3503.5 of the California Fish and Game Code specifically protects birds of prey, stating:

> *It is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto.*

Section 3513 of the CFGC duplicates the federal protection of migratory birds, stating:

> *It is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act.*

B. Regional Plans and Programs

When the County of Riverside developed both MSHCP's, comprehensive data was *collected under the purview of a scientific committee. The final conservation strategy in the MSHCPs was developed to fully mitigate impacts to sensitive biological resources. The issuance of the Section 10(a) permit by USFWS acknowledged the adequacy of the conservation programs as full mitigation. Each covered project in the County must comply with the requirements of the MSHCPs, including conducting habitat assessments and focused surveys, mandatory conservation of lands identified to have conservation value that would support the assemblage of several Conservation Areas in the Western Riverside County and Coachella Valley, and payment of mitigation fees. The Riverside Conservation Authority (RCA) and Coachella Valley Association of Governments (CVAG) have day-to-day management responsibility for western Riverside County and the Coachella Valley, respectively. Both agencies ensure that the required processes occur and that sensitive biological resources are properly protected and managed in both MSHCP regions. RCA, CVAG, the County of Riverside, USFWS and CDFW meet routinely throughout the year to review all actions, including project approvals, resulting conservation activities and other required mitigation measures taken under the MSHCPs. A series of meeting are held each year between all of the above agencies to ensure that the MSHCPs are successfully being implemented and managed. Annual reports are prepared and work plans for the subsequent year are prepared, reviewed, approved and implemented.*

This robust process is a joint effort by the federal, state and local governments to ensure that the sensitive biological resources found in the Western Riverside County and Coachella Valley are successfully protected and conserved for the future. It should be noted that as part of an applicant's participation in the MSHCP, habitat assessments and focused surveys will be required to assess the ongoing status of sensitive biological resources in specific areas. The results of these surveys will be used by the County, CVAG, and the wildlife agencies to verify the ongoing adequacy of the MSHCPs for protecting biological resources and to make the adjustments to guide the development of the annual work plans for the conservation programs authorized by USFWS and CDFW. This process will ensure that the ongoing conservation programs are protecting and managing sensitive biological resources as required by the federal and state endangered species acts, Migratory Bird Treaty Act, and other applicable natural resources laws, as well as required by CEQA.

1. Western Riverside County Multiple Species Habitat Conservation Plan

The continued loss of habitat to new development and the cumbersome process of environmental review and habitat mitigation on a project-by-project basis led to preparation of the WRC-MSHCP. The WRC-MSHCP is a multi-jurisdictional accomplishment that provides a regional conservation solution to species and habitat issues. The primary intent of the WRC-MSHCP is to provide for the conservation of a range of plants and animals within natural communities characteristic of western Riverside County and in return, provide take coverage and mitigation for projects throughout the plan area to avoid the cost and delays of mitigating biological impacts on a project-by-project basis.

The WRC-MSHCP was adopted by Riverside County on June 17, 2003, and is a comprehensive, multi-jurisdictional Habitat Conservation Plan (HCP) pursuant to Section 10(a)(1)(B) of FESA, as well as an NCCP pursuant to the California Fish and Game Code. The USFWS issued a Biological Opinion and FESA Section 10 permit for the WRC-MSHCP on June 22, 2004, and CDFW issued an NCCP Approval and Take Authorization on the same date. As long as adherence to the policies and requirements of the MSHCP is maintained, participants in the WRC-MSHCP, which include the County of Riverside and 18 cities, are allowed to authorize 'incidental take' of covered plant and wildlife species.

The WRC-MSHCP provides for the long-term survival of protected and sensitive species by designating a contiguous system of habitat to be added to existing public/quasi-public lands. The Plan includes an impact fee collected by the permittees and used in part to acquire these lands. Depending on the location of the private or public development project, certain biological studies are required for Plan compliance. These studies may

identify the need for specific measures to avoid, minimize and reduce impacts to covered species and their habitat.

The WRC-MSHCP defines two distinct consistency processes for development projects based on their location within the MSHCP's coverage area, with separate processes for projects located outside of Criteria Areas and those within a Criteria Area. Criteria Areas consist of 160-acre 'cells' with identified conservation objectives.

a. Outside Criteria Areas

Projects outside of the Criteria Areas are subject to a consistency analysis based on an examination of "Other Plan Requirements" in accordance with the following sections from the WRC-MSHCP:

Section 6.1.2 - Riparian/Riverine Requirements: This section sets forth the biological survey and report requirements regarding riparian/riverine habitat and associated species, focusing on riparian/ riverine areas, vernal pools and fairy shrimp habitat.

Section 6.1.3 - Narrow Endemic Plant Species Requirement: This section sets forth the biological survey and report requirements regarding narrow endemic plant species and requires focused surveys (generally during the bloom period) based on location in accordance with WRC-MSHCP Figure 6-1.

Section 6.3.2 - Additional Survey Needs and Procedures: This section sets forth the biological survey and report requirements regarding Criteria Area plant species, amphibian species, burrowing owl and mammal species.

Section 6.1.4 - Urban/Wildland Interface Guidelines: This section sets forth a range of measures to eliminate, reduce or minimize edge effects associated with the interface between development and the natural environment.

Section 6.9 - Application of Certain FESA Requirements: This section addresses USFWS proposed or adopted critical habitat designations and future recovery plans. It stipulates that FESA recovery plans do not require any additional land or financial compensation by the permitees. Additionally, Section 6.9 provides that "to the maximum extent allowable" the USFWS shall ensure that any future FESA Biological Opinions issued for future projects are consistent with the no jeopardy ruling granted by the WRC-MSHCP, as long as the project is "consistent with the terms and conditions of the MSHCP and its Implementing Agreement."

Through implementation of the WRC-MSHCP requirements found in Sections 6.1.2, 6.1.3, 6.3.2, 6.1.4 and 6.9, development projects outside of the Criteria Areas can be found consistent with the WRC-MSHCP, thereby ensuring impacts to Covered Species would be less than significant.

b. Inside Criteria Areas

Development projects inside Criteria Areas are subject to the Habitat Acquisition and Negotiation Strategy (HANS); a consistency analysis based on an examination of the MSHCP reserve assembly, other plan requirements, the Joint Project Review process and permittee MSHCP findings, as follows:

Reserve Assembly: Reserve assembly analysis includes a review of the project's relationship on three geographic levels. All projects within the Criteria Area must be reviewed for consistency with the following three reserve units: (1) cores and linkages, (2) Area Plans and subunits, and (3) criteria cells. The HANS process outlines a methodology for permittees to negotiate for the setting aside or purchase of areas needed for conservation (i.e.,

reserve assembly). Permittees may utilize incentives such as density bonuses or waivers of other local impact fees in return for conservation of a portion of a project site deemed important for MSHCP reserve assembly.

Other Plan Requirements: The requirements are the same as outlined for "Outside Criteria Areas."

Joint Project Review Process: Once a development project has been reviewed and a determination of consistency/inconsistency with the MSHCP is made by the county or city permittee, the project is reviewed by the Western Riverside County Regional Conservation Authority (RCA) through the Joint Project/Acquisition Review (JPR) process (as described in Section 6.6.2E of the MSHCP). To ensure that the requirements of the MSHCP are properly adhered to by all applicable parties, all projects within criteria cells are reviewed by the RCA through this process. Additionally, the JPR process includes a 10-day comment period for the USFWS and CDFW should they wish to comment on a decision made by the RCA.

Permittee MSHCP Findings: Once the JPR process is complete, the permittee prepares MSHCP findings for inclusion in final project entitlement or approval documents and staff reports. Findings of MSHCP consistency/ inconsistency cannot be made until the JPR process is complete.

Through implementation of these requirements, development projects inside Criteria Areas can be found consistent with the WRC-MSHCP. Impacts to covered species (candidate, sensitive or special status species) and their habitats resulting from development projects that are consistent with the WRC-MSHCP would be deemed less than significant because of their MSHCP compliance.

2. Coachella Valley Multiple Species Habitat Conservation Plan

The CV-MSHCP is a comprehensive, multi-jurisdictional habitat conservation plan focusing on conservation of species and their associated habitats in the Coachella Valley region of Riverside County. The overall goal of the CV-MSHCP is to maintain and enhance biological diversity and ecosystem processes within the region while allowing for future economic growth. The CV-MSHCP covers 27 sensitive plant and wildlife species, as well as 27 natural communities. The overall provisions for the Plan are subdivided according to specific resource conservation goals and organized according to geographic areas, i.e., Conservation Areas. These areas are identified as 'Core,' 'Essential' or 'Other Conserved Habitat' for sensitive plant, invertebrate, amphibian, reptile, bird and mammal species plus 'Essential Ecological Process Areas' and 'Biological Corridors and Linkages.' Each Conservation Area has specific Conservation Objectives that must be satisfied.

The CV-MSHCP received final approval on October 1, 2008. This, plus an Implementing Agreement (IA), allows signatories of the IA to issue take authorizations for all species covered by the CV-MSHCP, including state and federally-listed species, as well as other identified covered species and their habitats. Each city or local jurisdiction participating in the IA imposes a "development mitigation fee" for projects within its jurisdiction. With payment of the mitigation fee and compliance with the requirements of the CV-MSHCP, a project may be deemed compliant with CEQA, the National Environmental Policy Act (NEPA), CESA and FESA, and impacts to covered species and their habitat would be deemed less than significant.

Similar to the WRC-MSHCP, the CV-MSHCP provides for the long-term survival of protected and sensitive species by designating a contiguous system of habitat to be added to existing public/quasi-public lands. As noted above, the CV-MSHCP also includes an impact fee for the purpose of acquiring the requisite conservation lands. A range of biological studies may also be required as part of the CV-MSHCP environmental review process to identify the need for specific measures to avoid, minimize and reduce impacts to covered species and their habitat.

3. Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP)

The SKR HCP was prepared under the direction of the Riverside County Habitat Conservation Agency (RCHCA) Board of Directors, in consultation with USFWS and CDFW. The County of Riverside is a member agency of the RCHCA. The 30-year SKR HCP was designed to acquire and permanently conserve, maintain and fund the conservation, preservation, restoration and enhancement of Stephens' kangaroo rat-occupied habitat. The SKR HCP covers approximately 534,000 acres within the member jurisdictions and includes an estimated 30,000 acres of occupied Stephens' kangaroo rat habitat. The SKR HCP requires members to preserve and manage 15,000 acres of occupied habitat in seven Core Reserves encompassing over 41,000 acres.

On May 3, 1996, the USFWS issued a permit to the Riverside County Habitat Conservation Agency to incidentally take the federally endangered Stephens' kangaroo rat (*Dipodomys stephensi*). Similarly, the CDFW issued a California Endangered Species Act Management Authorization for Implementation of the Stephens' kangaroo rat on May 6, 1996. To date, more than $50 million has been dedicated to the establishment and management of a system of regional preserves designed to ensure the survival of SKR in the plan area. This effort resulted in the permanent conservation of approximately 50% of the SKR-occupied habitat remaining in the HCP area. Through direct funding and in-kind contributions, SKR habitat in the regional reserve system is managed to ensure its continuing ability to support the species. Core reserves were deemed complete in December of 2003.

4. Lower Colorado River Multi-Species Conservation Program (LCR-MSCP)

The LCR-MSCP was created to balance the use of the Colorado River water resources with the conservation of native species and their habitats. The program works toward the recovery of species currently listed under the FESA. It also reduces the likelihood of additional species listings. With a 50-year implementation period, the program accommodates current water diversions and power production, and optimizes opportunities for future water and power development by providing FESA compliance through its implementation. The LCR-MSCP covers over 400 miles of the lower Colorado River from Lake Mead to the U.S. border with Mexico and includes Lakes Mead, Mohave and Havasu, as well as the historic 100-year floodplain along the main stem of the river. The MSCP calls for establishment of over 8,100 acres of habitat for fish and wildlife species and the production of over 1.2 million native fish to augment existing populations. The plan benefits at least 26 species, most of which are state or federally listed. The federal Bureau of Reclamation, which manages the Colorado River, is the implementing agency for the LCR-MSCP. Partnership involvement occurs primarily through the LCR-MSCP Steering Committee, currently representing 57 entities, including state and federal agencies, water and power users, municipalities, Native American tribes, conservation organizations and other interested parties, which provide input and oversight functions.

C. County Policies and Regulations

1. Riverside County Board of Supervisors Policy J-11 (Parks - Regional Trails)

Board of Supervisors Policy J-11 addresses the Regional Park and Open-Space District's regional trail program. Section 4 of this policy provides regional trail information related to the use of trails in sensitive cultural and biological areas. Section 4 specifically reads: "Where possible, regional trails will avoid sensitive biological areas; trails along watercourses or channels will be located outside of the 25-year floodplain, where feasible. Trails in open-space reserves and wildlife corridors will be aligned to avoid plant, wildlife and cultural resource impacts and will require any of the following singularly or in combinations: directional signs, fencing and interpretive information to minimize or avoid impacts to the area. The use of firebreaks is encouraged." This policy ensures

that environmental objectives for regional trails are clear and implemented to prevent adverse effects to the natural areas in which they are located.

2. Riverside County Oak Tree Management Guidelines

In March 1993, the County of Riverside issued Oak Tree Management Guidelines to address the treatment of oak woodlands in areas where zoning and/or General Plan density restrictions allow the effective use of clustering. The guidelines are generally considered to be the most effective where minimum lot sizes are 2.5 acres or larger, or where oak woodlands are concentrated in a relatively small portion of a project site. The guidelines include recommendations for oak inventories, land use designs to cluster home sites in order to reduce impacts to oaks and mitigation measures for oak conservation.

3. Ordinance No. 559 - Regulating the Removal of Trees

Ordinance No. 559 regulates the removal of living native trees on parcels of property greater than one-half acre, located above 5,000 feet within the unincorporated area of Riverside County without first obtaining a permit to do so. The purpose of the ordinance is to ensure that the timberlands of Riverside County are protected and the ecological balance of such timberlands is preserved.

D. Existing County General Plan Policies

The following existing General Plan polices address biological resources.

1. Land Use (LU) Policies

Policy LU *9.2* (Previously LU 8.2): Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the General Plan and Federal and State regulations such as CEQA, NEPA, the Clean Air Act and the Clean Water Act.

Policy LU *9.3* (Previously LU 8.3): Incorporate open space, community greenbelt separators and recreational amenities into Community Development areas in order to enhance recreational opportunities and community aesthetics and improve the quality of life.

Policy LU 19.1: Where appropriate, use any adopted Density Transfer Program to help implement Rural Village Overlay Study Areas and the Multi-Species Habitat Conservation Program.

Policy LU *26.3* (Previously LU 20.4): Ensure that development does not adversely impact the open space and rural character of the surrounding area.

2. Circulation (C) Policies

Policy C *20.9* (Previously C 20.7): Incorporate specific requirements of the Western Riverside County Multiple Species Habitat Conservation Plan and the Coachella Valley Multiple Species Habitat Conservation Plan into transportation plans and development proposals.

3. Open Space (OS) Policies

Policy OS 5.1: Substantially alter floodways or implement other channelization only as a "last resort," and limit the alteration to:

a. that necessary for the protection of public health and safety only after all other options are exhausted;

b. essential public service projects where or other feasible construction method or alternative project location exists; or

c. projects where primary function is improvement of fish and wildlife habitat.

Policy OS 5.4: Consider designating floodway setbacks for greenways, trails and recreation opportunities on a case-by-case basis.

Policy OS 5.6: Identify and, to the maximum extent possible, conserve remaining upland habitat areas adjacent to wetland and riparian areas that are critical to the feeding, hibernation, or nesting of wildlife species associated with these wetland and riparian areas.

Policy OS 5.7: Where land is prohibited from development due to its retention as natural floodways, floodplains and watercourses, incentives should be available to the owner of the land including density transfer and other mechanisms as may be adopted. These incentives will be provided for the purpose of encouraging the preservation of natural watercourses without creating undue hardship on the owner of properties following these policies.

Policy OS 6.1: During the development review process, ensure compliance with the Clean Water Act's Section 404 in terms of wetlands mitigation policies and policies concerning fill material in jurisdictional wetlands.

Policy OS 6.2: Preserve buffer zones around wetlands where feasible and biologically appropriate.

Policy OS 6.3: Consider wetlands for use as natural water treatment areas that will result in improvement of water quality.

Policy OS 8.1: Cooperate with federal and state agencies to achieve the sustainable conservation of forest land as a means of providing open space and protecting natural resources and habitat lands included within the MSHCPs.

Policy OS 8.2: Support conservation programs to reforest privately held forest lands.

Policy OS 9.3: Maintain and conserve superior examples of native trees, natural vegetation, stands of established trees and other features for ecosystem, aesthetic and water conservation purposes.

Policy OS 9.4: Conserve the oak tree resources in the county.

Policy OS 18.2: Provide incentives to landowners that will encourage the protection of significant resources in the county beyond the preservation and/or conservation required to mitigate project impacts.

Policy OS 20.2: Prevent unnecessary extension of public facilities, services and utilities, for urban uses, into Open Space-Conservation designated areas.

E. Proposed New or Revised Riverside County General Plan Policies

The following proposed new or revised General Plan polices also address biological resources.

1. Land Use (LU) Policies

NEW **Policy LU 7.7:** *Require buffers to the extent possible between development and watercourses, including their associated habitat.*

Policy LU *9.1* (Previously LU 8.1): Provide for permanent preservation of open space lands that contain important natural resources, *cultural resources,* hazards, water features, watercourses, *including arroyos and canyons,* and scenic and recreational values.

Policy LU *9.4* (Previously LU 8.4): Allow development clustering and/or density transfers in order to preserve open space, natural resources, *cultural resources* and/or biologically-sensitive resources. *Wherever possible, development on parcels containing 100-year floodplains and blue line streams and other higher-order watercourses and areas of steep slopes adjacent to them shall be clustered so as to keep development out of the watercourse and adjacent steep slope areas, and to be compatible with other nearby land uses.*

NEW **Policy LU 26.6:** *Encourage clustered development where appropriate on lots smaller than 20 acres. The density yield of the site may be clustered on 0.5 acre lots; however, for sites located adjacent to Community Development Foundation Component, 10,000 square foot minimum lots may be considered.*

2. Open Space (OS) Policies

Policy OS 5.2: If substantial modification to a floodway is proposed, design it to reduce adverse environmental effects to the maximum extent feasible, considering the following factors:

a. Stream scour;

b. Erosion protection and sedimentation;

c. Wildlife habitat and linkages;

d. Cultural resources including human remains;

e. Groundwater recharge capability;

f. Adjacent property; and

g. Design (a natural effect, examples could include soft riparian bottoms and gentle bank slopes, wide and shallow floodways, minimization of visible use of concrete and landscaping with native plants to the maximum extent possible). A site-specific hydrologic study may be required.

Policy OS 5.3: Based upon site-specific study, all development shall be set back from the floodway boundary a distance adequate to address the following issues:

a. Public safety;

b. Erosion;

c. Riparian or wetland buffer;

d. Wildlife movement corridor or linkage; ~~and~~

e. Slopes*;*

f. Type of watercourse; and

g. Cultural resources.

Policy OS 5.5: ~~New development shall p~~*P*reserve and enhance existing native riparian habitat and prevent obstruction of natural watercourses. *Prohibit fencing that constricts flow across watercourses and their banks.* ~~Incentives shall be utilized to the maximum extent possible.~~

Policy OS *17.1* (Previously OS 17.3): Enforce the provisions of applicable MSHCPs~~, if adopted,~~ when conducting review of possible *legislative actions such as* general plan amendments, ~~and/or~~ zoning *ordinance amendments, etc.* ~~changes.~~

Policy OS *17.2* (Previously OS 17.1): Enforce the provisions of applicable MSHCPs~~, if adopted,~~ when conducting review of development applications.

Policy OS *17.3* (Previously OS 17.2): Enforce the provisions of applicable MSHCPs~~, if adopted,~~ when developing transportation or infrastructure projects that have been designated as covered activities in the applicable MSHCP.

Policy OS 18.1: Preserve multi-species habitat resources in the County of Riverside through the enforcement of the provisions of applicable MSHCP's~~, if adopted~~.

***NEW* Policy OS 18.3:** *Prohibit the planting or introduction of invasive, non-native species to watercourses, their banks, riparian areas, or buffering setbacks.*

***NEW* Policy OS 18.4:** *Develop standards for the management of private conservation easements and conservation lots in fee title. For areas with watercourses, apply special standards a-f (below) for their protection and apply standards g-j (below), generally:*

a. For conservation lands with watercourses, conform easement boundaries to setback conditions that will preserve natural flows and changes in the natural boundaries of a watercourse and its protective riparian habitat.

b. Use only 'open' fencing that permits the movement of wildlife and limit fencing to locations outside of setbacks to watercourses (no fencing is permitted to cross the banks or channel of a watercourse, unless no other option is available).

c. Allow fuel modification only to the outside of buffering vegetation (riparian vegetation and vegetation on slopes that buffer the watercourse from erosion and storm water pollution).

d. No planting of non-native invasive species is permitted.

e. No lighting of watercourse area is permitted.

f. Prohibit the use of pesticides and herbicides known to harm aquatic species and sensitive amphibians.

g. Ensure that lands under control of Homeowner's Associations employ an experienced non-profit conservation group or agency to manage/maintain the land.

h. Prohibit use of recreational off-road vehicles.

i. Prohibit grazing and alterations of vegetation except for fuel and weed management under close supervision of qualified natural lands manager.

j. For private conservation lands, especially those within criteria cells of MSHCP areas, ensure that easement and fee title agreements provide funding methods sufficient to manage the land in perpetuity.

Policy OS 20.1: Preserve and maintain open space that protects county environmental *and other nonrenewable* resources and maximizes public health and safety in areas where significant environmental hazards and resources exist.

4.8.4 Thresholds of Significance for Biological Resources

The project would result in a significant impact to biological resources if it would:

A. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies and regulations or by the CDFW or USFWS.

B. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies or regulations, or by the CDFW or USFWS.

C. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption or other means.

D. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

E. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional or state habitat conservation plan.

F. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

4.8.5 Effect of GPA No. 960 on the General Plan and on Biological Resources

The proposed project, GPA No. 960, would have spatial effects where it involves a variety of specific General Plan Land Use Designation (LUD) corrections and changes, several Policy Area, Study Area and overlay changes,

proposals for new trail and road alignments and standards, and an incidental commercial policy for rural areas. In addition, GPA No. 960 includes a number of updates to proposed roadway alignments and intersection locations, as well as functional classifications (widths, number of lanes, level of service targets, etc.), where needed throughout unincorporated Riverside County. In this section, the biology-related changes to the General Plan are outlined and the effects of proposed changes relative to biological resources are discussed. Specific impacts and mitigation are then evaluated according to identified significance thresholds in the section following this one.

A. Proposed Changes to the General Plan

As part of the project review process, biological data in the General Plan was updated and associated policies reviewed and revised where necessary. The existing General Plan addresses biological resources primarily in the Multipurpose Open Space (OS) Element. GPA No. 960 includes the following biology-related updates; text of relevant revised General Plan policies is provided in Section 4.8.3.D.

Multiple Species Habitat Conservation Plans: Text was added and policies updated to address the approval and implementation of the WRC-MSHCP and the CV-MSHCP. Figure OS-4a (Western Riverside Vegetation) and Figure OS-4b (Eastern Riverside County Vegetation) were revised accordingly.

Arroyo Protection: As part of GPA No. 960, text and policies were revised or added to reflect the 2007 Board of Supervisors adopted recommendations of the Joint County-City Arroyo-Watershed Advisory Committee.

In addition to the aforementioned changes to the General Plan, a variety of LUD and policy area revisions are also proposed, as per the descriptions in Section 3.0 of the EIR and associated Figure 3-1 (and corresponding maps within each Area Plan), that may directly or indirectly affect biological resources. Such changes would lead to either an increase or decrease in development potential (density or intensity); the risks associated with introducing new people and property into areas with the various biological resources outlined herein would be increased (or decreased) correspondingly.

GPA No. 960 also includes new and revised policies which would be implemented as part of this GPA. However, until development is proposed it is not feasible to ascertain the location of where they would be implemented. For example, the new incidental rural Retail-Commercial policy, Indian fee land policies and others as described in Section 3.0 of the EIR. Similarly, new maps for trails and county roads (General Plan Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met.

Actual locations for these improvements are determined when projects are proposed based on site assessment of opportunities and constraints, particularly as related to sensitive biological resources, such as rare habitats like vernal pools and sand dunes, among others, to determine environmentally preferred alignments to minimize adverse effects. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines, and such, are also developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans. Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need.

Accordingly, specific locations and timing of future infrastructure, including power and natural gas transmission lines, water and sewer lines and pumps, as well as roads, schools and other public services, are not presently foreseeable beyond the master countywide level already depicted in the 2003 General Plan and addressed previously in EIR No. 441. These improvements require site-specific analyses and mitigation when proposed as

part of (or to serve) future development as the General Plan builds out. As such, future impacts and mitigation would be assessed programmatically pursuant to the performance standards outlined in this EIR, as well as EIR No. 441, with project-specific analysis and mitigation developed at the later individual project stage.

B. Analysis of GPA No. 960 Effects on Biological Resources

The General Plan is concerned mainly with the physical build out of Riverside County; many of the changes associated with GPA No. 960 would affect planned land usage. In particular, proposed changes affect land use overlays, land use designations and policies that affect the conversion of rural, semi-rural, agricultural and vacant lands to suburban or urban uses in various parts of Riverside County. These *spatial* changes are associated with specific locations and, thus, the underlying biology (at least in terms of natural communities) can be generally assessed at this time.

Biological effects cannot be delineated at present for land use policy changes without currently assigned locations (Indian fee lands, incidental rural commercial, etc.). Likewise, the potential for future development occurring within the proposed revised policy areas and overlays has been generalized for this EIR. Due to the large scale of Riverside County and these policy areas (more than 111,400 areas potentially affected), it would not be feasible to provide detailed biological information or assess site-specific biological effects at this time given the size and programmatic nature of this EIR. However, future development accommodated by the updated General Plan could affect a variety of biological resources depending upon location. These include sensitive habitats, habitats known or suspected to be used by threatened, endangered or rare plant and animal species, habitat located within wildlife movement corridors or nursery sites and riparian habitat, such as wetlands or streams. Where not foreseeable at this time, such affects are addressed programmatically, as outlined in the subsequent section.

1. Spatial Analysis Methodology

Because biological resources are subject to a high level of public concern and are protected by a variety of different state and federal agencies, myriad documents and data sources exist addressing numerous aspects of regional biology. As a result, the spatial (GIS) information utilized by the Riverside County GIS Department incorporated a variety of data and sources, including:

RCLIS: The Riverside County Land Information System – the *geographical* base data assembled by the County of Riverside to describe existing lands within the county.

WRC-MSHCP Database: Encompasses the data assembled by the Western Riverside County Regional Conservation Authority with respect to the vegetation resources and land ownerships occurring within the boundaries of the WRC-MSHCP.

CV-MSHCP Database: Encompasses the vegetation data assembled by the Coachella Valley Association of Governments with respect to the vegetation resources occurring within the CV-MSHCP.

California Natural Diversity Database (NDDB): Encompasses the data collected by the CDFW with respect to the biological resources occurring within Riverside County.

U.S. Fish and Wildlife Critical Habitat Portal: Encompasses the data assembled by the USFWS regarding final critical habitat designations for federally-listed threatened and endangered species nationwide (including Riverside County).

To determine the scope of project effects, Riverside County GIS performed spatial analysis of the available biological resource data by overlaying it with known project components to determine acreage within each. The results for these existing resources within Riverside County are summed up in Tables 4.8-F through 4.8-N.

For purposes of these analyses, it was assumed that all natural habitats within the General Plan Foundations of Agriculture, Rural, Rural Community and Community Development would be 100% affected (i.e., removed or degraded to such an extent as to be of no biological value). It is also presumed that all natural vegetation within the Open Space Foundation, other than developed LUD's, such as mineral resources (OS-MIN) and recreation (OS-R) would be retained. Due to the countywide scale of the available vegetation mapping, the smallest vegetation patch size depicted is 10 acres. Thus, certain habitat types that typically occur in small patches (i.e., vernal pools) are likely under-represented in the tables and figures depicting vegetation on a countywide scale. However, the data are considered to be sufficient for the programmatic nature of this EIR, and it is anticipated that subsequent analyses for site-specific projects would achieve the appropriate level of fine-scale resolution.

To determine if an impact is significant, future development accommodated by the proposed project, GPA No. 960, would undergo site-specific analysis as part of their evaluation by the County of Riverside. If located within an area covered by an MSHCP, the applicable plan (the WRC-MSHCP or CV-MSHCP) would guide the analysis. The degree of significance of the anticipated biological impacts would depend upon various factors including, but not limited to, the site conditions at the time of project evaluation, the extent of the area potentially affected and the value of the affected habitat at local and regional scales.

To assess the extent of habitat potentially affected by future development accommodated by GPA No. 960, project items with spatial components were sorted into three categories based on their potential to affect biological resources, as follows:

Conserved: Represents lands within the WRC-MSHCP acquired by conservation entities and being designated as Open Space – Conservation Habitat (OS-CH) as a part of GPA No. 960. OS-CH is a conservation-based LUD with no other development potential. An OS-CH designation assures the lands' conservation status for purposes of Riverside County's General Plan.

Neutral: Represents lands in which proposed project changes would have either no net change on land-use related (spatial) effects or would serve to *decrease* effects by lowering intensity or density plans for future development. This includes the proposed deletions of the El Cariso, Aguanga and Anza Rural Village Study Areas (RVSAs) and deletion of the San Jacinto Agriculture/Development Potential Study Area. In these locations, future development would be required to conform to the existing General Plan LUDs without the potential for intensification that the RVSAs had provided.

Potential Effects: Encompasses those components of GPA No. 960 with the potential to have spatial effects in foreseeable locations. These include the proposed Good Hope and Meadowbrook Rural Village Overlays (RVOs), formal alternate land use plans replacing the existing RVSAs; Lakeland Village Policy Area around Lake Elsinore; Northeast Business Park Policy Area in San Jacinto; changes to LUDs to provide better safety and coordinated land use planning around the Blythe, Flabob and Riverside Municipal Airports[1]; and, a variety of parcel-specific LUD changes, as outlined in Section 3.0. In some of these cases, the proposed new LUD is consistent with an existing developed use and, thus would not actually result in new special effects (for example, placing existing fish farms under the AG LUD). However, to be conservative in estimating the potential for

[1] *The project areas around the Flabob and Riverside Municipal Airports are now within lands incorporated as part of the cities of Jurupa Valley and Estable, respectively, and are now outside of County of Riverside land use authority.*

adverse effects, this category does *not* distinguish between lands with existing built uses versus future (new) development potential.

In addition to the above, Riverside County was divided into three biological subregions that reflect the areas of coverage by the two major MSHCPs: western Riverside County (encompassing the WRC-MSHCP), Coachella Valley (encompassing the CV-MSHCP) and, third, the areas not covered by either MSHCP, which generally consists of a small region east of Anza and south of the San Jacinto Mountains, as well as the vast stretch of desert lying east of the Coachella Valley out to Riverside County's border with Arizona.

Accordingly, the first three subsections that follow include discussions of the project's general effects on each of the three subregions. Following that are summaries of the various biological resources expected to be affected by future development accommodated by the project, again, as divided into the three county territories described above. The significance of these effects is analyzed subsequently in Section 4.8.6 (Impacts and Mitigation).

2. Natural Communities

Table 4.8-F (Natural Communities Potentially Affected in Western Riverside County) provides a summary of potential effects of the proposed project on those communities within the boundaries of the WRC-MSHCP. Table 4.8-G (Natural Communities Potentially Affected in Coachella Valley) provides a similar summary of potential effects to natural communities within the CV-MSHCP, and Table 4.8-H (Natural Communities Potentially Affected in Non-MSHCP Areas) provides one for the portions of unincorporated Riverside County outside these two MSHCPs.

Table 4.8-F indicates that future development in western Riverside County accommodated by the project has the potential to affect a variety of major natural community classifications. Of these communities, three of the habitats do not provide significant natural habitat functions and values (i.e., agriculture[2], barren and developed/disturbed land categories); six provide natural habitat functions and values, but do not include habitats considered sensitive; and six include sensitive habitats due either to plant species or ecology present, or as habitat used or occupied by sensitive animal species. See Section 4.8.2.B for details on the sensitive habitats.

3. Potential Effects to Natural Communities

As previously identified in Table 4.8-D, many candidate, sensitive and special status species within western Riverside County can be associated with specific natural communities. Table 4.8-J (Sensitive Habitats Potentially Affected in Coachella Valley) provides a summary of potential effects of the proposed project on those communities within the boundaries of the WRC-MSHCP.

As shown in Table 4.8-F, the project has the potential to affect a variety of major natural community classifications previously identified in Table 4.8-A. Of these communities, three are comprised of habitats which do not provide significant natural habitat functions and values (i.e. agriculture, barren and developed/disturbed land); six provide natural habitat functions and values, but do not include habitats considered sensitive; and six include sensitive habitats due either to plant species or ecology present, or as habitat used or occupied by sensitive

[2] *While agricultural lands have the potential to habitat for a limited number of sensitive wildlife species (i.e., burrowing owl), foraging habitat for protected raptor species, and limited suitable habitat for sensitive plant species, the intensity of agricultral operations (discing, planting, harvesting, etc.) and consistent disturbance that occurs on agricultural land substantially reduces habitat function for agriculture areas. For classification of land within the County to facilitate a conservative biological resources analysis, it was deemed most accurate and appropriate to designate agricultural lands as not containing significant habitat function or value for native species.*

animal species. The data provided in Table 4.8-F forms the basis for the impact discussion found in Section 4.8.6 (Biological Resources – Impacts and Mitigation).

As shown in Table 4.8-G, below, the project has the potential to affect a variety of major natural community classifications within the Coachella Valley region. Of these communities, two classifications do not provide significant natural habitat functions and values (i.e., agriculture and developed, urban and disturbed land) and eight classifications include sensitive habitats due either to plant species or ecology present, or as habitat used or occupied by sensitive animal species. Due to the sensitivity and scarcity of the underlying habitats, impacts to chaparral, desert alkali scrub, desert scrub, dry wash woodlands and mesquite, sand dunes and sand fields, as well as riparian communities could be potentially significant if unmitigated.

Table 4.8-H, below, provides a summary of the proposed project's potential effects on those communities not covered by the WRC-MSHCP or the CV-MSHCP. As the table shows, future development accommodated by the project in areas outside the MSHCPs could affect a variety of natural communities; two of which do not provide significant natural habitat functions and values (i.e., agriculture and urban/disturbed land).

The alkali playa community provides natural habitat functions and values, but does not include habitats considered sensitive. Lastly, five categories include habitats deemed sensitive because of their ecology or due to the plant species present, or because they provide habitat occupied or otherwise used by a sensitive animal species. Due to the sensitivity and scarcity of the underlying habitats, effects to chaparral, coniferous woodlands and forest, desert dunes Mojavean and Sonoran desert scrub and riparian and bottomland communities could be potentially significant if unmitigated. No project-related effects were found in the non-MSHCP area of southwest Riverside County.

Table 4.8-H: Natural Communities Potentially Affected in Non-MSHCP Areas

Natural Community Major Classifications	Non-MSHCP Areas Habitat Total (acres)[1]	Project Components				Project Total (acres[1]) & *(% of habitat)[4]*

2. Changes would have either no net change on land-use related (spatial) effects or would serve to decrease effects by lowering intensity or density plans
3. GPA No. 960 activities which have a foreseeable impact on natural communities within the Non-MSHCP areas.
4. Percentage of potentially affected project area vs. habitat within the non-MSHCP areas of Riverside County

Source: Riverside County GIS Dept., GIS Analysis of project data (2012)

In summary, according to Tables 4.8-F, 4.8-G and 4.8-H, of the *foreseeable* potentially affected areas ~~foreseeable at this time~~, a total of *11,600* ~~10,970~~ acres could be adversely affected by future development accommodated by the project. *Approximately 90,000 additional acres would be also affected in a "neutral" manner by future project development (that is, the project only changes the nature of planned future uses; it does not create a "new" impact).* Out of nearly 4,120,000 acres of unincorporated land in Riverside County, the *project* total *for these two categories (101,500 acres)* represents approximately *2% of the total County* ~~0.3% of the total~~ area.

4. Sensitive Habitats

In addition to the general habitat types discussed above, a number of specific habitats have been particularly deemed sensitive by the CDFW due to their scarcity (meaning the plants and animals which rely on them for their survival are increasingly at risk) and frequently because they support endemic plant or animal species (that is, species that require the habitat's specific combination of traits and, thus, do not occur anywhere else). Accordingly, the sensitive habitat types indicated in Tables 4.8-I through 4.8-K (Sensitive Habitats), below, have the potential to be affected by future development within western Riverside County, the Coachella Valley and non-MSHCP areas, as indicated. For the purposes of this programmatic EIR, the sensitive vegetation communities addressed herein are those included on either the California Natural Diversity Database (NDDB) or the California Native Plant Society (CNPS) List of Vegetation Types. The NDDB is managed by the CDFW; the CNPS list is maintained by that Society with input and consultation with the CDFW and USFWS, among others.

5. Critical Habitat for Protected Species

When a species is proposed for listing as endangered or threatened under FESA, the USFWS must consider whether there are areas of habitat they believe are essential to the species' conservation. Those areas may be proposed for designation as critical habitat. Critical habitat designations provide extra regulatory protection because they trigger special management considerations and recovery actions. In Riverside County, the USFWS has identified critical habitat for 19 species. As shown in Table 4.8-L (Designated Critical Habitat Occurring in Riverside County), below, future development accommodated by GPA No. 960 has the potential to affect designated critical habitat for seven of these species. These effects occur exclusively within the WRC-MSHCP and CV-MSHCP biological resource areas. Analysis indicates that no project components outside the two MSHCPs would affect critical habitat.

As shown in Table 4.8-K below, future development accommodated by GPA No. 960 has the potential to affect a variety of sensitive habitat classifications previously identified in Table 4.8-C. Table 4.8-K forms the basis for the impact discussion, found in Section 4.8.6.

Table 4.8-I: Sensitive Habitats Potentially Affected in Western Riverside County

Sensitive Habitats	County Habitat Total (acres)[1]	Project Area Conserved (acres)[1] & (% of habitat)[3]		Project Area Potentially Affected[2] (acres)[1] & (% of habitat)[3]

Footnotes:
1. All values rounded to nearest 10 acres; except, values under 10 rounded to nearest whole unit. Thus, totals may not sum precisely.
2. "NA" indicates no critical habitat for this species is designated within this portion of Riverside County.

Source: USFWS, Critical Habitat Portal (accessed 4/30/12). Riverside County GIS Dept., analysis of project data, 2012.

6. Oak Woodlands

As shown in Table 4.8-M (Oak Woodlands Potentially Affected in Riverside County), future development accommodated by GPA No. 960 has the potential to affect oak woodlands throughout Riverside County. Oak habitats are sensitive and the State of California has established regulations to protect them. The implications of the effects to these oak resources are discussed under "Impacts and Mitigation" in the subsequent section (4.8.6).

Table 4.8-M: Oak Woodlands Potentially Affected in Riverside County

Natural Community Major Classification	County Habitat Total (acres)*	Areas Potentially Affected (acres)*	Percent Affected
Black Oak Habitats	*3,390*	*0*	*0%*

Total	***68,110 ~~59,830~~***	**5,300**	***8% ~~8.8~~%***

* All values rounded to nearest 10 acres; except, values under 10 rounded to nearest whole unit. Thus, totals may not sum precisely.
Source: Riverside County GIS Dept., GIS Analysis of project data, 2012.

7. Wetlands

Because wetland resources tend to be linear (along drainages) and depend on specific soils, topography, hydrology and vegetation, they cannot be analyzed in any great depth or detail at the countywide programmatic scope of this EIR. Rather, detailed analyses would be required at the implementing project development stage for future. Nonetheless, available data at the countywide level on habitat with known wetland or riparian components is shown in Table 4.8-N (Wetland-Associated Habitats Potentially Affected in Riverside County). Project components overlapping these are also shown. A myriad of agencies regulate wetland resources including the Corps, USFWS, CDFW and the County of Riverside (for purposes of implementing Section 6.1.2 of the WRC-MSHCP). Examples of the various required analyses and regulatory actions are described in Impact 4.8.A, in the subsequent section.

Table 4.8-N: Wetland-Associated Habitats Potentially Affected in Riverside County

Habitats Potentially Supporting Federally Protected Wetlands	County Habitat Totals (acres)[1]	Areas Potentially Affected (acres)[1]	Percent Affected
Western Riverside County	***43,420***	***3,910***	***9%***
Marsh Communities *Includ~~esing~~:* *Alkalai Playa (4 acres)* Cismontane Alkali Marsh *(1,920 acres)* *Fresh Emergent Wetland (1,610 acres)* *Vernal Pool (240 acres)* *Wet Meadow (50 acres)*	*3,830 ~~1,920~~*	*90 ~~1~~*	*2% ~~0%~~*
Riparian Scrub, Woodlands and Forest *Includ~~esing~~:* Desert Riparian *and* Desert Wash *(270 acres)* *Eucalyptus (1,110 acres)* ~~Fresh Emergent Wetlands~~ *Montane Riparian and Valley Foothill Riparin (20 acres)* *Riparian (Mulefat) Scrub (1,240 acres)* *Riparian Scrub (All Other) (1,070 acres)* *Southern Cottonwood Willow Riparian Forest (1,530 acres)* *Southern Sycamore Alder Riparian Woodland (430 acres)* *Southern Willow Scrub (7,830 acres)* Valley Foothill Riparian *(430 acres)*	*20,170 ~~13,510~~*	*2,650 ~~1,220~~*	*13% ~~9%~~*

4.8.6 Biological Resources - Impacts and Mitigation

A. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies and regulations, or by the CDFW or USFWS?

Impact 4.8.A – Adversely Affect Riparian and Other Sensitive Habitats: Future development accommodated by the proposed project, GPA No. 960, would increase rural, suburban and urban uses in Riverside County, adversely affecting riparian or other sensitive habitats in various areas. Compliance with a variety of laws, including Sections 401, 402 and 404 of the federal Clean Water Act, Section 1600 *et seq.* of the California Fish and Game Code and the multi-species habitat conservation plans for western Riverside County and the Coachella Valley, as well as a variety of existing and proposed General Plan policies and project-specific new Mitigation Measure 4.8.A-N1, would ensure that this impact is reduced to less than significant.

1. Analysis of Impact 4.8.A

Sensitive habitats are natural vegetation communities that are unique, of relatively limited distribution in the region or of particularly high wildlife value, as designated by federal, state or local conservation programs. Sensitive habitats occur in Riverside County as subtypes of the major natural communities listed in Tables 4.8-A, 4.8-B and 4.8-C for western Riverside County, the Coachella Valley region and the portions of Riverside County not covered by either MSHCP (predominantly the far eastern third of the county), respectively. These major natural communities are described in Section 4.8.2.

As shown in Table 4.8-I of the prior section, western Riverside County features nine sensitive habitat types. Based on project components with known or reasonably foreseeable spatial components, seven of these nine sensitive habitats would be affected by future development accommodated by the project; a total of roughly *7%* ~~6.9%~~ of western Riverside County's sensitive habitat. Due to the sensitivity and scarcity of the underlying habitats, impacts to grasslands, playas, riparian scrub, woodlands and forests, Riversidean alluvial fan sage scrub communities and aquatic habitats (water) could potentially be significant if unmitigated.

For the Coachella Valley region of Riverside County, 25 sensitive habitat types have been mapped (see Table 4.8-B). Of these, Table 4.8-J indicates that only nine (roughly 0.4%) would be affected by future development accommodated by the project. Due to the sensitivity and/or scarcity of the underlying habitats, impacts to chaparral, desert alkali scrub, desert scrub, dry wash woodlands and mesquite, sand dunes and sand fields, as well as riparian communities, could be potentially significant if unmitigated.

Lastly, within the non-MSHCP areas (particularly, the eastern third of the county), a total of eight major natural communities occur (see Table 4.8-C). As shown in Table 4.8-K, ~~there are eight sensitive habitat types and~~ three of the eight could be affected by GPA No. 960. Due to the sensitivity and/or scarcity of the underlying habitats, impacts to chaparral, coniferous woodlands and forest, desert dunes, Mojavean and Sonoran desert scrub and riparian and bottomland communities could be potentially significant if unmitigated.

Additional areas would also be affected by implementation of the proposed countywide policies outlined in the project description (Section 3.0) of this EIR. However, because these policies are not tied to any specific locations at this time, it would be speculative to try to assess their impacts on habitats or species present. Rather, such impacts would necessarily be addressed programmatically, as outlined below, with additional site-specific details being incorporated as they become available at the individual site-specific review stage.

Habitat may be lost or significantly altered due to direct impacts as well as indirect impacts resulting from development. Direct impacts are generally those in which habitat is lost to grading and filling. Indirect impacts to riparian or other sensitive habitats generally occur through edge effects, habitat alterations, disturbances, fragmentation or degradation. Edge effects occur where urban development meets open space. In these areas the potential for indirect impacts to wildlife within the open space are the greatest. Types of urban disturbances potentially affecting natural open space areas include: change in runoff quality and pattern; introduction of toxic chemicals (particularly fertilizers and other gardening chemicals) and manure; spill-over of nighttime lighting; increased ambient noise levels and spill-over noise; introduction of non-native plants (including potentially invasive species); increased risk of trash and refuse; and increased potential for human disturbances of open spaces.

In order to minimize these edge effects, Section 6.1.4 of the WRC-MSHCP and Section 4.5 of the CV-MSHCP include measures to protect open space designated for inclusion in MSHCP conservation areas and minimize edge effects. Further, myriad agencies govern riparian and wetland resources, including the Corps, USFWS, CDFW and the County of Riverside. When wetlands are found on lands proposed for development, the following analyses and (where necessary) regulatory actions are required. A mitigation plan or Determination of Biologically

Equivalent of Superior Preservation (DBESP) must be in place prior to project approval and the project is conditioned to obtain the requisite state and federal permits prior to grading. The County of Riverside requires mitigation at a ratio deemed acceptable to the resource agencies. Accordingly, these measures would also apply to future development under GPA No. 960. The regulations identified below are more fully described in Section 4.8.3 of this EIR.

- Jurisdictional delineation of waters of the U.S. and wetlands pursuant to the CWA and Corps protocol. If avoidance is infeasible, then applicants must obtain a CWA Section 404 permit from the Corps prior to project grading. These permits must include mitigation measures or other equivalent requirements necessary to reduce impacts to riparian and wetlands resources to below the level of significance and ensure no net loss of wetlands.

- Delineation of streams and vegetation within drainages and native vegetation of use to wildlife pursuant to CDFW and CFGC section 1600 *et seq*. Where necessary, applicants are required to obtain a Section 1601 or 1603 permit and a Streambed Alteration Agreement from CDFW. These permits must include mitigation measures or other equivalent requirements that reduce impacts to riparian and wetlands resources to below the level of significance and ensure no net loss of wetlands.

- Riparian/Riverine evaluation pursuant to the WRC-MSHCP Section 6.1.2. Applicants must complete the HANS process and avoid impacts to riparian areas to preserve the function and value of such habitats. Where avoidance is infeasible, a Section 404 and/or a Section 1601 or 1603 permit may be required.

In addition to the above, any habitat may also be considered sensitive (including those identified as non-sensitive) should it be found to support a listed, proposed or candidate species, or provide a viable habitat linkage between areas of sensitive habitat.

The impacts discussed herein are based on the assumption that biological resources would be directly or indirectly affected by build out of General Plan components amended by GPA No. 960 and associated public works projects. ('Build out' means that all development mapped in the General Plan is assumed to be built over the next 50 years; even though in reality full build out is rarely reached by a city or county.) Direct and indirect biological impacts include the following:

- Direct mortality of individuals of listed, proposed or candidate species, or loss of habitat occupied by such species.

- Alteration or loss of habitat for listed, proposed or candidate species that inhibits or compromises recovery efforts that could otherwise lead or contribute to the delisting of the species.

- Direct loss of sensitive natural communities.

- Fragmentation of sensitive habitats resulting in isolation of habitat patches creating a 'checkerboard' pattern of small habitat patches of limited biological value.

- Fragmentation of habitat that constricts, inhibits or eliminates wildlife movement.

- Direct loss of oak trees or alteration of natural processes (e.g., hydrology) resulting in indirect loss of oak trees.

- Alteration of habitat or natural processes that would result in the direct or indirect mortality of listed, proposed or candidate species or that would result in loss, fragmentation or isolation of sensitive habitat.

During subsequent project-level environmental analysis and review of individual future development projects, compliance with applicable regulations may also require coordination with resource agencies (e.g., USFWS, CDFW, or Corps) to determine specific mitigation measures necessary for impacts to waters of the U.S. (including wetlands), riparian habitats and state and federally listed species. This is especially true for the non-MSHCP areas of Riverside County. Resource agency permits for project-level approvals may require mitigation measures in addition to those outlined in the applicable MSHCP, EIR No. 441 or herein.

2. Regulatory Compliance for Impact 4.8.A

As explained below, compliance with the following existing laws, regulatory programs and General Plan Policies would aid in reducing impacts to riparian and other sensitive habitats.

a. Compliance with Federal, State and County Regulations

Compliance with the following federal, state and county regulations would prevent significant impacts to riparian and other sensitive habitats in Riverside County.

Federal Clean Water Act (Sections 401, 402 and 404): Many wetland communities (e.g., freshwater marsh, riparian forests, riparian woodlands, open water, flood channels, rivers and stream beds) within Riverside County include areas subject to federal Clean Water Act Sections 401, 402 and 404 where habitat meets the CWA definition of a "jurisdictional water of the U.S." or adjacent "wetland." Thus, regardless of MSHCP coverage, projects with jurisdictional waters or wetlands would be required to obtain a CWA Section 404 permit prior to issuance of a grading permit by the County of Riverside. Also, the Corps shall continue to consult with the USFWS pursuant to Section 7 of the FESA on projects that may affect federally listed species within Corps jurisdictional wetlands and waters. By regulation, Corps permits must ensure no net loss of riparian habitat and preserve the biological function and value of any jurisdictional waters on site.

Fish and Game Code Section 1600 *et seq*.: Many wetland communities (e.g. freshwater marsh, riparian forests, riparian woodlands, open water, flood channel, river and stream beds) within western Riverside County include areas subject to California Fish and Game Code Section 1600 *et seq.* and are regulated by the CDFW. The CDFW shall continue to work closely with the Corps, USFWS and the County of Riverside to ensure that agreements required pursuant to this code are consistent with the mitigation required for WRC-MSHCP Covered Species and the sensitive habitats on which they depend.

WRC-MSHCP: Land use within western Riverside County is subject to the WRC-MSHCP. The MSHCP identifies criteria cells within which 153,000 acres of new conservation will be achieved and contribute toward the assembly of the overall 500,000-acre WRC-MSHCP reserve system. Discretionary projects that occur within criteria cells are submitted to the County of Riverside for review and are subject to the Habitat Evaluation and Acquisition and Negotiation Strategy (HANS) which ensures that the sensitive habitats and riparian areas are conserved. Ongoing implementation of the WRC-MSHCP ensures that sufficient sensitive habitat is conserved to off-set the habitat losses incurred by future development within western Riverside County.

The MSHCP also identifies the requisite studies and land use considerations necessary to protect riparian areas outside of the criteria cells that contribute to the function and value of the reserve system and the sensitive habitats conserved therein. Pursuant to Section 6.1.2 of the WRC-MSHCP, as projects are proposed within the

plan area, an assessment of the potentially significant effects on riparian/riverine areas and vernal pools are performed using available information augmented by project-specific mapping provided to and reviewed by the Riverside County's biologist(s).

For identified and mapped resources not necessary for inclusion in the WRC-MSHCP Conservation Area, applicable mitigation, which may include federal and state regulatory standards related to wetland functions and values, shall be imposed by the County of Riverside. In the course of complying with this process, the County of Riverside must first demonstrate efforts to avoid and then minimize direct and indirect effects to mapped wetlands. If feasible, the project is redesigned to avoid wetland resources to ensure the long-term conservation of the areas to be avoided. If avoidance is not feasible, a practicable alternative that minimizes direct and indirect effects to riparian/riverine areas and vernal pools and associated functions and values to the greatest extent possible is identified and the applicant is conditioned to obtain a Section 1601/1603 permit from CDFW and a Section 404 permit from the Corps, where applicable. Additionally, Section 6.1.4 of the WRC-MSHCP sets forth a range of measures to eliminate, reduce or minimize edge effects associated with the interface between development and the natural environment.

Through implementation of the WRC-MSHCP requirements found in Sections 6.1.2, 6.1.3, 6.3.2, 6.1.4 and 6.9, development projects outside of the Criteria Areas can be found consistent with the WRC-MSHCP, thereby ensuring impacts to Covered Species are less than significant. A more detailed description of these MSHCP requirements is found in Section 4.8.3 above.

Coachella Valley Multiple Species Habitat Conservation Plan: Land use within the Coachella Valley region of Riverside County is regulated by the CV-MSHCP. The CV-MSHCP features a reserve system of 745,900 acres established from lands within 21 Conservation Areas. The CV-MSHCP is designed to ensure conservation of covered species as well as the natural communities on which they depend – including riparian habitat and other sensitive habitats. To ensure necessary habitat is preserved, discretionary projects that occur within its Conservation Areas are submitted for joint project review (JPR) by the County of Riverside and the Coachella Valley Conservation Commission (CVCC) pursuant to Section 6.6.1.1 of the CV-MSHCP. For proposals within the Santa Rosa and San Jacinto Mountains Conservation Area, the County of Riverside employs the HANS process instead. See Section 4.8.3 for details on how these processes work. Implementation of JPR and the HANS process ensures that sensitive habitats and riparian areas are conserved pursuant to the CV-MSHCP. Ongoing implementation of the CV-MSHCP ensures that sufficient sensitive habitats are conserved to offset habitat losses incurred by permitted development, including that which would result from implementation of the proposed project.

Although, land use designation changes within the valley are proposed as part of GPA No. 960, the only take (loss) authorized for habitats within the Coachella Valley would be those permitted in conjunction with Attachment 3 of the CV-MSHCP's permit from the USFWS, which delineates the extent of take authorized for the CV-MSHCP natural communities. This list indicates the necessary habitat conservation to be achieved for each habitat type and the allowable take that it offsets. Through compliance with the provisions of the CV-MSHCP, future project impacts to sensitive habitats would be completely accounted for and mitigated. This includes riparian habitats as well as other sensitive habitats.

b. Compliance with Existing Riverside County General Plan Policies

The following existing policies of the Riverside County General Plan would help further reduce significant impacts to riparian or other sensitive habitats in within western Riverside County. See Section 4.8.3.D for full text of each of these policies.

Policy LU 9.2: This policy would help prevent impacts to riparian and other sensitive habitats by requiring developments to comply with federal and State regulations pertaining to environmental resources.

Policy C 20.9: This policy would ensure that all transportation plans and development proposals reflect specific requirements of the WRC-MSHCP and the CV-MSHCP.

Policy OS 5.1: By allowing channelization of floodways only as a last resort, this policy would ensure that sensitive riparian habitats are allowed to persist rather than be lost due to development impacts.

Policy OS 5.6: By requiring that upland habitat areas be identified and conserved to the maximum extent possible, this policy would provide for the ongoing habitat function and value of sensitive riparian areas, allowing them to persist rather than be lost due to permanent development impacts.

Policy OS 6.1: By requiring compliance with the Clean Water Act's Section 404 process, this policy would assure no net loss of jurisdictional wetlands.

Policy OS 6.2: By requiring preservation of buffer zones around wetlands, this policy would assure that additional habitat is conserved for protected species that rely on riparian habitats, that edge effects would be minimized and that species mortality due to such edge effects was reduced.

Policy OS 9.3: By requiring the maintenance and conservation of superior examples of native trees, natural vegetation, stands of established trees and other features for ecosystem conservation purposes, this policy would ensure that species that rely on such habitats would be protected.

Policy OS 9.4: By requiring the conservation of oak tree resources in the county, this policy would ensure that no net loss of oaks occurs. Further, it would preserve nesting and foraging habitat essential to many protected bird species.

Policy OS 20.2: By preventing the unnecessary extension of public facilities and services and utilities into Open Space-Conservation areas, this policy would reduce the fragmentation of habitat essential to the survival of protected species.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan would further prevent significant impacts to riparian habitat or other sensitive natural communities. See Section 4.8.3.D for the full text of each of these policies.

Policy LU 7.7: By requiring buffers between development and watercourses, including their associated habitat, this policy would ensure that riparian habitat is allowed to persist rather than be lost to permanent development impacts.

Policy LU 9.1: By requiring that development provide for the preservation of open space that contain natural resources including arroyos and canyons, this policy would see that sensitive riparian and upland habitats are allowed to persist rather than be lost due to development impacts.

Policy OS 5.2: By requiring that modifications to floodways be designed to reduce adverse environmental effects, this policy would ensure that more floodways within the county are designed to conserve the function and value of riparian habitats and serve as species movement corridors.

Policy OS 5.3: By requiring setbacks from floodway boundaries for wildlife movement corridors and linkages, this policy would ensure that sensitive species dependent upon riparian linkages are allowed to persist rather than be lost due to development impacts.

Policy OS 5.5: Requiring that development preserve and enhance existing riparian habitat and prevent obstruction of natural watercourses, this policy would ensure that the function and value of such habitat is improved. Further, it provides that sensitive species dependent upon such habitats are allowed to persist rather than be lost to permanent development impacts.

Policy OS 17.1, 17.2 and 18.1: By specifying that the provisions of applicable MSHCPs must be enforced in the course of County land use review, review of legislative actions, planning of transportation or infrastructure projects, etc., these policies codify the local conservation measures developed for MSHCP-protected species throughout the county.

Policy OS 18.3: By prohibiting the planting or introduction of invasive, non-native species to watercourses, riparian areas and their buffers, this policy would minimize edge effects and associated species mortality.

Policy OS 18.4: By establishing specific standards for management of watercourses on private conservation easements, this policy would institute clear expectations concerning the elimination of edge effects, preservation of wildlife movement and minimization of fuel modification areas.

d. Additional Project-Specific Mitigation for Impact 4.8.A

Despite all of the above measures that lessen impacts to riparian habitat, additional project-specific mitigation is necessary to fully minimize impacts. New Mitigation Measure 4.8.A-N1 would ensure that, in areas of Riverside County not already regulated by either the WRC-MSHCP or CV-MSHCP, a jurisdictional assessment must be performed for projects proposed for areas that may support state or federally protected wetlands in order to determine if any riparian resources would be affected by the proposed implementing project. Further, where impacts to such wetlands are unavoidable, a CWA Section 404 permit must be obtained from the Corps and/or a streambed alteration agreement must be obtained from the CDFW pursuant to CFGC Section 1600 *et seq.* Among other things, plans developed pursuant to the Section 404 permit require no net loss of wetlands. Typically, this means that a project's loss or disturbance of wetlands must be offset by creation or protection of additional wetlands, often at a 3:1 (replacement:loss) ratio or other formula deemed acceptable by the applicable resource agency.

NEW **Mitigation Measure 4.8.A-N1:** ~~For sites not governed by an existing MSHCP,~~ Where site conditions (for example, topography, soils, vegetation, etc) indicate a project could adversely affect any riparian or riverine resources, then an appropriate assessment shall be prepared by a qualified professional. An assessment shall include, but not be limited to, identification and mapping of any riparian/riverine areas and evaluation of species composition, topography/hydrology and soil analysis, as applicable. An assessment shall be completed as part of the environmental review for the development proposal prior to its approval. Upon receipt of an assessment, the Riverside County Ecological Resources Specialist (ERS) shall review the document and make a finding that either:

a. Riparian/riverine areas do not exist on site;

b. Project-specific avoidance measures have been identified that would be sufficient to ensure avoidance of riparian/riverine areas; or

c. Impacts to riparian/riverine areas are significant and unavoidable. If avoidance is not feasible, a practicable alternative that minimizes direct and indirect effects to riparian/ riverine areas and vernal pools and associated functions and values to the greatest extent possible must be developed.

If impacts remain ~~significant and~~ unavoidable, then the ~~ERS will~~ projects shall be conditioned to require the project applicant to obtain a Section 404 permit from the ACOE and/or a Fish and Game Code Section 1600 agreement from CDFW prior to the issuance of any grading permit or other action by the County of Riverside that would lead to the disturbance of the riparian resource.

NEW **Mitigation Measure 4.8.A-N2:** ~~For sites not governed by an MSHCP, a~~ A general biological resources assessment (BRA) shall be required as part of the discretionary project review process at Riverside County's discretion. For example, a BRA would be required if a site inspection, aerial or other photos, resource agency data or any other information indicates potential for sensitive habitat to occur on, or be adversely affected by the proposed project. The BRA shall be prepared and reviewed as per the requirements outlined in Mitigation Measure 4.8.B-N1.

3. Finding on Significance of Impact 4.8.A

Implementation of the above-listed existing regulations and General Plan policies and, in particular, the provisions of the two multiple species habitat conservation plans, as well as new Mitigation Measures 4.8.A-N1 and 4.8.A-N2, would ensure that future development accommodated by GPA No. 960 would have a less than significant impact on riparian or other sensitive natural communities identified in local and regional plans, policies and regulations, and those identified by the CDFW and USFWS.

B. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies or regulations, or by the CDFW or USFWS?

Impact 4.8.B – Cause Direct or Indirect Impacts to Protected Species or Their Habitats: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting various sensitive species, including threatened, endangered and special status species protected under various local, state and federal laws. Compliance with the federal and California Endangered Species Acts (FESA and CESA), the federal Clean Water Act (CWA) and the California Fish and Game Code, as well as the two MSHCPs within Riverside County (WRC-MSHCP and CV-MSHCP), plus existing and proposed General Plan Policies would serve to avoid, reduce or minimize significant impacts to protected species and their habitats. In addition, a new project-specific mitigation measure, 4.8.B-N1, is proposed to ensure this impact would be less than significant.

1. Analysis of Impact 4.8.B

a. General Development Impacts

As shown in Tables 4.8-H and 4.8-D, a diverse number of species occupy Riverside County. Impacts to these species would occur in several ways. Grading and other land-disturbing activities as a result of development accommodated by GPA No. 960 would result in direct effects to species present, particularly for ground-dwelling nocturnal mammals such as gophers, kangaroo rats and pocket mice. Any reptiles, amphibians, invertebrates or

plants present would also be affected. Due to their higher mobility, birds would be less directly affected. Direct harm would generally be limited to unfledged birds (i.e., nestlings, eggs). Direct harm of larger mammals would also be minimal since they can typically flee the site.

Indirect impacts would also occur within all of these species groups. Indirect harm includes direct secondary impacts due to construction activities, such as: disturbed breeding, feeding, nesting or foraging behaviors; loss of foraging habitat; loss of food sources; loss of burrows; and, loss of nesting or roosting habitat. Indirect harm also includes ongoing secondary impacts due to human occupation, such as: disturbance by human intrusion, increased night-time lighting, introduction of new species (particularly dogs and house cats) and increased urban-associated predators (such as raccoons, opossums or coyotes) due to greater availability of scavenged food sources, i.e., refuse and pet foods.

For all of these impacts, the severity of their effect on a given species or individual of the species depends on a variety of factors:

- Type of habitat affected.
- Degree/amount of habitat affected (100% because of grub and grade vs. 50% because of mow and thin within fuels management zones, for example).
- Timing/duration of habitat effects (i.e., bird nesting season).
- Species-specific biological or ecological niches and needs (i.e., nocturnal, scavenger, etc.).

To the extent the aforementioned impacts affect non-listed species, they are considered to be less than significant. Such non-sensitive wildlife species would generally occur in large enough numbers that impacts to individuals on a site would not be significant. In addition, any open space set aside on a site or conserved elsewhere (for example, as part of MSHCP requirements) would provide protected habitat for the benefit of the common species as well as sensitive and protected species. Also, as discussed below, there are a number of regulatory measures that would minimize edge effects associated with interface areas between open space and development, which would also minimize impacts to both sensitive and non-sensitive species.

b. Adverse Effects on Protected Species

Species at risk for the aforementioned adverse effects are identified in Tables 4.8-D and 4.8-E. Pursuant to the tables, 349 species in Riverside County are considered candidate, sensitive or special status under FESA, CESA, and/or CNPS/CNPS designation. These include species that are listed as endangered or threatened under FESA, species proposed or candidates for such listing and species similarly listed under CESA. This list also includes species covered by regional MSHCPs within Riverside County. In addition, the California Native Plant Protection Act (NPPA) identifies approximately 2,000 native plant species of concern throughout the State of California. The full NPPA list is included in Appendix EIR-9. Given the vast range of habitats and species occurring in California, many of the 2,000 plants listed by the NPPA do not occur in Riverside County. To determine which are applicable to Riverside County, the CNPS and NDDB databases were used, the results of which are reflected in Tables 4.8-D and 4.8-E. The existence and location of the other 2,000 NPPA plants is not reasonably foreseeable at this time.

Of the aforementioned 349 protected species, 146 are addressed under the WRC-MSHCP and 27 under the CV-MSHCP. These species would be adequately covered by these plans to ensure that impacts to these species and their habitats would be less than significant. Within the 1,140 acres of non-MSHCP areas in Riverside County,

however, additional steps must be taken to ensure impacts to sensitive and protected species would not be significant.

Since impacts to species would generally occur pursuant to known species habitat associations (Table 4.8-D), foreseeable habitat losses, such as the 'Affected' acreages identified in Tables 4.8-F, 4.8-G and 4.8-H, indicate where such species would be affected. Because of the scope of this programmatic EIR, it is not feasible to analyze species-specific impacts at a site-specific level at this time. Moreover, it is infeasible to perform on the ground biological surveys for a project of this magnitude (covering a county of nearly 200 square miles in size) as many species are transient, changing location from day-to-day, month-to-month or year-to-year. Thus, even if performed, species surveys would be rendered obsolete within a short amount of time and *would* not be reflective of the entire county's biota.

Given the massive scope of Riverside County's ecosystems and wide array of plant and animal species within it, the specific likelihoods of any given sensitive species occurring on a specific site cannot be determined within the scope of this programmatic EIR. Rather, focused assessments would be performed in conjunction with future site-specific development proposals. Instead, this EIR addresses these impacts programmatically, including providing mitigation measures for impacts not already addressed through existing federal, state and local regulations.

Future analysis would be necessary to determine if an implementing project would have a significant impact on a sensitive species or its habitat. The potential for such a project's impacts to be considered significant would depend upon various factors including, but not limited to, the site conditions at the time of project evaluation, the extent of the area potentially affected and the value of the affected habitat at local and regional scales.

Site-specific analyses shall be required and performed pursuant to the mitigation measures cited for each biological region below. Where protected species or suitable habitat is found on a project site, various measures shall be required to address impacts. Such measures would include County of Riverside programs, State of California and/or federal regulations and CEQA-specific mitigation measures, as outlined below. Adherence to these measures shall ensure that candidate, sensitive and special status species are not jeopardized by future implementing project development and that impacts to these species are avoided or reduced to less than significant.

The following information characterizes the protected species within each area of the three biological regions of Riverside County.

Western Riverside County: Future development pursuant to GPA No. 960 has the potential to directly affect *approximately 6,300* ~~6,263~~ acres of habitat within twelve major natural community associations, as indicated in Table 4.8-F, and thus affect the associated candidate, sensitive or special species represented in Table 4.8-D.

Coachella Valley: Future development pursuant to GPA No. 960 has the potential to directly affect 3,570 acres of habitat within eight major natural community associations as indicated in Table 4.8-G and thus affect the associated candidate, sensitive or special species (as indicated in Table 4.8-D) that may occur in the affected natural communities.

Non-MSHCP Areas: Future development pursuant to GPA No. 960 has the potential to directly affect 1,141 acres of habitat within three major natural community associations as indicated in Table 4.8-H. Table 4.8-D indicates that candidate, sensitive or special species may occur in these affected natural communities.

c. Species with Designated Critical Habitat

As indicated in Section 4.8.5 and further clarified in Table *4.8-L* ~~4.8-I~~, development accommodated by GPA No. 960 has the potential to affect critical habitat for seven of 19 species for which the USFWS has designated 'critical habitat' in Riverside County. All except one of these seven species are covered under the WRC-MSHCP, CV-MSHCP or LCR-MSCP. The County of Riverside is a permittee under two of the three plans, the WRC-MSHCP and the CV-MSHCP. The only species for which critical habitat has been designated, but is not covered by an existing plan, is Casey's June beetle.

For the Western Riverside County and Coachella Valley MSHCPs, the County of Riverside has (and may extend to applicants) 'take' coverage for species with critical habitat designated when the USFWS issued the MSHCPs' *FESA* Section 10 permit. Thus the plans provide for the protection of those physical and biological features essential to the conservation of the covered species in a manner consistent with USFWS's regulations concerning protection of critical habitat.

Further, the implementing agreements for both plans provide that if new critical habitat is designated within the plans' boundaries after the issuance of their Section 10 permits, then under the 'No Surprises Rule,' no subsequent evaluation of the covered species nor any mitigation, compensation, conservation enhancement or other protective measures other than those already set forth in the MSHCPs would be required. Thus, impacts to species and their critical habitat occurring within the boundaries of the WRC-MSHCP and the CV-MSHCP are fully covered under those plans.

Moreover, compliance with the MSHCPs ensures that no significant impacts to covered species or their critical habitats would occur. This is because both plans are designed such that payment of the mitigation fee and compliance with the plans' requirements provide full mitigation under CEQA, NEPA, FESA and CESA for impacts to covered species and their habitats pursuant to agreements with the USFWS, the CDFW and other participating regulatory agencies (as set forth in the implementing agreements for each of the plans).

The LCR-MSCP covers and provides for the protection of the razorback sucker, a fish species for which critical habitat has been designated in non-MSHCP areas of eastern Riverside County. As indicated in Table *4.8-L* ~~4.8-I~~, none of the future development accommodated by GPA No. 960 is proposed for along the Colorado River nor would it affect, either directly or indirectly, the razorback sucker or its critical habitat.

As noted above, the only species for which Critical Habitat has been designated in Riverside County that is not covered by a MSHCP is the Casey's June beetle. The location of Critical Habitat for Casey's June beetle is in the Coachella Valley. ~~However,~~ Casey's June beetle is not a listed species under CESA*; however~~,~~ Casey's June beetle is listed as endangered under the Federal Endangered Species Act, as of September 22, 2011. Although not protected under CESA, development within the City of Palm Springs will address protential impacts to the federally endangered Casey's June beetle. Any federal nexus (i.e., federal funding, U.S. Army Corps of Engineers Clean Water Act Section 404 Permit for impacts to Corps regulater water features)~~,~~ would trigger the need to address the loss or adverse modification to Casey's June Beetle Critical Habitat in Palm Canyon.* As indicated in Table *4.8-L* ~~4.8-I~~, future development accommodated by GPA No. 960 would not foreseeably affect, either directly or indirectly, the Casey's June beetle or its critical habitat.

2. Regulatory Compliance for Impact 4.8.B

As detailed and explained below, compliance with the following existing laws, regulatory programs, General Plan Policies and existing EIR No. 441 mitigation measures would lessen significant impacts to candidate, sensitive and special status species.

a. Compliance with Federal, State and County Regulations

Compliance with the following state, federal and county regulations would reduce impacts related to candidate, sensitive and special status species.

Federal Endangered Species Act: FESA, as described in Section 4.8.3 above, ensures no take of a federally-listed species by private interests and non-federal government agencies occurs without an HCP approved by the USFWS and implemented by the permitee.

Migratory Bird Treaty Act: As indicated in Section 4.8.3 above, disturbing or destroying active nests of any native bird is a violation of the federal MBTA. Nests and eggs are also protected under CFGC Section 3503. As a result, special precautions must be taken to avoid disturbances to birds during their breeding seasons (most commonly between February and June).

Federal Clean Water Act: Section 401 of the CWA requires an applicant to obtain certification for any activity that may result in a discharge of a pollutant into waters of the United States. As a result, proposed fill in waters and wetlands requires coordination with the appropriate Regional Water Quality Control Board (RWQCB) that administers Section 401 and provides certification. The RWQCB also plays a role in review of water quality and wetland issues, including avoidance and minimization of impacts. Section 401 certification from the RWQCB is required prior to the issuance of a Section 404 permit from the Corps.

Under Section 404 of the CWA, the Army Corps has jurisdiction over wetlands and waters of the United States. A Section 404 permit is required for those activities that could discharge fill or dredge materials or otherwise adversely modify wetlands or other waters of the United States and associated habitat. Such permits are authorized by Army Corps and typically contain mitigation to offset unavoidable impacts to wetlands and other waters of the United States in a manner that achieves no net loss of wetland acres or values.

California Endangered Species Act: CESA, as described in Section 4.8.3 above, ensures that species listed by the State of California as threatened or endangered are not jeopardized without take authorizations issued by CDFW. Such authorizations are only issued pursuant to specific conditions found in Section 2081 of CESA.

Natural Community Conservation Planning Act (NCCP): The NCCP, as described in Section 4.8.3, provides for a broad-based ecosystem approach to planning for the protection and perpetuation of biological diversity. Both the WRC-MSHCP and the CV-MSHCP are NCCPs. As such, they allow for the issuance of take at the local level by permittees such as the County of Riverside, thereby streamlining the take authorization process on a project-by-project basis.

California Fish and Game Code Sections 1600-1603: The CDFW, through provisions of the Fish and Game Code Sections 1600–1603, is empowered to issue agreements (Streambed Alteration Agreements) for projects that would "divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake" (Fish and Game Code section 1602[a]). Streams and rivers are defined by the presence of a channel bed and banks, and intermittent flow. The limits of CDFW jurisdiction are also based on riparian habitat and may include wetland areas that do not meet ACOE criteria for soils and/or hydrology (e.g., where riparian woodland canopy extends beyond the banks of a stream away from frequently saturated soils).

California Native Plant Protection Act: Provisions of the NPPA prohibit the taking of listed plants from the wild and require notification of the CDFW at least 10 days in advance of any change in land use, which would

adversely impact, listed plants. This requirement allows CDFW to salvage listed plant species that would otherwise be destroyed. Further, CDFW promulgates a 'special plants' list which identifies the plants throughout the state that are determined to be rare. This list is also included in Appendix EIR-9.

The NDDB includes sightings of species from the NPPA 'special plants' list and the species' sensitivity is evaluated and ranked by CNPS. To the extent that such rare plants occur in Riverside County, they are reflected on Table 4.8-D and Table 4.8-E. It is important to note that plant growth is dependent on or affected by factors such as geographical location, soil types, precipitation rates, angle and direction of slopes, elevations, microclimates and successional considerations. Therefore, it is not uncommon to find a particular plant or grouping of plants growing outside what would be considered their customary habitat *where* ~~if~~ some of the above factors are advantageous to that growth. Should project-specific information indicate the presence of an NPPA species, then the project proponent would be required to notify CDFW 10 days prior to grading or any other change in land use which may adversely affect the species in question.

Stephens' Kangaroo Rat Habitat Conservation Plan: GPA No. 960 would affect areas covered by the SKR HCP. As indicated in section 4.8.3 above, the SKR HCP mitigates impacts from development on the SKR by establishing a network of preserves and a system for managing and monitoring them. Future development accommodated by GPA No. 960 within the SKR HCP boundary would be required to comply with the provisions of the HCP including payment of a mitigation fee.

Western Riverside County Multiple Species Habitat Conservation Plan: The WRC-MSHCP serves as a comprehensive, multi-jurisdictional habitat conservation plan, pursuant to Section (a)(1)(B) of FESA, as well as an NCCP per the State NCCP Act. The WRC-MSHCP and the associated Implementing Agreement (IA) allows participating jurisdictions, including Riverside County, to approve development that may result in the incidental take of species and their habitat provided that development proposal adheres to the requirements of the WRC-MSHCP. As such, the County of Riverside may issue take authorizations for species covered by the plan. By paying the mitigation fee and complying with the requirements of the WRC-MSHCP, a land use project would meet their obligations with respect to CEQA, NEPA, CESA and FESA for purposes of WRC-MSHCP covered species and their habitats. As part of GPA No. 960, continued participation in the WRC-MSHCP is required and proposed land use projects would be obligated to comply with all applicable provisions of the plan if within the boundaries of the WRC-MSHCP's coverage area.

Coachella Valley Multiple Species Habitat Conservation Plan (CV-MSHCP): The County of Riverside adopted the CV-MSHCP in May 2006 and in October 2008, the federal and state wildlife agencies issued the permits and authorizations required to implement the plan. Under the plan's IA, the County of Riverside may issue take authorizations for species covered by the CV-MSHCP, including state and federally-listed species, as well as other identified covered species and their habitats. The County of Riverside imposes a development mitigation fee for projects within its jurisdiction which funds the local obligation to the CV-MSHCP. By paying the mitigation fee and complying with the requirements of the CV-MSHCP, a land use project would meet their obligations with respect to CEQA, NEPA, CESA and FESA for impacts to covered species and their habitats. As part of GPA No. 960, continued participation in the CV-MSHCP is required and proposed land use projects would be obligated to comply with applicable plan provisions if developed within the CV-MSHCP's boundaries.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would lessen significant impacts to candidate, sensitive and special status species. See Section 4.8.3.D for the full text of each policy.

Policy C 20.9: This policy would ensure that all transportation plans and development proposals reflect specific requirements of the WRC-MSHCP and the CV-MSHCP.

Policy OS 5.1: By specifying that floodway channelization is only used as a last resort, the policy would ensure that sensitive species dependent upon riparian linkages are allowed to persist rather than be lost due to development.

Policy OS 5.6: By requiring that upland habitat areas be identified and conserved to the maximum extent possible, this policy would protect the ongoing habitat function and value of riparian linkages, retain sensitive foraging areas and allow riparian dependent populations to persist rather than be lost due to development.

Policy OS 6.2: By requiring preservation of buffer zones around wetlands, this policy would assure that additional habitat is conserved for protected species that rely on riparian habitats, that edge effects are minimized and that species mortality due to such edge effects is reduced.

Policy OS 9.3: By requiring the maintenance and conservation of superior examples of native trees, natural vegetation, stands of established trees and other features for ecosystem conservation purposes, this policy would ensure that species that rely on such habitats would be protected.

Policy OS 9.4: By requiring the conservation of oak tree resources in the county, this policy would ensure that no net loss of oaks occurs. Further, it would preserve nesting and foraging habitat essential to many protected bird species.

Policy OS 20.2: By preventing the unnecessary extension of public facilities and services and utilities into Open Space-Conservation areas, this policy would reduce the fragmentation of habitat essential to the survival of protected species.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan would help lessen significant impacts to candidate, sensitive and special status species. See Section 4.8.3.D for the full text of each of these policies.

Policy OS 5.3: By requiring setbacks from floodway boundaries for wildlife movement corridors or linkages, this policy ensures that sensitive species dependent upon riparian linkages are allowed to persist rather than be lost to permanent development impacts.

Policies OS 17.1, 17.2 and 18.1: By specifying that the provisions of applicable MSHCPs are enforced in the course of land use review, review of legislative actions, planning of transportation or infrastructure projects, etc., these policies codify the local conservation measures developed for 173 protected species throughout the county.

Policy OS 18.3: By prohibiting the planting or introduction of invasive, non-native species to watercourses, riparian areas and their buffers, this policy would minimize edge effects and associated species mortality.

3. Additional Project-Specific Mitigation Measures for Impact 4.8.B

Despite all of the above measures to lessen impacts to candidate, sensitive and special status species, additional project-specific mitigation measures are necessary to ensure that such impacts would be avoided, reduced or minimized to less than significant. Toward this end, two new CEQA-specific mitigation measures are proposed.

Mitigation Measure 4.8.B-N1 would require development accommodated by GPA No. 960 to assess project-specific impacts to protected species and, where necessary, mitigate such impacts through the appropriate local, state and federal regulations and permits. Mitigation Measure 4.8.B-N1 also addresses protected species not covered by the two existing MSHCPs to ensure that impacts to such are properly identified and mitigated through the appropriate local, state and federal regulations and permits. Thus, implementation of the following mitigation measures would ensure that project impacts to candidate, sensitive and special status species would be mitigated to less than significant.

NEW **Mitigation Measure 4.8.B-N1:** Prior to discretionary project approval for projects with the potential to substantially adversely affect sensitive (listed, candidate or special status) species or habitats ~~not covered by an existing MSHCP or HCP~~, a general biological resource assessment (BRA) shall be performed. The following requirements shall apply:

a. The BRA shall be performed by a Riverside County-approved biologist pursuant to a Memorandum of Understanding (MOU) executed between the biologist and the County of Riverside.

b. The biology/environmental firm or biologist preparing the BRA must be on Riverside County's list of qualified consultants.

c. Fieldwork must be performed by qualified biologists according to professional standards.

d. If included in the BRA, presence/absence surveys for specific plants must be conducted during the applicable blooming season or other conditions as deemed scientifically appropriate and valid.

e. Should affected species or habitat occur on the project site, then a "Focused Protocol Survey" must be prepared for those species using existing protocols established by the USFWS or CDFW. If no such protocols exist, the survey must be based on generally accepted biological survey protocols appropriate to the species.

The BRA requirement *may* be waived if any of the following conditions are documented to exist.

a. The area affected by the proposed project ("footprint" herein) consists entirely of built environment (structures, pavement, etc.) and none of the biota or plant material present (i.e., landscaping) represent likely habitat used by a sensitive species.

b. The Riverside County Environmental Resource Specialist (ERS) finds in writing that the proposed footprint does not have any biological resources expected to be used by a protected species or plant.

c. The project or activity proposed is to be performed under an existing incidental take permit, habitat conservation plan or other governing permit, license or authorization (i.e. Section 7 consultation) and no new significant effect to the covered species or other protected species or resource is expected to occur.

In addition to the items herein, the BRA shall also be prepared in accordance with the Riverside County "Guide to Preparing General Biological Resource Assessments," as well as any other requirements of the Riverside County Environmental Programs Department, Planning Department or other County of Riverside agency.

Upon receipt of the BRA, the Riverside County ERS shall review it and all supporting documentation. If the Riverside County ERS finds that the project does not have the potential to substantially affect sensitive species or habitat, no further mitigation is required. If the Riverside County ERS finds that the project has the potential to

substantially adversely affect sensitive species or habitat, then additional mitigation will be developed and imposed to reduce such impacts to below a level of significance. Such mitigation may include but not be limited to obtaining incidental take permits from the USFWS and/or CDFW, as applicable and acquisition and conservation of replacement habitat at appropriate ratios.

4. Findings on Significance of Impact 4.8.B

For the reasons presented above, implementation and compliance with the above-listed existing regulations, General Plan policies and local, state and federal permit requirements, as well as new Mitigation Measure 4.8.B-N1, would ensure that future development accommodated by the project, GPA No. 960, would have less than significant impacts, either directly or through habitat modification, on any species identified as threatened, endangered, candidate, sensitive or special status species in local or regional plans, policies and regulations, or by the CDFW or USFWS.

C. Would the project have a substantial adverse effect on federally-protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, etc.) through direct removal, filling, hydrological interruption or other means?

Impact 4.8.C – Adversely Affect Wetlands: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marshes, vernal pools, etc.) through direct removal, filling, hydrological interruption or other means. Compliance with the existing laws, regulatory programs and General Plan policies, as well as new project-specific Mitigation Measures 4.8.C-N1 and 4.8.C-N2, would ensure impacts to wetlands would be less than significant.

1. Analysis of Impact 4.8.C

Federally protected wetlands are defined in Section 404 of the Clean Water Act (CWA) as areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include freshwater marshes, riparian forests, riparian woodlands, open water, flood channels, rivers and stream beds and similar areas. The natural vegetation communities in unincorporated Riverside County with the potential to contain federally protected wetlands are identified in Table 4.8-N in Section 4.8.5.

Direct impacts to federally protected wetlands would occur if future development resulted in direct removal, fill (which essentially means placing dirt into), hydrological interruption or other disturbance to these resources. Such effects are often associated with clearing and grubbing, grading, paving and building for new development, redevelopment and construction of roads, flood control projects and other infrastructure.

For this analysis, areas with the potential to support federally protected wetlands were approximated by juxtaposing regional vegetation maps for Riverside County against the proposed foreseeable spatial changes associated with GPA No. 960 (as described more fully in Section 3.0). The analysis was not limited to areas where federally protected wetlands are known to occur but, rather, a wide range of riparian habitats were included. As such, this represents a conservative (or worst-case) estimate of potential impacts to federally defined wetlands. Actual impacts can only be determined through specific site surveys and project-level information, particularly jurisdictional delineation as per Corps standards.

Table 4.8-N identifies the estimated acreage of impacts to habitats likely to support federally protected wetlands within Riverside County. The analysis indicates that approximately *471,400* ~~470,800~~ acres of (broadly defined) wetlands occur in unincorporated Riverside County. *Countywide, it is estimated that the project would potentially adversely affect around 5,000 acres of wetlands.* Of this *project* total, approximately *3,910* ~~3,210~~ acres (*9%* ~~0.7%~~) fall within ~~areas of~~ western Riverside County, *430* ~~470~~ acres (*0.4%* ~~0.1%~~) are in Coachella Valley and 660 acres (*0.2%* ~~0.1%~~) are within the non-MSHCP areas of the county. Future development accommodated by GPA No. 960 may occur on*,* ~~or~~ near *or within the watershed of* any of these riparian habitats. Conservatively assuming all qualify as federally protected wetlands, *the 5,000-acre* ~~a~~ total *that* ~~of roughly 4,340 acres (less than 1.0%)~~ may be assumed to be directly affected as a result of the proposed project *represents roughly 1% of the wetlands in Riverside County*.

Determination of specific locations and acreages actually affected would have to be performed at the implementation stage as future development proposals are submitted to the County of Riverside. Where subsequently determined to occur, impacts to federally protected wetlands would be addressed as per the programmatic measures outlined herein. Such measures would include compliance with County of Riverside programs, state and federal regulations, General Plan policies and CEQA specific mitigation measures, as outlined below. Adherence to these measures shall ensure that wetlands are not adversely affected by future implementing project development. Thus, impacts to federally protected wetlands would be less than significant.

2. Regulatory Compliance for Impact 4.8.C

As detailed below, compliance with the following existing laws, regulatory programs, General Plan policies would lessen adverse effects to federally protected wetlands.

a. Compliance with Federal, State and County Regulations

Several federal, state and local regulations would reduce impacts related to substantial adverse effects on federally protected wetlands. All of which are summarized below:

Federal Clean Water Act: Where they meet Corps guidelines, many wetland communities (e.g., freshwater marshes, riparian forests, riparian woodlands, open water, flood channels, rivers and streambeds) within western Riverside County would be subject to the federal Clean Water Act (Sections 401, 402 and 404) as regulated by federal agencies. Projects proposing to affect federally protected wetlands would be required to obtain a Section 404 permit prior to grading. This applies to sites both within and outside of the MSHCP coverage areas. The Corps shall also continue to consult with the USFWS pursuant to Section 7 of the FESA on projects that may affect federally listed species within Corps jurisdictional wetlands or waters or potentially affected by the Corps issuance of a Section 404 permit. Since Corps permits must ensure no net loss of riparian habitat and preservation of biological function and value of any jurisdictional waters on site, compliance with Corps Section 404 requirements would ensure that no wetlands are significantly affected.

California Fish and Game Code Sections 1600-1603: Many wetland communities within Riverside County include areas subject to California Fish and Game Code Section 1600 *et seq*., as regulated by the CDFW. Streams and rivers are defined by the presence of a channel bed and banks, and intermittent flow. The limits of CDFW jurisdiction are also based on riparian habitat and may include wetland areas that do not meet Corps wetland criteria due to soils or hydrology (e.g., where riparian woodland canopy extends beyond the banks of a stream away from frequently saturated soils). Thus, development sites with riparian habitat or drainages present would have to be delineated as part of the Riverside County project development process. Where affected by a proposed development, a streambed/bank alteration agreement must be obtained from the CDFW prior to grading. The CDFW shall continue to work closely with the Corps, USFWS and the County of Riverside to

ensure that the Fish and Game Code Section 1600 agreements are designed to fully mitigate impacts to wetlands. The County of Riverside would also ensure that any permits needed are consistent with the mitigation required by the WRC-MSHCP or the CV-MSHCP.

Western Riverside County Multiple Species Habitat Conservation Plan (WRC-MSHCP): As indicated previously, the WRC-MSHCP serves as a comprehensive, multi-jurisdictional habitat conservation plan, pursuant to FESA Section (a)(1)(B) and as a Natural Communities Conservation Plan (NCCP) under the State NCCP Act. The MSHCP identifies the requisite studies and land use considerations necessary to protect riparian areas within western Riverside County and outside of the criteria cells that contribute to the function and value of the reserve system and the sensitive habitats conserved therein. Pursuant to Section 6.1.2 of the WRC-MSHCP, proposed projects require assessment of potentially significant effects on any riparian/riverine areas or vernal pools. The assessment must be performed per County of Riverside, MSHCP, CDFW and Corps standards, then be provided to and reviewed by a Riverside County biologist.

Where not included in a WRC-MSHCP Conservation Area, applicable requirements (which may include federal and state regulations) shall be imposed by the County of Riverside. As part of MSHCP compliance, the County of Riverside first looks to avoid, or at least minimize, direct and indirect effects to the mapped wetlands. If avoidance is feasible, then measures are incorporated into the project design to ensure the long-term conservation of the areas to be avoided. If avoidance is not feasible, a practicable alternative that minimizes direct and indirect effects to riparian/riverine areas and vernal pools and their associated functions and values to the greatest extent possible is selected. Additionally, Section 6.1.4 of the WRC-MSHCP sets forth a range of measures to eliminate, reduce or minimize edge effects associated with the interface between development and the natural environment. These also aid in reducing indirect impacts to wetlands.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan lessen substantial adverse effects on federally protected wetlands. See Section 4.8.3.D for the full text of each of these policies.

Policy LU 9.2: This policy would help prevent impacts to riparian and other sensitive habitats by requiring developments to comply with federal and State regulations pertaining to federally protected wetlands.

Policy OS 5.1: By allowing channelization of floodways only as a last resort, this policy would ensure that federally protected wetlands are allowed to persist rather than be lost due to development impacts.

Policy OS 5.6: By requiring that upland habitat areas be identified and conserved to the maximum extent possible, this policy would protect the ongoing habitat function and value of federally protected wetlands allowing them to persist rather than be lost due to permanent development impacts.

Policy OS 6.1: By requiring compliance with the Clean Water Act's Section 404 process, this policy would assure no net loss of federally protected wetlands.

Policy OS 6.2: By requiring preservation of buffer zones around wetlands, this policy would assure that additional habitat is conserved and that potential edge effects to federally protected wetlands were reduced.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan would also help to lessen adverse effects to federally protected wetlands. See Section 4.8.3.D for the full text of each of these policies.

Policy LU 7.7: By requiring buffers between development and watercourses, including their associated habitat, this policy would ensure that federally protected wetlands and their associated habitat(s) are allowed to persist rather than be lost to permanent development impacts.

Policy LU 9.1: By requiring that development provide for the preservation of open space that contain natural resources including arroyos and canyons, this policy would see that sensitive riparian and upland habitats which contribute to federally protected wetlands are allowed to persist rather than be lost due to permanent development impacts.

Policy OS 5.2: By requiring that modifications to floodways be designed to reduce adverse environmental effects, this policy would ensure that more floodways within the county are designed to conserve federally protected wetlands.

Policy OS 5.5: Requiring that development preserve and enhance existing riparian habitat and prevent obstruction of natural watercourses, this policy would ensure the function and value of federally protected wetlands.

Policy OS 17.1, 17.2 and 18.1: By specifying that the provisions of applicable MSHCPs are enforced in the course of County land use review, review of legislative actions, planning of transportation or infrastructure projects, etc., these policies codify the local conservation measures developed for MSHCP-protected wetland resources throughout western Riverside County.

Policy OS 18.3: By prohibiting the planting or introduction of invasive, non-native species to watercourses, riparian areas and their buffers, this policy would minimize edge effects to wetlands.

Policy OS 18.4: By establishing specific standards for management of watercourses on private conservation easements, this policy would institute clear expectations concerning the elimination of edge effects, preservation of wildlife movement, minimization of fuel modification areas and identification of a permanent management entity.

3. Additional Project-Specific Mitigation for Impact 4.8.C

Despite all of the above measures to lessen adverse effects on federally protected wetlands, additional project–specific mitigation measures would be necessary to further avoid, reduce or minimize impacts. Toward this end, two new CEQA-specific measures are proposed. New Mitigation Measure 4.8C-N1 would ensure that, in areas of Riverside County not already regulated by the WRC-MSHCP, a jurisdictional assessment is performed to determine if a project site may support federally protected wetlands and, where impacts to such wetlands are unavoidable, require a 404 permit to be obtained from the ACOE. Similarly, new Mitigation Measure 4.8C-N2 would address state protected wetlands pursuant to CFGC Section 1600 *et seq.*

NEW **Mitigation Measure 4.8.C-N1:** If site conditions (for example, topography, soils, vegetation, etc.) indicate that the proposed project could affect riparian/riverine areas or federally protected wetlands as defined by Section 404 of the CWA, then an appropriate assessment shall be prepared by a qualified professional as part of Riverside County's project review process. An assessment shall include, but not be limited to, identification

and mapping of any wetland(s) or riparian resources present; evaluation of plant species composition, topography and hydrology; a soils analysis (where appropriate) and conclusions stating the presence or absence of jurisdictional wetlands. An assessment shall be completed as part of the CEQA review for the development proposal.

Should any grading or construction be proposed within or alongside the banks of the watercourse or wetland, the land divider/permit holder shall provide written notification to the Riverside County Planning Department that the alteration of any watercourse or wetland, located either on site or on any required offsite improvement areas, complies with the U.S. Army Corp of Engineers Nationwide Permit Conditions. Or, the land divider shall obtain a permit under Section 404 of the Clean Water Act. Copies of any agreements shall be submitted along with the notification.

NEW **Mitigation Measure 4.8.C-N2:** If site conditions (for example, topography, soils, vegetation, etc.) indicate that the proposed project could affect riparian/riverine areas or federally protected wetlands as defined by CFGC section 1600 *et seq*., then an appropriate assessment shall be prepared by a qualified professional as part of Riverside County's project review process. An assessment shall include, but not be limited to, identification and mapping of any wetland(s) or riparian resources present; evaluation of plant species composition, topography and hydrology; a soils analysis (where appropriate) and conclusions stating the presence or absence of jurisdictional wetlands. An assessment shall be completed as part of the CEQA review for the development proposal.

Should any grading or construction be proposed within or along the banks of any natural watercourse or wetland located either on site or on any required offsite improvement areas, the land divider/permit holder shall provide written notification to the Riverside County Planning Department that the appropriate California Department of Fish and Game Wildlife notification pursuant to Sections 1601/1603 of the California Fish and Game Code has taken place. Or, the land divider shall obtain an "Agreement Regarding Proposed Stream or Lake Alteration" (Section 1601/1603 Permit). Copies of any agreements shall be submitted along with the notification.

4. Finding on Significance of Impact 4.8.C

For the reasons presented above, implementation and compliance with the above-listed existing regulations and General Plan policies as well as new Mitigation Measures 4.8.C-N1 and 4.8.C-N2, would ensure that development accommodated by GPA No. 960 would have less than significant impacts on federally protected wetlands. Additionally, the imposition of other proposed/revised General Plan policies discussed above would further reduce this insignificant impact.

D. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Impact 4.8.D – Impede Species Movement, Migration, Wildlife Corridors or Use of Wildlife Nursery Sites: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in the county, adversely affecting movement, migration, wildlife corridors and the use of native wildlife nursery sites. Compliance with existing laws, regulatory programs and General Plan policies, as well as new project-specific Mitigation Measures 4.8.B-N1 and 4.8.D-N1, would ensure that this impact is less than significant.

1. Analysis of Impact 4.8.D

Future development accommodated by GPA No. 960 would result in creation of new barriers to animal movement in the urbanizing portions of the county, namely western Riverside County and Coachella Valley; however, impacts to wildlife movement would be mitigated through the establishment of corridors and linkaes established by the WRC-MSHCP and the CV-MSHCP, as described below. Within the non-MSHCP areas, particularly the easternmost third of the county, future development would be scattered and of lower densities. As a result, no significant interference with wildlife movement, corridors or nursery sites is expected within the non-MSHCP areas.

As part of the WRC-MSHCP, a system of corridors and linkages has been established to accommodate wildlife movement within the open areas of western Riverside County. The plan includes 20 core areas and 10 noncontiguous habitat blocks linked together by 19 linkages and 29 constrained linkages. These are described more fully within the WRC-MSHCP, Section 3.2.3: Cores and Linkages within the MSHCP Conservation Area. Additionally, the Clarifications and Corrections to the MSHCP (May 2004) and the plan's USFWS Biological Opinion (June 2004) incorporate two additional Special Linkages into the WRC-MSHCP. The Pass Area Plan Special Linkage is located in the northeast plan area and connects the San Jacinto Mountains to the San Bernardino Mountains via San Gorgonio Wash. The Southwest Area Plan Special Linkage connects the area between the Santa Margarita Ecological Reserve and the Pechanga Indian Reservation.

In the Coachella Valley, the CV-MSHCP establishes conservation areas and articulates objectives and measures for the preservation of core habitat and the biological corridors and linkages needed to maintain essential ecological processes within the plan area. For example, one biological corridor with two undercrossings is identified for the Stubbe Canyon Wash under Interstate 10, two corridors are located at Whitewater and San Gorgonio Rivers under Highway 111, a linkage and a corridor are identified for the Whitewater River area under Interstate 10, another biological corridor exists at Mission Creek under Highway 62, two are located at Mission Creek and Willow Wash under Interstate 10 and there are five biological corridors within the Desert Tortoise Linkage Conservation Area under Interstate 10.

While none of the corridors and linkages within the WRC-MSHCP or the CV-MSHCP is mapped at a resolution that would allow a spatial analysis of the potential effects of GPA No. 960, intensified development in these areas would have the potential to result in direct or indirect impacts. Direct impacts to wildlife movement corridors generally occur from blockage or interference with the connectivity between blocks of habitat, a decrease in the width of a corridor or linkage that constrains movement, or the loss of visual continuity within a linkage or corridor. Even when not directly constrained by development, corridors are also vulnerable to edge effects and human encroachment as well. Nonetheless, sufficient programs are in place within both MSHCPs that would prevent substantial interference with wildlife movement and corridors. With the corridor conservation measures, edge effect controls and other components of the two plans to ensure protection, provisions of the WRC and CV MSHCPs would ensure that future development within western Riverside County and the Coachella Valley does not substantially interfere with wildlife movement or corridors.

Official corridor and linkage designations have not been established for the non-MSHCP areas. However, only two spatially identifiable sites exist at which GPA No. 960 would propose land use modifications. Each site is located in the East County – Desert Area Plan and is described in Section 3.0 of this EIR. The first site is a 4.8-acre private holding located within the Joshua Tree National Park. GPA No. 960 proposes to change the existing land use designation (which was applied in error in 2003) from OS-CH to OS-RUR. The net allowable land use would be one residence per 20 acres. The second site consists of land use changes required by the ALUC near the Blythe Airport and encompasses approximately 443 acres within the Palo Verde Valley Area Plan. GPA changes to this area include updated text, tables and figures to more accurately represent airport compatibility

zones and the airport influence area. Because of the densities involved, neither of these two GPA No. 960 changes would interfere substantially with the movement of native resident or migratory wildlife species or with established native resident or migratory wildlife corridors. Impacts are considered less than significant.

Wildlife nursery sites include areas that provide the resources necessary for reproduction of a species, including foraging habitat, breeding habitat and water sources. Direct impacts to nursery sites from implementation of GPA No. 960 would include removal of habitat for development and infrastructure. Indirect impacts to nursery sites would have the potential to result from noise, lighting and changes in drainage patterns, introduction of pests or domestic animals and other edge effects. These impacts can substantially interfere with native wildlife nursery sites. Determining whether or not a specific area is a nursery site requires field surveys, which are often only valid for a given breeding season depending on the wildlife species present. Although a literature search failed to uncover any published data to indicate the presence of wildlife nursery sites within Riverside County, it is nonetheless expected that such sites exist. Therefore, it is reasonably foreseeable that future development accommodated by GPA No. 960 could have the potential to directly or indirectly affect nursery sites.

In their role as natural community conservation plans, the WRC-MSHCP and the CV-MSHCP were required by State and federal permitting authorities to provide for the movement of species, protect wildlife corridors and facilitate genetic flow. The MSHCPs protect native wildlife nursery sites by conserving large blocks of representative native habitats suitable for supporting species' lifecycle requirements and the essential ecological processes of species which depend on such habitats. The EIR for the WRC-MSHCP concluded that the plan provides for the movement of species through established wildlife corridors and protects the use of native wildlife nursery sites. Thus, through the protections afforded by the WRC and CV MSHCPs, future development accommodated by GPA No. 960 would have a less than significant impact on the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or the use of native wildlife nursery sites within western Riverside County and the Coachella Valley. Within the non-MSHCP areas, the low density/intensities proposed and large amounts of open space would serve to limit potential impacts to less than significant.

2. Regulatory Compliance for Impact 4.8.D

As detailed below, compliance with the following existing laws, regulatory programs and General Plan policies would lessen significant impacts to species movement, migration, wildlife corridors and use of native wildlife nursery sites.

a. Compliance with Federal, State and County Regulations

Compliance with the following State, federal and County regulations would lessen significant impacts to species movement, migration, wildlife corridors and use of native wildlife nursery sites.

Federal Endangered Species Act: As indicated previously, HCPs are required for projects which impact listed and non-listed species. An HCP is a plan which outlines ways of maintaining, enhancing and protecting a given habitat type needed to protect species. The plan includes measures to minimize impacts and provisions for permanently protecting land, restoring habitat and relocating plants or animals to another area. HCP's may capture habitat(s) that support the lifecycle of the species in question and therefore may provide protections for native nursery sites, corridors and linkages. An HCP is required before an incidental take permit may be issued.

Migratory Bird Treaty Act: As noted previously, the WRC-MSHCP and CV-MSHCP take permits constitute Special Purpose Permits pursuant to the MBTA. Specifically, the biological opinion for the WRC-MSHCP

stipulates that covered activities must comply with the MBTA and clearing of habitat be avoided during the active breeding season within the Criteria Areas and Public/Quasi Public Lands. For purposes of the MSHCP, the breeding season is defined as March 1 to June 30.

The biological opinion issued for the CV-MSHCP indicates that take of covered species listed under FESA which are also MBTA species is subject to the terms and conditions specified in the CV-MSHCP section 10(a) Permit. Any such take does not violate the MBTA. For other birds protected by the MBTA and not listed under the FESA, no take is authorized under the MBTA (including killing and wounding of any such birds, or take of eggs and active nests). For these, standard MBTA compliance measures would be required.

Federal Clean Water Act: Under section 404 of the CWA, the Corps has jurisdiction over wetlands and waters of the United States. A section 404 permit is required for those activities that could discharge fill or dredge materials or otherwise adversely modify wetlands or other waters of the United States and associated habitat. Such permits are authorized by Corps and typically contain mitigation to offset unavoidable impacts to wetlands and other waters of the United States in a manner that achieves no net loss of wetland acres or values. Streams and rivers are often utilized as wildlife corridors and linkage areas.

California Endangered Species Act (Fish and Game Code 2050 *et seq*.): Should state threatened or endangered species be found on a future development site, take authorization from the CDFG would be required for any unavoidable impact to a State-listed species. The CDFG may authorize incidental take to endangered species, threatened species and candidate species. For western Riverside County and the Coachella Valley, the WRC-MSHCP and the CV-MSHCP received state take authorizations pursuant to the NCCPA and allow for the issuance of such take at the local level by permittees, such as the County of Riverside.

Natural Community Conservation Planning Act: As noted previously, both the WRC-MSHCP and the CV-MSHCP are NCCPs. As such, they provide for the conservation of species and the natural communities on which they depend for their life-cycle needs. The WRC-MSHCP and the CV-MSHCP both allow for the issuance of take at the local level by permittees, including the County of Riverside, thereby streamlining the take authorization process on a project-by-project basis. Compliance with these requirements would ensure the regional wildlife corridors and movement areas identified in these two plans are adequately protected from future development.

California Fish and Game Code Sections 1600-1603: The CDFG, through provisions of the CFGC Sections 1600–1603, is empowered to issue agreements (Streambed Alteration Agreements) for projects that would "divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake" (CFGC Section 1602[a]). Streams and rivers are often utilized as wildlife corridors and linkage areas.

Western Riverside County Multiple Species Habitat Conservation Plan (WRC-MSHCP): The WRC-MSHCP is based on the concept of creating linkages (wildlife corridors) between core areas (reserves). The mechanism for creating the linkages is obtained through conservation within the Criteria Areas. As indicated in the above analysis, the plan is based on securing numerous corridors and linkages links between core reserves. Future development accommodated by GPA No. 960 would be subject to the provisions of the WRC-MSHCP, as described previously in Impact 4.8.B. Thus, compliance with the WRC-MSHCP would ensure the protection of wildlife corridors, movement areas and nursery sites within western Riverside County.

Coachella Valley MSHCP (CV-MSHCP): The CV-MSHCP is also based on the concept of creating linkages (wildlife corridors) between core areas (reserves). The mechanism for creating the linkages is obtained through

conservation within the Criteria Areas. The overall provisions for the plan are subdivided according to specific resource conservation goals organized by geographic areas defined as conservation areas. These areas are identified as Core, Essential or Other Conserved Habitat for sensitive plant, invertebrate, amphibian, reptile, bird and mammal species, plus Essential Ecological Process Areas and Biological Corridors and Linkages. Each conservation area has specific conservation objectives that must be satisfied. Future development accommodated by GPA No. 960 would be subject to the provisions of the CV-MSHCP as described previously in Impact 4.8.B. Thus, compliance with the CV-MSHCP would ensure the protection of wildlife corridors, movement areas and nursery sites within Coachella Valley.

Stephens' Kangaroo Rat Habitat Conservation Plan: The SKR HCP is based on the concept of maintaining adequate habitat for the long-term survival of the Stephens' kangaroo rat. The mechanism for maintaining such habitat is obtained through payment of a fee that is used by Riverside County to acquire and manage habitat suitable for the species. Compliance with this plan would protect the movement needs of this species.

b. Compliance with Existing Riverside County General Plan Policies

The following existing General Plan policies would lessen impacts to species movement, migration, wildlife corridors and use of native wildlife nursery sites. See Section 4.8.3.D for full text of each.

Policy C 20.9: This policy would ensure that all transportation plans and development proposals reflect specific requirements of the WRC-MSHCP and the CV-MSHCP.

Policy OS 5.1: By specifying that floodway channelization is only used as a last resort, the policy would ensure that sensitive species dependent upon riparian linkages are allowed to persist rather than be lost due to development.

Policy OS 5.6: By requiring that upland habitat areas be identified and conserved to the maximum extent possible, this policy would protect the ongoing habitat function and value of riparian linkages, retain sensitive foraging areas and allow riparian dependent populations to persist rather than be lost due to development.

Policy OS 6.2: By requiring preservation of buffer zones around wetlands, this policy would assure that additional habitat is conserved for protected species that rely on riparian habitats, that edge effects are minimized and that species mortality due to such edge effects are reduced.

Policy OS 9.3: By requiring the maintenance and conservation of superior examples of native trees, natural vegetation, stands of established trees and other features for ecosystem conservation purposes, this policy would ensure that the species that rely on such habitats would be protected.

Policy OS 9.4: By requiring the conservation of oak tree resources in Riverside County, this policy would ensure that no net loss of oaks occurs. Further, it would preserve nesting and foraging habitat essential to many protected bird species.

Policy OS 20.2: By preventing the unnecessary extension of public facilities and services and utilities into Open Space-Conservation areas, this policy would reduce the fragmentation of habitat essential to the survival of protected species.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan would lessen significant impacts to candidate, sensitive or special status species. See Section 4.8.3.D for the full text of each of these policies.

Policy OS 5.3: By requiring setbacks from floodway boundaries for wildlife movement corridors and linkages, this policy would ensure that sensitive species dependent upon riparian linkages are allowed to persist rather than lost due to development impacts.

Policies OS 17.1, 17.2 and 18.1: By specifying that the provisions of applicable MSHCPs must be enforced in the course of Riverside County land use review, review of legislative actions, planning of transportation or infrastructure projects, etc., these policies codify the local conservation measures developed for MSHCP-protected species throughout Riverside County.

Policy OS 18.3: By prohibiting the planting or introduction of invasive, non-native species to watercourses, riparian areas and their buffers, this policy would minimize edge effects and associated species mortality.

3. Additional Project-Specific Mitigation for Impact 4.8.D

Despite all of the above measures that lessen impacts to wildlife movement and nurseries, additional project-specific mitigation measures are necessary to further avoid, reduce or minimize impacts to ensure they are less than significant. Mitigation Measure 4.8.B-N1, as described previously under Impact 4.8.B, would lessen the impact by requiring a BRA to determine if a proposed project may contain sensitive or protected species or habitat for which additional assessment and/or mitigation would be necessary. Mitigation Measure 4.8.D-N1 (below) would lessen the impact by requiring a Riverside County ERS to make a determination if a wildlife nursery or corridor is essential to the long-term viability of a species and take steps to avoid or minimize project-specific effects to the resource. Implementation of these mitigation measures would ensure that project impacts to wildlife movement and nursery sites are mitigated to less than significant.

NEW **Mitigation Measure 4.8.D-N1:** Should a wildlife nursery site or native resident or migratory wildlife corridor be uncovered through a biological resources assessment (BRA), then a consultation with a Riverside County Ecological Resources Specialist (ERS) shall occur. The ERS shall make a determination if the site is essential for the long-term viability of the species. If such a determination is made, then the ERS shall work with the applicant to avoid the effects of development on the resource in question and condition the land use case accordingly. Should significant impacts to nursery site or corridor not be avoidable, project applicant shall be required to ensure the preservation of comparable nursery or corridor habitat offsite.

4. Findings on Significance of Impact 4.8.D

For the reasons presented above, implementation and compliance with the above-listed existing regulations, plans and General Plan policies, as well as new Mitigation Measures 4.8.B-N1 and 4.8.D-N1, would ensure that future development accommodated by the project, GPA No. 960, would have less than significant impacts on wildlife nurseries, species movement, migration and wildlife corridors.

E. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional or State habitat conservation plan?

Impact 4.8.E – Conflict with Adopted Habitat Conservation Plans: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, including areas covered by adopted HCPs, in particular the WRC-MSHCP and the CV-MSHCP. Compliance with the provisions of these MSHCPs would ensure that future development accommodated by GPA No. 960 is consistent with the plans and that this impact is less than significant.

1. Analysis of Impact 4.8.E:

As explained above, the WRC-MSCHP and the CV-MSHCP (also permitted as NCCPs) apply to land use activities within western Riverside County and the Coachella Valley. The MSHCPs are the cornerstones of Riverside County's General Plan Open Space and Conservation Element. As such, policies within the General Plan specifically require compliance with existing MSHCPs to ensure that that there are no conflicts with local biological resource protections. In addition, the SKR HCP remains in effect for the majority of western Riverside County. Although the reserve land is acquired for this HCP, a mitigation fee is still collected on new development to ensure the long-term maintenance and monitoring of the reserves. GPA No. 960 does not make any changes to how these HCPs are implemented nor does it change the steps required to comply with said HCPs.

Future development accommodated by GPA No. 960 would be required, through Riverside County-required conditions of approval, to comply with applicable fee ordinances relevant to the implementation of specific programs that protect biological resources thereby reinforcing compliance with applicable resource protection policies. For example, Riverside County Ordinance No. 663 requires development projects within the SKR HCP area to pay a development mitigation fee to establish the reserves, administer the plan and otherwise meet the requirements of the SKR HCP. Similarly, Riverside County Ordinances No. 810 and No. 875 require land use projects within the coverage areas of those plans to pay a development impact fee to establish reserves and implement the respective conservation plans.

Additional adopted HCPs are located within the County of Riverside but apply to other agency/ special district activities. Examples include the Southwest Riverside County MSHCP, the Lake Mathews MSHCP and the LCR-MSCP. None of these conservation plans would apply to future development accommodated by GPA No. 960 nor does GPA No. 960 appear to interfere with the conservation or preservation of existing lands within these HCPs nor interfere with future reserve assembly. For instance, the LCR MSCP extends over 400 miles of the lower Colorado River, includes areas of Blythe within the 100-year floodplain and addresses at least 26 species but the plan only covers activities related to water diversion and conveyance, electric power generation and transmission facilities and appurtenant works that support these facilities. Development accommodated by GPA No. 960 does not in fall within or adjacent to any conservation or refuge areas established by the LCR MSCP for Reach 4. However, ALUC land use changes described in Section 3.0 of this document may affect a small portion of the westerly reaches of the MSCP area within Blythe near the intersection of North Neighbors Boulevard and Interstate 10. As with the other two MSHCPs, any future development proposed within the LCR-MSCP's coverage area would be required through project conditions of approval to comply with the plan.

There are numerous federal and state regulations in place to ensure that adopted HCPs, NCCPs and other conservation plans are successful. The combination of local programs and conditions of approval requirements as well as federal and state programs, would ensure that conflicts with provisions of the adopted HCPs, NCCPs

and other approved habitat conservation plans in effect within unincorporated Riverside County are less than significant.

2. Regulatory Compliance for Impact 4.8.E

As detailed and explained below, compliance with the following existing laws, regulatory programs, ordinances and General Plan policies, would ensure that impacts to adopted HCPs, NCCPs and other approved habitat conservation plans as a result of GPA No. 960 are less than significant.

a. Compliance with Federal, State and County Regulations

Compliance with the following state, federal and county regulations would prevent significant impacts to adopted habitat conservation plans.

Migratory Bird Treaty Act: The biological opinion issued for the CV-MSHCP indicates that take of covered species listed under FESA which are also MBTA species is subject to the terms and conditions specified in the CV-MSHCP Section 10(a) Permit. Any such take does not violate the MBTA. For other birds protected by the MBTA and not listed under the FESA, no take is authorized under the MBTA (including killing and wounding of any such birds, or take of eggs and active nests). For these, standard MBTA compliance provisions would apply.

Natural Community Conservation Planning Act: Both the WRC-MSHCP and the CV-MSHCP are NCCPs. As such, they provide for the conservation of species and the natural communities on which they depend for their life-cycle needs. The WRC-MSHCP and the CV-MSHCP allow for the issuance of take at the local level by permittees, includes the County of Riverside, thereby streamlining the take authorization process on a project-by-project basis for impacts within western Riverside County and the Coachella Valley.

Western Riverside County Multiple Species Habitat Conservation Plan (WRC-MSHCP): Biological effects of development within western Riverside County would be mitigated to less than significant levels through compliance with the WRC-MSHCP. As detailed above, a number of Riverside County General Plan policies, as well as Ordinance No. 810 and standard project conditions of approval are required by the County of Riverside. Through implementation of these measures, future development compliance and consistency with the WRC-MSHCP would be assured.

Coachella Valley MSHCP (CV-MSHCP): Biological effects of development within Coachella Valley would be mitigated to less than significant levels through compliance with the CV-MSHCP. As detailed above, a number of Riverside County General Plan policies, as well as Ordinance No. 810 and standard project conditions of approval are required by the County of Riverside. Through implementation of these measures, future development compliance and consistency with the CV-MSHCP would be assured.

Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP): Effects on the Stephens' Kangaroo Rat of development within the boundaries of the SKR HCP would be mitigated to less than significant levels through compliance with the SKR-MSHCP. As detailed above, a number of Riverside County General Plan policies, as well as Ordinance No. 663 and standard project conditions of approval are required by the County of Riverside. Through implementation of these measures, future development compliance and consistency with the SKR-MSHCP would be assured.

b. Compliance with Existing Riverside County General Plan Policies

The following existing policies of the Riverside County General Plan, C 20.9, OS 5.1, 5.6, 6.2, 9.3, 9.4 and 20.2, would lessen conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional or state habitat conservation plan for the reasons previously indicated under Impact 4.8.B. See Section 4.8.3.D for full text of each policy.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new or revised policies of the Riverside County General Plan, OS 5.3, 17.1, 17.2, 18.1 and 18.3, would lessen conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional or state habitat conservation plan for the reasons previously indicated under Impact 4.8.B. See Section 4.8.3.D for full policy texts.

3. Findings on Significance of Impact 4.8.E

With implementation of the above-listed regulations, ordinances, plans and General Plan policies, GPA No. 960 would have less than significant impacts on the adopted HCPs, NCCPs in effect within unincorporated Riverside County and other approved local, regional or state habitat conservation plans.

F. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Impact 4.8.F – Conflict With Local Biological Resource Protection Policies or Ordinances: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County. In some locations this could result in conflicts with local policies and ordinances protecting biological resources, such as Riverside County's Oak Tree Management Guidelines, for example. Compliance with existing laws, regulatory programs, Riverside County Ordinance No. 559 and General Plan policies would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.8.F

Where future development accommodated by GPA No. 960 would affect protected biological resources, such as the Riverside County Oak Tree Management Guidelines, there is the potential for conflicts between growth and biological needs.

As presented in Table 4.8-M, in Section 4.8.5 above, future development accommodated by GPA No. 960 could affect approximately *5,300* ~~5,290~~ acres out of roughly *68,100* ~~59,830~~ acres of natural community associations known to support oak woodlands. Impacts to oaks occur primarily within the WRC-MSHCP area and represent approximately *8%* ~~8.8%~~ of the countywide oak woodland habitat. Oaks may be indirectly affected by construction activities if such activities are unable to avoid 100% of a tree's 'protected zone' and project-specific hydrological alterations that could affect long-term viability of oak resources. Conflicts with Riverside County's Oak Tree Management Guidelines would be eliminated, however, by project conditions of approval requiring compliance with the Guidelines wherever qualifying oak resources are found to occur (e.g., through a BRA, etc.).

With respect to prospective conflicts between this ordinance and future development, biological resource protection is also afforded by Riverside County Ordinance No. 559, which regulates the removal of trees. In

regards to trees and forest resources, as analyzed in Section 4.5 (Agriculture and Forestry), foreseeable components of GPA No. 960 include two sites with forestry resources. These sites total roughly 77 acres and are located in the San Jacinto Mountains. See Section 4.5.5.C for full details on these areas. To ensure compliance with Ordinance No. 559, all projects found (i.e., via a BRA, etc.) to have qualifying trees that would be removed as part of the project shall be required through conditions of approval to comply with this ordinance.

2. Regulatory Compliance for Impact 4.8.F

As detailed below, compliance with the following existing laws, regulatory programs and General Plan policies are sufficient to ensure that potential conflicts with local biological resources regulations as a result of GPA No. 960 would be less than significant.

a. Compliance with Federal, State and County Regulations

Compliance with the following state, federal and county regulations and guidelines would prevent potential conflicts with local biological resource regulations.

Riverside County Oak Tree Management Guidelines: Riverside County's Oak Tree Management Guidelines address the treatment of oak woodlands in order to reduce potential adverse development impacts to oak trees and their protected zones. By requiring applicants proposing developments on those sites where oak tree resources exist to provide biological studies, onsite vegetation inventories, mitigation and monitoring plans as wells as design plans that avoid oak trees and their protected zones when feasible, potential impacts to this biological resource would be reduced to less than significant levels. Although the majority of the plans that are consistent with the guidelines would reduce potential development impacts to less than significant levels, the guidelines do not exempt projects from CEQA. Compliance with the guidelines would also reduce potential conflicts with oak woodland protection policies and laws. Application of these management guidelines during the course of the normal development review and/or as a condition of approval would ensure that future development accommodated by GPA No. 960 does not conflict with Riverside County's Oak Tree Management Guidelines and that oaks are adequately protected.

Riverside County Ordinance No. 559 - Regulating the Removal of Trees: Ordinance No. 559 regulates the removal of native trees from lots that are at a minimum one-half acre in size and that are located above 5,000 feet in elevation in unincorporated Riverside County. The goal of the ordinance is to further ensure the preservation of Riverside County's timberlands. Applicants proposing the removal of those native trees that meet the ordinance's conditions would be required to file a separate application with the Planning Department for an approval, conditional approval or denial for the removal of trees. Application of this ordinance during the course of the normal development review process and/or through project conditions of approval would ensure that future development accommodated by GPA No. 960 does not conflict with local policy concerning timberlands management.

b. Compliance with Existing General Plan Policies

The following existing policies of the Riverside County General Plan would prevent significant conflicts with policies and regulations protecting biological resources such as oak trees and timberlands. See Section 4.8.3.D for the full text of each of these policies.

Policies OS 9.3 and 9.4: By providing for the maintenance and preservation of natural trees and vegetation, including oak trees, for ecosystem, aesthetic and water conservation purposes, these policies would reduce conflicts between development and oak trees and forest resources.

3. Finding on Significance of Impact 4.8.F

The analysis presented above indicates that future development accommodated by GPA No. 960 would have less than significant impacts due to inconsistencies with local policies and ordinances for biological resources. In addition, compliance with the above-listed existing regulatory programs and General Plan policies would further reduce or avoid this insignificant impact.

4.8.7 Significance After Mitigation for Biological Resources

Implementation of and compliance with the above regulations, Riverside County General Plan policies and project-specific mitigation measures would ensure that significant impacts to known biological resources, as described in Section 4.8.4, are either avoided or minimized to less than significant. Specifically, compliance with existing laws and policies, as well as project-specific Mitigation Measures 4.8.A-N1, 4.8.A-N2, 4.8.B-N1, 4.8.C-N1, 4.8.C-N2 and 4.8.D-N1 would ensure that significant biological resources are appropriately identified and protected. Lastly, the General Plan policies and mitigation measures presented herein would ensure that the biological impacts of future development accommodated by GPA No. 960 are minimized and that they do not conflict with local biological resources policies or habitat conservation plans. Together these measures ensure that any significant adverse impacts to biological resources resulting from future development accommodated by GPA No. 960 would be mitigated to below the level of significance.

Section 4.9

Cultural and Paleontological Resources

Section 4.9
Cultural and Paleontological Resources

4.9.1 Introduction

This section assesses the potential impacts on cultural resources that could arise from disturbances and impacts resulting from development consistent with the proposed project, General Plan Amendment No. 960 (GPA No. 960). Cultural resources include areas, places, sites (particularly archeological sites), buildings, structures, objects, records, or manuscripts associated with history or prehistory. Some specific examples of cultural resources are pioneer homes, buildings, or old wagon roads; structures with unique architecture or designed by a notable architect; prehistoric Native American village sites; pioneering ethnic settlements; historic or prehistoric artifacts or objects, rock inscriptions, human burial sites; battlefields; railroad water towers; prehistoric trails; early mines or important historic industrial sites. Cultural resources may also include places that have historic or traditional associations or that are important for their natural resources. Cultural resources are important for scientific, historic and, at times religious, reasons to cultures, communities, groups and individuals.

Paleontological resources (evidence of past life forms and their biota) are valued for the information they yield about the history of the earth and its past ecological settings. Although not human-related, paleontological resources are also included in this section, as their impacts and mitigation requirements tend to be similar to that of archeological resources. On rare occasion, fossils have been found in archeological sites that have been modified by man, making them also artifacts.

4.9.2 Existing Setting - Cultural and Paleontological Resources

The cultural resource characteristics of Riverside County reflect patterns of human settlement, human use of the land and its resources, the artistic expressions on material culture and natural features, technologies and ideologies, as well as past environmental conditions. The existing paleontological setting reflects the paleontological record and related geology as they are currently known for Riverside County. This sub-section includes information summarized from Section 4.6 of the 1999 "Existing Setting Report" prepared for the 2003 RCIP General Plan.

A. Cultural / Ethnological Resources

The cultural history of Riverside County is divided into two general chronological units: prehistory and the historic time periods which include ethnohistoric information. "Prehistory" encompasses the period of earliest human activities prior to the keeping of written records and spans over 99% of the total extent of human society. Due to the lack of written sources for this period, archeological study is key to its understanding. In Southern

California, the prehistoric period refers only to Native American traditions, beginning with the settlement of the Southern California region at least 10,000 to 12,000 years ago and extending forward through time to initial Euro-American settlement in the late 18th century when the mission system was established, disrupting native life ways. Nearly a century later, between 1875 and 1891, at least ten Indian reservations were set aside in Riverside County and nearby vicinities. Most indigenous tribal people ~~natives~~ were moved to these reservations, further disrupting and largely ending, the persistence of traditional Native American life ways. The historic era began around 1774 with the exploratory expeditions of Juan Bautista de Anza and continued to 45 years before the present day, ~~(currently 1966)~~ as defined by CEQA.

1. Prehistory

Riverside County environmental conditions during the late Pleistocene and Holocence periods fostered an ecologically rich region for human settlement. This 14,000-year period of human occupation was marked by an overall trend toward increasing aridity and warmer temperatures, with some temporary reversals as well as periods of climatic stability. As environmental conditions changed, Native American populations adapted with modifications in settlement patterns, subsistence practices, social organization and technology.

Three primary geomorphic provinces are found in Riverside County: the Mojave Desert, the Colorado Desert and the Peninsular Ranges. The diverse prehistoric landscape and habitats of the internally drained basins and pluvial (landlocked) lakes of the Mojave Desert region, the fresh water lakes of the Colorado Desert and the prominent ranges of the Peninsular Range were used by ancient and indigenous groups of people, leaving a rich archeological heritage. The following artifacts and features are characteristic of the Prehistoric Period: ceramics, projectile points of many types, grinding implements (mortars and pestles, metates and manos), enigmatic cogstones, shell, bone, clay beads and pendants, evidence of big game hunting. Additional background information on these types of artifacts may be found in Section 4.7 of EIR No. 441, the EIR associated with the 2003 RCIP General Plan. The EIR No. 441 section also contains an extensive introduction to the cultural timelines associated with the Prehistoric Period.

Due to the thousands of years spanned by the Prehistoric Period, the impermanence of many indigenous material goods and the widely scattered and varying itinerant patterns of settlement, the prehistoric archeological record tends to be less clearly defined and more sporadically preserved than that of later eras. Nevertheless, a large number of prehistoric resources are known or expected to occur within Riverside County. When uncovered as a result of an archeological investigation or development activities, such resources are, at minimum, documented and entered into a statewide recording system (CHRIS, the California Historical Resources Information System). These records are archived and maintained by the Eastern Information Center (EIC) located at the University of California at Riverside (UCR), a branch of the California Office of Historical Preservation. Of these recorded sites within Riverside County, a few have been designated as federal, state and/or county cultural resources as shown in Table 4.9-A (Cultural Resources of Riverside County), below. A number of sites, however, are protected in the confidential archives of the EIC and are not publicly accessible to protect and preserve their scientific and cultural value.

2. Ethnohistory

The Ethnohistoric Period of Riverside County at the time of Euro-American contact was distinguished by eight distinct resident cultural groups of Native Americans: Cahuilla (primarily), Gabrielino, Juaneño, Luiseño, Quechan, Halichidhoma, Chemehuevi and Serrano. These groups occupied territories across Southern California generally as indicated in Figure 4.9.1 (Southern California Tribal Territories). It should be noted that territorial boundaries did change for some tribal groups throughout time. The majority of western Riverside County was

occupied by the Cahuilla who spoke a Cupan language within the Takic family of the Uto-Aztecan language stock. The western part of the county, in the vicinity of the Santa Ana Mountains fell within the territory of the Gabrielinos, Juaneños and Luiseños who also spoke Cupan languages. These three populations had territories that extended from the coast eastward and northeastward across the Santa Ana and Palomar mountains, encompassing Temescal Valley and Lake Elsinore, and extending toward the foothills of the San Jacinto and Santa Rosa Mountains.

Table 4.9-A: Cultural Resources of Riverside County[1]

	Cultural Resource	NRHP[1]	CSHL	CPHI	RCHL	Location	Theme[2]
Prehistoric Period (Before 1772)							
1	Andreas Canyons	X				Palm Springs, Riverside	AG, A/L,
2	Archeological Sites (CA-RIV-504 and CA-RIV-773)	X				Blythe, Riverside	ARC, A/L, IP
3	Blythe Intaglio	X				I-10 to Highway 95, 13 miles north of Blythe	EV, IP
4	Buttercup Farms Pictograph	X				Perris, Riverside	A/L, IP
5	Carved Rock		X		X	I-15 to Temescal Canyon road, view from road right of way	NA, IP
6	Coachella Valley Fish Traps	X			X	I-10 to Chuckawalla Valley Road, south to Corn Springs Road, 8 miles to campground	ARC, IP
7	Giant Desert Figures		X			On Highway 95, 16 miles North of Blythe	NA, A/L
8	Gus Lederer Site	X				Desert Center, Riverside	ARC, A/L, REL, IP
9	Hemet Maze Stone		~~X~~		X	From Hwy 74, go N 3.2 miles on California Ave to Maze Stone Park (site located Approx. 0.3 mile past gate), near Hemet.	IP
10	Indian Canyons				X	Take S. Palm Canyon from Hwy 11 to the Indian Canyons Toll Gate	NA
11	McCoy Spring Archeological Site	X				Blythe, Riverside	A/L, IP
12	Murrieta Creek Archeological Area	~~X~~				Temecula, Riverside	IP
13	North Chuckwalla Mountain Petroglyph District (CA-RIV 1383)	X				Desert Center, Riverside	IP
14	North Chuckwalla Mountain Quarry Dist.	X				Desert Center, Riverside	IP
15	Painted Rock		X		~~X~~	From Temescal Canyon Rd, east on Dawson Canyon Road, south along railroad track berm	NA, IP
16	Site of Indian Village of Pochea		X		~~X~~	Ramona Bowl, 27400 S Girard St, Hemet; plaque near restrooms.	NA, IP
17	Tahquitz Canyon	X				500 West Mesquite, Palm Springs	IP, AG, REL
Exploration Period (1772-1818)							
18	Coachella Valley Preserve				X	I-10 to Ramon, east to Thousand Palms Canyon Road, north to Thousand Palms Oasis	E/S
19	Site of De Anza Camp ~~and Crossing~~		X			S/Terwilliger on Coyote Cyn.	E/S
20	Site of De Anza Crossing of the Santa Ana River		X		X	Jurupa Heights; plaque located between clubhouse and #1 tee, Jurupa Hills Country Club Golf Course, 6161 Moraga Ave, Rubidoux.	E/S
21	Site of Indian Wells, Indian Wells			X	~~X~~	17 miles SE on SR111	W, E/S

Source: Riverside County, EIR No. 441, Section 4.7, 2003. California State Parks Office of Historic Preservation, Database and Guide to the Historic Landmarks of Riverside County, accessed October 2014.

The eastern part of Riverside County was strongly influenced by the presence of the Colorado River. Three indigenous cultures were present in this area at the time of Euro-American contact: the Halchidhoma, Quechan and Chemehuevi. The first two spoke languages belonging to the Colorado Branch of the Yuman family of the Hokan language stock. The Chemehuevi spoke a language belonging to the Numic family of the Uto-Aztecan language stock. Except for the Washo, Numic languages were the only ones spoken throughout the Great Basin at the time of Euro-American contact. Directly north of the Cahuilla, the Serrano occupied a large territory that encompassed much of San Bernardino County, edging southward into Riverside County. The Serrano spoke a language classified within the Serran group of the Takic family of the Uto-Aztecan language stock. See Section 4.7 of EIR No. 441 for further background on these ethnological groups and cultures.

As with the Prehistoric Period, a large number of ethnohistorical resources are also known or expected to occur within Riverside County. When uncovered as a result of an archeological investigation, such resources are, at minimum, documented and entered into the statewide recording system maintained by the EIC. In many cases, when artifacts can be tied to a specific cultural group, such as a Tribe or Band, they may be returned to that tribe for final disposition, if they are not curated. Of the known ethnohistorical sites that occur within Riverside County, a few have been listed for special protections, as shown in Table 4.9-A and depicted in Figure 4.9.2 (Historical Resources). The locations of most sites, however, are not publicly available to protect them from disturbance and preserve their scientific and cultural values.

B. Historical Era

As generally defined and used in archeology, the advent of written documentation of events separates the Historic Era from the Prehistoric Period. In Riverside County, the Historic Era is generally said to begin around 1772, with the European exploration of the western coasts of North America. Key events associated with the Historic Era include: first European contact with Southern California (1772-1818); establishment and proliferation of the Spanish missions (1769-1833); Mexican overthrow of Spanish rule in 1821, followed by the Rancho Period as Mission control ceded to private land ownership; the Treaty of Guadalupe Hidalgo, which ended the Mexican-American War in 1848 and lead to California becoming a U.S. territory; the early Californian Period, around 1850 when California officially entered the Union as a free state; the growth period following statehood, increasing pace after the 1865 end of the U.S. Civil War; expansion, settlement and development, particularly of transportation, agriculture and water infrastructure from about 1870 to 1920, including incorporation of the County of Riverside on May 9, 1873; and an additional wave of growth, particularly suburban, following World War II. Again, see EIR No. 441's Section 4.7 for additional details on the history of early California.

As with both the Prehistoric and Ethnohistoric Periods, a large number of cultural resources from the Historic Era are known or expected to occur within Riverside County. In general, the historical resources known to occur within Riverside County are better documented due to several variables that differ from the earlier eras. As settlement patterns became more and more fixed, systems of documentation became more regularized and increasingly preserved. Thus, there is a greater body of "historical record" from which historical resources may be ascertained, rediscovered and documented. Also, the modern era has seen the development of a greater ethos of preservation, in which a historical (or prehistorical) resource is recognized as having informational value in its own right. As a result, many more sites have been documented and preserved when identified. And, of course, many historic structures and sites dating from only the last century or so are extant (still standing), with many buildings still being used.

Starting in the 1930s, the preservation of historical (and prehistorical/archeological) resources became systemized through a number of state and federal regulations (as described below). Once a resource is "listed" pursuant to one of these regulations, it becomes subject to various levels of additional protection to help preserve the resource for the enjoyment and use of future generations. Thus, Table 4.9-A provides a catalog of the various cultural resources that have been listed within Riverside County. In many cases, the resource is located within a city.

Because of the vast size of Riverside County, Table 4.9-A only includes known listed sites/resources within the county recognized at the various level indicated and should not be considered exhaustive or exclusive. In particular, the potential exists for sites in the county to have previously unknown archeological and historical resources present either on the surface or below ground.

1. Archeological Sensitivity

As mentioned above, it is expected that a large number of archeological and historical resources occur within Riverside County that are currently undiscovered or unknown. This is particularly true for resources that are located below the ground's surface. For sub-surface resources, discovery most often only occurs if the site is disturbed, such as through archeological investigation, or as more commonly happens, when construction activities such as grading or trenching are initiated.

2. Paleontological Resources

Fossils, which are nonrenewable paleontological resources, are important for dating sedimentary rocks and thus determining the time of movement of faults against which those sediments lie. Eastern and western Riverside County have fossiliferous sediments that occur in various settings. In the western portion of Riverside County, fossils occur in sediments lying on the surface of crystalline bedrock or are deposited in or between the major fault zones. The eastern desert portions of Riverside County are marked by fault block mountains that contain older fossil-bearing sediments with younger fossil-containing deposits found around dry lakes, along high stands of the Salton Sea and in terraces left by the Colorado River. The geological eras represented by the fossil records found in Riverside County are briefly summarized as follows, and as shown in Table 4.9-B (Paleontological Resources by Age, Formation and Location), below.

C. Geological Layers

The oldest fossils in California are from the Proterozoic Age, dating to 900 million years ago. However, no fossils from this Age are currently known to occur in Riverside County. It is thought that in this portion of Southern California, fossils earlier than the Jurassic Period may have been destroyed by the natural processes of metamorphism (geological changes in the rocks and soils). The oldest fossils actually found in Riverside County date from the Late Jurassic Period (150 million years ago). By the Late Cretaceous Period, at the end of the Age of Dinosaurs, fossils found include ammonites, clams and giant oysters.

The Cenozoic Era, the Age of Mammals, is divided into the Tertiary Period (65 million years to 2 million years) and the Quaternary Period, which includes the Pleistocene (2 million years to 10 thousand years) and the Holocene (10,000 years ago to present). The Tertiary Period records depositional events where continental sediments mixed with marine sediments. These important fluctuations in sea level are recorded in the Elsinore Fault Zone in western Riverside County and in the Salton Trough in eastern Riverside County. Riverside County has yielded notable finds of large fossils from the Tertiary Period including whales, sharks, primitive elephants and oreodonts, camels and horses.

During the Quaternary Epoch, Riverside County was affected by increased Pleistocene rainfall which filled basins and fault zones and turned depressions into lakes. The influx of new sediment buried remains of large and small animals. Deposition of fossiliferous sediment occurred along the margins of the Salton Sea and along the Colorado River. The climate changed drastically ten thousand years ago from the end of the wet Pleistocene to the very dry Holocene. The record of changing plants and animals is preserved as mummified samples in the nests built by pack rats.

D. Fossil Record

Riverside County has an extensive record of fossil life. Key resources known to occur in Riverside County are listed in Table 4.9-B, below. The record starts in Jurassic times, 150 million years ago, with diverse marine mollusks. The oldest Tertiary flora in Southern California is found east of Lake Elsinore and dates to around 60 million years ago. Fossils of 23 million-year-old oreodonts and camels, as well as camel tracks, were found in the Orocopia Mountains in central Riverside County.

Marine advances are recorded in Corona and the Salton Trough. Marine sandstones of the Imperial Formation in the Salton Trough are found as far northwest as Cabazon. Three million years ago, near the present Interstate 15/Highway 91 interchange, a white sand beach lapped at the edge of the Pacific Ocean. The subsequent Ice Ages left fossils of giant sloths, mammoths, camels and bison that were preyed upon by giant bear, American lion and sabercats.

Table 4.9-B: Paleontological Resources by Age, Formation and Location

Era	Western Riverside County	Central Riverside County	Eastern Riverside County
Mesozoic Era: The Age of Dinosaurs			
Jurassic Period - 150 million years ago	The Bedford Canyon Formation in western Riverside County has been dated by a distinctive fauna of ammonites, brachiopods and mollusks as Late Jurassic in age.		
Late Cretaceous Period - 75 million years ago	The Ladd Formation contains Holz Shale which has yielded large ammonites and giant clams distinctive to that time period. Dinosaurs have not yet been found in Riverside County, but are likely to occur in this unit, which encompasses the Santa Ana Mountains. Hadrosaur bones from a duck bill dinosaur have been found in nearby Santiago Canyon in Orange County.		
Cenozoic Era: The Age of Mammals			
General	Western Riverside County has a long Tertiary record of marine advances and retreats. The fossiliferous marine sediments interfinger with sediments from the continent which contain land mammals. This record spans from 65 million years to 2 million years ago.	The fossils in central Riverside County are located on the bedrock isthmus between troughs of marine advances in western and eastern Riverside County. In part, the marine advances were simultaneous and only 40 miles apart.	The Tertiary record of eastern Riverside County includes Eocene marine fossils and the earliest record of Miocene land mammals in Riverside County. Deposition of late Miocene and early Pliocene marine sediments and their fossils have separate histories in the San Jacinto and San Andreas Fault Zones and along the Colorado River.
Paleocene Epoch- 65 to 55 million years ago	The Martinez Formation, marine and non-marine siltstone, sandstone and coal north of Lake Elsinore, contains Riverside County's oldest known fossil flora. The Silverado Formation in southwestern Riverside County and Temescal Canyon consists of non-marine silty sands that grade upward into marine sediments containing diverse molluscan fauna.		
Eocene Epoch - 55 to 34 million years ago	The Santiago Formation crops out in Santa Ana Canyon. The marine and non-marine sandstone contains abundant marine mollusks.		The Orocopia Mountains contain marine clams, snails and foraminifera. The Andreas Fault has caused these sediments to move 200 miles away from their counterparts in the Tejon Pass.

1. Paleontological Sensitivity

Figure 4.9.3 (Paleontological Sensitivity) identifies the sensitivity of lands within Riverside County in relation to the potential for finding paleontological resources. The Paleontological Sensitivity map classifies lands into the

categories below. It should be noted that the map does not substitute for site-specific investigations, as deemed necessary.

a. Low Potential

Lands for which previous field surveys and documentation demonstrate as having a low potential for containing significant paleontological resources subject to adverse impacts. The mapping of low potential was determined based on actual documentation and was not generalized to cover all areas of a particular rock unit on a geologic map.

It must be noted that surface geology, such as soils, are not always indicative of subsurface geology or the potential for paleontological resources. For instance, an area mapped as soil type "Qal" may actually be a thin surficial layer of non-fossiliferous sediments which covers fossil-rich Pleistocene sediments. Also, an area mapped as granite may be covered by a Pleistocene soil horizon that contains fossils. Thus, actual sensitivity must be ultimately determined by both a records search and a field inspection by a paleontologist.

b. Undetermined Potential

Areas underlain by sedimentary rocks for which literature or unpublished studies are not available have undetermined potential for containing significant paleontological resources. These areas need to be inspected by a qualified vertebrate paleontologist before a specific determination of high potential or low potential can be assigned.

c. High Potential

Sedimentary rock units with high potential for containing significant non-renewable paleontological resources include rock units in which vertebrate or significant invertebrate fossils have been found or determined likely to be present. These units include, but are not limited to, sedimentary formations which contain significant non-renewable paleontological resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. High sensitivity includes not only the potential for yielding abundant vertebrate fossils, but also for production of a few significant fossils that may provide new and significant data. High sensitivity areas are mapped as either "High A" or "High B," according to the following criteria:

High Sensitivity A: High A is based on geologic formations or mapped rock units that are known to contain or have the correct age and depositional conditions to contain significant paleontological resources. These include rocks of Silurian or Devonian age and younger that have potential to contain remains of fossil fish, and Mesozoic and Cenozoic rocks that contain fossilized body elements and trace fossils such as tracks, nests and eggs.

High Sensitivity B: High B is a sensitivity equivalent to High A, but is based on the occurrence of fossils at a specified depth below the surface. This category indicates fossils that are likely to be encountered at or below 4 feet of depth and may be impacted during construction activities.

RIVERSIDE COUNTY PLANNING DEPARTMENT

PALEONTOLOGICAL SENSITIVITY

This page intentionally left blank

4.9.3 Policies and Regulations Addressing Cultural and Paleontological Resources

Existing cultural resources, including historical and archeological, and paleontological resources within Riverside County are protected through a wide variety of policies and regulations. The following existing federal and state policies and regulations are intended to ensure the preservation of cultural, historical and archeological resources in Riverside County:

Historic properties can consist of prehistoric or historic archeological resources. The National Register of Historic Places defines an archeological site as "the place or places where the remnants of a past culture survive in a physical context that allows for the interpretation of these remains." As outlined below, historic properties and resources are protected under a wide variety of policies and regulations. Additionally, cultural and paleontological resources are recognized as a non-renewable resource and require further analysis and mitigating protection under CEQA. There are also a number of laws and regulations designed to protect Native American interests in cultural resources, particularly human remains and associated funerary objects, which receive additional protection under Public Resources Code (PRC) Section 5097.98. The various state and federal regulations that deal with cultural and paleontological resources include the following:

A. Federal Regulations

National Historic Preservation Act: The National Historic Preservation Act (NHPA) was passed in 1966 and is codified in Title 16, Section 470 *et seq.* of the U.S. Code (USC). The goal of the Act is to ensure federal agencies act as responsible stewards of our nation's resources when their actions affect historic properties. Among the regulations of the NHPA, Section 106 requires federal agencies to take into account the effects of their undertakings on historic properties and afford the Advisory Council on Historic Properties (ACHP) a reasonable opportunity to comment. The historic preservation review process mandated by Section 106 is outlined in regulations issued by ACHP. See Title 36 Code of Federal Regulations (CFR) Part 800, "Protection of Historic Properties."

Section 106 applies when two thresholds are met: 1) there is a federal or federally-licensed action, including grants, licenses and permits, and 2) that action has the potential to affect properties listed in or eligible for listing in the National Register of Historic Places. Section 106 requires each federal agency to identify and assess the effects of its actions on historic resources. The responsible federal agency must consult with appropriate state and local officials, Indian Tribes, applicants for federal assistance and members of the public, and consider their views and concerns about historic preservation issues when making final project decisions. The agency should also plan to involve the public and identify any other potential consulting parties. If the agency determines that it has no undertaking or that its undertaking is a type of activity that has no potential to affect historic properties, the agency has no further Section 106 obligations.

Pursuant to Section 106, impacts to a cultural site or artifact must be declared "significant," "potentially significant" or "not significant." Under NHPA regulations, impacts to "significant" archeological sites must be mitigated for, while "not significant" archeological remains need not. A "potentially significant" determination is utilized when there is not enough information to make a conclusive ruling. NHPA mitigation would not be necessary for archeological sites avoided during development.

National Register of Historic Places (NRHP): Developed in 1981 pursuant to Title 36 CFR Section 60, the NRHP provides an authoritative guide to be used by federal, state and local governments, private groups and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment. It should be noted that the listing of a private property on the NRHP does not prohibit any actions which may otherwise be taken by the property owner with respect to the property. The listing of sites in California to the National Register is initiated through an application submitted to the State Office of Historical Preservation. Applications deemed suitable for potential consideration are handled by the State Historic Preservation Officer. All NRHP listings for sites in California are also automatically added to the California Register of Historical Resources by the State of California. The listing of a site on the NRHP does not generally result in any specific physical protection. Among other things, however, it does create an additional level of CEQA (and NEPA, the National Environmental Protection Act) review to be satisfied prior to the approval of any discretionary action occurring that might adversely affect the resource.

National Historic Landmarks Program: The National Historic Landmarks Program, developed in 1982 and as authorized by the Historic Site Act, identifies and designates National Historic Landmarks (NHLs) to "encourage the long-range preservation of nationally-significant properties that illustrate or commemorate the history and prehistory of the U.S." The program is administered by the Department of the Interior pursuant to 36 CFR Section 65.5. Unlike any of the other state or federal registries, sites listed on the NHL are explicitly preserved and protected from harm under federal law.

American Indian Religious Freedom Act: This Act became law in 1978 (Public Law 95-341, 42 USC 1996 and 1996a) in order to protect and preserve for American Indians their inherent right of freedom to believe, express and exercise their traditional religions. These religious rights extend to, but are not limited to, access to sites, use and possession of sacred objects and the freedom to worship through ceremonials and traditional rites.

Under this regulation, federal agencies and departments are charged with evaluating their policies and procedures in consultation with native traditional religious leaders in order to eliminate interference with the free exercise of native religion. Agencies must determine and make appropriate changes necessary to protect and preserve Native American religious cultural rights and practices, and to accommodate access to and use of religious sites "to the extent that the use is practicable and not inconsistent with an agency's essential functions." The intent is to protect Native Americans' First Amendment right to "free exercise" of religion.

Native American Graves Protection and Repatriation Act (NAGPRA): Enacted in 1990 under Title 25 USC Section 3001, NAGPRA describes the rights of Native American lineal descendants, Indian Tribes and Native Hawaiian organizations with respect to treatment, repatriation and disposition of Native American cultural items for which they can show a relationship of lineal descent or cultural affiliation. The statute also requires federal agencies and museums receiving federal funds to inventory holdings of Native American human remains and funerary objects and provide written summaries of other cultural items. In an attempt to recognize the religious and cultural significance of such sites and to protect their sacred integrity, it also provides for greater protection of Native American burial sites and more careful control over the removal of Native American human remains, funerary objects, sacred objects and items of cultural patrimony on federal and tribal lands.

Federal Antiquities Act: The federal Antiquities Act of 1906 was enacted with the primary goal of protecting cultural resources in the United States. As such, it explicitly prohibits appropriation, excavation, injury and destruction of "any historic or prehistoric ruin or monument, or any object of antiquity" located on lands owned or controlled by the federal government without permission of the Secretary of the federal department with jurisdiction. It also establishes criminal penalties, including fines and/or imprisonment, for these acts. Neither the Antiquities Act itself nor its implementing regulations (Title 43, CFR Part 3) specifically mentions paleontological resources. However, several federal agencies – including the National Park Service, the Bureau of

Land Management and the U.S. Forest Service – have interpreted objects of antiquity as including fossils. Consequently, the Antiquities Act also represents an early cornerstone for efforts to protect the nation's paleontological resources.

Paleontological Resources Preservation Act: The federal Paleontological Resources Preservation Act of 2002 (PRPA) was specifically intended to codify the generally accepted practice of limiting collection on public (federal) land of vertebrate fossils and other rare and scientifically significant fossils to qualified researchers who obtain a permit from the appropriate state or federal agency and agree to donate any materials recovered to recognized public institutions where they will remain accessible to the public and to other researchers.

Actions by the U.S. Army Corps of Engineers: Appendix C of Title 33 CFR Section 325 establishes procedures to be followed by the U.S. Army Corps of Engineers (ACOE) to fulfill the requirements of the National Historic Preservation Act (NHPA), as well as other applicable historic preservation laws and Presidential directives related to historic resources potentially affected by ACOE actions (including issuance of permits pursuant to the federal Clean Water Act [CWA]). It specifies that when a project's authorization requires a federal action (for example, issuance of permit pursuant to Section 404 of the CWA), the project must comply with the requirements of Section 106 of the NHPA.

B. State Regulations and Protection Programs

California Administrative Code, Title 14, Section *4308* ~~4307~~: This section states that "No person shall remove, injure, deface or destroy any object of paleontological, archeological or historical interest or value."

California Code of Regulations (CCR): In addition, CCR *Title 14* Section 1427 recognizes that "California's archeological resources are endangered by urban development and population growth and by natural forces." Accordingly, the State Legislature finds that "these resources need to be preserved in order to illuminate and increase public knowledge concerning the historic and prehistoric past of California." Lastly, it states that any person "not the owner thereof, who willfully injures, disfigures, defaces or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor." The code also specifies that it is a misdemeanor to "alter any archeological evidence found in any cave or to remove any materials from a cave." (See also, Sections 622*1/2* and 623 of the California Penal Code.)

California Register of Historic Resources: The State's Office of Historic Preservation (OHP) manages and oversees the California Register of Historic Resources (CRHR), which is intended to serve as "an authoritative guide to the state's significant historical and archeological resources." As outlined in PRC Section 5020 *et seq.*, resources listed must meet one of four "significance criteria" related to events, people, construction/artistic value or information. Sites must also retain sufficient integrity to convey their significance. The CRHR includes a number of types resources, including: all properties listed in or determined formally eligible for listing in the NRHP; all California Historical Landmarks from #770 onward; specific California Historical Landmarks issued prior to #770 and certain California Points of Historical Interest, as deemed appropriate for listing by the California Historic Resources Commission; and, any properties nominated per OHP regulations. California Historical Landmarks are intended to recognize resources of statewide significance. Points of Historical Interest recognize resources of local or countywide significance. And lastly, as mentioned above, all NRHR listings within California are automatically added to the CRHR. The listing of a site on a California State register does not generally result in any specific physical protection. Among other things, however, it does create an additional level of CEQA review to be satisfied prior to any discretionary action occurring that might adversely affect the resource.

Traditional Tribal Cultural Places Act (Senate Bill 18): Senate Bill 18 (SB 18) enacted in 2004 requires local governments to consult with Native American groups at the earliest point in the local government land use planning process for General Plan Amendments, Specific Plans and Specific Plan Amendments. The consultation is intended to establish a meaningful dialogue regarding potential means to preserve Native American places of prehistoric, archeological, cultural, spiritual and ceremonial importance. It also establishes a means for Tribes to hold conservation easements and for tribal cultural places to be included in open space planning.

Regulation of Cultural Resources Pursuant to the Public Resources Code: Section 5097 of the California Public Resources Code (PRC) outlines the requirements for cultural resource analysis prior to the commencement of any construction project on state lands. It further specifies that the unauthorized disturbance or removal of archeological, historical or paleontological resources located on public lands (including those owned by counties, cities, etc.) is a misdemeanor. It also prohibits the knowing destruction of objects of antiquity without a permit (i.e., expressed permission) on public lands and provides for criminal sanctions for violators. The section was amended in 1987 to require consultation with the California Native American Heritage Commission whenever Native American graves are found. It also establishes that violations for taking or possessing remains or artifacts are felonies.

PRC Sections 5097.9 through 5097.991 establish that no public agency or private party using or occupying public property (or operating on under a public license, permit, grant, lease or contract made after July 1, 1977) shall in any manner interfere with the free expression or exercise of Native American religion as provided in the U.S. Constitution and the California Constitution. It also prohibits such agencies and parties from causing severe or irreparable damage to any Native American sanctified cemetery, place of worship, religious or ceremonial site or sacred shrine located on public property, except on a clear and convincing showing that the public interest and necessity so require it.

These sections also establish the state's Native American Heritage Commission (NAHC). The NAHC is tasked with working to ensure the preservation and protection of Native American human remains, associated grave goods and cultural resources. Towards this end, the NAHC has a strategic plan for assisting the public, development communities, local and federal agencies, educational institutions and California Native Americans to better understand problems relating to the protection and preservation of cultural resources and to serve as a tool to resolve these problems. In 2006, PRC Sections 5097.91 and 5097.98 were amended by State Assembly Bill 2641 to authorize the NAHC to bring legal action when necessary to prevent damage to Native American burial grounds or places of worship. It also established more specific procedures to be implemented in the event that Native American remains are discovered.

California Public Resources Code Related to Paleontological Resources: Several sections of the California Public Resources Code protect paleontological resources. Section 5097.5 prohibits "knowing and willful" excavation, removal, destruction, injury and defacement of any paleontological feature on public lands (lands under state, county, city, district or public authority jurisdiction, or the jurisdiction of a public corporation), except where the agency with jurisdiction has granted express permission. Section 30244 requires reasonable mitigation for impacts on paleontological resources that occur as a result of development on public lands. The California Administrative Code Sections 4307-4309, relating to the State Division of Beaches and Parks, afford protection to geologic features and "paleontological materials," but grant the director of the state park system authority to issue permits for specific activities that may result in damage to such resources, if the activities are for state park purposes and in the interest of the state park system.

California Government Codes Addressing Native American Heritage: Section 6254(r) of the Government Codes exempts from disclosure public records of Native American graves, cemeteries and sacred places maintained by the NAHC. Pursuant to SB 18, GC Section 65351 specifies how local planning agencies should

provide opportunities for involvement of California Native American tribes to consult on the preparation or amendment of general plans. In particular, GC Section 65352 requires local planning agencies to refer proposed actions of general plan adoption or amendment to California Native American tribes on the contact list maintained by the NAHC and others, with a 45-day opportunity for comments.

In regards to historical properties, GC Section 25373 and 37361 allows city and county legislative bodies to acquire property for the preservation or development of a historical landmark. It also allows local legislative bodies to enact ordinances to provide special conditions or regulations for the protection or enhancement of places or objects of special historical or aesthetic interest or values. Lastly, GC Sections 50280-50290 implement the Mills Act which allows the negotiation of historical property contracts between a private property owner of a "qualified historical property" and provides additional guidelines for such contracts.

State Health and Safety Code: The Healthy and Safety Code (HSC) Section 7050.5(b) requires that excavation on a project site cease "in the event of discovery or recognition of any human remains in any location other than a dedicated cemetery" until the coroner can determine regarding the circumstances, manner and cause of any death. The coroner is then required to make recommendations concerning the treatment and disposition of the human remains. Further, this section of the code makes it a misdemeanor to intentionally disturb, mutilate or remove interred human remains. Section 7051 specifies that the removal of human remains from "internment or a place of storage while awaiting internment" with the intent to sell them or to dissect them with "malice or wantonness" is a public offense punishable by imprisonment in a state prison. Lastly, HSC Sections 8010-8011 establish the California Native American Graves Protection and Repatriation Act consistent with the federal law addressing the same. The Act stresses that "all California Indian human remains and cultural items are to be treated with dignity and respect." It encourages voluntary disclosure and return of remains and cultural items by publicly funded agencies and museums in California. It also outlines the need for aiding California Indian tribes, including non-federally recognized tribes, in filing repatriation claims.

C. California Environmental Quality Act (CEQA) Directives

In many cases, CEQA provides fairly wide latitude for a Lead Agency to determine environmental impacts and their level of significance. For historical resources, however, CEQA includes explicit standards in several areas. This includes determining when a resource is "historically significant" or "unique," as well as when an impact to such resource is significant. The result is a series of steps that are applied to the consideration of cultural resources.

First, it must be determined whether an "historic resource" is present. Secondly, it must be determined if the project would cause a "substantial adverse change" in the significance of an historical resource. Additionally, sites not qualifying as an historic resource could be found to be a "unique archeological resource," which are also afforded protection. These terms are defined in the State CEQA Guidelines, as noted below. If an archeological resource is neither a "unique archeological resource" nor an "historic resource," then affects to it are not considered significant under CEQA.

1. Definition of "Historical Resources"

Under CCR Section 15064.5(a) an "historical resource" is defined as including the following:

(1) A resource listed in, or determined to be eligible by the State Historical Resources Commission for listing in, the California Register of Historical Resources.

(2) A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in an historical resource survey meeting the requirements of PRC Section 5024.1(g) shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

(3) Any object, building, structure, site, area, place, record or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historic Places, including the following:

i. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

ii. Is associated with the lives of persons important in our past;

iii. Embodies the distinctive characteristics of a type, period, region or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

iv. Has yielded, or may be likely to yield, information important in prehistory or history.

2. Definition of "Substantial Adverse Change"

CCR Section 15064.5(b) defines a "substantial adverse change" as meaning the "physical demolition, destruction, relocation or alteration of the resource or its immediate surroundings" such that the significance of the historical resource would be "material impaired." This term is further defined as being when a project, "demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that" does any of the following:

(1) Conveys its historical significance and justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources.

(2) Accounts for its inclusion in a local register of historical resources pursuant to PRC Section 5020.1(k) or its identification in an historical resources survey meeting the requirements of PRC Section 5024.1(g), unless the public agency reviewing the effects of the project established by a preponderance of evidence that the resource is not historically or culturally significant.

(3) Conveys its historical significance and justifies its eligibility for inclusion in the California Register of Historical Resources, as determined by a lead agency for the purposes of CEQA.

3. Definition of "Unique Archeological Resource"

PRC Section 21083.2(g) defines this as "an archeological artifact, object or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

(1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

(2) Has a special and particular quality, such as being the oldest of its type or the best available example of its type.

(3) Is directly associated with a scientifically recognized important prehistoric or historic event or person."

Accordingly, CEQA Section 21083.2 specifies that if a project will cause damage to a unique archeological resource, the lead agency may "require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state." "Preservation in place" is when the relationship between artifacts and the archeological context of the site is kept intact. This can be accomplished by avoiding construction on the archeological site; incorporating a park, greenspace or other open space around or over the site; and deeding the resource site into a permanent conservation easement. Other forms of conservation are to be considered as well.

Section 15064.5(c) of the State CEQA Guidelines also establishes that if "maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction" of the historical resource is conducted "in a manner consistent with" the [U.S.] Secretary of the Interior's Standards for the Treatment of Historic Properties (Weeks and Grimmer, 1995), then the project's impact on the historical resource "shall generally be considered mitigated to below a level of significance."

Lastly, CCR Section 15126.4(b) specifies that when "data recovery through excavation is the only feasible mitigation," a data recovery plan shall be prepared and adopted prior to any excavation being undertaken. The data recovery plan is designed to provide for adequately recovering the scientifically consequential information from and about the historical resource using current industry standards in archeological methods. In Riverside County, the resultant study is deposited with the Eastern Information Center at UCR. Any human remains recovered shall be treated in accordance with the provisions of [HSC] Section 7050.5.

In terms of specific mitigation for archeological resources, PRC Section 21083.2 also specifies a variety of financial standards for funding such measures and limits the amount that can be required to be spent. In some cases, such as for significant historic resources, these limits do not apply.

D. County Ordinances, Regulations and Programs

1. Ordinance No. 578 - Establishment of Historic Preservation Districts

This ordinance is intended to facilitate the preservation of areas deemed historically important to the County of Riverside. The ordinance specifies that a Historic Preservation District may be established if the Riverside County Board of Supervisors adopts a resolution that includes the boundaries of the Historic Preservation District and finds that the proposed Historic Preservation District is in conformity with the Cultural and Paleontological section of the Multipurpose Open Space Element of the Riverside County General Plan. It must also find that, for the county, state or nation: the area exemplifies or reflects significant aspects of the cultural, political, economic or social history; the area is identified with historic personages or with important events in history; or, that the area embodies the distinguishing characteristics of a significant architectural period which is inherently valuable for the study of architecture unique to the history of the county, state or nation.

Under this ordinance, no building or structure within the boundaries of an adopted Historic Preservation District can be constructed or altered, except in strict compliance with the plans approved in conjunction with the issuance of a Historic District Alteration Permit by the Riverside County Planning Director. The ordinance also outlines how such certificates are to be reviewed and processed in order to preserve the "historical significance and related construction theme" of the Historic District.

2. Riverside County Historic Preservation Commission

The Riverside County Historical Commission was established in 2005 to advise the Board of Supervisors on historical preservation matters. It is tasked with working to discover and identify persons, events and places of historical importance within Riverside County, and to make recommendations relating to the preservation of appropriate historic sites and structures. To accomplish this, the Commission established criteria and procedures to identify and recognize historic landmarks in Riverside County. These criteria should be used when reviewing a potentially historically or culturally significant site that could be affected by the proposed development. Such resources are noted in the countywide list provided in Table 4.9-A.

3. Riverside County Planning Department Procedures

The Riverside County Archeologist reviews all proposed land use projects subject to CEQA and not otherwise deemed categorically exempt. The Riverside County Archeologist reviews various internal databases for information that might pertain to the age of any buildings found on site, grading permits, ground disturbance activities and building permits. Where buildings are 45 years or older, the project applicant is required to perform an architectural history evaluation to assess potential historic value as part of a Phase I Cultural Resources study. When the study is completed, and if historic-period resources were identified during a survey, a copy of the report is transmitted to the Riverside County Historic Preservation Officer (CHPO) for review and comment. The CHPO sends relevant comments back to the Riverside County Archeologist.

Vacant parcels within areas known to have prehistoric or historic resources trigger a Phase I Cultural Resources study. Similarly, any parcels with environmental, geomorphological or vegetative features known to increase the likelihood of cultural resources being present trigger a "Phase I" cultural resources study. Such studies are required to follow the reporting formula found on the Riverside County Planning Department's website which mirror the recommendations published by the SHPO in 1987.

The Riverside County Archeologist reviews all Phase I cultural resources studies for completeness and reasonable conclusions based on current industry standards in archeology. The Phase I study serves to advise the Riverside County Archeologist on matters relating to any identified prehistoric or historic resources, provide the requisite information to complete the project-related CEQA analysis and guide the Riverside County Archeologist in determining which land use conditions of approval and/or mitigation measures apply to the proposed project.

Copies of studies are provided to tribes, upon their request, as a confidential document. If a proposed project is subject to the requirements of the Traditional Tribal Places Act (commonly referred to as Senate Bill 18), a Phase 1 report is forwarded to tribes who request it as part of consultation under SB 18. Typically, official tribal consultations are scheduled after the report has been sent to the tribe(s) to maximize consultation efforts.

In order to ensure the review and protection of paleontological resources for projects subject to CEQA and not otherwise categorically exempt, the Riverside County Geologist performs an initial review of the County of Riverside's database and mapped information for the subject site. When existing information indicates that a site proposed for development has high paleontological sensitivity, a paleontological resource impact mitigation

program (PRIMP) is required for the project. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources. If the site warrants protection, then an "Environmental Constraint" is placed on the approved map for the project, stating that:

> *"This site, as delineated on this ECS map and as indicated in the county's General Plan, has been mapped as having a high potential for containing significant nonrenewable fossil material. The proposed project's potential to impact paleontological resources has been determined to be possible. Therefore, mitigation of this potential impact in the form of monitoring of all site earth-moving activities and collection/curation of all significant fossils unearthed is required unless proven unnecessary through comprehensive literature research and site inspection."*

When existing information indicates that a site proposed for development has low paleontological sensitivity, no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the Riverside County Geologist must be notified and a paleontologist must be retained by the project proponent. The paleontologist documents the extent and potential significance of the paleontological resources on the site and establishes appropriate mitigation measures for further site development.

When existing information indicates that a site proposed for development has undetermined paleontological sensitivity, a report is filed with the Riverside County Geologist documenting the extent and potential significance of the paleontological resources on site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources.

Listed below are the standardized conditions of approval pertaining to cultural and paleontological resources. Based on the foregoing information, the Riverside County Archeologist may tailor these conditions or apply additional conditions as the individual project-specific circumstances, Phase 1 cultural resources study and any "Phase II" archeological testing studies dictate. Testing is done to obtain additional information toward a significance evaluation for CEQA purposes.

4. General Conditions of Approval for Discretionary Actions

The following items are the generic Conditions of Approval typically applied to proposed development projects by the Riverside County Archeologist for cultural resources, as deemed warranted by site conditions and/or data. For the remaining items in this sub-section, the term "project" refers to the future development project for which the conditions would apply, not specifically to GPA No. 960.

a. General Conditions Applied for Cultural / Native American Resources

General Condition – If Human Remains Found: The developer/permit holder or any successor in interest shall comply with the following codes for the life of [the proposed] project:

If human remains are encountered, State [HSC] Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and their disposition has been made. If the Riverside County Coroner determines the remains to be Native American, the Native American Heritage Commission shall be contacted within the period specified by law.

Subsequently, the Native American Heritage Commission shall identify the "Most Likely Descendant." The Most Likely Descendant shall then make recommendations and engage in consultation with the County of Riverside and the property owner concerning the treatment of the remains as provided in Public Resources Code Section 5097.98. Human remains from other ethnic/cultural groups with recognized historical associations to the project area shall also be subject to consultation between appropriate representatives from that group and the Riverside County Planning Director.

General Conditions – Inadvertent Archeological Find: The developer/permit holder or any successor in interest shall comply with the following for the life of [the proposed] project:

If during ground disturbance activities, cultural resources are discovered that were not assessed by the archeological reports and/or environmental assessment conducted prior to [proposed] project approval, the following procedures shall be followed. A cultural resources site is defined, for this condition, as being three or more artifacts in close association with each other, but may include fewer artifacts if the area of the find is determined to be of significance due to its sacred or cultural importance.

a. All ground disturbance activities within 100 feet of the discovered cultural resource shall be halted until a meeting is convened between the [project's] developer, the project archeologist, the Native American tribal representative (or other appropriate ethic/cultural group representative) and the Planning Director to discuss the significance of the find.

b. At the meeting, the significance of the discoveries shall be discussed and after consultation with the Native American tribal (or other appropriate ethnic/cultural group) representative and the archeologist, a decision is made, with the concurrence of the Planning Director, as to the appropriate mitigation (documentation, recovery, avoidance, etc) for the cultural resource.

c. Further ground disturbance shall not resume within the area of the discovery until an agreement has been reached by all parties as to the appropriate preservation or mitigation measures.

Prior to Grading Permit – Cultural Resources Professional: As a result of [description of the finding would be inserted here], prior to the issuance of grading permits, the developer/permit holder shall retain and enter into a monitoring and mitigation service contract with a qualified [(select appropriate position) Archeologist, Historic Archeologist, Architectural Historian, Historian or Prehistoric Archeologist] for services. This professional shall be known as the "Project Archeologist." The Project Archeologist shall be included in the pre-grade meeting to provide cultural/historical sensitivity training including the establishment of set guidelines for ground disturbance in sensitive areas with the grading contractors and special interest monitors. The Project Archeologist shall manage and oversee monitoring for all initial ground-disturbing activities and excavation of each portion of the project site including clearing, grubbing, tree removal, grading, trenching, stockpiling of material, rock crushing, structure demolition, etc. The Project Archeologist shall have the authority to temporarily divert, re-direct or halt the ground disturbance activities to allow identification, evaluation and potential recovery of cultural resources in coordination with any required tribal or special interest monitors.

The developer/permit holder shall submit a fully executed copy of the contract to the Riverside County Planning Department to ensure compliance with this condition of approval. Upon verification, the Planning Department shall clear this condition. Note:

- The Project Archeologist is responsible for implementing mitigation using standard professional practices for cultural resources. The Project Archeologist shall consult with the County of Riverside, developer/ permit holder and any tribal or required special interest group monitor throughout the process.

- The agreement shall not modify any approved condition of approval or mitigation measure.

Prior to Grading Permit – Special Interest Monitor: As a result of [add statement of finding], prior to the issuance of grading permits, the developer/permit holder shall enter into contract and retain a monitor(s) designated by the [name of the special interest group(s) who will be monitoring would be inserted here]. This [group's monitor(s)] shall be known as the Special Interest Monitor (SI Monitor) for [the] project. The contract shall address the treatment and ultimate disposition of cultural resources which may include repatriation and/or curation in Riverside County-approved curation facility.

The SI Monitor shall be on site during all initial ground-disturbing activities and excavation of each portion of the project site, including clearing, grubbing, tree removals, grading, trenching, stockpiling of materials, rock crushing, structure demolition, etc. The SI Monitor shall have the limited authority to temporarily divert, redirect or halt the ground disturbance activities to allow identification, evaluation and potential recovery of cultural resources in coordination with the Project Archeologist, which is the contracted cultural resource professional, such as an Archeologist, Historic Archeologist, Architectural Historian and/or Historian.

The developer/permit holder shall submit a fully executed copy of the contract with the SI Monitor to the Riverside County Planning Department to ensure compliance with this condition of approval. Upon verification, the Planning Department shall clear this condition. Note:

- The Project Archeologist is responsible for implementing mitigation and standard professional practices for cultural resources. The professional shall consult with the County of Riverside, developer/permit holder and the special interest group monitor throughout the process.

- Special interest monitoring does not replace any required cultural resource monitoring, but rather serves as a supplement for consultation and advisory purposes for the special interest groups only.

- This agreement shall not modify any approved condition of approval or mitigation measure.

- The developer/permit holder shall contact the Planning Director for consideration of this condition after forty-five (45) days, if an agreement with the special interest group(s) has not been [reached].

- Should repatriation be preferred, it shall not occur until after a "Phase IV" monitoring report has been submitted to the Riverside County Archeologist. Should curation be preferred, the development/permit holder is responsible for all costs.

Prior to Grading Permit – Tribal Monitoring: As a result of [add statement of finding], prior to the issuance of grading permits, the Developer/permit holder shall enter into an agreement and retain a monitor designated by the [provide the name of the Tribe(s) who will be monitoring]. This group['s monitor] shall be known as the Tribal Monitor(s) for [the] project. The agreement shall address the treatment and ultimate disposition of cultural resources which may include repatriation and/or curation in a Riverside County-approved curation facility. The Tribal Monitors shall be on site during all initial ground-disturbing activities and excavation of each portion of the project site including clearing, grubbing, tree removal, grading, trenching, stockpiling of materials, rock crushing, structure demolition, etc. The Tribal Monitor(s) shall have the limited authority to temporarily divert, redirect or halt ground disturbance activities to allow identification, evaluation, consultation and potential recovery of cultural resources in coordination with the Project Archeologist.

The developer/permit holder shall submit a fully-executed copy of the contract with the Tribal Monitors to the Riverside County Archeologist to ensure compliance with this condition of approval. Upon verification, the Riverside County Archeologist shall clear this condition. Note:

- The Project Archeologist is responsible for implementing mitigation and standard professional practices for cultural resources and shall consult with the County of Riverside, designated Tribal Monitor(s) and developer/permit holder throughout the process.
- Tribal monitoring does not replace any required cultural resources monitoring, but rather serves as a supplement for consultation and advisory purposes for Tribal interests only.
- This agreement shall not modify any approved condition of approval or mitigation measure.
- The developer/permit holder shall contact the Planning Director for consideration of this condition after 45 days, if an agreement with the Tribe has not been [reached]. The developer/permit holder has the burden of demonstrating a good-faith effort to secure the Tribal agreement.
- Should repatriation be preferred, it shall not occur until after a "Phase IV" monitoring report has been submitted to the Riverside County Planning Department. Should curation be preferred, the development/permit holder is responsible for all costs.

Prior to Building Final Inspection – Cultural Resources Report: Prior to final inspection of the first building permit, the development/permit holder shall submit two copies of a "Phase IV" cultural resource monitoring report that complies with the Riverside County Planning Department's requirements for such reports. The report shall be prepared by a Riverside County-certified professional archeologist. The report shall include evidence of the required cultural/historical sensitivity training for the construction staff held during the pre-grading meeting. The Riverside County Archeologist shall review the report to determine adequate mitigation compliance. Provided the report is adequate, the Riverside County Archeologist shall clear this condition.

b. General Conditions Applied by County Geologist for Paleontological Resources

Prior to Grading Permit Issuance – Paleontological PRIMP and Monitor: PDP [insert report number], prepared by [insert name of technical firm] for this [proposed] project, concluded the potential to impact significant paleontological resources is high or this site is mapped in Riverside County's General Plan as having a high potential for paleontological resources (fossils). Proposed project site grading/ earthmoving activities could potentially impact this resource. Hence, prior to issuance of grading permits:

a. The applicant shall retain a qualified paleontologist ("Project Paleontologist") approved by the County of Riverside to create and implement a project-specific plan for monitoring site grading/earthmoving activities.

b. The Project Paleontologist retained shall review the approved development plan and grading plan and shall conduct any pre-construction work necessary to render appropriate monitoring and mitigation requirements as appropriate. These requirements shall be documented by the Project Paleontologist in a Paleontological Resource Impact Mitigation Program (PRIMP). The PRIMP shall be submitted to the Riverside County Geologist for review and approval prior to issuance of a grading permit [by the county].

c. Information to be contained in the PRIMP, at a minimum and in addition to other industry standard and Society of Vertebrate Paleontology standards, are as follows:

- Description of the proposed site and planned grading operations.
- Description of the level of monitoring required for all earthmoving activities in the project area.
- Identification (name) and qualifications of the qualified paleontological monitor to be employed for grading operations monitoring.
- Identification of personnel with authority and responsibility to temporarily halt or divert grading equipment to allow for recovery of large specimens.
- Direction for any fossil discoveries to be immediately reported to the property owner who in turn will immediately notify the Riverside County Geologist of the discovery.
- Means and methods to be employed by the paleontological monitor to quickly salvage fossils as they are unearthed to avoid construction delays.
- Sampling of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates.
- Procedures and protocol for collecting and processing of samples and specimens.
- Fossil identification and curation procedures to be employed.
- Identification of the permanent repository to receive any recovered fossil material. The County of Riverside must be consulted on the repository [or] museum to receive the fossil material and a written agreement between the property owner/developer and the repository must be in place prior to site grading.
- All pertinent exhibits, maps and references.
- Procedures for reporting of findings.
- Identification and acknowledgement of the developer for the content of the PRIMP as well as acceptance of financial responsibility for monitoring, reporting and curation fees.

All reports shall be signed by the Project Paleontologist and all other professionals responsible for the report's content as appropriate. Two wet-signed original copies of the report(s) shall be submitted to the office of the Riverside County Geologist along with a copy of this condition and the grading plan for appropriate case processing and tracking. These documents should not be submitted to the project Planner, the Plan Check staff, the Land Use Counter or any other county office. In addition, the applicant shall submit proof of hiring (i.e., copy of executed contract, retainer agreement, etc.) of a Project Paleontologist for the in-grading implementation of the PRIMP.

Prior to Grading Final – Paleontological Monitoring Report Requirement: The applicant shall submit to the Riverside County Geologist one wet-signed copy of the Paleontological Monitoring Report prepared for site grading operations at [the] site. The report shall be certified by the professionally qualified Project Paleontologist

responsible for the content of the report. The Project Paleontologist must be on Riverside County's Paleontology Consultant List. The report shall contain a report of findings made during all site grading activities and an appended itemized list of fossil specimens recovered during grading (if any) and proof of accession of fossil materials into the pre-approved museum [or other] repository. In addition, all appropriate fossil location information shall be submitted to the Western Information Center, the San Bernardino County Museum and the Los Angeles County Museum of Natural History, at a minimum, for incorporation into their Regional Locality Inventories.

Additional/Alternate Language for Small Disturbance Projects (accessory WECS, "mono-poles"/ "mono-pines"/etc. [i.e., cellular towers], minimal ground disturbance) to be Added for Projects Located in the "Undetermined" Potential Zone: [For use when] according to Riverside County's General Plan, [a proposed development] site has been mapped as having an "Undetermined Potential" for paleontological resources. [One of the two paragraphs below would be inserted into conditions, as applicable; the non-applicable one would be deleted.]

This category encompasses areas underlain by sedimentary rocks for which literature and unpublished studies are not available and, as such, have an undetermined potential for significant paleontological resources. However, due to the limited nature of the [proposed] project's earthmoving activity, it is unlikely significant impacts to paleontological resources would occur. Nevertheless, should fossil remains be encountered during site development, conditions 1 through 7, below must be met. *OR*

According to Riverside County's General Plan, [the] site has been mapped as having a "High Potential" for paleontological resources at depth. However, Paleontological Assessment Report No. [insert number] concluded a low potential for encountering fossil remains due, in part, to the limited earthmoving required to construct the project. As such, this project is not anticipated to require any direct mitigation for paleontological resources. However, should fossil remains be encountered during site development, conditions [*a* through *g*, below], must be met.

General Condition - Projects Located Completely within the Low Potential Zone: [Applies when] according to Riverside County's General Plan, [the] site has been mapped as having a "Low Potential" for paleontological resources. This category encompasses lands for which previous field surveys and documentation demonstrated a low potential for containing significant paleontological resources subject to adverse impacts. As such, [the] project [would] not [be] anticipated to require any direct mitigation for paleontological resources. However, should fossil remains be encountered during site development, the following conditions must be met:

a. All site earthmoving shall be ceased in the area of where the fossil remains are encountered. Earthmoving activities may be diverted to other areas of the site.

b. The owner of the property shall be immediately notified of the fossil discovery and shall in turn immediately notify the Riverside County Geologist of the discovery.

c. The applicant shall retain a qualified paleontologist approved by the County of Riverside.

d. The paleontologist shall determine the significance of the encountered fossil remains.

e. Paleontological monitoring of earthmoving activities will continue thereafter on an as-needed basis by the paleontologist during all earthmoving activities that may expose sensitive strata. Earthmoving activities in areas of the project area where previously undisturbed strata will be buried, but not otherwise disturbed, need not be monitored. The supervising paleontologist will have the authority to reduce

monitoring once he/she determines the probability of encountering any additional fossils has dropped below an acceptable level.

f. If fossil remains are encountered by earthmoving activities when the paleontologist is not on site, these activities will be diverted around the fossil site and the paleontologist called to the site immediately to recover the remains.

g. Any recovered fossil remains will be prepared to the point of identification and identified to the lowest taxonomic level possible by knowledgeable paleontologists. The remains then will be curated (assigned and labeled with museum [or] repository fossil specimen numbers and corresponding fossil site numbers, as appropriate; placed in specimen trays or vials [along] with completed specimen data cards) and catalogued. Associated specimen data and corresponding geologic and geographic site data will be archived (specimen and site numbers, and corresponding data, entered into appropriate museum repository catalogs and computerized databases) at the museum [or] repository by a laboratory technician. The remains will then be accessioned into the museum [or] repository fossil collection, where they will be permanently stored, maintained and, along with associated specimen and site data, made available for future study by qualified scientific investigators. The County of Riverside must be consulted on the repository [or] museum to receive the fossil material prior to [its] being curated.

E. Existing Riverside County General Plan Policies

The following policies are already part of the General Plan and are not part of the proposed project, GPA No. 960. Rather, these existing policies are considered to play a role in ensuring any potential environmental effects are avoided, reduced or minimized through their case-by-case application. The County of Riverside has existing programs in place that ensure applicable policies are imposed once a development proposal triggers a specific policy or policies. The need for specific policies is determined through subsequent CEQA analysis performed for site-specific projects. These measures are implemented, enforced and verified through their inclusion into project conditions of approval.

1. Multi-Purpose Open Space (OS) Element Policies

Policy OS 19.2: The County of Riverside shall establish a cultural resources program in consultation with Tribes and the professional cultural resources consulting community. Such a program shall, at a minimum, address each of the following: application processing requirements; information database(s); confidentiality of site locations; content and review of technical studies; professional consultant qualifications and requirements; site monitoring; examples of preservation and mitigation techniques and methods; and the descendant community consultation requirements of local, state and federal law.

Policy OS 19.3: Review proposed development for the possibility of cultural resources and for compliance with the cultural resources program.

Policy OS 19.4: To the extent feasible, designate as open space and allocate resources and/or tax credits to prioritize the protection of cultural resources preserved in place or left in an undisturbed state.

Policy OS 19.5: Exercise sensitivity and respect for human remains from both prehistoric and historic time periods and comply with all applicable laws concerning such remains.

Policy OS 19.6: Whenever existing information indicates that a site proposed for development has high paleontological sensitivity as show on ~~Figure OS-7~~ *Figure OS-8*, a paleontological resource impact mitigation program (PRIMP) shall be filed with the County Geologist *prior to site grading*. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources.

Policy OS 19.7: Whenever existing information indicates that a site proposed for development has low paleontological sensitivity as show on ~~Figure OS-7~~ *Figure OS-8*, no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the County Geologist shall be notified and a paleontologist shall be retained by the project proponent. The paleontologist shall document the extent and potential significance of the paleontological resources on the site and establish appropriate mitigation measures for further site development.

F. Proposed New or Revised Riverside County General Plan Policies

The following policy modifications are proposed under GPA No. 960 to correct a reference to a state code and clarify directives for paleontological curation.

1. Land Use (LU) Element Policies

Policy LU *4.5* (Previously LU 4.4): Permit historically significant buildings to vary from building and zoning codes in order to maintain the historical character of the county; providing that the variations do not endanger human life and buildings comply with the State Historic~~al~~ *Building* Code.

2. Open Space (OS) Element Policies

Policy OS 19.6: Whenever existing information indicates that a site proposed for development has high paleontological sensitivity as show on ~~Figure OS-7~~ *Figure OS-8*, a paleontological resource impact mitigation program (PRIMP) shall be filed with the County Geologist *prior to site grading*. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources.

Policy OS 19.8: Whenever existing information indicates that a site proposed for development has undetermined paleontological sensitivity as shown on [General Plan] Figure ~~OS-7~~ *Figure OS-8*, a report shall be filed with the County Geologist documenting the extent and potential significance of the paleontological resources on site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources *prior to approval of that department*.

***NEW* Policy OS 19.9:** *Whenever paleontological resources are found, the County Geologist shall direct them to a facility within Riverside County for their curation, including the Western Science Center in the City of Hemet.*

4.9.4 Thresholds of Significance for Cultural and Paleontological Resources

The project would result in a significant impact on cultural resources if it would:

A. Cause a substantial adverse change in the significance of historical resource as defined in CCR Section 15064.5.

B. Cause a substantial adverse change in the significance of an archeological resource pursuant to CCR Section 15064.5.

C. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

D. Disturb any human remains, including those interred outside of formal cemeteries.

4.9.5 Effect of GPA No. 960 on the General Plan and on Cultural and Paleontological Resources

A. Proposed Changes to the General Plan

The proposed update to the General Plan (pursuant to General Plan Amendment No. 960) includes changes to land use overlays, land use designations amendments and policies that will allow for the conversion of rural, semi-rural, agricultural and vacant lands into suburban or urban uses in areas throughout Riverside County. As with the current General Plan, future development consistent with GPA No. 960 has the potential to adversely affect historic, archeological or paleontological resources, both known and previously unknown. In particular, GPA No. 960 contains policy changes that may facilitate the further development of specific areas or development at greater intensities or densities than that previously planned. These include the new Rural Village Land Use Overlays in Good Hope and Meadowbrook, as well as other new-proposed Policy Areas, such as Lakeland Village and the Northeast Business Park. Similar increases in potential for ground-disturbing development will also occur for lands in which their base General Plan land use Foundation has been changed from that of a lower intensity (such as "Rural" or "Open Space") to one allowing higher intensities (such as "Rural Community" or "Community Development"). A variety of individual parcels are proposed for this type of change under GPA No. 960. In some cases, the proposed changes may remove a barrier to potential future development by proposing a more logical, readily-implementable land use scenarios. ~~such as for Lakeland Village.~~

As part of the project review process, cultural and paleontological information within the General Plan was updated and associated polices reviewed and revised where necessary. The existing General Plan addresses such resources primarily in the Multipurpose Open Space Element and, to a minor degree, the Land Use Elements. Specifically, GPA No. 960 includes two policy updates. The first clarifies that historically significant buildings must comply with the State Historic Building Code. The second update directs found paleontological resources to a facility within Riverside County for curation. Text of the relevant revised General Plan policies is provided in Section 4.9.2.E above. Within the Land Use Element, the open space land use designation was updated to include cultural preservation within the Open Space Conservation category. Additionally, a Historic District Overlay was added to allow for specific protections, land uses, the application of the Historic Building Code and consideration for contributing elements to a prospective historic district.

B. Analysis of GPA No. 960 Effects on Cultural and Paleontological Resources

In all of these scenarios (changes leading to future development potential where none previously existed, as well as potential increases in density or intensity), the GPA No. 960 changes have the potential to result in increased areas of disturbance to both structures and artifacts on the site's surface, as well as any subsurface artifacts, paleontological or geological features. Particularly in rural or previously undisturbed areas, future development that ensues could lead to the discovery of archeological, historical or paleontological resources deemed significant, including the uncovering of human remains.

At the programmatic level addressed in this EIR, a variety of regulatory measures, including compliance with and implementation of federal, state and local regulations, as well as county ordinances and Riverside County General Plan polices, would serve to ensure potential impacts to cultural resources are reduced to the point where impacts are less than significant. (See full discussion on impacts and mitigation, below.) In addition, all future implementing projects (such as parcel and tract maps, conditional use permits, etc.) would be subject to further CEQA review focusing on the specifics of the proposed project – which cannot be foreseen at this time (since no specific development proposals are included in GPA No. 960).

County of Riverside procedures for project-specific CEQA review include applying all applicable regulatory measures, such as those outlined herein, and requiring consistency with all applicable General Plan policies and existing EIR No. 441 mitigation measures (as per EIR No. 441's Mitigation Monitoring and Reporting Program) and the internal Planning Department procedures also as presented herein. These regulatory measures, policy actions and Departmental procedures addressing project-specific significant impacts are included in a project's conditions of approval. The County of Riverside assigns these measures as required in compliance with CEQA in its discretionary capacity as Lead Agency. The conditions of approval, which are developed and issued by the County of Riverside, form the basis of the contractual obligations to which a project is subject in order to obtain the applied-for land use entitlement from the County of Riverside and provide the legal instrument through which all measures deemed necessary for CEQA purposes are implemented.

4.9.6 Cultural and Paleontological Resources – Impacts and Mitigation

A. Would the project cause a substantial adverse change in the significance of historical resource as defined in CCR Section 15064.5?

Impact 4.9.A - Adversely Change the Significance of Historical Resources: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting known and presently unknown historic resources. Compliance with existing laws, County Ordinance No. 578, General Plan policies and existing Mitigation Measure 4.7.1B from EIR No. 441 would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.9.A

As indicated in Table 4.9-A, Riverside County has a significant number of historic structures, sites and ruins, along with other historic resources that have yet to be identified. Many of these are located in cities and therefore not under the jurisdiction of this General Plan. It is expected that future development consistent with GPA No.

960 has the potential to result in impacts to four known, plus other presently unknown historic resources. Three of the four known sites are under preservation by a public or non-profit entity. The fourth site, Riverside Cement Co., is privately owned and could potentially be subject to future development. Future development could also result in the disturbance of vacant lands and possible conversion of existing agricultural lands to various developed uses. This development could cause the destruction or loss of a known or unknown historical resource, as defined in Section 15064.5 of the State CEQA Guidelines.

2. Regulatory Compliance for Impact 4.9.A

As detailed and explained below, compliance with existing laws, regulatory programs, General Plan policies, are sufficient to ensure that substantial adverse change in the significance of historical resources as a result of GPA No. 960 would be less than significant.

a. Compliance with Federal, State and County Regulations

Historic properties and resources are protected under a wide variety of federal, state and county regulations including Riverside County Ordinance No. 578 and the state and federal programs outlined in Section 4.9.2 (Existing Setting – Cultural and Paleontological Resources), above, that would prevent substantial adverse change in the significance of historical resources. These programs afford preservation or mitigation to historic resources in a variety of ways.

National Historic Preservation Act (NHPA): NHPA, in particular Section 106, serves to ensure that public property meeting federal standards for listing or eligibility are identified and given appropriate environmental review under CEQA. This applies to both typical "historic" resources, such as buildings, structures and landscapes, as well as to archeological resources, such as those that may yield "important information in history or prehistory."

Native American Graves Protection and Repatriation Act (NAGPRA): Compliance with NAGPRA would ensure any human remains or funerary artifacts associated with a Native American descendant are handled appropriately. This includes protecting known burial sites from disturbance and carefully controlling the removal of any Native American human remains or related objects, as well as appropriate coordination between Riverside County and Tribes. Projects in Riverside County requiring federal action (e.g., issuance of a federal CWA Section 404 permit by the ACOE) also trigger these federal requirements.

In the case of General Plan Amendments and Specific Plans, adherence to California's Traditional Tribal Cultural Places Act, Section 65352.3 of the Government Code (Senate Bill 18) would be used to ensure that historic and prehistoric cultural resources are considered prior to project approval and that mitigation measures or conditions of approval appropriate to site conditions are applied to prevent significant impacts to cultural resources. Specifically, the law requires the County of Riverside to consult with Native American groups at the earliest point in the land use planning process regarding potential means to preserve Native American places of prehistoric, archeological, cultural, spiritual and ceremonial importance.

Actions by the U.S. Army Corps of Engineers: Appendix C of Title 33 CFR Section 325 establishes procedures to be followed by the U.S. Army Corps of Engineers (ACOE) to fulfill the requirements of the NHPA, as well as other applicable historic preservation laws and Presidential directives related to historic resources potentially affected by ACOE actions (including issuance of permits pursuant to the federal Clean Water Act [CWA]). It specifies that when a project's authorization requires a federal action (for example, issuance

of permit pursuant to Section 404 of the CWA), the project must comply with the requirements of Section 106 of the NHPA.

Traditional Tribal Cultural Places Act (Government Code Section 65352.3): This program ensures appropriate CEQA review of all discretionary projects. To that end, a Riverside County Archeologist reviews prospective cultural (including archeological) impacts of land use projects, implements explicit review procedures (as described in more detail above) and applies standard conditions of approval as required for projects with potential for disturbing or uncovering historical or archeological resources. These conditions include requirements for site monitoring during construction, actions to take if a resource is uncovered during grading/construction and also documentation and reporting requirements to verify compliance (see Section 4.9.2 above). They also establish specific protocols to be followed should Native American remains be discovered in order to ensure compliance with state laws, for example, PRC Section 5097, as well as for the discovery of any human remains, whether modern, historic or prehistoric. Above all, adherence to the Riverside County Planning Department's established cultural resources policies, procedures and conditions of approval would ensure historic and prehistoric cultural resources are considered prior to approval of projects subject to CEQA.

California Register of Historic Resources: The State's Office of Historic Preservation (OHP) manages and oversees the California Register of Historic Resources (CRHR), which is intended to serve as "an authoritative guide to the state's significant historical and archeological resources." This program serves as a resource to identify and convey the significance of sites that the State of California deems historic resources. Table 4.9-A identifies those resources within Riverside County.

Regulation of Cultural Resources (Public Resources Code Section 5097): This program outlines the requirements for cultural resource analysis prior to the commencement of any construction project on state lands and specifies that the unauthorized disturbance or removal of resources located on public lands (including those owned by counties) and prohibits the destruction of objects of antiquity without a permit on public lands. As indicated above, the County of Riverside employs an archeologist to review prospective cultural impacts of land use projects, implement explicit review procedures and apply standard conditions of approval as required for projects with potential for disturbing or uncovering historical or archeological resources.

California Environmental Quality Act: Compliance with this state law would ensure that future land use projects accommodated by GPA No. 960 would be reviewed with consistent standards for determining historic resources and their respective significance (CCR Section 15064.5 (a)). Further, CCR Section 15064.5(b)) provides guidance to the County of Riverside in determining the "substantial adverse change" that may occur as the result of a future site specific project. Section 15064.5(c) of the State CEQA Guidelines also establishes that if "maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction" of the historical resource is conducted "in a manner consistent with" the [U.S.] Secretary of the Interior's Standards for the Treatment of Historic Properties (Weeks and Grimmer, 1995), then the project's impact on the historical resource "shall generally be considered mitigated to below a level of significance."

Lastly, CCR Section 15126.4(b) specifies that when "data recovery through excavation is the only feasible mitigation," a data recovery plan shall be prepared and adopted prior to any excavation being undertaken. The data recovery plan is designed to provide for adequately recovering the scientifically consequential information from and about the historical resource using current industry standards in archeological methods. In Riverside County, the resultant study is deposited with the Eastern Information Center at UCR. Any human remains recovered shall be treated in accordance with the provisions of HSC Section 7050.5.

Riverside County Ordinance No. 578 – Historic Preservation Districts: Compliance with this ordinance prevents the construction or alteration of any building or structure within an adopted Historic Preservation

District, except in strict compliance with the plans approved in conjunction with the issuance of a Certificate of Historic Appropriateness by the Riverside County Planning Director. The ordinance also sets specific criteria to be used in determining how such certificates are to be used in order to preserve the "historical significance and related construction theme" of the Historic District. At the time of EIR No. 521's NOP release on April 13, 2009, there were no Historic Preservation Districts in Riverside County.

b. Compliance with Existing General Plan Policies and County Procedures

The following existing policies of the Riverside County General Plan would ensure that no substantial adverse changes in the significance of a historic resource would occur as a result of GPA No. 960. Further, the following existing Riverside County procedures and conditions of approval would also ensure that no substantial adverse changes in the significance of an archeological resource would occur as a result of GPA No. 960. See Section 4.9.3.E for full text of each of the policies, procedures and conditions of approval mentioned below.

Policies OS 19.2 - 19.5: Compliance with these policies would ensure that projects are adequately reviewed for historic resources prior to approval; that appropriate mitigation measures are developed and incorporated into project design and project conditions of approval; and ensure that projects are appropriately reviewed for archeological resources and conditioned to comply with applicable state and federal regulations.

Riverside County Planning Department Procedures: Compliance with the Planning Department procedures would further ensure that projects are adequately reviewed; additional information is collected where warranted; archeological resources are identified and, where significant, preserved; human remains are treated in accordance with applicable laws; and Tribal participation occurs pursuant to SB 18 guidance when applicable;

General Conditions of Approval for Cultural Resources: Project-level compliance with conditions of approval is enforceable by the County of Riverside. When the Riverside County Archeologist ascribes conditions to a land use project, these measures are implemented at the appropriate stages of the land use development process. Project applicants must satisfy the terms of their conditions of approval before they may be authorized to implement subsequent stages in their land use development process.

c. Compliance with Proposed New or Revised General Plan Policies

Revised Policy LU 4.5 of the Riverside County General Plan would contribute to ensuring that development impacts to historic resources would be less than significant. Utilization of this policy ensures that land use projects with historically significant structures have flexibility to vary from existing building and zoning codes to preserve such structures thereby facilitating preservation of historical buildings. See Section 4.9.3.F for full text of the policy.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, it was found that General Plan policies related to historic resources would "help reduce the effects of growth and development by requiring development proposals to be evaluated for the presence of historical resources; by protecting historic buildings from demolition; and providing capital for preservation of historic buildings." However, CEQA mitigation measures were developed to ensure that "future development within the county would not have any significant adverse impacts on historic resources." Because one measure (4.7.1B) applies to the entire General Plan area, it remains applicable to the currently proposed GPA No. 960. This existing mitigation measure would prevent substantial adverse change in the significance of historical resources and therefore reduces impacts to such resources to less than significant.

Existing Mitigation Measure 4.7.1B: Avoidance is the preferred treatment for cultural resources. Where feasible, project plans shall be developed to allow avoidance of cultural resources. Where avoidance of construction impacts is possible, capping of the cultural resource site and avoidance planting (e.g., planting of prickly pear cactus) shall be employed to ensure that indirect impacts from increased public availability to the site are avoided. Where avoidance is selected, cultural resource sites shall be placed within permanent conservation easements or dedicated open space.

3. Finding on Significance for Impact 4.9.A

Compliance with the above regulatory programs, General Plan policies and existing Mitigation Measure 4.7.1B from EIR No. 441, GPA No. 960 would prevent substantial adverse changes in the significance of historical resources. Additionally, the imposition of Riverside County regulations, programs and procedures discussed above would further avoid or reduce this insignificant impact.

B. Would the project cause a substantial adverse change in the significance of an archeological resource pursuant to CCR Section 15064.5?

Impact 4.9.B – Cause the Destruction of Known Archeological Resources: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, may adversely affect known or presently unknown archeological resources. Compliance with existing laws, General Plan policies, Planning Department procedures, project-level conditions of approval for cultural resources, existing Mitigation Measure 4.7.1B from EIR No. 441 and new Mitigation Measure 4.9.B-N1 would be sufficient to ensure that this impact is less than significant with mitigation.

1. Analysis of Impact 4.9.B

Future development consistent with General Plan changes arising from GPA No. 960 would result in the disturbance of vacant lands and possible conversion of existing structures and agricultural lands to various developed uses. This development could cause the destruction or loss of known or unknown archeological resource, as defined in Section 15064.5 of the State CEQA Guidelines.

Significant archeological resources exist within Riverside County, based on what is known from histories of local Native American and other descendant communities, and archeological and historic surveys conducted by archeologists and historians. Given the amount of undisturbed land that remains available for development, the distinct possibility exists that subsurface archeological resources may be disturbed through grading activities. Impacts on archeological resources could result from future development authorized pursuant to General Plan, as updated by GPA No. 960, in the form of individual private development and public works projects. Because the scope of GPA No. 960 is essentially countywide, site-specific investigation of archeological resources is beyond the scope of this EIR. Instead this section focuses on developing a strategy to assess risks to archeological resources and reduce any impacts to such resources.

2. Regulatory Compliance for Impact 4.9.B

As detailed and explained below, compliance with the following laws, programs and General Plan policies would lessen adverse changes in the significance of archeological resources.

a. Compliance with Federal and State Regulations

Compliance with the following state, federal and county regulations and programs would lessen adverse changes in the significance of an archeological resource as a result of GPA No. 960.

National Historic Preservation Act: For the reasons outlined under Impact 4.9.B, the National Historic Preservation Act, in particular Section 106, would ensure that project sites on public land or subject to federal permits are identified and assessed for archeological resources, such as those that may yield "important information in history or prehistory."

Native American Graves Protection and Repatriation Act: Compliance with NAGPRA would ensure that any human remains or funerary artifacts associated with a Native American descendant are handled appropriately. And, in the case of General Plan Amendments and Specific Plans, adherence to California's Traditional Tribal Cultural Places Act (Senate Bill 18) would ensure that archeological resources are considered prior to discretionary project approval and that mitigation measures appropriate to site conditions are applied to prevent significant impacts to cultural resources. Specifically, the law requires Riverside County to consult with Native American groups at the earliest point in the land use planning process regarding potential means to preserve Native American places of prehistoric, archeological, cultural, spiritual and ceremonial importance.

Actions by the U.S. Army Corps of Engineers: Appendix C of Title 33 CFR Section 325 establishes procedures to be followed by the ACOE to fulfill the requirements of the National Historic Preservation Act (NHPA), as well as other applicable historic preservation laws and Presidential directives related to historic resources potentially affected by ACOE actions (including issuance of permits pursuant to the federal Clean Water Act [CWA]). It specifies that when a project's authorization requires a federal action (for example, issuance of permit pursuant to Section 404 of the CWA), the project must comply with the requirements of Section 106 of the NHPA.

Traditional Tribal Cultural Places Act (Senate Bill 18): In response to Senate Bill 18 and to ensure appropriate CEQA review of land use projects not otherwise deemed categorically exempt, a Riverside County Archeologist reviews prospective cultural (historic and pre-historic) impacts of land use projects, implements explicit review procedures (described in Section 4.9.2 above) and applies conditions of approval to proposed projects with the potential for disturbing or uncovering historical or archeological resources. These conditions include requirements for site monitoring during construction, actions to take if a cultural resource is uncovered and also documentation and reporting requirements to verify compliance. They also establish the specific protocols to be followed should Native American remains be discovered, in order to ensure compliance with state laws (e.g., PRC Section 5097), as well as for the discovery of *any* human remains, whether modern, historic or prehistoric.

The Riverside County Archeologist serves as cultural liaison to the Tribes and their descendant groups to facilitate consultation. When consultation is conducted for a proposed project, conditions of approval may be negotiated with the Tribes. Adherence to the Riverside County Planning Department's established cultural resources policies, procedures and conditions of approval (identified in Section 4.9.2, above) would ensure that archeological resources are considered prior to approval of all projects subject to CEQA.

California Environmental Quality Act: Compliance with this state law would ensure that future land use projects accommodated by GPA No. 960 would be reviewed for determining whether any unique archeological resources (CCR Section 21083.2(g)) would be affected. Section 21083.2 also provides guidance to Riverside County in determining "reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state." Lastly, CCR Section 15126.4(b) specifies that when "data recovery through

excavation is the only feasible mitigation," a data recovery plan shall be prepared and adopted prior to any excavation being undertaken. The data recovery plan would be designed to ensure adequate recovery of scientifically consequential information from and about the historical resource using current industry standards in archeological methods. In Riverside County, the resultant study would be deposited with the EIC at UCR. And, as per above, any human remains uncovered would be treated in accordance with HSC Section 7050.5.

Ordinance No. 578 – Historic Preservation Districts: Compliance with this ordinance prevents the construction or alteration of any building or structure within an adopted Historic Preservation District, except in strict compliance with the plans approved in conjunction with the issuance of a Certificate of Historic Appropriateness by the Riverside County Planning Director. The ordinance also sets specific criteria to be used in determining how such certificates are to be used in order to preserve the "historical significance and related construction theme" of the historic district. At the time of EIR No. 521's NOP release on April 13, 2009, there were no Historic Preservation Districts adopted in Riverside County.

b. Compliance with Existing General Plan Policies and County Procedures

The following existing policies of the Riverside County General Plan would lessen substantial adverse changes in the significance of an archeological resource from occurring as a result of future implementation of a project pursuant to GPA No. 960. Further, the following existing Riverside County procedures and conditions of approval would also lessen substantial adverse changes in the significance of an archeological resource. See Section 4.9.3.E for full text of each of the policies, procedures and conditions of approval mentioned below.

Policies OS 19.2, 19.3, 19.4, 19.5: Compliance with these policies would ensure that proposals are adequately reviewed for archeological resources prior to approval; that appropriate mitigation measures are developed and incorporated into project design and/or conditions of approval; and, that all applicable state and federal regulations are applied as warranted.

Riverside County Planning Department Procedures: Compliance with the Planning Department procedures outlined in Section 4.9.3.D would further ensure that projects are adequately reviewed, additional information is collected where warranted, archeological resources are identified and, where significant, preserved, that any human remains uncovered are treated in accordance with applicable laws and, lastly, that Tribal participation occurs pursuant to SB 18 guidance when applicable.

General Conditions of Approval for Cultural Resources: Future development projects approved by Riverside County include a set of conditions of approval that are enforced by the County of Riverside. When the Riverside County Archeologist places conditions of approval on a land use project, the measures are implemented (and verified by the County of Riverside) at various stages of the land use development process. Project applicants must satisfy their conditions of approval before being authorized to implement subsequent stages of the development process (for example, requirements that must be met before a subdivision map can be recorded, before a grading permit, building permit or occupancy can be issued, etc.).

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, it was found that "although Riverside County and the General Plan [contains] policies to protect and minimize the effects of prospective growth on archeological resources, the potential exists for destruction of known archeological resources to occur if mitigation is not provided to protect such resources." (Final EIR No. 441, page 4.9-27) Mitigation Measure 4.7.1B was imposed to "ensure that future development in the county would not have any significant adverse impacts on historic

resources." Because 4.7.1B applies to the entire General Plan area, it remains applicable to the currently proposed GPA No. 960.

Existing Mitigation Measure 4.7.1B: (See Impact 4.9.A, above, for the full text of this measure.)

3. Additional Project-Specific Mitigation for Impact 4.9.B

Despite all of the above measures that lessen substantial adverse changes in the significance of an archeological resource impacts to archeological resources, additional project-specific mitigation measures are necessary to further avoid, reduce or minimize impacts. New Mitigation Measure 4.9.B-N1 would lessen the impact by providing for dialog with the appropriate ethnic or cultural group concerning the dispensation of cultural resources where it is infeasible for those resources to be avoided or preserved in place. Implementation of this mitigation measure will ensure that project impacts to archeological resources are mitigated to less than significant.

NEW **Mitigation Measure 4.9.B-N1:** If avoidance and/or preservation in place of cultural resources is not feasible, the following mitigation measures shall be initiated for each impacted site:

a. Discoveries shall be discussed with the Native American tribal (or other appropriate ethnic/ cultural group representative) and the Riverside County Archeologist, and a decision shall be made with the concurrence of the Planning Director, as to the appropriate mitigation (documentation, recovery, avoidance, etc.) appropriate for the cultural resource.

b. Further ground disturbance shall not resume within the area of the discovery until an agreement has been reached by all parties as to appropriate preservation or mitigation measures.

4. Findings on Significance for Impact 4.9.B

For the reasons presented above, implementation and compliance with the above-listed existing regulations, General Plan policies, county programs and procedures and existing Mitigation Measure 4.7.1B from EIR No. 441, as well as new Mitigation Measure 4.9.B-N1, would ensure that development accommodated by GPA No. 960 would have less than significant impacts on archeological resources.

C. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Impact 4.9.C – Cause the Destruction of Unique Paleontological Resources or Sites: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County and could result directly or indirectly in destruction of unique paleontological resources or sites or unique geological features. Compliance with existing laws, General Plan policies, Planning Department procedures and project-level general conditions of approval for paleontological resources would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.9.C

Future development within vacant areas of unincorporated Riverside County would result in the disturbance of vacant lands, including subsurface soils or unique geological features potentially containing paleontological resources. Significant paleontological resources, including fossilized large mammal remains, are known to exist

within Riverside County, based on past scientific studies, as well as from fossils and other resources that have already been recovered from various sites. Given the amount of undisturbed land still available for development, there remains the possibility that paleontological resources would be disturbed through grading activities. Impacts on paleontological resources would result from future development consistent with the General Plan, as updated pursuant to GPA No. 960, in the form of individual private development and public works projects.

For the purposes of this section, paleontological resources are defined as including fossilized remains of vertebrate and invertebrate organisms, fossil tracks and track ways and plant fossils. Because the scope of GPA No. 960 is essentially countywide, site-specific investigation of paleontological resources is beyond the scope of this EIR. Instead, this section focuses on developing a strategy to assess risks to paleontological resources and avoid or minimize any impacts to such resources.

At the countywide level, based on existing studies and geological data, Figure 4.9.3 shows areas within Riverside County that have the potential to contain paleontological resources. The figure indicates there are areas within Riverside County containing high or undetermined potential for paleontological resources. Changes to the General Plan resulting from GPA No. 960 could result in the future authorization of development within areas that contain high sensitivity for paleontological resources, resulting directly or indirectly in the destruction of a unique paleontological or geologic resource or site.

However, less than 19% of the land proposed for development under GPA No. 960 is considered to be in areas of high paleontological sensitivity. Approximately 76% of the land proposed for development under GPA No. 960 is considered to be in areas with low paleontological sensitivity and only 6% is considered to be of undetermined paleontological value. Future development could result in the disturbance of vacant lands and possible conversion of existing agricultural lands to various developed uses. This development could directly or indirectly cause the destruction of unique paleontological resources. Because the scope of GPA No. 960 is essentially countywide, site-specific investigation of paleontological resources is beyond the scope of this EIR. Instead this section focuses on developing a strategy to assess risks to paleontological resources and reduce any impacts to such resources.

2. Regulatory Compliance for Impact 4.9.C

As detailed and explained below, compliance with existing laws, regulatory programs, General Plan policies, Planning Department procedures, and general project-level conditions of approval are sufficient to ensure that impacts to paleontological resources or sites or unique geologic features as a result of GPA No. 960 would be less than significant.

a. Compliance with Federal, State and County Regulations

Compliance with the following state, federal and county regulations would prevent significant impacts to paleontological resources or sites or unique geologic features.

Paleontological Resources Preservation Act (PRPA): The PRPA was specifically intended to codify the generally accepted practice of limiting collection on public (federal) land of vertebrate fossils and other rare and scientifically significant fossils to qualified researchers who obtain a permit from the appropriate state or federal agency and agree to donate any materials recovered to recognized public institutions where they will remain accessible to the public and to other researchers.

PRPA specifies that a permit is require for collecting paleontological resources from public land and also establishes conditions for the appropriate collection and curation processes such resources are subject to; in order to ensure preserve the scientific value of such materials. Federal regulations require that projects within the county needing federal action (e.g., issuance of a federal Clean Water Act Section 404 permit by the ACOE) also trigger application of these federal standards.

Actions by the U.S. Army Corps of Engineers: Appendix C of Title 33 CFR, Section 325, establishes procedures to be followed by the ACOE to fulfill the requirements of NHPA, as well as other applicable historic preservation laws and Presidential directives related to historic resources potentially affected by ACOE actions (including issuance of permits pursuant to the federal CWA). It specifies that when a project's authorization requires a federal action (for example, issuance of permit pursuant to Section 404 of the CWA), the project must comply with the requirements of Section 106 of NHPA.

Regulation of Paleontological Resources Pursuant to California's Public Resources Code: PRC Section 5097 specifies that the unauthorized disturbance or removal of archeological, historical or paleontological resources located on public lands (including those owned by counties, cities, etc.) is a misdemeanor. It also prohibits the knowing destruction of objects of antiquity without a permit (i.e., express permission) on public lands and provides for criminal sanctions for violators. Section 5097.5 prohibits "knowing and willful" excavation, removal, destruction, injury and defacement of any paleontological feature on public lands (lands under state, county, city, district or public authority jurisdiction, or the jurisdiction of a public corporation), except where the agency with jurisdiction has granted express permission. Section 30244 requires reasonable mitigation for impacts on paleontological resources that occur as a result of development on public lands.

b. Compliance with Existing Riverside County General Plan

The following existing policies of the Riverside County General Plan would prevent significant impacts to paleontological resources or unique geologic features. See Section 4.9.3.E for full text of each policy.

Policies OS 19.7: Compliance with this policy ensures projects with low paleontological sensitivity are adequately reviewed should fossils be encountered during site development and that projects are appropriately conditioned to comply with applicable state and federal regulations.

c. Compliance with Proposed New or Revised General Plan Policies

The following proposed new policies of the Riverside County General Plan would further prevent significant impacts to paleontological resources or unique geological features. See Section 4.9.3.F for the full text of each of these policies.

Policies OS 19.6 and 19.8: Compliance with these policies ensures projects are adequately reviewed for paleontological resources prior to approval; that appropriate mitigation measures are developed and incorporated into project design and project conditions of approval; and that projects are appropriately conditioned to comply with applicable state and federal regulations.

Policy OS 19.9: By ensuring that the Riverside County Geologist directs newly found paleontological resources to a facility within Riverside County for their curation, this policy would further ensure preservation.

3. Finding on Significance for Impact 4.9.C

With implementation of the above-listed existing regulations, General Plan policies, Riverside County Planning Department procedures and project-level general conditions of approval, GPA No. 960 would have a less than significant impact on paleontological resources or sites or unique geologic features.

D. Would the project disturb any human remains, including those interred outside of formal cemeteries?

Impact 4.9.D - Result in the Disturbance of Human Remains: Future development accommodated by GPA No. 960 would increase rural, suburban and urban uses in Riverside County, adversely affecting human remains, including those interred outside formal cemeteries. Compliance with existing laws, regulatory programs, General Plan policies, Planning Department procedures, project-level general conditions of approval for cultural resources, and existing Mitigation Measures 4.7.1A and 4.7.1B would be sufficient to ensure that this impact is less than significant.

1. Analysis of Impact 4.9.D

Future development consistent with GPA No. 960 would result in disturbance of vacant lands. This has the potential to disturb buried cultural resources and human remains, including those interred outside of formal cemeteries, in both known and previously unknown locations.

Policies in the current General Plan and Riverside County Planning Department procedures require site-specific cultural resources surveys be conducted prior to development occurring. A cultural resources survey, which includes a records search of both the archeological repository at the Eastern Information Center at UCR, as well as appropriate historical reference materials, can identify the existence of known above-surface human remains, archeological and historic resources, and also indicate the likelihood for buried cultural resources, including human remains. However, the survey cannot determine with certainty whether buried cultural resources or human remains would be found until the surface soil is disturbed, such as during grading activities. Destruction or disturbance of such surface or buried cultural resources during construction of individual private development or public works projects can occur if appropriate regulatory measures are not strictly adhered to, particularly state laws regarding the discovery of human remains.

2. Regulatory Compliance for Impact 4.9.D

As detailed and explained below, compliance with existing laws, regulatory programs, General Plan policies, Planning Department procedures, project-specific mitigation measures, project-level general conditions of approval for cultural resources and existing Mitigation Measures 4.7.1A and 4.7.1B from EIR No. 441 are sufficient to ensure that disturbances to human remains, including those outside formal cemeteries, would be less than significant.

a. Compliance with Federal, State and County Regulations

Compliance with the following state, federal and county regulations would prevent significant disturbances to human remains, including those outside formal cemeteries. The full text for the following regulations can be found in Section 4.9.3 of this EIR.

Because most uncovered human remains and/or associated burial artifacts are of historical or prehistoric eras, they tend to be handled in a manner similar to archeological resources. In this aspect, the regulatory measures outlined for impacts to historical and archeological resources for Impacts 4.9.1 and 4.9.2, above, also apply for buried human remains. At the federal level, this includes the NHPA and, in particular, NAGPRA, which would ensure that any human remains or funerary artifacts associated with a Native American descendant, are handled appropriately. This includes protecting known burial sites from disturbance and ensuring careful control over the removal of any Native American human remains or related objects, as well as appropriate coordination between Riverside County and Tribes. Projects within Riverside County needing federal action (such as, issuance of a federal Clean Water Act Section 404 permit by the ACOE), would trigger application of these federal standards.

As human remains uncovered are most likely to be associated with prehistoric Native Americans, adherence to California's Traditional Tribal Places Act (Senate Bill 18) would help ensure that historic and prehistoric cultural resources are considered prior to discretionary project approval and that mitigation measures appropriate to site conditions are applied to prevent significant impacts to cultural resources. Specifically, the law requires Riverside County to consult with Native American groups at the earliest point in the land use planning process for certain types of projects regarding preservation of Native American places of prehistoric, archeological, cultural, spiritual and ceremonial importance.

Additionally, for every project subject to CEQA not otherwise categorically exempt, the County of Riverside reviews said project and implements conditions of approval (see Section 4.9.3 above). The project conditions are designed specifically to address land use projects with potential for disturbing or uncovering historical or archeological resources associated with Native American history or prehistory. These conditions include requirements for site monitoring during construction, actions for uncovering of a resource and also documentation and reporting requirements to verify compliance. Riverside County's conditions of approval establish the specific protocols to be followed should Native American remains be discovered in order to ensure compliance with state laws, for example, PRC Section 5097, as well as for the discovery of *any* human remains, whether modern, historic or prehistoric. Treatment for human remains can vary from leaving them in place to coordinating a relocation effort with the approval of the "Most Likely Descendant" from either a Native American Tribe or appropriate ethnic/cultural group.

Lastly, since uncovered human remains can also be of modern origins, and hence potentially part of a crime scene, specific County of Riverside regulations require contacting the Riverside County Coroner's Office for initial assessment of any uncovered human remains. Specifically, HSC Section 7050.5(b) states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to PRC Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to their treatment and disposition has been made. If the remains are determined not to be modern, subsequent treatment of the discovery is handled in coordination with the Tribe determined by the State of California to be the "Most Likely Descendant," see Existing Mitigation Measure 4.9.1A, below for additional details.

b. Compliance with County General Plan Policies and Procedures

The following existing policies of the Riverside County General Plan would contribute to ensuring that potential impacts to human remains and any associated artifacts resulting from future development accommodated by GPA No. 960 are less than significant. See Section 4.9.3.E for the text of each policy.

Policies OS 19.2 - 19.5: These policies ensure projects are adequately reviewed for cultural resources prior to approval; that appropriate mitigation measures are developed and incorporated into project design and/or conditions of approval; sites are avoided or conserved when possible; and, all efforts involve Native American

Tribes as dictated by SB 18 and Section 15064.5(d) of the State CEQA Guidelines. Policy OS 19.5 requires compliance with all applicable laws related to human remains.

Planning Department Procedures: Compliance with department procedures would further ensure projects are adequately reviewed; additional information is collected where warranted; archeological resources are identified and, where significant, preserved; human remains are treated in accordance with applicable laws; and Tribal participation occurs pursuant to SB 18 guidance when applicable.

General Conditions of Approval for Cultural Resources: Future development project-level compliance with conditions of approval is enforceable by the County of Riverside. When the Riverside County Archeologist ascribes conditions to a land use project, these measures are implemented at the appropriate stages of the land use development process. Project applicants must satisfy the terms of their conditions of approval before they may be authorized to implement subsequent stages in their land use development process. Specifically, a general condition concerning the finding of human remains is applied to each land use project by the Riverside County Archeologist. It requires that, if human remains are encountered, no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and their disposition has been made. If the Riverside County Coroner determines the remains to be Native American, the NAHC shall be contacted within the period specified by law.

Subsequently, the NAHC shall identify the "Most Likely Descendant." The Most Likely Descendant shall then make recommendations and engage in consultation with Riverside County and the property owner concerning the treatment of the remains as provided in PRC Section 5097.98. Human remains from other ethnic/cultural groups with recognized historical associations to the project area shall also be subject to consultation between appropriate representatives from that group and the Riverside County Planning Director.

c. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.7.1A and 4.7.1B were imposed to reduce impacts related to human remains. These measures remain applicable to this project and would lessen impacts to human remains, including those not in formal cemeteries, by ensuring that development which encounters human remains follow HSC directives and requiring avoidance as the preferred treatment of cultural resource sites. Because existing Mitigation Measures 4.7.1A and 4.7.1B apply countywide, they remain applicable to proposed GPA No. 960 as well.

Existing Mitigation Measure 4.7.1A: If human remains are encountered during a public or private construction activity, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The Riverside County Coroner must be notified within 24 hours. If the Coroner determines that the burial is not historic, but prehistoric, the State Native American Heritage Commission (NAHC) must be contacted to determine the most likely descendant (MLD) for this area. The MLD may become involved with the disposition of the burial following scientific analysis.

Existing Mitigation Measure 4.7.1B: (See Impact 4.9.A, above, for the full text of this measure.)

3. Finding on Significance for Impact 4.9.D

With implementation of, and compliance with, the above-listed existing laws, regulatory programs, General Plan policies, Riverside County Planning Department procedures and existing Mitigation Measures 4.7.1A and 4.7.1B from EIR No. 441, GPA No. 960 would have less than significant impacts on human remains and related artifacts, including those interred outside formal cemeteries.

4.9.7 Significance After Mitigation for Cultural and Paleontological Resources

Development and implementation activities resulting from the proposed project, General Plan Amendment No. 960, would be subject to a number of existing state and federal laws, General Plan policies, Riverside County Ordinance; Planning Department procedures, standard and tailored conditions of approval and existing Mitigation Measures 4.7.1A and 4.7.1B from EIR No. 441, as well as new Mitigation Measure 4.9.1-N1, as identified above. Collectively, these regulatory compliance and mitigation measures would reduce to below the level of significance any potential adverse changes in the significance of either archeological or historical resources, as they are defined in CCR Section 15064.5. The measures herein would also ensure that future impacts would neither directly nor indirectly destroy a unique paleontological resource or site, or unique geological feature. And, lastly, these measures would ensure that any impacts associated with the disturbance of any human remains, including those interred outside of formal cemeteries, would be less than significant. In total, these measures ensure that any significant adverse impacts to cultural resources resulting from future development accommodated by GPA No. 960 would be mitigated to below the level of significance.

Section 4.10

Energy Resources

Section 4.10 Energy Resources

4.10.1 Introduction

Due to a number of convergent trends in California, including unprecedented growth and increasing energy costs, there has never been a more important time for a dialogue on energy issues and energy efficiency in Riverside County. As required by State CEQA Guidelines, Appendix F, this section assesses the potential impacts on energy resources, specifically electricity and natural gas consumption, as a result of the construction and operation of future development accommodated by the proposed project, General Plan Amendment No. 960 (GPA No. 960), as the Riverside County General Plan builds out over the next 50 or so years. Related information, particularly associated with energy conservation, is also presented in Section 4.7 (Greenhouse Gases).

A. Background on Energy

Most simply, "energy" refers to the force that enables "work" to be done. "Power," though often used interchangeably when referring to utilities, properly denotes the rate at which energy is generated and consumed. As an example, when a light bulb with a power rating of 100 watts (W) is turned on for one hour, the energy used (consumed) is 100 watt-hours (Wh) or one kilowatt-hour (kWh). By comparison, one kilowatt is also equal to approximately 1.34 horsepower.

For the purposes of this analysis, these terms are used to focus specifically on the types of energy and power associated with development and growth within Riverside County. In particular, energy refers to electric power used to run the myriad machines and equipment that serve modern life, such as for lighting, heating, communications, entertainment and computation, to name but a few. Energy sources can also refer to the fossil fuels and to the other ("alternative") sources of energy that either directly provide a service or utility (for example, using natural gas in a stove to cook a meal or heat a home) or provide them indirectly by generating electricity instead (i.e., solar arrays and hydroelectric dams). A third type of energy source, fuel, encompasses all energy used to power transportation systems – that is, "mobile sources," such as cars, trucks, buses, trains and airplanes. However, fuel is not discussed in this section; see Section 4.7 instead.

Energy efficiency involves the creation and use of technology to produce the same end product using less energy. For example, an "energy-efficient" air conditioner produces the same level of cooling capability while using less electricity than the average air conditioner on the market. Standards for energy efficiency are continually changing as technological innovations make better use of energy. For example, an air conditioner that was considered "energy efficient" 30 years ago is probably not energy efficient by today's standards.

Energy conservation, though often confused with energy efficiency, is a separate issue. While both involve reducing overall energy use, they achieve this goal in different ways. Conservation involves cutting waste of

energy whereas energy efficiency does not. Specifically, "conservation," as used herein refers to the use of *less* energy through various means. For the purposes of this section, energy conservation is defined in terms of:

- Decreased reliance on natural gas and electricity.
- Decreased per-capita energy consumption.
- Increased use of renewable energy sources.

Conservation can be achieved through a variety of proactive means involving forethought in design and conscientious application of behaviors to operations. For example, replacing an old air conditioner with an energy efficient one would still waste energy if it is run even when the building is empty. The equipment is "energy efficient," but it is the practice and mode of its operation (by humans) that ensures that its use "conserves" energy. In fact, in this example, it may even have been more economical (saving electricity and money) to simply shut off the a/c on weekends than to buy a new unit.

In addition to explicitly addressing a variety of adverse environmental impacts, Appendix F of the State CEQA Guidelines specifies a variety of information and issues related to energy conservation that should be included in an EIR. The energy conservation issues included throughout this section are intended to comply with the State CEQA Guidelines.

B. Data Sources

Data on electricity annual usage in unincorporated Riverside County for 2008 (the most recent year of complete data available) was collected from Southern California Edison (SCE) and the Imperial Irrigation District (IID), the two main power suppliers in Riverside County, as part of the Greenhouse Gas Technical Report for Riverside County, dated May 2011, prepared by Atkins for the project (see Appendix EIR-6). The study also provided natural gas consumption data for Riverside County from the Southern California Gas Company (SCGC). Any other countywide data on electricity or natural gas consumption used in this section came from the GHG Technical Report or directly from filings with the California Energy Commission (CEC), as noted. As per currently accepted standards, the energy consumption calculations developed for this project use factors published in the Southern California Air Quality Management District (SCAQMD) "CEQA Air Quality Handbook," as noted in the applicable sections below. Background information and energy sector forecasts were collected from a number of reports issued by the CEC and California Public Utilities Commission (CPUC), which regulate these utilities, as well as the providers themselves. These various reports are indicated in the text and bibliography. Any other information sources used in this section are noted where they occur. See References (Section 7.3 of this EIR) for full listings of all sources and citations.

4.10.2 Existing Environmental Setting – Energy Resources

Provision of adequate power and energy is a significant component of public services in Riverside County. The following section describes the current power and energy resources serving unincorporated Riverside County, including electricity, natural gas and alternative energy sources. For a map of the types and locations of alternative energy sources and generating facilities in Riverside County, see Figure 4.10.2.

A. Electricity Sources

Electricity can be generated from a variety of sources. These include non-renewable fossil-fuel dependent sources, such as oil, coal or natural gas-fired steam generation facilities. Because they require fossil fuel combustion, such facilities have an associated array of air pollutant emissions; as discussed in Section 4.6 (Air Quality) and Section 4.7 (Greenhouse Gases). Electricity production from steam generation can also be achieved using other (alternative), non-fossil heat sources, such as nuclear and solar energy. Waterways can include dams with hydroelectric stations which convert the kinetic energy of falling water to electricity with zero operational emissions. Similarly, another "renewable" source, wind turbines, convert the kinetic energy of moving air into electricity, also with zero emissions.

Table 4.10-A (Summary of Electrical Production Facilities in Riverside County), below, provides a summary of all electrical energy generating facilities in Riverside County producing 0.10 megawatts (MW) and greater, as reported by the CEC. Within Riverside County, there are a total of 13 electricity generating facilities that operate on fossil fuels (chiefly natural gas). This includes at least five facilities located within and operated by municipalities (Palm Springs, Riverside and Corona), as well as several private generators (for example, powering country clubs in Indian Wells and Palm Desert). In total, these 13 generators produce a total of 1,382.466 MW of online power within Riverside County; nearly three times the production of the next largest source of power generation (wind facilities). According to the CEC, all of the fossil-fuel powered electrical generators in Riverside County use natural gas as the "primary fuel" in their "oil/gas" type facilities. Some of the generating facilities located outside Riverside County that provide electricity for use in Riverside County use other fossil fuels, including diesel and coal, in addition to natural gas, as well as a variety of alternate (renewable) energy sources. The CEC tracks usage of renewable energy resources which include: biomass and waste, geothermal, solar, wind and "small hydroelectric," which the CEC defines as facilities generating under 30 MW.

1. Biomass / Bio-gas Energy (Waste-to-Energy)

'Waste-to-energy' facilities utilize biomass and bio-gas as fuels (energy sources) derived from organic waste, including consumer, industrial and green wastes, such as dead trees, tree branches, yard clippings, leftover crops, wood chips, bark, sawdust, tires and livestock manure, as well as gas produced by the decomposition of waste buried at landfills. Using biomass/bio-gas to generate energy (heat and/or electricity) is a reasonable supplement to fossil fuels since California alone produces more than 60 million tons of suitable wastes each year. If all of it was utilized, California could generate close to 2,000 MW of electricity, which is enough energy for about two million homes.

According to the State of California, Riverside County is home to three facilities in which electricity is generated via biomass or bio-gas. The El Sobrante Landfill generates 4.05 MW from landfill gas and Riverside County's Badlands Landfill generates 1.20 MW. In Mecca, the Colmac Energy facility generates 54.15 MW of electricity from biomass, specifically agricultural and wood wastes. In total, as shown in Table 4.10-A, biomass/bio-gas facilities in Riverside County generate 59.50 MW.

Key: CCDW = City of Corona Dept. of Water
IEEC = Inland Empire Energy Center
LHMWD = Lake Hemet Municipal Water District
RCWMD = Riverside County Waste Management Dept.
CoR= City of Riverside
DWA = Desert Water Agency
IID = Imperial Irrigation District
SCE = Southern California Edison
MWD = Metropolitan Water District of So. California

Footnotes:
1. Table lists all facilities producing 0.10 MW or greater.
2. WTE = Waste-to-energy. WTE facilities use the following fuel sources: WTE-1: biomass, agricultural and wood waste; WTE-2: landfill gas; WTE-3: landfill gas and mixed solid waste.
3. Generation data per correspondence from Riverside County Waste Management Department, dated February 8, 2013.

Source: CEC, California Energy Almanac. 2010.

2. Hydroelectric Power

Hydroelectric power uses the kinetic energy of moving water to make electricity. The water from a river or reservoir can be sent through a hydroelectric power plant or powerhouse. This method is one of the largest producers of renewable energy in the world. In California, about 15% of all electricity comes from hydroelectric means. Currently, California law limits the types of hydroelectric power that can be considered "renewable

energy" due to growing concerns about the effects on fish and other wildlife. Hydroelectric facilities must be smaller than 30 MW and typically consist of hydrogenerators placed in water aqueducts.

A total of 11 hydroelectric facilities are located in Riverside County, including at least four that are within municipalities to serve those cities (Corona and Banning). All but one are "small hydroelectric facilities," that is, producing under 30 MW. The sole "large" facility is operated by the Metropolitan Water District of Southern California (MWD) at Diamond Valley Reservoir near Hemet, with an online capacity of 39.6 MW. By comparison, the next-largest facility in Riverside County, the Perris Small Conduit, only produces 7.9 MW. None of the ten "small" facilities individually reach even 10 MW. Most of these smaller facilities consist of inline or conduit-based turbines and similar such facilities. Other than two facilities operated by SCE in the San Gorgonio area, one each operated by Lake Hemet Municipal Water District and the Desert Water Agency, all facilities are operated by MWD. In total, as shown in Table 4.10-A, hydroelectric facilities located within Riverside County generate 63.508 MW.

3. Solar / Photovoltaic Energy

California's "Renewable Energy Portfolio" standard, which is discussed in more detail below, requires electric utility companies to obtain 20% of their power from renewable energy sources by 2010 and 33% by 2020. A main source of renewable power for the portfolio will be solar energy. Sunlight can be changed directly into electricity using solar cells, also known as photovoltaic cells. Photovoltaic cells can be found on many small appliances, such as calculators. However, they were first developed for use on space satellites. Electrical energy from solar cells can be used directly in a home or business for lights and appliances. Throughout Southern California, many homes and businesses utilize private solar cells (rooftop units, for example) for their individual sites' electricity needs.

On a commercial/industrial basis, large-scale solar arrays, including photovoltaic, as well as other types, such as "concentrated solar power" (heliostats, etc.), are used to provide electricity directly into the regional grid. The largest solar facility in the world, the Solar Energy Generating Systems, is located in the Mojave Desert north of Riverside County and consists of nine parabolic solar units (nearly a million mirrors spread across 1,600 acres) generating 354 MW of electricity annually.

Within Riverside County itself, no large-scale solar projects were in operation at the time the NOP was issued in April 2009. However, a number of large solar projects have been proposed on federal Bureau of Land Management (BLM) land in the desert of eastern Riverside County. The "Desert Sunlight Solar Farm," an approximately 4,144-acre, 550-megawatt project just east of Palm Springs was approved by BLM in August of 2011 *and as of 2014 is still in construction with hopes of coming on-line in 2015*. BLM has right-of-way requests encompassing more than 300,000 acres for development of 34 large solar thermal power plants totaling approximately 24,000 MW. Not all of these projects, however, have reached the CEC or CPUC application stage. In Riverside County, a huge (10-square mile) parabolic solar facility was approved by the U.S. Department of Interior and CEC in 2010 for construction on public (BLM) lands near Blythe. Once built, the facility will provide upwards of 1,000 MW. Other CEC-approved projects in Riverside County include Genesis Solar, a 250-MW solar trough project, the 500-MW solar trough Palen Solar Power Project and the 150-MW solar tower Rice Solar Energy Project. It should be noted that these projects will add additional electricity to the Western Grid, rather than Riverside County directly.

4. Wind Energy

The kinetic energy of the wind can be changed into other forms of energy, namely mechanical or electrical energy. Blowing wind spins the blades on a wind turbine which in turn rotate a shaft that turns a generator to make electricity. This method can be used on both a large and small scale; one turbine could produce enough electricity to power a school or a home. In addition, there are wind "farms" where turbines are grouped together in the windiest areas. About 11% of the world's wind-powered electricity is generated in California, with one of the three most prominently windy areas occurring in the San Gorgonio Pass of Riverside County (the other two areas are Altamont Pass east of San Francisco and the Tehachapi Pass south of Bakersfield). Together these three areas make enough electricity to supply an entire city the size of San Francisco.

Of the "alternative" energy-generating facilities located in Riverside County, wind-energy conversion systems (WECS) are the largest contributor by far. With 504.044 MW from 28 wind facilities in Riverside County, this is nearly ten times the amount generated by either biomass/bio-gas or hydroelectric sources. Riverside County's 28 WECS facilities are located entirely within the San Gorgonio Pass/Palm Springs region and the northern end of the Coachella Valley.

5. Geothermal

According to PRC Section 6903, geothermal resources are defined as:

> *"The natural heat of the earth, the energy in whatever form, below the surface of the earth present in, resulting from or created by, or which may be extracted from such products obtained from naturally heated fluids, brines, associated gases and steam, in whatever form, found below the surface of the earth, but excluding oil, hydrocarbon gas or other hydrocarbon substances."*

Over the years, numerous studies have been performed to determine the nature of geothermal resources in the Salton Trough, including studies of temperatures and temperature gradients, ground levels and slopes, seismicity, groundwater and hydrology of underlying waters, etc. In particular, the University of California at Riverside conducted an extensive study of Imperial Valley between 1965 and 1970. Together, this data has facilitated the development of economically efficient geothermal power plants in the Imperial County portion of the basin, south of the southern end of the Salton Sea.

Under the Federal Geothermal Steam Act, the U.S. Geological Survey (USGS) mapped 13 areas as "Known Geothermal Resources Areas" within California; none occur within Riverside County (though nine occur in Imperial County). There are, however, a number of locations with hot springs and other localized geothermal heat sources in Riverside County. In particular, there are mapped geothermal resources around the Salton Sea region, predominantly at the southeast end of the sea (in Imperial County, which addresses this resource through a Geothermal/Alternative Energy and Transmission Element in their General Plan). While there are four geothermal plants operating in Imperial County (generating nearly 1,800 MW of electricity), there are none within Riverside County. Though not used for commercial energy generation, geothermal water is used by fish farms in the Salton Sea area to accelerate growth rates and increase yields of farmed fish. Thermal waters are obtained from onsite wells at these farms.

B. Electricity Providers Serving Riverside County

Three companies provide the majority of the electricity serving unincorporated Riverside County: the largest, by far, is investor-owned Southern California Edison, which serves unincorporated western Riverside County. The

public providers, Imperial Irrigation District (IID) and Anza Electric Cooperative (AEC), provide the balance. IID serves the eastern desert portion of Riverside County and AEC serves the central mountainous region (the San Jacinto Mountains located between eastern and western Riverside County). Figure 4.10.1 (Electricity Providers Serving Riverside County) shows the electricity providers serving Riverside County. In addition to these providers, the cities of Banning, Corona, Moreno Valley and Riverside also provide electrical service to local customers; but only within their city boundaries for the most part. In 2009, the State of California reports these four cities provided a total of 2,386 gigawatts (GWh) of electricity to their customers (one gigawatt equals 1,000 megawatts [MW]). However, since they do not serve customers within unincorporated Riverside County, these municipal providers are not discussed further in this section.

1. Southern California Edison

SCE provides electrical service to customers within a 50,000-square mile area covering nearly 14 million people in 11 counties in the southern half of California, including western Riverside County. It provides electricity to users via 16 utility interconnections and nearly 5,000 different transmission and distribution circuits. SCE facilities include hydropower, nuclear and coal-powered facilities: the Big Creek Hydroelectric System (a collection of six major reservoirs, 27 dams and nine power plants in the Central Sierra Nevada Mountains northeast of Fresno), the San Onofre Nuclear Generating Station (SONGS) in Orange County near San Clemente and the Mojave Generating Station in the eastern high desert north of Riverside County. SCE also maintains and operates transmission and distribution infrastructure to provide purchased power to end users throughout its service area.

California law requires all energy providers to furnish their electricity customers with a power content label, with information about the energy resources used to generate their electricity. These percentages are based on electricity sold to California consumers during the previous year, as reported to the CEC. For ~~the second quarter of 2009~~ *2012,* SCE projected their power mix to consist of: ~~16~~*20*% from eligible renewable sources (including *1* ~~2~~% biomass and waste, 9% geothermal, 1% small hydroelectric, 1% solar and *8*~~3~~% wind), plus *21*~~51~~% from natural gas, *7*~~10~~% from coal, ~~4~~*5*% from large hydroelectric, *7*~~18~~% from nuclear and less than *4*1% from "other." In total, SCE reported a total energy consumption of approximately *86,558*~~85,850~~ GWh in *2012*~~2009~~, the most recent year for which data is available from the CEC. An additional ~~4,531~~ *5,445* GWh were also "self-generated" within the SCE's planning area in *2012* ~~2009~~.

SCE has declared itself the nation's largest purchaser of renewable energy, buying and delivering approximately 13.6 million MWh in 2009. This includes electricity generated from wind (3.5 million MWh in *2009*), solar (845,000 MWh), biomass (899,000 MWh), geothermal (7.785 million MWh, 57% of its total renewables portfolio) and small hydroelectric suppliers (561,000 MWh). In total, in 2009 renewable sources provided nearly 17% of SCE's total energy delivery. This amount will increase with the completion of the "nation's largest wind transmission project," the Tehachapi Renewable Transmission Project (in Kern County, north of Los Angeles) currently under construction. When complete, this project will be capable of delivering 4,500 MW of electricity from wind farms and other generators in the region. Another 66.6 MW will be obtained from AES Mountainview via a wind farm in the San Gorgonio Pass region of Riverside County. SCE also contracts with a number of smaller (under 20 MW) renewable electricity generators. SCE also has a number of upgrades and expansions planned or underway for the region. Among these are various projects in or affecting Riverside County, as listed in Table 4.10-B (SCE Electricity System Projects), below.

Table 4.10-B: SCE Electricity System Projects

Project Name (In-Service Date)*	Location / Areas Served	New Services or Facilities	Status
Alberhill System Project (2014)	Lake Elsinore, Wildomar, Menifee and portions of unincorp. Riv. Co. (Temescal Valley area)	New 500/115 kV substation, two 500-kV and one 115-kv transmission lines plus modify existing lines	Under regulatory review
Devers-Palo Verde No. 2 Project (2013)	Riverside County (approx. along I-10 I-215, approx. between Blythe and Menifee)	New 500/220 kV Colorado River substation near Blythe, two new 500-kv transmission lines, one 111-miles long and one 42-miles long	~~Under regulatory review; Construction to begin mid 2011~~ *Completed*
Devers-Mirage (mid 2011)	Palm Springs, Rancho Mirage, Palm Desert, Indian Wells, Cathedral City and surrounding unincorp. areas, (including Thousand Palms)	Split existing 115-kV (Devers) sub-transmission system into two, with new 115-kV sub-transmission line and upgrades to existing lines and equipment	~~Construction to begin in 2011~~ *Completed*
El Casco System Project (mid 2012)	Banning, Beaumont, Cherry Valley, Yucaipa and adjacent unincorp. Riverside County	New substation and 115-kV transmission line, upgrade 15.4 miles of existing lines and equipment	~~Construction began in 2009~~ *Completed*
Valley-Ivy Glen Sub-transmission Line & Fogarty Substation Project (~~2012~~*2016*)	Lake Elsinore, Perris and unincorporated areas of southwest Riverside County	New 115/12 kV substation (Fogarty) and new 115-kV sub-transmission lines	Construction to begin in ~~2011~~*2015*
Lakeview Substation Project (late 2013)	Lakeview, Nuevo and unincorp. areas of western Riverside County	New 115/12 kV substation and 115-kV sub-transmission lines plus upgrades to existing equipment	Under regulatory review
Red Bluff Substation Project (mid 2013)	Desert Center and eastern unincorporated Riverside County	New 500/200 kV substation and two new transmission lines plus upgrades to existing equipment	Application filed with the CPUC (November 2010)
Triton Substation Proj. (Approx. 2012)	Temecula, Murrieta and southwestern Riv. Co.	New 115/12 kV substation and 12-kV sub-transmission line segment	~~Approved by CPUC in September 2010~~ *Complete*
Circle City Sub-Station and Mira Loma-Jefferson Sub-Transmission Line Project (2016)	*Corona, Chino, Norco, Eastvale, and Ontario.*	*New Sub-Station and Source Lines, plus 66Kv Sub-Transmission Line*	*Currently in Siting Phase*
West of Devers Upgrade Project (2020)	*Banning, Beaumont, Calimesa, unincorporated Riverside County, San Bernardino County*	*Replacement of 48 Miles of 220kV line with new double circuit 220 kV line.*	*Under Review by CPUC*
Valley South Sub-Transmission Project (2019)	*Menifee, Temecula, Murrieta, Wildomar, and unincorporated Riverside County*	*3.4 miles of 115kV Lines, Improvements to Valley Station*	*Developing Permit to Construct*

* Date proposed for completion of project and its placement into service.

2. Imperial Irrigation District

A publicly-owned power utility, IID provides electrical service to the southeastern end of the Coachella Valley, all of Imperial County and parts of San Diego County. The sixth-largest electrical utility in California, IID serves more than 145,000 customers and controls more than 1,100 MW of energy. Roughly 30% of its power is produced locally via hydroelectric facilities along the All-American Canal. Steam-generation facilities and several natural gas turbines provide the balance.

According to filings with the CEC, in ~~2010~~*2013* IID had a projected power mix of *34.27*~~7.86~~% from eligible renewable sources (including *11.46*~~0.02~~% biomass and waste, *6.23*~~0.20~~% geothermal, *7.69*~~41~~% small hydroelectric, *4.83*~~0.23~~% wind and ~~less than 0.01~~*4.83*% solar), plus *34.59*~~47.46~~% from natural gas, *12.28* ~~29.48~~% from coal, *3.72*~~10.34~~% from large hydroelectric, *2.88*~~4.63~~% from nuclear and *0.01*~~0.23~~% from "other." Altogether, IID reported a total energy consumption of approximately *3,398*~~3,314~~ GWh in *2012*~~2009~~, the most recent year for which CEC data was available. An additional *21.52* ~~8.85~~ GWh were "self-generated" within the IID's planning area in *2012* ~~2009~~.

By *2016* ~~2014~~, IID will generate almost 25% of its annual energy requirements from renewable energy sources. Currently, generation sources used by IID include hydroelectric resources on the All-American Canal system (totaling approximately 250,000 MWh), plus natural gas and diesel-fuel generation facilities within or near IID's service territory. IID has entitlement to 3,679 MWh per month from the Parker-Davis Hydroelectric Project on the Colorado River in western Arizona. Also, as a member of the Southern California Public Power Agency, the IID participates in two projects: the San Juan Generating Station Unit 3, a 1,800-MW coal-fired plant in New Mexico that provides IID with up to 106 MW per hour, and the Palo Verde Nuclear Generation Station near Phoenix, Arizona. IID receives a small amount of energy (approximately 14 MW) from this nuclear station. IID also obtains energy and "ancillary services" from the Yuma Axis Steam Plant in Arizona and, rarely, up to 19.7 MW from an associated small gas-fired turbine also in Yuma. In terms of renewable energy sources, IID expects to have 103 MW online by 2016. IID has a number of upgrades and expansions planned or underway for the region. Among these are the following projects in or affecting Riverside County:

Table 4.10-C: Imperial Irrigation District Electricity System Projects

Project Name (In-Service Date)*	Location / Areas Served	New Services or Facilities	Status
Greenhunter Mesquite Biomass Generation Facility (2011)	District-wide	Enter into a power purchase agreement for 18 MW of biomass electricity generation	For 2011 delivery
Ice Bear Thermal Energy Storage Plant (2011)	District-wide	To provide 10 MW of load shifting & interruptible loads to achieve 50 MW of demand-side management	For 2011 delivery
El Centro Steam Plant Unit No. 3 (2012)	El Centro / District-wide	New 140-MW combined cycle generation facility at the existing El Centro Steam Plant	~~Under construction~~ *Completed*
Geothermal Generation (2014)	District-wide	Enter into a power purchase agreement for 50 MW of geothermal generation	For delivery by 2013
Geothermal Generation (2014)	District-wide	Enter into a power purchase agreement for 17 MW of geothermal generation with other So. Cal. Public Power Agency members	For delivery by 2014
SunPeak Niland Solar Electricity Gen. (2014)	District-wide	Enter into a power purchase agreement for 20 MW of solar thermal electricity generation	For delivery by 2014
Path 42 Transmission & New Lines (2016)	District-wide	New 500-kV transmission line and upgrades to Path 42 transmission lines	To be completed by 2016
Midway to Bannister Transmission Project (mid 2011)	Coachella Valley to Imperial County	New 35-mile 230-kV transmission line to connect the Midway and Bannister substations to geothermal resources in the Salton Sea region	Phase I completed early 2011

Project Name (In-Service Date)*	Location / Areas Served	New Services or Facilities	Status
Dixieland IV Transmission Project (2010)	District-wide	New 8-mile line to connect Imperial Valley and Dixieland substations	Portion completed in 2008
Ave 58 Substation (mid 2011)	District-wide	Add a new 161/92 kV transformer to existing Ave 58 substation	Under construction
PV-North Gila Transmission Project (2014)	Palo Verde and Imperial County, also Yuma, AZ	Participate in development of new 117-mile long 500-kV transmission line between Palo Verde and Yuma, AZ	MOU approved for Phase I
Multi-Substation Transmission Line Project (n/s)	Coachella Valley, Imperial County	New 500 kV line connecting the Imperial Valley, Midway and Coachella Valley substations plus upgrades to existing equipment	Planned project

* Date proposed for completion of project and its placement into service.
Source: Imperial Irrigation District, Integrated Resource Plan, 2010.

3. *Anza Electric Cooperative*

Located west of IID is the Anza Electric Cooperative (AEC), which is classed by the State of California as a rural electric cooperative. AEC provides electricity to a large portion of desert and mountainous central Riverside County (much of the region covered by REMAP [Riverside Extended Mountainous Area Plan], including Anza, Garner Valley, Pinyon Pines and parts of Aguanga). In total, AEC serves nearly 4,000 customers over a 500-square mile area.

AEC's main power supplier is the Arizona Electric Power Cooperative (AEPC), which generates and transmits electricity out of its Apache Generating Station east of Benson, Arizona. The facility consists of two coal-fired steam units each producing 195 MW of power, plus several gas turbines. In total, the station's gross rated output is 602 MW. In addition, two of its steam units have dual fuel capacity and can burn either coal or natural gas. Due to restructuring, power from the AEPC is transmitted to the AEC via a transmission system owned and operated by a separate entity, the Southwest Transmission Cooperative (SWTC). Their facilities include a 500-kV transmission line connecting the Palo Verde area to the Pinal West Switchyard located near Mobile, Arizona.

In total, according to CEC filings, AEC's electricity portfolio for ~~2009~~ *2012* consisted of ~~92~~*85*% coal and ~~7~~*4*% natural gas (from the Apache Generating Station), ~~plus~~ ~~1~~*6*% from large hydroelectric sources*, and 6% from unspecified sources*. None of these sources qualify as "eligible renewable sources" under California reporting standards. In total, AEC provided *47.85*~~45.01~~ GWh of electricity to their customers in *2012*~~2009~~, the most recent year in which data was available from the CEC.

C. Electricity Transmission

Essential to the region's energy supply are the high-voltage electric transmission connections to other energy markets. The transmission system provides a number of functions including: 1) enabling wholesale market transactions that help to stabilize electric prices; 2) improving system reliability and stability; 3) creating opportunities for establishing new electric generation stations; and 4) providing additional voltage support when needed. Although publicly available information is presented here, it should be noted that federal energy security requirements actually prevent energy providers from providing too much detail on transmission projects and locations.

Because of its importance at the regional, state and national levels, utility corridor planning occurs at all three of these levels, in addition to local. At the federal level, a multi-agency group (including the Bureau of Land Management, Departments of Energy and Defense, and the U.S. Forest Service) developed a West-wide Energy Corridor Plan designating energy corridors on federal lands in eleven states within the western U.S. pursuant to

Section 368 of the Energy Policy Act of 2005 (Public Law 109-58). Specifically, this law directed the various federal agencies to designate under their respective land management authorities corridors on federal lands for oil, gas and hydrogen pipelines, in addition to electricity transmission and distribution facilities (collectively known as "energy corridors"). In conjunction with the West-wide Energy Corridor plan, the agencies prepared and issued in 2008 a Final Programmatic Environmental Impact Statement for the same. In July of 2009, multiple organizations filed a complaint against the U.S. Department of the Interior, *et al.*, challenging various aspects of the agencies' Records of Decision, including charges of Endangered Species Act violations. In 2012, a settlement agreement was reached establishing "specific actions to mutually resolve the challenges in the Complaint" (per the West-wide Energy Corridor Programmatic EIS Information Center website). See *Wilderness Society, et al. v. United States Department of the Interior, et al., No. 3:09-cv-03048-JW (N.D. Cal.).* Figure 4.10.3 (Energy Transmission Corridors and Lines) shows the Section 368 utility corridor-designated federal lands occurring within Riverside County.

At the state level, regional and intrastate transmission line planning is undertaken by a number of agencies (see discussion under Section 4.10.3, Policies and Regulations). Through a variety of programs, including the Renewable Energy Transmission Initiative (RETI), the State of California has identified existing and future transmission system improvements planned to ensure the additional energy resources developed within the state to meet the state's renewable energy portfolio targets can be efficiently transmitted to the needed regions. RETI plans affecting Riverside County are also shown in Figure 4.10.3.

The specific transmission lines crossing the state are owned and operated by individual energy providers, both public and private. Two public utilities, SCE and IID, operate major electricity transmission lines in Riverside County. Major electricity transmission lines are those that carry a minimum of 220 kilovolts (kV) of power. SCE operates a 500-kV transmission line extending east-west through most of Riverside County. The 500-kV line follows the I-10 corridor from the Arizona border west to the San Gorgonio Pass area, veers south of I-10 toward Perris and then extends west from Perris into Orange County. From the San Gorgonio Pass area, multiple 220-kV lines run north of I-10 and follow San Timoteo Canyon into Redlands in San Bernardino County. Portions of the SCE 220-kV transmission lines also pass through the northwest corner of Riverside County.

The IID's transmission system consists of 500-kV, 230-kV, 161-kV and 92-kV transmission lines that run from northwestern San Bernardino County to Imperial County in the southeastern-most corner of California and further east into Arizona as well. The 500-kV line connects the Palo Verde Substation to the Northern Gila 500/69 kV substation near Yuma, Arizona, and the Imperial Valley 500/230 kV substation near El Centro. The system contains two major circuits, one of which connects with the SCE system at SCE's Devers and Mirage substations. Several other substations are also connected into the collector system with SCE. IID operates a 220-kV transmission line that extends from its Hinds water pumping plant located along I-10 west of Desert Center to its Iron Mountain pumping plant, in San Bernardino County, north of the intersection of State Route 62 (SR-62) and SR-177. In addition, energy from the San Juan Generating Station is transmitted via Western Area Power Administration's 500-kV substation near Palo Verde and delivered ultimately to IID's Blythe Substation.

D. Electricity Consumption

Electricity consumption has increased in every decade of the 20th century, although at a decelerating rate. In recent decades, average annual growth was 5% during the 1970s, 3.9% during the 1980s and 2.5% in the 1990s. During the energy crisis years of 2001 and 2002, electricity usage fell significantly. However, demand has rebounded since 2002, with growth averaging 2.7% per year between 2002 and 2005. More recently, economic stagnation has once again triggered a slight leveling off of consumption.

It was estimated that for 2009, unincorporated Riverside County plus the cities served by SCE consumed a total of approximately 95,942.80 GWh, according to data from the California Energy Consumption Data Management System. As shown in Table 4.10-D (Electricity Consumption in Riverside County by Major Energy Provider), below, the commercial buildings sector and residential sectors were the two largest consumers of electricity, together accounting for over two-thirds of all electricity used. The majority (89.4%) of electricity provided to unincorporated Riverside County was delivered by SCE, with lesser usage by self-generators in the SCE Planning Area (4.7%) and the two largest wholesale water providers in the region, IID and MWD, using 3.5% and 2.3% respectively, of the total energy consumed. Lastly, AEC represented only a small fraction of use, 0.04%, while self-generators in the Riverside County portion of IID's planning area used the smallest fraction (less than 0.01%).

According to the most recent available assessment of publicly owned utility adequacy performed by the CEC (2009c), there are several major trends in energy procurement that could affect long-range resource availability and planning for energy providers within the state, including:

- Utilities are forecasting slow growth in the amount of energy required to meeting customer demand, with a 9% increase in ten years (less than 1% per year growth).
- Energy supply from utility fossil resources is expected to remain relatively unchanged with total share reducing slightly from 63% in 2010 to 57% in 2018.
- As long-term contracts for coal-fired generation expire over the next 10-12 years, use of coal resources is expected to decrease roughly 37% between 2010 and 2022.
- Contracts for renewable energy supplies are expected to account for the largest increases in energy supplies utilized by Riverside County providers as additional facilities come online over the next 10 years in response to California State initiatives.
- Wind will be the fastest-growing source of alternative energy generation.
- Geothermal energy, particularly in Riverside County and through IID, will continue to grow.
- Solar will also be a major energy source, but will gain market share more slowly as large solar facilities come online.
- Energy generated from biomass will more than double within the state, with the majority derived from landfill gas capture and utilization.
- Energy self-generation rates are expected to continue to increase as the State Solar Roof initiative and other alternative energy programs continue to be implemented.
- By 2018, the CEC projects roughly 31% of all retail energy from publicly owned utilities will be from renewable sources, a 175% increase by volume over 2008 levels.

Source: California Energy Commission, California Energy Consumption Data Management System, 2009.

Data filed with the CEC (Forms 1.1a and 1.2), as reported in "California Energy Demand 2010-2020 Staff Energy Demand Forecast" (December 2009), indicates that by 2020 electricity consumption demand in SCE's service area is forecast to increase to 112,964 GWh, a 1.16% annual usage increase.

The CEC (2009c) states that annual peak-hour capacity for IID is expected to increase 17% from 1,095 MW in 2010 to 1,276 MW in 2018. IID forecasts a capacity surplus of 57 MW in 2018, due in part to short-term and spot market energy purchases of 125 MW. In total, the CEC report indicates IID has scheduled additions to its electric supply (through additional facilities or contracts) of 73% between 2010 and 2018. In addition, the CEC reports that IID has submitted an Energy Balance table showing an additional potential energy surplus averaging 3,615 GWh per year, but because such energy is generated from fossil-fuel sources and would only be generated if total energy requirements increased within IID, it was not included in CEC totals (nor shown in Table 4.10-D).

The CEC also found that as of 2008, AEC had adequate energy capacity and supplies to serve its customers. According to projections extrapolated from CEC data (2009c), with a total growth rate of approximately 7.7% for the next ten years (2008 – 2018), the projected energy demand for 2018 within AEC's service area would grow by approximately 3.78 GWh. AEC maintains a planning reserve margin of 12%; this is the amount of generation capacity that exceeds its forecasted peak demand, expressed as a percentage of the peak demand. Thus, even without additional supply or contract procurements, AEC would have sufficient power to meet forecast 10-year growth demand increases.

E. Natural Gas

Natural gas is a colorless, odorless gas composed mainly of methane with other heavier hydrocarbon gases plus non-combustible gases, such as nitrogen and carbon dioxide. Natural gas accumulates underground in formations, such as dry gas reservoirs (which contain primarily methane), associated reservoirs (where natural gas is produced along with oil) and unconventional resources (such as coal bed methane, tight sands and shale). After production, natural gas is processed to ensure that the quality meets pipeline quality specifications and is then transported via long interstate pipelines for distribution to retail customers. During transportation and distribution of natural gas, a small amount of mercaptans (sulfur compounds with a strong, pungent odor) are added to make sure that any gas leak is immediately identified.

Natural gas is produced in the U.S., Canada and Mexico in varying amounts depending on the region and source reservoir type. The major gas-producing regions in the U.S. are located in the Gulf of Mexico (both on- and offshore), Rocky Mountains, San Juan Basin, Permian Basin, Anadarko Basin, Michigan Basin and the Appalachian region.

California produces about 15% (historically about 1 billion cubic feet per day [Bcfd]) of the total natural gas consumed in the state. The other 85% comes from the San Juan and Rocky Mountains basin and Canada's Western Sedimentary basin. These supplies reach California via large interstate pipelines. According to the CPUC (2006), overall U.S. natural gas production ranges between 60 to 70 Bcfd, with California's consumption ranging between 5.5 to 6.5 Bcfd. With the recent drop in production levels in California, total domestic production has dropped to about 0.85 to 0.90 Bcfd. Nearly half *of* the natural gas produced in the state is distributed by utility companies to end users. The other half is directly provided to industry and electricity generation customers for their use.

The CPUC regulates natural gas utility service for the 10.5 million customers that receive natural gas from SCGC, Pacific Gas and Electric Company, San Diego Gas and Electric Company, Southwest Gas and two other natural gas utilities. Most of California's natural gas customers are residential and small commercial customers (referred to as "core" customers), who accounted for approximately 40% of the natural gas delivered by California utilities. Large consumers like electric generators and industrial customers (referred to as "non-core" customers) account for the remaining 60%.

In addition to regulating California utilities' natural gas rates and services, the CPUC also regulates its in-state transportation over the utilities' transmission and distribution pipeline systems, storage, procurement, metering and billing. SCGC owns and operates two natural gas storage fields in Southern California. These storage fields help meet peak seasonal demand and allow Southern California customers to secure natural gas supplies more efficiently. SCGC also owns and operates four underground storage facilities located around Southern California (none in Riverside County). According to the most recent available data (from the 2010 California Gas Report), these facilities provide SCGC with a total of 133.1 Bcf of storage capacity, of which 80 Bcf is allocated to their core residential, commercial and small industrial customers. About 4 Bcf is used for 'system balancing' and the remaining capacity is available to other customers. The 2008 completion of the Costa Azul liquefied natural gas terminal in Baja California, Mexico, has also expanded the supply of natural gas available to Southern California.

Together with its sister firm, San Diego Gas and Electric, SCGC serves all of Southern California, a total of over 20,000 square miles including Riverside County. Both are regulated subsidiaries of Sempra Energy, a publicly traded utility company. SCGC provides natural gas to Riverside County through three major natural gas pipelines traversing Riverside County from east to west. Most of the major natural gas transmission pipelines in Riverside County are operated by SCGC.

Main natural gas pipelines follow Interstate 10 through most of Riverside County. Dual pipelines branch off these main lines near Desert Center and extend southward into Imperial County. Another set of dual lines branch off the main pipelines near Gilman Springs Road at State Route 60 and extend southward into San Diego County. Near the Interstate 215 (I-215) interchange, one pipeline veers to the south and extends west across Riverside County following State Route 91. Another veers to the north and follows the I-215 before extending west across Riverside County through the City of Riverside and community of Pedley. SCGC pipelines also extend north-south through the western portion of Riverside County, providing system connectivity to west San Bernardino Valley and the upper desert region in San Bernardino County.

Delivery of natural gas via pipelines is not available to all residents in unincorporated Riverside County, especially in some rural, mountainous and desert areas. Residents of such areas generally use propane or other fuel sources for heating and cooking purposes. Propane is stored in above-ground tanks on individual properties and is provided by private gas purveyors, which supply the tanks via truck.

F. Natural Gas Consumption

California relies heavily on imported natural gas. According to the CEC (2005), only about 15% of the natural gas supply can be met from in-state sources. Almost half of California's natural gas is imported from the southwest United States, a little over one quarter from Canada and the remainder from the Rocky Mountain states, which only began supplying natural gas to California in 1992. Overall natural gas supply in the state is projected to increase 14% between 2003 and 2013, with most of the growth from imports from the Rocky Mountain region.

According to the CEC (2005), California's total natural gas supply increased from 1,980 Bcf in 1990 to 2,422 Bcf in 2001. Indigenous natural gas production was low in the mid-1990s, but production has increased over the past few years. Service by SCGC was forecast to reach 890.4 Bcf by 2010. Data from the GHG Analysis (see Appendix EIR-6) prepared for this project indicates that annual natural gas usage for Riverside County in 2008 was 9.28 Bcf (approximately 96 million therms). The CPUC (2006) has established California as having an average natural gas usage rate of 0.06 cf per capita per day.

SCGC plans and designs its gas delivery systems to provide continuous service to its core (retail) customers under an extreme peak day event. The extreme peak day design criteria is defined as a 1-in-35 likelihood event for each utility's service area. Temperature also affects the likelihood of an extreme peak day event, since gases expand when heated. Demand on an extreme peak day is met through a combination of withdrawals from underground storage facilities and flowing pipeline supplies. SCGC is approved by the CPUC to hold a firm storage withdrawal amount of 2.225 Bcfd to serve the core portfolio of SCGC's retail core customers. Firm withdrawal plus firm pipeline supplies must be sufficient to meet peak day operating requirements.

In terms of growth, SCGC (2010) has forecast an average increase in "active meters" of 1.2% annually from 2009 through 2030. Across all of its market sectors, however, SCGC predicts an overall contraction in gas demand of approximately 0.21% annually between 2010 and 2030. Driving this contraction is the continued slump in the housing market, reduced employment forecasts, higher gas prices and aggressive energy-efficiency savings goals. In particular, the State-mandated push to alternative energy generation through non-fossil fuel means is expected to greatly reduce the amount of natural gas used for electricity generation in the state over the next two decades.

4.10.3 Policies and Regulations Addressing Energy Resources

A. State and Federal Regulations

The Federal Energy Regulatory Commission is an independent agency that regulates the transmission and sale of electricity, natural gas and oil; licenses and inspects hydropower projects; reviews proposals to build liquefied natural gas terminals; and oversees related environmental matters.

The California Public Utilities Commission (CPUC) regulates privately owned (i.e., investor-owned) electric power and natural gas utility companies in the State of California, as well as telecommunications, water, railroad, rail transit and passenger transportation utilities. Assembly Bill 1890, enacted in 1996, deregulated the power generation industry, allowing customers to purchase electricity on the open market. Under deregulation, the production and distribution of power that was under the control of investor-owned utilities (e.g., Southern California Edison) was decoupled. For these utilities, the CPUC regulates the design, installation and management of California's public electric, natural gas, water, transportation and telecommunications. The CPUC also provides consumer programs and information, such as energy efficiency, low income programs, demand response and California solar initiative for California's energy consumers.

California Energy Code (CCR Title 24, Part 6): Title 24, Part 6 of the California Code of Regulations (CCR), forms the California Energy Code, (often referred to simply as "Title 24," for short). Also known as "California's Energy Efficiency Standards for Residential and Nonresidential Buildings," this code was established in 1978 in response to a legislative mandate to reduce California's energy consumption. These standards are updated periodically by the CEC to allow consideration and possible incorporation of new energy efficiency technologies and methods.

Since the adoption of Part 6 of Title 24, California has led the nation in reducing per-capita energy use by funding energy efficiency programs administered by the state's electric and gas utilities. These include establishment of the California Renewable Energy Portfolio Standards, California Solar Initiative and others. In 2008, the CPUC adopted the state's first "Long-Term Energy Efficiency Strategic Plan," to provide a "roadmap" to achieving maximum energy savings across the various major energy uses and sectors in California.

California Green Building Standards Code (CCR Title 24, Part 11): Periodically, the State of California updates Title 24 regulations to ensure they continue to serve as appropriate standards for energy efficiency and conservation. In 2008, the State of California adopted Part 11 into CCR Title 24 to establish the "California Green Building Standards Code," (CGBSC) as well as a variety of related changes throughout the other parts of Title 24. These changes were adopted, effective August 1, 2009, for several reasons:

- To provide California with an adequate, reasonably priced and environmentally sound supply of energy.
- To respond to Assembly Bill 32, the Global Warming Solutions Act of 2006, which mandates that California must reduce its GHG emissions to 1990 levels by 2020.
- To pursue California energy policy, which states that energy efficiency is the resource of first choice for meeting California's energy needs.
- To act on the findings of California's Integrated Energy Policy Report (IEPR) that concludes that the Title 24 standards are the most cost-effective means to achieve energy efficiency. The IEPR also calls for the standards to continue to be upgraded over time to reduce electricity needs and peak demand, and

recognizes the role of the standards in reducing energy used for meeting California's water needs and in reducing GHG emissions.

- To meet the West Coast Governors' Global Warming Initiative commitment to include aggressive energy efficiency measures into updates of state building codes.

- To meet the Governor's Executive Order No. S-20-04 for the Green Building Initiative to improve the energy efficiency of non-residential building through aggressive standards.

As outlined by the California Building Standards Commission in Section 101.1 of the 2008 CGBSC: "The California Green Building Standards Code is Part 11 of twelve parts of the official compilation and publication of the adoption, amendment and repeal of building regulations to the California Code of Regulations, Title 24, also referred to as the California Building Standards Code." The purpose of this code is to "improve public health, safety and general welfare by enhancing the design and construction of buildings" through "sustainable construction practices" in several categories, including planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency and environmental air quality (2008 CGBSC, Section 101.2). These standards apply to essentially all "building structures throughout the State of California" (including their "design, operation, construction, replacement, use and occupancy, location, maintenance, removal and demolition"). (2008 CGBSC Section 101.3)

Section 202 of the code defines a "green building" as "a holistic approach to design, construction and demolition that minimizes the building's impact on the environment, the occupants and the community." The code contains both mandatory and voluntary green building measures. Among other standards, the CGBSC establishes two "tiers" of energy performance for green buildings: Tier 1, in which the California Energy Code (i.e., CCR Title 24, Part 6) requirements for energy efficiency are exceeded by 15%; and, Tier 2, in which the requirements are exceeded by 30%. See CGBS Section 503.1. The CGBSC also introduces additional standards for water conservation and efficiency (see EIR Section 4.19 (Water Resources) for details).

Senate Bill 1078: California's Renewables Portfolio Standard (RPS) was established in 2002 by Senate Bill 1078. It requires the state's retail sellers of electricity, that is, investor-owned utilities, electric service providers and community choice aggregators, to procure at least 20% of their retail electricity sales from eligible sources of renewable energy by 2017. California's energy agencies subsequently committed to achieving the 20% target by 2010, seven years earlier than the original target. This 20% target was codified in 2006 by the enactment of Senate Bill 107, which took effect on January 1, 2007. A higher, more ambitious goal of 33% renewables by 2017 was initially set by the CEC and CPUC in their joint "Energy Action Plan." However, Governor Schwarzenegger's November 2008 Executive Order No. S-14-01 set the goal at 33% by 2020. In creating the RPS, the legislature underscored the importance of increasing the diversity, reliability, public health and environmental benefits of the energy mix.

Other State Actions and Programs: As part of its overall effort to address greenhouse gases (GHGs) and global climate change, the State of California has promulgated a number of regulations and programs that address energy conservation both directly and indirectly. These are discussed in Section 4.7 (Greenhouse Gases) of this EIR.

Regulation and Authorities for Electrical Transmission Lines: There are several agencies which have regulatory authority over the siting and permitting of electrical transmission power lines in California. Each agency has specific areas of oversight or circumstances when oversight occurs, as listed below. However, in all cases, power electrical transmission lines must undergo environmental review prior to a siting decision being made. If the line is intrastate and does not cross federal lands, then the proposed line must undergo

environmental review according to CEQA. Depending on the type of operator (municipal versus investor-owned utility), the agency responsible for environmental oversight can change. If the transmission line is wholly within federal lands, then the responsible federal agency must prepare an environmental review of the project as pursuant to the National Environmental Policy Act (NEPA). If a project crosses both state and federal lands in California, then a joint document is usually prepared. Typically, the agency with the greatest extent of affected land (often measured linearly) serves as the lead agency in the preparation of the environmental document. The agencies with regulatory and environmental oversight are as follows:

- **California Energy Commission (CEC):** Electrical transmission lines that are part of a power generation facility over 50 MW in size from the facility to the first point of interconnection.

- **Federal Energy Commission (FERC):** Interstate electrical transmission lines where the primary intent of the line is to service interstate power interest and where there are no formal state environmental guidelines and where federal lands may also be affected.

- **California Public Utilities Commission (CPUC):** Transmission lines that are sited and developed by an Investor Owned Utility (IOU), part of a rate decision and/or interconnected with an IOU transmission line. Subject to a variety of rules and reviews pursuant to PUC General Order 131(d), "Rules Relating to the Planning and Construction of Electrical Generation, Transmission/Power/Distribution Line Facilities and Substations Located in California," and Rules 17.1 and 17.3 (the CPUC's "Rules of Practice and Procedure") which require the CPUC to conduct CEQA reviews for transmission line applications. These rules apply to any project initiated by an IOU in the State of California on public or private land.

- **Other Federal Agencies (BLM, U.S. Forest Service, U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, Bureau of Indian Affairs, Department of Defense, etc.):** Lines that are within federal lands and not being developed primarily for interstate transmission of electrical power.

- **California State Lands Commission:** Lines that are primarily or exclusively within the boundaries of lands owned by the State of California.

- **Municipal Utilities (Including Irrigation Districts and Water Authorities):** Agencies that act as their own regulatory entities for the siting and permitting of electrical transmission lines (typically under authorities delegated by the State of California); for example, the Imperial Irrigation District. Municipal utilities must follow CEQA guidelines with respect to siting decisions. However, they are not subject to other extra-territorial review and oversight, assuming none of the conditions for other agencies (as per above) apply.

Renewable Energy Transmission Initiative (RETI): RETI is a statewide initiative to help "identify the transmission projects needed to accommodate [the State's recently adopted] renewable energy goals, support future energy policy and facilitate transmission corridor designation, and transmission and generation siting and permitting." The principal aim of RETI is to "identify those [competitive renewable energy] zones that can be developed in the most cost effective and environmentally benign manner" and "prepare detailed transmission plans for those zones identified for development."

B. County Regulations

In addition to complying with state regulations, Riverside County has engaged in a series of local activities that will further California's long-term energy efficiency goals by off-setting demand for energy, especially natural gas and electricity. Some of these County of Riverside activities include the following:

Wind Implementation Monitoring Program (WIMP): Under this County of Riverside program, wind energy conversion systems (WECS), the wind turbines used to generate electricity, are monitored through the planning, installation and operational phases to ensure environmental compliance, particularly with regard to noise and vibration.

Board of Supervisors (BOS) Policy H-29 (Sustainable Building Policy): Adopted in February 2009, this policy establishes a series of sustainable building practices to be used "in the design of [Riverside] County capital improvement project in order to reduce pollution, protect natural resources, enhance asset value, optimize building performance and create healthier workplaces for [Riverside] County employees." Among other things, use of "green" building practices include both design changes and engineering equipment features designed to reduce operating costs associated with heating, ventilation and air conditioning (HVAC) systems and lighting systems by using "as little energy as possible." Specifically, the policy states that all Riverside County building projects exceeding 5,000 square feet initiated on or after March 1, 2009, must meet the criteria for LEED™ certification under the LEED™ rating system or a Riverside County-approved equivalent. For renovations to existing buildings, the Board encourages the use of LEED™ existing building (LEED-EB) criteria. The policy also sets forth a number of performance targets and goals that "should be met or exceeded."

BOS Policy H-4 (Conservation of Energy in County Facilities): This policy was originally adopted by the Board in 1975, revised once in 1979 and then several times between 2001 and present, most recently in August 2010. First and foremost, the policy states that "all County [of Riverside] departments are responsible for conserving energy." It outlines an extensive list of actions to be taken by the Riverside County Economic Development Agency (EDA) in its role of managing and operating County of Riverside facilities. Areas covered by EDA directives include building heating and cooling systems (i.e., reducing A/C use), lighting (i.e., increasing use of fluorescent bulbs and reducing lighting use), building controls (that is, building automation systems set and monitored to only operate lighting, equipment and other electricity use only during a building's operational hours), water conservation, energy conservation programs developed in conjunction with local providers and energy efficiency programs which specify that rebates and incentives obtained for various conservation activities or purchases be used to further fund such measures. Less detailed directives applicable to all Riverside County departments are also included.

County Weatherization Program: This program has been offered by the Community Action Partnership of Riverside County since 1979. The services are available at no cost to low-income homeowners and renters living in Riverside County who meet the income guidelines. Priority is given to families with the lowest incomes and highest energy burden, to people age 60 and over, those permanently disabled and to families with children under five years of age. Weatherization or weatherproofing is the practice of protecting a building and its interior from the elements, particularly from sunlight and wind, in order to reduce energy consumption and optimize energy efficiency. The program works through a process of pre-inspection, in which needed weatherization measures are identified, improvement installation and then post-inspection of the work, in which a weatherization inspector verifies the work was performed as authorized. Funding is provided by federal LIHEAP and the Department of Energy.

Low Income Energy Assistance Program: Also offered by the Community Action Partnership, this program provides credits for payments to utilities for energy-related expenses (specifically, electricity, gas, wood, oil and

propane). Qualification for the program is based on household income, priority points and energy burden. The assistance is offered on a once-per-year basis.

C. Existing County General Plan Policies

The General Plan includes policies that reduce or minimize the effects of addition demand and consumption of energy resources, especially electricity and natural gas, associated with prospective growth within Riverside County. The following existing General Plan policies directly or indirectly address the issue of energy resources and their conservation:

1. Open Space (OS) Element Policies

Policy OS 10.1: Provide for orderly and efficient wind energy development in a manner that maximizes beneficial uses of the wind resource and minimizes detrimental effects to the residents and the environment of the county.

Policy OS 10.2: Continue the County's Wind Implementation Monitoring Program (WIMP) in order to study the evolution of wind energy technology, identify means to solve environmental and community impacts, and provide for an ability to respond with changes in the County's regulatory structure.

Policy OS 11.1: Enforce the state Solar Shade Control Act, which promotes all feasible means of energy conservation and all feasible uses of alternative energy supply sources.

Policy OS 11.2: Support and encourage voluntary efforts to provide active and passive solar access opportunities in new developments.

Policy OS 11.3: Permit and encourage the use of passive solar devices and other state-of-the-art energy resources.

Policy OS 12.1: Allow for the development of non-electrical, direct heat uses of geothermal heat and fluids for space, agricultural, and industrial heating in situations and localities where naturally occurring hydrothermal features will not be degraded.

Policy OS 12.2: Base all geothermal decisions on appropriate data relating to anticipated environmental, cultural, aesthetic, archaeological and social impacts.

Policy OS 12.3: Weigh the benefits of geothermal as a viable energy source against the protection of hot springs, geysers, thermal pools, and other thermal features for their ecological, educational, and recreational values.

Policy OS 12.4: Permit geothermal heat utilization for space heating in buildings.

Policy OS 16.2: Specify energy efficient materials and systems, including shade design technologies, for County buildings.

Policy OS 16.3: Implement public transportation systems that utilize alternative fuels when possible, as well as associated urban design measures that support alternatives to private automobile use.

Policy OS 16.4: Undertake proper maintenance of County physical facilities to ensure that optimum energy conservation is achieved.

Policy OS 16.5: Utilize federal, state, and utility company programs that encourage energy conservation.

Policy OS 16.6: Assist public buildings and institutions in converting asphalt to greenspace to address the heat island effect.

Policy OS 16.7: Promote purchasing of energy-efficient equipment based on a fair return on investment, and use energy-savings estimates as one basis for purchasing decisions for major energy-using devices.

Policy OS 16.8: Promote coordination of new public facilities with mass transit service and other alternative transportation services, including bicycles, and design structures to enhance mass transit, bicycle and pedestrian use.

Policy OS 16.9: Encourage increased use of passive, solar design and day-lighting in existing and new structures.

Policy OS 16.10: Encourage installation and use of cogenerating systems where they are cost-effective and appropriate.

2. Air Quality (AQ) Element Policies

Policy AQ 5.2: Adopt incentives and/or regulations to enact energy conservation requirements for private and public developments.

Policy AQ 5.3: Update, when necessary, the County's Policy Manual for Energy Conservation to reflect revisions to the County Energy Conservation Program.

Policy AQ 5.4: Encourage the incorporation of energy-efficient design elements, including appropriate site orientation and the use of shade and windbreak trees to reduce fuel consumption for heating and cooling.

Policy AQ 13.1: Manage the County of Riverside transportation fleet fueling standards to achieve an appropriate alternate fuel fleet mix.

D. Proposed New or Revised County General Plan Policies

GPA No. 960 includes the following proposed policies and plans related to electricity and natural gas use, as well as energy conservation:

1. Open Space (OS) Element Policies

NEW **Policy OS 11.4:** *Encourage site-planning and building design that maximizes solar energy use/ potential in future development applications.*

Policy OS 16.1: Continue to implement Title 24 of the ~~State Building Code~~ *California Code of Regulations (the "California Building Standards Code"), particularly Part 6 (the California Energy Code) and Part 11 (the California Green Building Standards Code), as amended and adopted pursuant to County ordinance.* Establish mechanisms and incentives to encourage architects and builders to exceed the energy efficiency standards ~~of~~ *within* CCR Title 24.

NEW **Policy OS 16.11:** *Provide incentives such as transfer of development rights and clustering to private developments that provide energy-efficient site design.*

NEW **Policy OS 16.12:** *Consider energy-efficient site design and construction techniques in renovation, construction or procurement of leased spaces.*

NEW **Policy OS 16.13:** *Encourage installation and use of new technology at existing facilities or the establishment of new waste/waste reduction facilities, where cost-effective and appropriate, to ensure that optimum energy conservation is achieved.*

NEW **Policy OS 16.14:** *Coordinate energy conservation activities with the County Climate Action Plan (CAP) as decreasing energy usage also helps reduce carbon emissions.*

2. Air Quality (AQ) Element Policies

Policy AQ 4.1: *Require* ~~Encourage~~ the use of *all feasible* building materials/methods which reduce emissions.

Policy AQ 4.2: *Require* ~~Encourage~~ the use of *all feasible* efficient heating equipment and other appliances, such as water heaters, swimming pool heaters, cooking equipment, refrigerators, furnaces and boiler units.

Policy AQ 4.3: *Require* ~~Encourage~~ centrally heated facilities to utilize automated time clocks or occupant sensors to control heating *where feasible.*

Policy AQ 4.4: Require residential building construction to comply with energy use guidelines detailed in *Part 6 (California Energy Code) and/or Part 11 (California Green Building Standards Code) of* Title 24 of the California ~~Administrative~~ Code *of Regulations.*

NEW **Policy AQ 18.1:** *Baseline emissions inventory and forecast. Riverside County CAP has included baseline emissions inventory with data on County's CO2e emissions for specific sectors and specific years. The carbon inventory greatly aids the process of determining the type, scope and number of GHG reduction policies needed. It also facilitates the tracking of policy implementation and effectiveness. The carbon inventory for the County consists of two distinct components; one inventory is for the County as a whole, as defined by its geographical borders and the other inventory is for the emissions resulting from the County's municipal operations.*

NEW **Policy AQ 18.2:** *Adopt GHG emissions reduction targets. Pursuant to the results of the Carbon Inventory and Greenhouse Gas Analysis for Riverside County, future development proposed as a discretionary project pursuant to the General Plan shall achieve a greenhouse gas emissions reduction of 25% compared to Business As Usual (BAU) project in order to be found consistent with the County's Climate Action Plan (CAP).*

NEW **Policy AQ 18.3:** *Develop a Climate Action Plan for reducing GHG emissions. The Riverside County CAP has been developed to formalize the measures necessary to achieve County GHG emissions reduction targets. The CAP includes both the policies necessary to meet stated targets and objectives. These targets, objectives and Implementation Measures may be refined, superseded or supplemented as warranted in the future.*

NEW **Policy AQ 18.4:** *Implement policies and measures to achieve reduction targets. The County shall implement the greenhouse gas reduction policies and measures established under the County Climate Action Plan for all new discretionary development proposals.*

NEW **Policy AQ 18.5:** *Monitor and verify results. The County shall monitor and verify the progress and results of the CAP periodically. When necessary, the CAP's "feedback" provisions shall be used to ensure that any changes needed to stay "on target" with stated goals are accomplished.*

NEW **Policy AQ 19.3:** *Require new development projects subject to County discretionary approval to achieve the GHG reduction targets established in the CAP either through:*

a. *Garnishing 100 points through the Implementation Measures found in the County's CAP; or*

b. *Requiring quantification of project-specific GHG emissions and reduction of GHG emissions to, at minimum, the applicable GHG reduction threshold established in the CAP.*

NEW **Policy AQ 20.10:** *Reduce energy consumption of new developments (residential, commercial and industrial) through efficient site design that takes into consideration solar orientation and shading, as well as passive solar design.*

NEW **Policy AQ 20.11:** *Increase energy efficiency of new developments through efficient use of utilities (water, electricity, natural gas) and infrastructure design. Also, increase energy efficiency through use of energy-efficient mechanical systems and equipment.*

NEW **Policy AQ 20.12:** *Support programs to assist in retrofitting older affordable housing units to improve their energy efficiency, particularly residential units built prior to 1978 when CCR Title 24 energy efficiency requirements went into effect.*

NEW **Policy AQ 20.18:** *Encourage the installation of solar panels and other energy-efficient improvements and facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc).*

NEW **Policy AQ 20.19:** *Facilitate development and sitting of renewable energy facilities and transmission lines in appropriate locations.*

NEW **Policy AQ 20.21:** *Provide homeowner education programs on the various voluntary ways in which they may reduce their homes' GHG emissions, e.g., improving home insulation, adding solar energy and providing information on energy-saving landscaping techniques.*

NEW **Policy AQ 20.27:** *Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel through fleet transitioning programs. Also reduce total vehicle miles traveled by County employees, both commuting to work sites and travel for the conduction of County activities.*

NEW **Policy AQ 20.28:** *Increase the energy efficiency of all existing and new County buildings and infrastructure operation (roads, water, waste disposal and treatment, etc.). Also decrease energy use through incorporating renewable energy facilities (such as, solar array installations, individual wind energy generators, geothermal heat sources) on County facilities where feasible and appropriate.*

NEW **Policy AQ 23.2:** *For discretionary actions, land use-related greenhouse gas reduction objectives shall be achieved through development and implementation of the appropriate Implementation Measures of the Climate Action Plan for individual future projects. County programs shall also be developed and implemented to address land use-related reductions for County operations and voluntary community efforts.*

NEW **Policy AQ 24.1:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions achieved through improving energy efficiency and increasing energy conservation:*

a. *Require new development (residential, commercial and industrial) to reduce energy consumption through efficient site design that takes into consideration solar orientation and shading, as well as passive solar design. Passive solar design addressed the innate heating and cooling effects achieved through building design, such as selective use of deep eaves for shading, operable windows for cross-ventilation, reflective surfaces for heat reduction and expanses of brick for thermal mass (passive radiant heating).*

b. Require new development (residential, commercial and industrial) to design energy efficiency into the project through efficient use of utilities (water, electricity, natural gas) and infrastructure design.

c. Require new development (residential, commercial and industrial) to reduce energy consumption through use of energy efficient mechanical systems and equipment.

d. Establish or support programs to assist in the retrofitting of older affordable housing units.

e. Actively seek out existing or develop new programs to achieve energy efficiency for existing structures, particularly residential units built prior to 1978 when CCR Title 24 energy efficiency requirements went into effect.

f. Balance additional upfront costs for energy efficiency and affordable housing economic considerations by providing or supporting programs to finance energy-efficient housing.

***NEW* Policy AQ 24.2:** *For discretionary actions, energy efficiency and conservation objectives shall be achieved through development and implementation of the appropriate Implementation Measures of the Climate Action Plan for all new development approvals. County programs shall also be developed and implemented to address energy efficiency and conservation efforts for County operations and the community.*

***NEW* Policy AQ 26.1:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions derived from energy generation:*

a. Encourage the installation of solar panels and other energy-efficient improvements.

b. Facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc.).

c. Facilitate development of renewable energy facilities and transmission lines in appropriate locations.

d. Facilitate renewable energy facilities and transmission line siting.

e. Provide incentives for development of local green technology businesses and locally produced green products.

f. Provide incentives for investment in residential and commercial energy efficiency improvements.

g. Identify lands suitable for wind power generation or geothermal production and encourage development of these alternative energy sources.

***NEW* Policy AQ 26.2:** *For discretionary actions, the objectives for greenhouse gas reduction through increased use of alternative energy sources shall be achieved through development and implementation of the applicable Implementation Measures of the Climate Action Plan. County programs shall also be developed and implemented to address use of alternative energy for County operations and within the community.*

***NEW* Policy AQ 29.1:** *The County shall implement programs and requirements to achieve the following Objectives related to reducing greenhouse gas emissions from County transportation, such as fleet composition, construction equipment, employee commuting and travel on County business:*

a. Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel.

b. Increase use of alternative and lower carbon fuels in the County vehicle fleet.

c. Reduce total vehicle miles traveled by County employees, both commuting to work sites and travelling for the conduction of County activities.

NEW **Policy AQ 29.2:** *The County shall implement programs and requirements to achieve the following objectives related to reducing greenhouse gas emissions through improving energy efficiency for County facilities and operations:*

a. Improve the energy efficiency of all existing and new County buildings.

b. Improve the energy efficiency of County infrastructure operation (roads, water, waste disposal and treatment, buildings, etc.)

c. Decrease energy use through incorporating renewable energy facilities (such as, solar array installations, individual wind energy generators, geothermal heat sources) on County facilities where feasible and appropriate.

4.10.4 Thresholds of Significance for Energy Resources

The proposed project would result in a significant impact to energy resources if it would:

A. Require or result in substantial adverse physical impacts associated with the provision of new or physically altered utilities, such as electricity production or transmission facilities, the need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives.

B. Require or result in substantial adverse physical impacts associated with the provision of new or physically altered utilities, such as natural gas production or transmission facilities, the need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives.

C. Result in an inefficient, wasteful or unnecessary consumption of energy.

4.10.5 Effect of GPA No. 960 on the General Plan and Energy Resources

A. Proposed Changes to the General Plan

As part of the project review process, energy resource data in the General Plan was updated and energy-related policies reviewed and revised where necessary. Energy resources are addressed directly in the General Plan's Multipurpose Open Space Element and in various locations throughout the Land Use Element. The General Plan includes the following updates under GPA No. 960.

Energy Efficiency: Text was added and policies updated or added in the OS Element and elsewhere to increase emphasis on energy efficiency for new development. New Policies OS 11.4, 16.11, 16.12 and 16.13 were revised as part of this.

Greenhouse Gas Emissions Reductions: As part of GPA No. 960, new text and policy was added to the existing Air Quality (AQ) Element to address greenhouse gas reduction within Riverside County. A major emphasis for greenhouse gas reductions is increasing energy efficiency and alternate energy usage, which results in less fossil fuel emissions from traditional electricity generators. New AQ Element policies that address energy efficiency, either directly or indirectly were added, including: AQ 18.3, 18.4, 18.5, 19.3, 20.10, 20.11, 20.12, 20.18, 20.19, 20.21, 20.27 and 20.28.

In addition to these changes, a variety of LUD and policy area changes are proposed, as per the descriptions in Section 3.0 (Project Description) of this EIR and associated Figure 3-1 (and corresponding maps within each Area Plan) that may indirectly affect energy resources. Such changes would lead to either an increase or decrease in development potential (density or intensity); the demand for electricity and natural gas generated by new residents, visitors and workers would also be altered correspondingly.

GPA No. 960 also includes new and revised policies which would be implemented at a future time in locations not foreseeable at present; for example, the new incidental rural Retail-Commercial policy, Indian fee land policies, as others as described in Section 3.0 of the EIR. Similarly, new maps for trails and Riverside County roads (GP Figures C-7 and C-1, respectively, plus corresponding maps within each Area Plan) indicate general road and trail alignments, but not specific locations since specific design and construction sites must be determined based on specific site topography, existing development and timing, as well as both existing and future levels of service to be met. Actual locations for these improvements will be determined based on site assessment of opportunities and constraints to determine environmentally preferred alignments to minimize adverse effects. Likewise, other infrastructure and utilities, such as power transmission lines, water and sewer lines, and such, are also developed based on the providing agency's existing and future levels of service and need assessments and forecasts; typically based on five-year capital improvement plans.

Generally, however, such improvements are not proposed until either specific new developments or overall growth within an area triggers their need. As such, the specific locations and timing of future electricity and natural gas transmission and service lines are not presently foreseeable beyond the master utility corridor level already depicted in the General Plan and addressed previously in EIR No. 441. Rather, they will require site-specific analyses and mitigation when proposed as part of (or to serve) future development as the General Plan builds out. As such, future impacts and mitigation would be assessed programmatically pursuant to the performance standards outlined in Section 4.10.6 herein, as well as elsewhere throughout this EIR, with project-specific analysis and mitigation developed at the later individual project stage.

B. Analysis of GPA No. 960 Effects on Energy Resources

For changes from the current (baseline) uses of energy, an analysis was prepared to assess this project's potential contribution to future energy demands. Specifically, energy analyses were made of the existing and proposed land uses for which the land use, policy area or other land use-related change included in GPA No. 960 could be associated with a specific location or area. Other land use changes associated with the project are expected but cannot be reasonably foreseen at the programmatic level; they are assessed instead under the growth and cumulative impact analyses in Section 5.0 (Additional Required CEQA Topics).

The energy resource analyses prepared for this section use the baseline and project build out scenarios prepared for this EIR as outlined in Section 4.1 (EIR Assumptions and Methodology) and Section 4.2 (Land Use), and as presented in Tables 4.2-F and 4.2-G, in particular. The population and developed use intensities derived from these two scenarios were then combined with various energy use factors to develop theoretical energy demand predictions, specifically for electricity and for natural gas. The same factors were used for both scenarios, which allows for a valid comparison between the two scenarios. The baseline results represent the existing levels of

energy use occurring at various foreseeable locations across Riverside County, and project build out results represent the potential future energy demand that could occur if all of the changes proposed by GPA No. 960 were to be implemented on those same sites. By controlling these variables, valid comparison between the two is possible.

These data should not be construed as the actual energy usage for a given location, a specific existing use or its future development. Privacy laws protect such information from being publicly released for private properties. Further, specific information is typically provided by the associated utility provider when an implementing development is proposed. Each utility provider has developed its own methods, formulae and factors for projecting future demand, which are not available or practicable for calculating for this programmatic EIR. In general, however, where the proposed project is consistent with regional (Southern California Association of Governments [SCAG]) and county growth projections, it is assumed long-range planning undertaken by individual utilities and service providers would be sufficient to meet future needs, since they also reference these same SCAG and county projections.

The results of the energy modeling (electricity and natural gas, the only two energy sources for which sufficient information was available for accurate modeling) for the existing baseline condition and proposed project build out conditions are summed up in Tables 4.10-E, 4.10-F, 4.10-G and 4.10-H. These tables' totals are ascribed to the specific (direct) uses listed. Indirect energy uses, such as by water providers, are addressed separately at the regional scale (see Section 4.7 (Greenhouse Gases)). Because energy use depends on the technology, generation source, service area size and a number of other factors, specific indirect energy use projections are not feasible as part of this programmatic EIR. The significance of these effects, their impacts, as well as any mitigation applicable or needed, are discussed in the subsequent section. Again, it should also be noted that the two modeled outcomes represent the changes that are reasonably foreseeable at this time at the programmatic level of this EIR. Other future development that may occur as a result of this project will have to undergo additional project-specific, focused CEQA review once sufficient details are known.

Table 4.10-E: Theoretical Annual Electricity Demand for Existing Uses of Land

Existing Use of Land	Electricity Duty Factor[1]	Area[2]	Dwelling Units or Square Feet[3]	Theoretical Electricity Use
Residential Uses				
Rural, West[4]	6.133 MWh/du	8,080 ac	3,160 du	19,370 MWh
Single-Family, West[4]	5.010 MWh/du	760 ac	1,380 du	6,910 MWh
Multi-Family, Mobile Home Parks and Apartments, West[4]	3.403 MWh/du	100 ac	120 du	410 MWh
Rural, East[4]	8.578 MWh/du	110 ac	40 du	350 MWh

As indicated in Section 4.19 (Water Resources), the proposed project includes roughly 40,600 acres of land outside of established public water agencies. When a retail water supplier is not available, development is generally required to "self-serve," meaning pump water from directly on site or arrange to obtain water from a nearby private source. The JBS Energy study (Economic and Demographic Factors Affecting Residential California Energy Use, 2002) found that in desert climate zones, residences using onsite pumps to provide water had a substantially different electricity usage rate compared to homes receiving municipal water. In Table 4.10-F, electricity usage for potential residential units within the east Riverside County areas outside of existing water provider service areas was calculated separately.

Table 4.10-H: Theoretical Natural Gas Demand for Proposed Land Use Build Out

Similarly, these calculations also assume that natural gas supplied by SCGC would be used to serve all of these land uses' demands, as a worst-case scenario. In reality, remote locations, such as vacation homes on large desert parcels, would likely not be served by direct connection to SCGC supplies. Rather, they would be either all-electric service or supplied by individual above-ground storage tanks for propane or fuel oil. Unlike the division of homes potentially using well water in eastern Riverside County, it was not possible within the scope of this programmatic EIR to determine the future residences (particularly vacation units) that would be using natural gas versus all-electrical due to the numerous factors that affect such a determination. Rather, the calculations in these tables assume all residences are occupied year-round; likely an overestimate (i.e., 'worst-case' scenario) since in actuality many existing and proposed residences would be used as vacation homes and only occupied part of the year (particularly in the east desert). See the footnotes for the individual energy tables for additional notes on the various assumptions and calculations made for each data set assuming year-round use represents the 'worst case' scenario for utility usage. See the footnotes for the individual energy tables for additional notes on the various assumptions and calculations made for each data set.

4.10.6 Energy Resources - Impacts and Mitigation

A. Would the project require or result in substantial adverse physical impacts associated with the provision of new or physically altered utilities, such as electricity production or transmission facilities, the need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives?

Impact 4.10.A – Increase Demand for Electricity: Future development accommodated by the proposed project, GPA No. 960, would be less intense than that currently planned in the existing General Plan. Thus, on a relative basis, the project would not increase demand for electricity over current plans. Site-specific foreseeable land use changes proposed under the project, however, do have the potential to introduce new development or intensify existing development on previously vacant or less-developed lands. Analysis of energy demands associated with these changes indicates project demands would be insignificant compared to existing baseline levels and forecast Riverside County growth rates. For these reasons, the proposed project would not have a significant impact on existing electricity supplies, production or transmission facilities. The project would not trigger the need for new or altered facilities nor result in substantial environmental impacts due to the construction of such facilities. Moreover, compliance with existing regulatory programs and General Plan policies, as well as new ones proposed as part of GPA No. 960, would further reduce the already insignificant impact associated with project-related electricity demand and service.

1. Analysis of Impact 4.10.A

In general, the introduction of new development into an area brings with it an attendant new demand for energy resources, electricity in particular. The energy provider serving the area in which the new development is located is normally responsible for supplying electricity service to the site. The proponent of the new development, however, is typically required to bear the responsibility and/or cost associated with constructing the infrastructure necessary to provide such service (for example, transmission lines from the utility's substation to the development site). In addition, the site developer is also responsible for constructing or installing the necessary equipment and facilities for providing electricity within the development itself (for example, power lines running from the transmission lines to the homes and businesses within the new development, as well as the wiring and electrical outlets within the structures themselves and so on).

It is the utility provider that is responsible for providing the energy resource, in this case, electricity, to be used at new development sites. When a project's demand for electricity exceeds that which the provider can supply, it would trigger the need for additional (new) or upgraded resources, such as electricity-generating facilities. Such facilities may be provided directly by the project applicant (e.g., through solar panels installed within the development), directly by the utility provider (e.g., through construction of a new hydroelectric dam or power plant) or indirectly by the utility provider (e.g., through purchase of electricity from another energy provider who has excess supply or has built new facilities to increase supply). Often times, a combination of these approaches may be used. Nevertheless, when new supply is needed, the construction of the facilities to provide the needed new supply, either within the local area, region or elsewhere, must be evaluated for their potential to result in their own significant environmental effects. As noted in the question above, when triggered by a project, either directly (specifically to meet project demand) or indirectly (through a substantial cumulative contribution), the environmental effects of such improvements are attributable to the project and must be disclosed and mitigated.

Towards this end, the potential future contributions that could be attributable to the proposed project were evaluated in terms of demand for electricity. First, the proposed land use-related changes of GPA No. 960 that could be tied spatially to specific future development potential were evaluated relative to their sites' existing environmental baselines to determine their effect on electricity demand. As outlined in Section 4.10.3 and, in particular, Tables 4.10.E and 4.10.F, it was found that build out of new development associated with GPA No. 960 changes would increase annual demand for electricity by 86.9 GWh compared to the 2008 baseline demand. Since the build out horizon for the proposed project and the Riverside County General Plan itself is approximately 2060, this means that the increased demand for electricity would occur incrementally over 50 years. Thus, on a simple incremental basis, the proposed project's direct effect on future electricity demands would result in approximately 1.7 GWh of increased demand each year. This represents an annual growth rate of 2.8%. Thus, electricity demand resulting from future development accommodated by the proposed project would increase incrementally the annual need for electricity service above existing conditions.

The project uses RCP-08 forecasts issued by Riverside County's Center for Demographic Research (CCDR), which includes a 2.6% growth rate between 2007 and 2008 in its 2008 Riverside County Progress Report and a 1.4% growth rate for Riverside County between 2008 and 2009 in its 2009 Riverside County Progress Report. The long-term growth rate forecast by the CCDR for the next 25 years, however, calls for housing to grow at 3.6% per year between 2010 and 2035 (the furthest year forecast in RCP-10). As such, the project-associated annual increase of 2.8% does not represent an increase in excess of what is already being forecast by the County of Riverside for the future. Further, since the project is consistent with Riverside County growth projections, to the extent the utility providers utilize such projections, the project would not significantly affect them.

The electricity demand estimated for future project development is based on a worst-case (business-as-usual) scenario that does not take into account any of the energy efficiency and other conservation standards of the County of Riverside or State of California. As outlined in Section 4.7, implementation of specific building energy-efficiency standards outlined in the proposed Climate Action Plan and other energy-related measures affecting electricity supplies are documented to reduce 2020 electricity demands by roughly 47.8% (yielding an annual electricity growth rate of roughly 0.53%). A full discussion of these measures, including their relationship to existing and proposed energy conservation efforts of both the State of California and the County of Riverside, is provided in Section 4.7.

Analysis released by SCE in 2007 indicates that it currently anticipates and plans for a 1.2% annual growth increase in electricity demand, while AEC forecasts 7.7% growth over the next 10 years. (No IID growth rate was available; see Section 4.10.2.) As such, a project-associated annual increase of roughly 0.53% would be within the range of increasing demand planned for and accommodated by the electricity providers within the county that would serve any such future development.

For all of the above reasons, the electricity demands associated with project changes are considered well-within the range of that planned for by the utility providers. Thus, meeting the energy demand generated by the proposed project would not result in a significant environmental impact.

Although the proposed project would create minor additional demands on electricity supplies and the associated distribution infrastructure necessary for its transmission, these energy needs are expected to be well within the service capabilities of the local providers, SCE, IID and AEC. All electrical lines and other system improvements would be installed, in whole or in part, at the expense of the future development project proponents as a Condition of Approval for their projects. This would serve to avoid adverse impacts to the electricity distribution system. Likewise, compared to that of Riverside County as a whole, the project would contribute an insignificant incremental amount to the long-term need for additional new or upgraded facilities. For all of these reasons, the project would not result in a significant impact on existing or future electricity providers or infrastructure.

There is also the matter of electricity demand that would be associated with future development arising from project implementation that is expected to occur, but cannot be tied to a specific location or point in time. In such instances, specific environmental impacts tied to specific locations cannot be ascertained, but the effects can be described on a programmatic level. In this case, two statistics are relevant. First, build out of the proposed project, as implemented through the amended General Plan, is forecast to result in fewer homes, people and jobs than currently forecast for the existing General Plan (roughly 2.0%, 1.4% and 5.6%, respectively). It may be reasonably assumed that associated future electricity demand would be similarly reduced. Since public utilities use municipal and County General Plans as part of their long-range planning processes, this means that the project's future needs are in line with (and in fact, less than) those previously disclosed to the utilities.

Further, for regional planning, service providers for Riverside County also use projections issued by SCAG. The current adopted SCAG plan is the 2008 Regional Transportation Plan (RTP-08). For unincorporated Riverside County, for the Year 2035, it forecasts population, housing and employment figures that are significantly higher than what the General Plan, as amended by the proposed project, would call for. Specifically, compared to RTP-08, the proposed project would yield a 25.4% decrease in housing units, 22.1% decrease in population and 15.4% decrease in jobs. A decrease in energy demand, compared to that necessary to serve RTP-08 development levels, could also be assumed. For these reasons, the proposed project's long-range effect on long-term electricity demand and provision of electric service and related infrastructure would be less than significant.

Lastly, where future development consistent with the proposed project is constructed, there could be environmental impacts related to the provision of services to the individual sites, such as electricity transmission lines. In general, these types of transmission lines and pipelines can be constructed within the rights-of-way of existing roads or beneath roads being constructed as part of a project. In such cases, environmental impacts are typically temporary and readily mitigated. Other than the areas served by AEC or IID, all of unincorporated Riverside County is served by SCE. In unincorporated western Riverside County, served by SCE, much of the area is urbanized and existing infrastructure networks are present. As such, additional connects to such networks would be feasible without extensive new transmission lines. The same holds for the Coachella Valley region, which is served by IID. In the Aguanga and Anza areas, served by AEC, additional transmission lines may be needed for development in the more remote portions of the area. However, at the lower densities/intensities proposed under GPA No. 960, such additional lines could be accommodated within or along existing roadways, without significant new environmental effects.

2. Regulatory Compliance for Impact 4.10.A

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, programs, policies and existing mitigation measures from prior EIR No. 441 would further reduce or minimize this already insignificant impact.

a. Compliance with Federal, State and County Regulations

Compliance with a variety of state and county regulations and programs that address energy conservation either directly or indirectly as part of greenhouse gas reduction plans would further prevent already insignificant impacts associated with electricity demand. These regulations and programs are described in detail in Section 4.10.3 of this EIR and also discussed in Section 4.7 (Greenhouse Gases).

b. Compliance with Existing General Plan Policies

Within the Riverside County General Plan, existing Multipurpose Open Space (OS) Element Policies OS 10.1, 10.2, 11.2, 11.3, 12.1-12.4 and 16.1-16.10, and Air Quality (AQ) Element Policies AQ 5.2-5.4 would further reduce the already insignificant impact on electricity utilities. See Section 4.10.3.C for full text of each of these policies.

c. Compliance with Proposed New or Revised General Plan Policies

In addition to existing policies, new and revised policies from the General Plan's OS Element (Policies OS 11.4 and 16.11-16.13) and AQ Element (AQ Policies 4.2-4.4, 20.10-20.12, 20.18-20.21 and 20.28) would further reduce the already insignificant impacts associated with electricity demand. See Section 4.10.3.C for full text of each of these policies.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, certified for the 2003 RCIP General Plan, Mitigation Measures 4.8.1A and 4.8.1B were imposed to further minimize impacts due to additional demand and consumption of electricity and ensure they were less than significant. Although the potential impacts of this project (GPA No. 960) are already less than significant, these measures are programmatic in nature and thus remain applicable.

Existing Mitigation Measure 4.8.1A: The County [of Riverside] shall review all development proposals prior to the approval of development plans to guarantee that sufficient energy resources and facilities are available to supply adequate energy to the proposed project and associated uses.

Existing Mitigation Measure 4.8.1B: The County [of Riverside] shall review all development plans prior to approval to guarantee that energy conservation and efficiency standards of Title 24 are met and are incorporated into the design of the future proposed project.

3. Finding on Significance for Impact 4.10.A

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on demand and consumption of electricity, as well as on the infrastructure and facilities that supply the electricity. In addition, compliance with the above-listed existing regulatory programs and General Plan policies, as well as existing EIR No. 441 Mitigation Measures 4.8.1A and 4.8.1B, would further reduce or avoid these already insignificant project impacts to electricity resources and infrastructure.

B. Would the project require or result in substantial adverse physical impacts associated with the provision of new or physically altered utilities, such as natural gas production or transmission facilities, the need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives?

Impact 4.10.B – Increase Demand for Natural Gas: Future development consistent with the proposed project, GPA No. 960, would be less intense than that currently planned in the existing General Plan. Thus, on a

relative basis, the project would not increase demand for natural gas over current plans and would not trigger new additional environmental impacts. Site-specific land use changes proposed in GPA No. 960, however, do have the potential to introduce new development or intensify existing development on previously vacant or less-developed lands. Analysis of energy demands associated with these changes indicate project demands would be insignificant compared to existing baseline levels and are in line with expected growth rates. For these reasons, the proposed project would not have a significant impact on existing natural gas supplies, production or transmission facilities. The project would not trigger the need for new or altered facilities nor result in substantial environmental impacts due to the construction of such facilities. Moreover, compliance with existing regulatory programs and General Plan policies, as well as new ones proposed as part of GPA No. 960, would further reduce already insignificant impacts associated with project-related natural gas demand and service.

1. Analysis of Impact 4.10.B

In general, the introduction of new development into an area brings with it an attendant new demand for energy resources, including natural gas. The Southern California Gas Company (SCGC) is the natural gas provider for Riverside County and would provide gas to new developments within its service zones. Where SCGC cannot provide service, individual homes and other uses would have to either rely solely on electricity or provide their own onsite gas, typically propane or fuel oil stored in small, aboveground storage tanks.

Regardless of the source, the proponent of the new development, however, is typically required to bear the responsibility and/or cost associated with constructing the infrastructure necessary to provide such service (for example, pipelines connecting to SCGC's delivery system). In addition, the site developer is also responsible for constructing or installing the necessary equipment and facilities for providing natural gas within the development itself (for example, pipelines running from the SCGC's transmission point to the homes and businesses within the new development, as well as the piping and connections within the structures themselves, and so on).

When a project's demand for energy exceeds that which the provider can supply, it would trigger the need for additional (new) or upgraded resources, such as natural gas production and storage facilities, as well as pipelines. Such facilities may be provided directly by the project applicant (e.g., through individual above-ground storage tanks for propane or fuel oil installed within the development), by SCGC directly (e.g., through construction of a new facility) or indirectly (e.g., through purchase of gas from another provider with excess supply or new facilities to increase supply). Occasionally, a combination of these approaches may be used. Nevertheless, when new supply is needed, the construction of the facilities to provide the needed new supply, either within the local area, region or elsewhere, must be evaluated for their potential to result in their own significant environmental effects. As noted in the question above, when triggered by a project, either directly (specifically to meet project demand) or indirectly (through a substantial cumulative contribution), the environmental effects of such improvements are attributable to the project and must be addressed.

Towards this end, the potential future contributions of the areas proposed to change as a result of the project were evaluated for natural gas demand. First, the proposed land use-related changes of GPA No. 960 that could be tied spatially to specific future development potential were evaluated relative to their sites' existing environmental baseline to determine their effect on natural gas demand. As outlined in Section 4.10.3 and, in particular, Tables 4.10.G and 4.10.H, it was found that build out of foreseeable new development resulting from GPA No. 960, without any mitigation or reduction policies applied (that is, the "business-as-usual" scenario), would increase annual demand for natural gas by 865,530 kcf (8.95 million therms) compared to the 2008 baseline demand.

Since the build out horizon for the project and the Riverside County General Plan itself is approximately 2060, this means that the increased demand for natural gas would occur incrementally over 50 years. Thus, on a simple

incremental basis, the proposed project's direct effect on future natural gas demand would result in approximately 16,645 kcf of increased demand each year. When compared to the baseline (2008) natural gas demand for unincorporated Riverside County, this represents an annual increase of 3.4%. Thus, natural gas demand resulting from the reasonably foreseeable future development that could be authorized pursuant to the project would annually increase incrementally the need for natural gas service above existing conditions, assuming all development uses natural gas from SCGC.

The project uses RCP-08 forecasts issued by Riverside County's Center for Demographic Research (CCDR), which includes a 2.6% growth rate between 2007 and 2008 in its 2008 Riverside County Progress Report and a 1.4% growth rate for Riverside County between 2008 and 2009 in its 2009 Riverside County Progress Report. The long-term growth rate forecast by the CCDR for the next 25 years, however, calls for housing to grow at 3.6% per year between 2010 and 2035 (the furthest year forecast in RCP-10). As such, the project-associated annual increase of 3.4% does not represent an increase in excess of what is already being forecast by the County of Riverside for the future. Further, since the project is consistent with Riverside County growth projections, to the extent the utility providers utilize such projections, the project would not significantly affect them.

The natural gas demand estimated for future project development is based on a worst-case (business-as-usual) scenario that does not take into account any of the energy efficiency and other conservation standards of the County of Riverside or State of California. Implementation of specific building energy-efficiency standards outlined in the proposed Climate Action Plan and other energy-related measures affecting natural gas use are documented to reduce 2020 demands by 47.8% (yielding an annual growth rate for natural gas use of roughly 0.87%). A full discussion of these measures, including their relationship to the energy conservation efforts of both the State of California and the County of Riverside, is provided in Section 4.7.

Analysis released by the CEC in 2009 indicated that SCGC currently anticipates and plans for an overall demand growth rate of 0.8% between 2010 and 2020. The project-associated annual increase of 0.87% is near to the anticipated increasing demand planned for and accommodated by SCGC. Thus, meeting the natural gas demand generated by the proposed project would not result in a significant environmental impact.

For all of the above reasons, the natural gas demands associated with project changes are considered well-within the range of that planned for by the utility providers. Thus, meeting the energy demand generated by the proposed project would not result in a significant environmental impact.

Although the proposed project would create small additional demands on natural gas supplies and the associated distribution infrastructure necessary for its delivery, at an annual growth rate of 0.87%, energy needs are expected to be within the service capabilities of SCGC. In terms of construction, all necessary gas pipelines, meters and other system improvements would be installed, in whole or in part, at the expense of the future development project proponents as a Condition of Approval for their projects. This would serve to avoid adverse impacts to gas distribution systems. Likewise, with such a small average rate of change compared to that of unincorporated Riverside County as a whole, the project would contribute an insignificant incremental amount to the long-term need for additional new or upgraded facilities. For all of these reasons, the project would not result in a significant impact on existing or future natural gas providers or infrastructure.

There is also the matter of natural gas demand that would be associated with future development arising from project implementation that is expected to occur, but cannot be tied to a specific location or point in time. In such instances, specific environmental impacts tied to specific locations cannot be ascertained, but the effects can be described on a programmatic level. In this case, two statistics are relevant. First, build out of the proposed project, as implemented through the amended General Plan, is forecast to result in fewer homes, people and jobs than currently forecast for the existing General Plan (roughly 2.0%, 1.4% and 5.6%, respectively). It may be

reasonably assumed that associated future natural gas demand would be similarly reduced. Since public utilities use municipal and County General Plans as part of their long-range planning processes, this means that the project's future needs are in line with (and in fact, less than) those previously disclosed to the utilities.

Further, for regional planning, service providers for Riverside County also use projections issued by SCAG. The current adopted SCAG plan is the 2008 Regional Transportation Plan (RTP-08). For unincorporated Riverside County, for the Year 2035, it forecasts population, housing and employment figures that are significantly higher than what the Riverside County General Plan, as amended by the proposed project, would call for. Specifically, compared to RTP-08, the proposed project would yield a 25.4% decrease in housing, 22.1% decrease in population and 15.4% decrease in jobs. A decrease in energy demand, compared to that necessary to serve RTP-08 development levels, would also be assumed. Thus, for all of these reasons, the proposed project's long-range effects on long-term natural gas demand, its provision and its related infrastructure would be less than significant.

Lastly, where future development consistent with the proposed project is constructed, there could be environmental impacts related to the provision of services to the individual sites, such as gas pipelines. In general, these types of transmission pipelines can be constructed within the rights-of-way of existing roads or beneath roads being constructed as part of a project. In such cases, environmental impacts are typically temporary and readily mitigated. In terms of natural gas, all of unincorporated Riverside County is supplied by the Southern California Gas Company.

In unincorporated western Riverside County, much of the area is urbanized and existing infrastructure networks are present. As such, additional connections to such networks would be feasible without extensive new pipelines. The same holds for the Coachella Valley region. In the more rural portions of Riverside County, such as the Aguanga and Anza areas, and the desert east of Coachella Valley, additional transmission lines may be needed for development in the more remote portions of the area. However, at the lower densities/intensities proposed under GPA No. 960, such additional pipelines could be accommodated within or along existing roadways without significant new environmental effects. For development in remote areas where natural gas service cannot be readily extended, homes (the principal use proposed for such remote areas) can be designed and constructed to utilize only electricity for heating and cooking, or can include onsite propane, natural gas or fuel oil tanks supplying the individual residents. In such cases, tanks are filled through services the occupant contracts for directly through a third-party provider.

2. Regulatory Compliance for Impact 4.10.B

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, General Plan policies and existing mitigation measures from EIR No. 441 would further minimize this already insignificant impact.

a. Compliance with Federal, State and County Regulations

Compliance with a variety of state and county regulations and programs that address energy conservation either directly, or indirectly as part of greenhouse gas reduction plans, would further prevent already insignificant impacts associated with natural gas demand. These regulations and programs are described in detail in Section 4.10.3 of this EIR.

b. Compliance with Existing General Plan Policies

Existing policies of the Riverside County General Plan OS and AQ Elements (Policies OS 12.1-12.4, 16.1, 16.2, 16.4-16.7, 16.10, and 5.2-5.4) would further reduce already insignificant impacts to natural gas demand and infrastructure. See Section 4.10.3.C for full text of each policy.

c. Compliance with Proposed New or Revised General Plan Policies

In addition to existing policies, new and revised policies from the General Plan's OS Element (Policies OS 16.11 and 16.12) and AQ Element (Policies AQ 4.2-4.4, 18.3-18.5, 19.3, 20.11, 20.12, 20.21 and 20.28) would further reduce the already insignificant impacts associated with natural gas demand. See Section 4.10.3.C for full text of each of these policies.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measures 4.8.1A and 4.8.1B, as set forth under Impact 4.10.A, above, were also imposed to further minimize impacts due to additional demand and consumption of natural gas and to ensure impacts were less than significant. Although the potential impacts of this project are already less than significant, the EIR No. 441 measures are programmatic in nature and thus remain applicable to this project.

3. Finding on Significance for Impact 4.10.B

The analysis presented above indicates that development consistent with the proposed project, GPA No. 960, would have less than significant impacts on demand for and consumption of natural gas, as well as on the infrastructure and facilities that supply the gas. In addition, compliance with the above-listed existing regulatory programs, standards and General Plan policies, as well as existing Mitigation Measures 4.8.1A and 4.8.1B from EIR No. 441, would further reduce or avoid these insignificant project impacts to natural gas resources and infrastructure.

C. Would the project result in an inefficient, wasteful or unnecessary consumption of energy?

Impact 4.10.C – Cause the Inefficient Use of Energy: Future development consistent with the proposed project GPA No. 960 would be less intense than that currently planned in the existing General Plan. Therefore, on a relative basis, the project would not increase demand for energy over current plans. The project also proposes to add a number of new policies and programs targeting energy efficiency and conservation directly in order to reduce greenhouse gas emissions by roughly 30% (see EIR Section 4.7, Greenhouse Gases). As a result of implementation of such measures, new development would be more energy-efficient and less wasteful of energy than existing uses or proposed uses without GPA No. 960. For these reasons, the project would not result in inefficient, wasteful or unnecessary energy consumption and the project's impacts on use of energy would be less than significant. No project-specific mitigation is required. Moreover, compliance with existing regulatory programs and General Plan policies, as well as new ones proposed as part of GPA No. 960, would further reduce the already insignificant impacts associated with efficient use of energy.

1. Analysis of Impact 4.10.C

As discussed in Section 4.10.5, above, the project includes proposed changes designed to *reduce* potential development and build out capacity in the Riverside County General Plan. As such, it serves to reduce unnecessary construction and development on lands not needed to accommodate existing and projected future Riverside County residents and employees. As an example, Rural Village Overlays (RVOs) would be formalized by the project where development patterns and expected growth make them natural locations for the extension of urbanizing areas, as in the Good Hope and Meadowbrook RVOs. Conversely, RVOs are proposed to be removed from areas where remote location, lack of infrastructure availability and general lack of urbanizing pressure indicate additional capacity would not be needed, such as for the Aguanga and Anza areas. By focusing growth via the selective use of RVOs, GPA No. 960 would prevent inefficient and unnecessary consumption of energy, both for energy used in buildings and for fuel used by vehicles travelling to and from such locations.

Also, as outlined in Section 4.7, implementation of specific building energy-efficiency standards outlined in the proposed Climate Action Plan (CAP) and other energy-related measures affecting electricity supplies, are documented to reduce 2020 electricity demands by over half. In addition to addressing direct energy use, Section 4.7 also addresses water consumption and wastewater generation, two major sources of indirect energy use. A full discussion of these implementation measures, including their relationship to existing and proposed energy conservation efforts of both the State of California and the County of Riverside, is provided in Section 4.7. As a result of the CAP measures, new development would be more energy efficient than existing uses and facilitate long-term energy conservation. For these reasons, the proposed project would not result in significant impacts due to inefficient, wasteful or unnecessary energy consumption.

2. Regulatory Compliance for Impact 4.10.C

The above analysis indicates that this impact would be less than significant and hence no project-specific mitigation is needed. Moreover, the following regulations, programs, policies from prior EIR No. 441 would further reduce this already insignificant impact.

a. Compliance with Federal, State and County Regulations

Compliance with a variety of state and county regulations addressing energy conservation directly or indirectly, as part of greenhouse gas reduction plans, would further prevent already insignificant impacts associated with use of energy. See Section 4.10.3 of this EIR for more information on these, plus Section 4.7 for additional information as well.

b. Compliance with Existing General Plan Policies

Existing policies of the Riverside County General Plan would further reduce the already insignificant impact on energy usage. These include Policies OS 11.1-11.3, 12.1-12.4 and 16.1-16.10, and Policies AQ 5.2-5.4 and 13.1. See Section 4.10.3.C for the full text of each.

c. Compliance with Proposed New or Revised General Plan Policies

A number of new or revised policies from the OS and AQ Elements of the County General Plan would further reduce the already insignificant impacts associated with energy usage. These include: Policies OS 11.4, 16.11-16.13, and Policies AQ 4.2-4.4, 18.3-18.5, 19.3, 20.10-20.12, 20.18, 20.19, 20.21, 20.27 and 20.28. See Section 4.10.3.C for full text of each of these policies.

d. Compliance with Existing Mitigation Measures from EIR No. 441

In EIR No. 441, prepared for the 2003 RCIP General Plan, Mitigation Measure 4.8.1B was imposed to further minimize impacts due to additional demand and consumption of electricity and ensure they were less than signify-cant. Although the potential impacts of this project are already less than significant, this measure is programmatic in nature and thus remains applicable to this project.

Existing Mitigation Measure 4.8.1B: The County [of Riverside] shall review all development plans prior to approval to guarantee that energy conservation and efficiency standards of Title 24 are met and are incorporated into the design of the future proposed project.

3. Finding on Significance for Impact 4.10.C

The analysis presented above indicates that future development consistent with the proposed project would have less than significant impacts on the usage of energy, energy efficiency and energy conservation. In addition, compliance with the above-listed existing regulatory programs, standards and General Plan policies, as well as existing Mitigation Measure 4.8.1B from EIR No. 441, would further reduce or avoid insignificant project impacts to energy usage.

4.10.7 Significance After Mitigation for Energy Resources

The analysis presented above indicates that future development consistent with the proposed project, GPA No. 960, would have less than significant impacts on demand for and consumption of energy resources, that is, elec-tricity and natural gas. Impacts on the infrastructure and facilities that produce and supply these energy resources, including the need for new or upgrading construction, as well as transmission lines for services, would also be less than significant. Lastly, the project would not have a significant effect on the use of energy and would not result in inefficient, wasteful or unnecessary consumption of energy. In addition, compliance with a variety of existing regulatory programs, standards and General Plan policies, in particular the Climate Action Plan, as well as existing Mitigation Measures 4.8.1A and 4.8.1B from EIR No. 441, would further reduce these insignificant project impacts.

Section 4.11

Flood and Dam Inundation Hazards

Section 4.11
Flood and Dam Inundation Hazards

4.11.1 Introduction

This section assesses the potential flood and dam inundation hazards that could affect future development accommodated by the proposed project, General Plan Amendment No. 960 (GPA No. 960). It also describes the potential impacts on people and property that could arise from future development and disturbances within areas at risk for flooding. Much of the hazard and background data in this section comes from Appendix H of the General Plan, "Natural Hazard Mapping, Analysis and Mitigation: A Technical Background Report in Support of the Safety Element of the New Riverside County 2000 General Plan" (Earth Consultants International, August 2000). Where such information is summarized, this study can be referenced for further details. Also, hydrology, water quality and storm drainage issues are discussed in Section 4.19 (Water Resources) rather than here.

A. Background

In the simplest sense, a flood occurs when water temporarily covers land that is not normally covered with water. For most rivers and streams, flooding is a natural and recurring event. Natural flooding typically occurs when heavy or continuous rainfall exceeds the absorptive capacity of soil and the flow capacity of the river, stream or lake. This causes the watercourse to overflow its banks onto adjacent lands. Floodplains are those lands most subject to recurring floods, situated adjacent to rivers and streams (the floodways). Floodplains are therefore "floodprone" and can be hazardous to development activities, particularly vulnerable ones, for example hospitals and houses.

1. Flooding Probability

Floods are usually described in terms of their statistical frequency. A "100-year flood" or "100-year floodplain" describes a flood event subject to a 1% (one in a hundred) probability of being equaled or exceeded in the given year. It should be remembered that this concept does *not* mean such a flood will occur only once in a hundred years. Whether or not it occurs in a given year has no bearing on the fact that there is still a 1% chance of a similar occurrence in the following year. The statistical frequency of a flood event expresses the degree of risk evaluated, e.g., 5-year, 20-year, 50-year, 500-year floodplain. A 10-year flood, for example, is the discharge that will exceed a certain volume which has a 10% (one in ten) probability of occurring each year.

2. Flooding and Related Terminology

In addition to the above, a number of terms that address various aspects of flooding are defined below to aid in the understanding of this section.

Floodplain: Most simply, any land areas, such as the lowland and relatively flat areas adjoining inland and coastal waters, susceptible to being inundated by water from any source.

Floodway: As defined by Riverside County Ordinance No. 458, it is the "channel of a river or other watercourse and adjacent land areas necessary to discharge the waters" from a 100-year flood without increasing the water's surface elevation "more than one foot at any one point." (Note, a different definition applies to the Colorado River for the purposes of Ordinance No. 458.) In common parlance, the floodway often refers to the active channel portion of a floodplain in which water flows on a regular basis.

Floodway Fringe: Refers to the area subject to inundation by floods generated from a watercourse, up to and including the floodway flow, but which is not required for safe conveyance of floodway flow.

Base Flood: Essentially equivalent to a 100-year flood. Delineated by a Base Flood Elevation (BFE) that indicates the water surface elevation that a 100-year flood would reach.

Flood Hazard: The potential for inundation by water that involves the risk to life, health, property and natural floodplain values. Generally, three physical characteristics with the greatest bearing on a floodplain's relative hazard are topography or slope (especially flatness), geomorphology (the type of soils and their characteristics) and hydrology (the amount and speed of water flow, as well as past flooding history, in particular). Flooding itself can cause three types of effects (primary, secondary and tertiary; see discussion under "Effects").

Development: As defined pursuant to Riverside County Ordinance No. 458 (and as generally used herein), this means "any man-made change to improved or unimproved real estate, including but not limited to, building or other structures, mining, dredging, filling, grading, paving, excavation, drilling operations, [or] storage of equipment or materials."

Special Flood Hazard Areas (SFHAs): Generally refer to areas within a floodplain subject to a 1% or greater chance of flooding in any given year. More specifically, however, Riverside County Ordinance No. 458, Section 3, includes a list of studies that encompass the "floodplains, flood boundaries and flood hazards" defined as SFHAs for the purposes of the ordinance. Note the "flood hazard areas" addressed by the County of Riverside in the General Plan and Ordinance No. 458 are only based *in part* on Federal Emergency Management Agency (FEMA) maps and are not synonymous with FEMA terms.

Flood Insurance Rate Map (FIRM): The official map on which FEMA or the Federal Insurance Administration has delineated both the areas of special flood hazards and the risk premium zones applicable to the community.

Floodproofing: Riverside County Ordinance No. 458 defines this as "any combination of structural and nonstructural additions, changes or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents."

Channel / Canal: A channel is a linear, incised watercourse; a canal is an artificial linear watercourse.

Dam: Any artificial barrier impounding (holding) or diverting water. Dams 25 feet and taller above the natural stream bed are regulated by the State of California pursuant to the California Water Code (CWC) Section 6002 *et seq.* Barriers (dams) below six feet in height or with storage capacity of under 15 acre-feet are not regulated by the State of California.

Dam Inundation Zone: The area downstream from any dam or impounded water; for large bodies of water, this can extend a very great distance. Formally defined in CWC Section 6000. The State of California designates areas of "potential flooding in the event of sudden or total failure of any dam...[that] would result in death or personal injury" should it fail (California Government Code [CGC], Section 8589.5(a)).

Reservoir: A natural or man-made area containing water impounded by a dam.

Seiche: Seiche is a standing wave that forms in an enclosed or partially enclosed body of water. The creation of seiche have been observed on lakes, reservoirs, swimming pools, harbors and seas. The effect is caused by resonances in the (at least partially) confined body of water. Most often these disturbances are caused by wind and are imperceptible. However, in the event of an earthquake, the ground movement (lateral and/or vertical) can be enough to create a large standing wave (seiche) that causes the "slosh" of the waterbody onto its shores at levels higher than expected.

Levee / Dike: Both of these structures are designed to hold back water. A "levee" normally refers to structures that only hold back floodwater or stormwaters (thus are only in use during these events). A dike is a linear construction that holds back water continuously, for example, the famous dikes of Holland that hold back the sea from the country's reclaimed lowlands. In the U.S., however, the term "levee" is also often used to refer to dikes; for example, the extensive system of dikes that hold back the tidal waters of the Sacramento-San Joaquin Delta create farmable islands of land within the Delta.

Sheetflow: The unconstrained flow of water across flat lands, typically at shallow depths (and as opposed to flow through a watercourse, which is delineated by bed and bank features).

Mudflow: Movement of earth (soil) caused by water, usually rain. Can be a hazard for certain types of loose (unconsolidated) soils, steep slopes (15 degrees or greater) and areas lacking vegetation (denuded by fire or grading, for example).

Alluvial Fan: An alluvial fan is a fan- or cone-shaped deposit of sediment crossed and built up by streams. These flows come from a single point source at the apex of the fan, most typically where a stream exits a canyon and transitions from bank-confined to unconfined sheetflow or meandering channels. Thus, alluvial fans are typically found where a canyon draining from mountainous terrain emerges out onto a flatter plain, especially along fault-bounded mountain fronts.

Stormwater: Stormwater is simply water that originates from a precipitation or snow event (i.e., rain, hail, sleet or snowfall, or snow melt).

Runoff / Urban Runoff: Runoff generally refers to stormwater discharged from developed areas, such as residential, commercial, industrial or public facilities, as well as construction areas (but not dairies, farms, feedlots or open space). "Urban runoff" may also include other water sources, such as irrigation flows/runoff and water flowing off of impervious surfaces, such as roofs, sidewalks and pavement. (Urban runoff may pick up various contaminants, such as fertilizers and pesticides from lawns, oils and other petrochemicals from roads, trash and debris from parking lots, etc., and can be a substantial source of water pollution if not adequately controlled.) Runoff will flow (drain) along the path of lowest elevation until reaching an area large enough to impound it or a discharge point that allows it to enter a storm drain, watercourse or other water conveyance feature.

When it does not soak into the ground, it becomes surface runoff and either flows directly into surface waterways or is channeled into storm sewers, which themselves eventually discharge to surface waters. Urban runoff may contain pathogens, sediment, trash, fertilizers, oxygen-demanding substances, pesticides, heavy metals and

petroleum products. If not properly managed and controlled, urbanization may adversely impact water quality and quantity in the receiving waters.

Scour: Scour is the powerful and concentrating clearing and digging action of flowing air or water, especially the downward erosion by stream water in sweeping away mud and silt on the outside curve of a bend, or during flooding.

3. Hydrology

The western one-third of Riverside County lies within the California Department of Water Resources South Coast Region, west of the San Jacinto Mountains, and the eastern two-thirds of Riverside County lie within the Colorado River Region. Designated watershed areas are included within each region, several of which partially lie within Riverside County. See EIR Section 4.19 for more information on hydrology; in particular, Section 4.19.2.B and Figure 4.19.3, show the major watersheds within Riverside County.

B. Baseline Data Sources

Pursuant to CEQA, the descriptions of the physical environmental conditions provided in this EIR are as they exist at the time of the issuance of the Notice of Preparation (NOP), that is, April 13, 2009. This environmental setting constitutes the baseline physical conditions by which Riverside County, as Lead Agency under CEQA, determines whether an impact is significant.

Because of the countywide scope and nature of this project and its programmatic EIR, much of the data presented herein cannot all be said to represent a single point in time (i.e., April 13, 2009). In such cases, the data set that is best supported by substantial evidence is used. For the flood and dam inundation baseline data used herein, the following sources were determined to be the best-supported substantial evidence available and were used for the reasons stated. Land use data and other environmental data sets are described in their respective sections elsewhere.

The data used herein is a compilation of project GIS (Geographical Information Systems) data derived from spatial analysis of the project performed by the Riverside County GIS Department. The project data was compared to County of Riverside 100-year floodplain and dam inundation maps. Riverside County's 100-year floodplain maps are updated based on information provided by FEMA, the U.S. Army Corps of Engineers (Army Corps), the California Department of Water Resources (DWR) and the Riverside County Flood Control and Water Conservation District (FCWCD). Dam and dam inundation maps are updated based on information obtained from the federal Bureau of Reclamation, the California Division of Safety of Dams and from FCWCD. (Note: Neither FEMA nor the County of Riverside has jurisdiction over dam inundation areas.) Additional analysis included within the section has been based on various sources cited in the text.

4.11.2 Existing Environmental Setting – Flood and Dam Inundation Hazards

Three principal types of flood hazards must be taken into account in the effort to protect people and property: main-stream flooding (including flash flooding) which are generally precipitation based, dam inundation and earthquake-induced flooding (i.e., tsunamis and seiche). The nature of each of these risks is described here. The relative susceptibility of the project's expected future development to each is discussed later in this section.

A. Precipitation-Related Flooding Hazards

1. Main-Stream Flooding

Main-stream flooding is the most basic type of flooding encountered. It occurs when water rapidly builds up in a drainage feature, such as a stream or river, and then surges downstream towards an outlet. When the flow level exceeds the capacity of the drainage's banks, flooding of lands outside the watercourse will result. This type of flooding process typically takes days or even weeks to arise, although in arid Southern California, floods set off in the space of hours are not unknown. At its most extreme, flashfloods are a type of main-stream flooding in which storm flows build up in less than 6 hours, often with little to no warning. During major floods, flood water carries heavy debris loads and causes considerable damage from deposition. For example, during a storm in 1969, the Santa Ana River carried a total load of more than 11 million tons of sediment.

The precipitation that leads to most main-stream floods that affect Riverside County can be attributed to three types of storm events. The first is a general winter storm that combines high-intensity rainfall and rapid melting of mountain snow pack. The second is a tropical storm out of the southern Pacific Ocean that can cause prolonged periods of heavy rainfall which saturates soils, increasing runoff. The third type is a summer thunderstorm which can lead to brief but heavy localized rainfall. In desert areas in particular, this third type of rainfall can lead to flash-flooding.

Historical stream flow data collected by the U.S. Geological Survey (USGS) indicate that in Riverside County peak stream flows typically occur in January, February and March. Riverside County's average precipitation varies from more than 30 inches per year in the San Jacinto Mountains to less than 5 inches per year in the Blythe region. According to the 2008 FEMA Flood Insurance Study for Riverside County, most major floods in the county occurred as a result of general winter storms. However, serious flooding, including potentially lethal flash-flooding, also occurred as a result of summer thunderstorms. Historical stream flow data for locations within the county is provided in Section 5.4 of the 1999 Existing Settings Report prepared for the 2003 RCIP General Plan.

According to FEMA, the major rivers in western Riverside County are dry or nearly dry most of the year and generally only pose flood threats to developments within the floodplain during general storms of long duration. When a major storm moves into the area, water collects rapidly and becomes surface runoff. The resultant flood flows have predominantly short durations and sharp peaks. Increased urbanization further increases flood potential by increasing the amount of impervious surfaces from which water will run off, instead of absorbing into the ground or puddling.

2. Historical Flooding Sources and Events

Historically, during the 20th century floods were the leading natural disaster in the United States in terms of number of lives lost and property damage. Since 1965, there have been 17 Gubernatorial and Presidential flood disaster declarations for Riverside County. The most recent declaration occurred in January 2011 after late January's severe winter storms and the resultant flooding led the governor and president to issue a disaster declaration covering ten counties in California, including Riverside County. Details on the historical flood events in Riverside County may be found in the 1999 Existing Setting Report. Also, see Appendix H of the General Plan for additional details. For details on the flood-controlling properties of dams and other structures along these rivers, see Section 4.11.2.

Santa Ana River: The Santa Ana River has been the source of the region's most notable floods in the last 150 years, including the Great Flood of 1862 in which flows exceeded an estimated 300,000 cubic feet per second

(cfs). Other years in which this river has flooded include: 1867, 1884, 1891, 1916, 1938, 1969, 1980 and 1993. Prior to extensive dam and reservoir controls, the Santa Ana River had a large flood event about every five years.

San Jacinto River: The 730-square mile San Jacinto River watershed drains into Lake Elsinore in western Riverside County. The San Jacinto River originates in the San Jacinto Mountains and passes through the cities of San Jacinto, Perris, Canyon Lake and Lake Elsinore. The river is an important regional resource that provides water supply, wildlife habitat, drainage and recreational opportunities to the region. The only major flood control structures on the river are levees in the City of San Jacinto built by the Army Corps in the early 1960s. Within the 30-mile reach of the river between Lake Elsinore and San Jacinto, only minor channelization exists. The river is characterized by expansive overflow areas, including the Mystic Lake area. The river has caused major flooding damage to agricultural areas and rendered Interstate 215 and several local arterial transportation routes impassable several times. The San Jacinto River flooded in 1916, 1927, 1931, 1937, 1938, 1966, 1969, 1980 and 1993. Its largest flood of record occurred on February 16, 1927, with a peak discharge of 45,000 cfs near San Jacinto. Agricultural uses, railways and highways were extensively damaged. The flooding in 1980 accompanied failure of the river's levee system, resulting in extensive additional damage.

Santa Margarita River, Temescal and Murrieta Creeks: Murrieta Creek passes through the cities of Murrieta and Temecula in southwest Riverside County, and then joins with Temecula Creek to form the upper reach of the Santa Margarita River. The Santa Margarita River flows southwesterly into San Diego County, through the Camp Pendleton Marine Base and then empties into the Pacific Ocean. Murrieta and Temecula experienced severe flood damage, estimated in excess of 10 million dollars, from Murrieta Creek overflow in January 1993. Camp Pendleton also suffered extensive flood damage, estimated at $88 million, to facilities and aircraft due to Santa Margarita River overflow.

An Army Corps Feasibility Study addressing flood control, environmental enhancement and recreation for Murrieta Creek was prepared in April 1998. Major floods have been reported nine times for Murrieta Creek: in 1862, 1884, 1916, 1938, 1943, 1969, 1978, 1980 and 1993.

San Gorgonio River: Flooding on the San Gorgonio River caused damage in 1938, 1965, 1966 and 1969. During the 1969 flood, the San Gorgonio River attained an estimated peak discharge of 17,000 cfs, which resulted in loss of life and extensive damage in the Cabazon area.

Whitewater River: The Whitewater River is the principal drainage course through the Coachella Valley. It is typically dry, but flows southeasterly when it carries water. The Whitewater has a total drainage area of approximately 850 square miles and drains areas as far away as the summit of San Gorgonio Pass and the steep southern and eastern slopes of Mount San Gorgonio. Although the mean annual precipitation on the floor of the Coachella Valley is low (4 inches), high and intense precipitation in the tall, steep surrounding mountains poses flood hazards. Floods that affect the Coachella Valley are typically of short duration with high peak volumes and carry large amounts of debris. In the Whitewater River basin, a major flood occurs on average every ten years. The largest flood on record was in March 1938, with peak discharge estimated at 42,000 cfs, almost twice the peak of the second largest flood, which reached 24,000 cfs in 1965.

Colorado River: Due to the long history of water storage in the Southwestern U.S., hydroelectric dams and other flood control facilities now span the multi-state expanse of this major river to channel water to the region's cities to reduce natural flooding risks. Today, water flow in this river is subject to extensive and elaborate plans designed to balance a variety of competing needs, such as supplying water, protecting the environment and ensuring adequate recreational opportunities on the river, to name a few. Further details are provided under the dam inundation hazards sub-section below.

3. Floodprone Areas in Riverside County

In Riverside County, the three largest drainages of concern for main-stream flooding are the Santa Ana River, San Jacinto River and Whitewater River. In the western portion of Riverside County, the large rivers are dry most of the year and only pose flood threats to developments within the floodplain during general storms of long duration. In western Riverside County, these include the Santa Ana, San Jacinto, San Gorgonio and Santa Margarita Rivers, as well as Temescal and Murrieta Creeks. Lake Elsinore and other lakes, as well as various alluvial fans throughout the county, are also susceptible to flooding, for example Millard Canyon. Major floods along the San Jacinto River resulting from intense rainfall have been shown typically to peak in approximately 1.5 days with a total duration of flooding of four days.

Eastern Riverside County, being marked by extensive desert, does not possess as many major flood-prone drainages; the Whitewater and Colorado Rivers being the two principal ones. Rather, because of the arid climate and extremely porous (sandy) soils, water flows tend to pass rapidly through the region. Tributaries to the major rivers present additional flood hazards, mostly caused by local thunderstorms. Within Coachella Valley, there are many smaller washes that run out of the surrounding mountains and down into the valley floor, in some cases emptying into Whitewater River to the northwest or the Salton Sea to the southeast. The desert areas extending to the east from the Palm Springs area are also susceptible to sheet flow flooding, with flow depths of generally less than 2 feet. These types of flows leave the mouths of canyons and often follow unpredictable paths. Lastly, the desert also contains numerous washes (for example, Morongo Wash) and alluvial fans that are susceptible to flooding (see discussion below).

Additionally, many of the smaller drainages throughout the county, particularly those running through the alluvial fans that flank Riverside County's hillsides, are susceptible to smaller-scale floods and also flash-flooding. Figure 4.11.1 (100-Year Flood Hazard Zones Within Riverside County) shows the areas of Riverside County considered potentially at risk for flooding based on information from FEMA mapping, plus DWR and County of Riverside data. Key waterbodies are described below; a list of all potential flooding sources studied by FEMA is provided in Table 4.11-A (Potential Flooding Sources Studied in Riverside County).

Table 4.11-A: Potential Flooding Sources Studied in Riverside County

Water Source Studied	Water Source Studied	Water Source Studied
Acacia Creek Drain	Lincoln Avenue Drain	San Sevaine Channel
Alessandro Wash	Little Morongo Wash	Santa Ana River
All American Canal	Long Canyon Wash	Sheet Flow along Ocotillo Road
Arlington Canal	Macomber Palms Channel	Smith Creek
Arroyo Del Toro	Magnesia Falls Road	Smith Creek West Tributary
Bear Creek	Magnesia Springs Channel	South Norco Channel and Trib.s A and B
Beaumont Chanel	Main Street Drain	Spring Brook
Bedford Canyon Wash	Mangular Channel	Spring Brook Wash
Big Morongo Wash	Marshall Creek	Stetson Avenue Channel
Biskra Palms Channel	McVicker Canyon Wash	Stovepipe Canyon Creek
Blind Canyon Channel	Metz Road Basin	Stream A (Vicinity of Des. Hot Springs)
Bly Channel	Mirage Indian Trail Wash	Sun City Channels A-A, C-C, H-H and X-X
Box Springs Wash	Mission Creek	Sun City Southeast Tributary
Calimesa Channel	Mockingbird Canyon Wash	Sunny Slope Channel
Carrizo Alluvial Fan	Montgomery Creek	Sunnymead Storm Channel
Channel H	Mountain Avenue Wash	Taylor Avenue Drain
Cherry Avenue Channel	Murrieta Creek	Temecula Creek
Coachella Valley Stormwater Channel	North Cathedral Channel	Temescal Wash
Country Club Creek and North Tributary	North Norco Channel and Trib.s A, B and C	Tequesquite Arroyo
Day Creek Santa Ana River	North Palm Springs Wash	The Veldt
Dead Indian Alluvial Fan	North Side Wolf Valley Creek	Third Street Basin

Water Source Studied	Water Source Studied	Water Source Studied
Deep Canyon Alluvial Fan	Oak Street Channel	Thousand Palms Canyon Wash
Deep Canyon Storm Water Channel	Ocotillo Drive Wash	Thousand Palms Main Channel
Desert Hot Springs Channel	Orange Lateral	Thousand Palms Tributaries A, B and C
Dunes View Road Channel	Ortega Wash	Thunderbird Wash
Dry Morongo Wash	Ortega Channel	Tramview Wash
East Cathedral Channel	Palm Canyon Wash	Tramview Wash Tributary
East Gilman Home Channel	Palm Valley Drain	University Wash
East Rancho Mirage Storm Channel	Park Hill Drain	Wash G
El Cerrito Channel	Pechanga Creek	Wash I
Elsinore Spillway Channel	Perris Valley Storm Drain	Wasson Canyon Creek
Garden Air Gold Course Wash	Pigeon Pass Channel	West Cathedral Channel
Gilman Home Channel	Prenda Wash	West Norco Channel
Harrison Wash	Pushawalla Canyon Wash	West Pershing Channel
Hemet Storm Channel	Pyrite Channel	Whitewater River
Highland Springs Channel	Rache Channel	Whitewater River (C.V.S.C.)
Interstate-10 Wash	Ramsey Street Drain	Whittier Avenue Channel
Kalmia Street Wash	Rice Canyon Wash	Woodcrest Wash
Lake Elsinore	Salt Creek and Tributary	Unnamed Stream A
Lakeland Village Channel	Salt Creek Overflow	Unnamed Stream B
Lakeview Wash	San Gorgonio River	Unnamed Stream C
Leach Canyon Channel	San Jacinto River	1001 Ranch Drain
Lime Street Channel	San Jacinto Lateral	1001 Ranch Drain West Tributary

Source: FEMA, Flood Insurance Study – Riverside County, California, and Incorporated Areas, Volume 1 of 4, Aug. 2008. Table 2 (Flooding Sources Studies By Detailed Methods).

a. Western Riverside County

As reported in the 2008 FEMA study (pages 15-16), extensive commercial and residential development has occurred within the floodplain of the Santa Ana River in the Rubidoux area and on Murrieta Creek in the communities of Murrieta and Temecula. Extensive residential development has encroached upon the floodplains of San Sevaine and Salt Creeks in the Mira Loma area. San Sevaine Channel was constructed to divert flows away from development along San Sevaine Creek, but with minimal effect on large floods. Some degree of improvement has been constructed on the Santa Ana River, Murrieta Creek and Salt Creek in these high-hazard reaches as well. Moderate industrial, commercial and residential development exists along the Temescal Wash floodplain, primarily adjacent to the Corona corporate limits along Sixth Street. Moderate residential development exists in the floodplains of the following streams: Day Creek in the community of Sunnymead; Edgemont B North Fork in the Edgemont area; portions of Noble Creek and Little San Gorgonio Creek; numerous small tributaries in the Lakeland Village area; the Romoland and Homeland areas; the east side of the City of Hemet; and along San Gorgonio Creek in the Cabazon area. In most cases, some improvement to the watercourse has occurred along with the progress of development.

Lake Elsinore is situated in the southwestern comer of Riverside County in the Santa Ana River basin. The total drainage area of the lake is 770 square miles, of which all but about 50 square miles come from the San Jacinto River watershed. Located in a natural sink, the lake's only outlet is via the Elsinore Spillway Channel and Temescal Wash. Under current conditions, the lake level must exceed an elevation of 1,260 feet (the highest point along the spillway channel) before any outflow will occur. Since 1965, Colorado River water has been brought in via the San Jacinto River, as needed to maintain a lake surface of approximately six square miles. Prior to this importation scheme, the lake was intermittent, occasionally being dry for several consecutive years. Development around the lake is concentrated on the urbanized northern shore, within the corporate limits of the City of Lake Elsinore. Moderately dense residential development can be found in unincorporated areas around much of the lake perimeter, but is generally less dense than within the city.

RIVERSIDE COUNTY PLANNING DEPARTMENT

100-YEAR FLOOD HAZARD ZONES

\\agencyfiltmaps\Projects\Planning\SafetyElement\100yrFlood.mxd

This page intentionally left blank

Throughout its history, Lake Elsinore has been subject to flooding and drying, depending on runoff amounts. The lake loses an average of 15,000 acre-feet a year to evaporation, dropping its surface level more than 4.5 feet. In wet years, runoff from the San Jacinto River watershed pours into Lake Elsinore, which is the lowest point in the watershed. Currently, natural runoff is the only source of water for the lake. In the past, when runoff caused upstream reservoirs to spill, Lake Elsinore often filled, but rarely discharged.

The Lakeview Wash study area, as identified by FEMA, is situated on an alluvial fan, positioned at the base of the Lakeview Mountains and adjacent to the floodplain of the San Jacinto River. The upper portion of the study area is largely undeveloped and the wash has eroded an entrenched path in the lightly vegetated natural fan surface. Below Tenth Street, the wash enters residential areas of moderate density and flow becomes subject to control by buildings and paved roads. Floods on Lakeview Wash are usually produced by orographically-induced thunderstorms (that is, caused by moisture interacting with mountains).

The Bautista Wash watershed, which includes Park Hill Drain, is located on the western flank of the San Jacinto Mountains in west-central Riverside County. Flooding from Park Hill Drain and Bautista Wash affects portions of the cities of Hemet and San Jacinto, as well as unincorporated Riverside County areas. Before reaching the San Jacinto River, the streams flow over the relatively smooth surfaces of an alluvial fan and apron. The lack of topographic relief allows floodwaters to spread out (sheet flow) over wide areas. The residential and commercial area is moderately dense and further development is expected in the area.

The Pechanga Creek/Wolf Valley area studied by FEMA is a wide alluvial wash in southwestern Riverside County. The topography of the valley indicates that the floodwater of Pechanga Creek formerly affected wide areas. At present, the creek is largely confined to the southern edge of Wolf Valley due to its own encroachment and the influence of Pechanga Road. The transfer of some flow from the creek to the northern portion of the valley appears possible; an occurrence which would augment the flood hazard potential posed by the smaller tributary streams now threatening the north side of Wolf Valley. Runoff from Wolf Valley enters Temecula Creek and finally the Santa Margarita River. Within the Pechanga Indian Reservation, yearly mining of the bottom of Pechanga Creek as a source of sand causes alterations in the natural configuration of the channel.

b. Eastern Riverside County

In addition to major rivers (Whitewater and the Colorado), the watersheds of the desert create a number of alluvial fans in the many canyons and mountains that cross the desert. Alluvial fans studied near Thousand Palms and Desert Hot Springs are located on the northeastern side of the Coachella Valley at the bases of the Indio Hills and the Little San Bernardino Mountains, respectively. Coachella Valley is a northwest/southeast trending valley lying between the Little San Bernardino and Santa Rosa Mountains. The major settlements of Palm Springs and Palm Desert are located on the southwestern side of the valley on alluvial fans along the Santa Rosa Mountains. The detailed FEMA study areas (on the opposite side of the Coachella Valley) are affected by floodwater that originates in both the Indio Hills and the Little San Bernardino Mountains. Runoff from the large drainage basins of Thousand Palms Canyon, Pushawalla Canyon and Thousand Palms Main Channel have formed two sets of alluvial fans: between the Indio Hills and Little San Bernardino Mountains and at the base of the Indio Hills. Runoff from the Little San Bernardino Mountains spreads out over the initial fan area, then re-concentrates before flowing through or around the Indio Hills and opening out again onto the fans.

The intervening set of alluvial fans helps to reduce peak discharges from the larger watersheds by promoting the spreading and infiltration of runoff from the Little San Bernardino Mountains. The remaining basins are much smaller in size and represent watersheds draining only the Indio Hills. All of the streams carry water and sediment into the general areas of Desert Hot Springs or Thousand Palms, forming numerous coalescent alluvial fans. Many desert locations are subject to flood hazards from more than one flooding source due to the wide

areas threatened by each of the streams as they flow over the debris cones. In addition, the Interstate 10 freeway was constructed at the base of the alluvial fans adjacent to the Indio Hills, in what appears to be an abandoned channel of Big Morongo Wash.

The principal drainage course through the Coachella Valley from the City of La Quinta southward, the Whitewater River passes through the developed portion of Coachella Valley via channelization within the Coachella Valley Stormwater Channel. This man-made channel flows northeast and eventually empties into the Salton Sea. The Coachella Valley Water District maintains the channel.

The Salton Sea was formed accidentally in 1905 when floods eroded a cut in a bank of the Colorado River made during construction of the All-American Canal. As a result, water was diverted from the Colorado River into the Salton Trough forming the sea. Presently, the western six miles of Salton Sea lie within Riverside County; the remainder lies in Imperial County. Because of the Sea's relatively flat shoreline, even a slight increase in water levels can flood the recreational facilities along the water's edge. In the late 1970s and early 1980s, major flash-flooding in the Imperial and Coachella Valleys and flood control releases from Colorado River dams negated local conservation efforts to control the rising sea. Coachella Valley Water District (2000) reports that improved irrigation practices and a reduction in California's use of Colorado River water after completion of the Central Arizona Project have subsequently contributed to an on-going gradual decrease in the Salton Sea's elevation.

4. Flood Maps for Riverside County

The Federal Insurance Rate Map (FIRM) is the official map created and distributed by FEMA as part of the National Flood Insurance Program (NFIP). (See Section 4.11.3 (Policies and Regulations Addressing Flood and Dam Inundation) for more information). It delineates Special Flood Hazard Areas, those areas subject to inundation by the base flood, for every county and community that participates in NFIP. FIRMs contain flood risk information based on historic, meteorological, hydrologic and hydraulic data, as well as open space conditions, flood control works and development. Figure 4.11.1 shows mapped floodways and floodplains for unincorporated Riverside County (from several sources, as specified in Riverside County Ordinance No. 458). In addition to FEMA FIRMs, Riverside County has developed its own flood maps that account for additional areas of known risk. *The Riverside County Planning Department and Riverside County Flood Control and Water Conservation District work in continued coordination to ensure the flood safety of new development within the County*. Riverside County flood maps delineate 1% annual chance (100-year) flood boundaries and elevations for areas not studied by FEMA.

As noted above, Riverside County Ordinance No. 458 (Regulating Flood Hazards and Implementing the National Flood Insurance Program) specifies the sources of flood hazard mapping applicable in the County of Riverside. The ordinance applies to "all the *special flood hazard areas within the* ~~following~~ unincorporated areas *and within the jurisdiction* of the County of Riverside *on file at [Riverside County Flood Control and Water Conservation District] headquarters and shown on the Public Flood Hazard Determination Interactive Map found at http://rcflood.org. These special flood hazard areas incorporate*:"

- The flood hazard areas shown on the maps prepared by the Federal Insurance Administration entitled, "The Flood Insurance Study for the County of Riverside," effective August 28, 2008, with accompanying Flood Insurance Rate Maps and Flood Hazard Boundary Maps, including any amendments, revisions or additions *that go into effect pursuant to the provisions of applicable Federal law*.

- The flood hazard areas shown on the maps prepared by the U.S. Army Corps of Engineers entitled:

    - San Gorgonio River and Smith Creek, June 1973.

- San Gorgonio River and Tributaries, October 1974.
- *Warm Springs Creek, February 2003.* ~~Santa Ana River Mainstem Project, August 1991.~~

- The flood hazard areas shown on the maps prepared for Riverside County*, including any amendments, revisions or additions* ~~entitled~~:

- ~~Wildomar Valley, 100-Year Floodplain Limits, October 1979, as revised May 1986.~~
  - Cactus Valley, 100-Year Floodplain and Floodway Limits, March 1980.
  - Cabazon Flood Study, Flood Hazard Areas, June 1980.
  - Lakeview and Sierra Vista Tracts, 100-Year Floodplain Limits, October 1990.
  - Tucalota Creek, October 1974.
  - Long Valley Wash, October 2002.
- ~~Paloma Wash, October 2002.~~
- ~~Warm Springs Creek, February 2003.~~
  - Juniper Flats Floodplain, May 2006.
  - Flood Insurance Study for Oasis Area of the Coachella Valley, April 2003.
- ~~Awareness Maps, supplemented as needed by delineated floodplain area information.~~
- *The flood hazard areas as shown on the Awareness Maps that were prepared by the California Department of Water Resources and received by Riverside County Flood Control and Water Conservation District on July 25, 2011, including any amendments, revisions or additions that are adopted by the County Board of Supervisors.*
- The flood hazard areas shown on the map prepared as part of the "Flood Plain Information, Colorado River, Palo Verde Dam to Imperial Dam," dated October 1974, for that area between the Palo Verde Diversion Dam and Taylor Ferry; or on any Flood Insurance Rate Maps and Flood Hazard Boundary Maps, including any amendments or additions *that go into effect pursuant to the provisions of the applicable Federal laws for the Colorado River.*
- Any maps of flood hazard areas adopted by resolution of the Riverside County Board of Supervisors.

The ordinance goes on to state that "notwithstanding the provisions of any other ordinance to the contrary," within the *special flood hazard areas shown on the maps referred to above* ~~unincorporated areas of Riverside County shown on the above maps~~, "no structure, including flow-obstructing structures, shall be constructed, located or substantially improved and no land shall be graded, filled or developed, and no permit or approval shall be granted therefore, unless it complies with all the applicable requirements" of Ordinance No. 458 and all other applicable county ordinances. This strict prohibition is the principal means Riverside County has for ensuring new development is not constructed in, or affected by, 100-year flood hazards or exposed to flood risks.

B. Dam Inundation Hazards

The second type of flood hazard, dam inundation, can also result in downstream flood damage. However, where main-stream flooding occurs as a result of precipitation (rain or snow) runoff, dam inundation flows are a result of the failure of a dam. As defined in the State's Multi-Hazard Mitigation plan, page 330, dam failure is the "un-controlled release of impounded water from behind a dam." Causes of dam failure include flooding, earthquake, blockage, landslide, lack of maintenance, improper operation, poor construction, vandalism and terrorism.

The Multi-Hazard Mitigation Plan (page 331) also notes: "The term 'dam failure' encompasses a wide variety of circumstances. Situations that would constitute a dam failure vary widely, from developing problems to a partial or catastrophic collapse of the entire dam. Potential causes of a dam failure are numerous and can be attributed to deficiencies in the original design of the dam, the quality of construction, the maintenance of the dam and [functioning] of the appurtenances [during dam operation], and acts of nature including precipitation in excess of the designed capacity, flood and damage from earthquakes. Water over-topping the dam crest is a common cause of failure in earthen dams. Overtopping will cause erosion of the dam crest and eventual dam breach. Piping of earth dams is another common form of failure. Piping is a form of erosion that occurs underground caused by rodent burrowing and the presence of extensive root systems from vegetation growing on and around the dam." Dam failures can also arise from the earthquake-induced effects of liquefaction, lateral spreading or primary fault rupture. See Section 4.12 (Geology and Soils) for further details on these.

A dam failure event is extremely hazardous, as it will typically occur quickly and with little warning. Areas directly below the dam are at the greatest risk. The area downstream of a dam potentially at risk to flooding should the dam fail is called the "dam inundation zone." The zone is defined by a number of factors including downstream topography, soils and the volume of water impounded by the dam on its upstream side in the associated reservoir. As water moves farther downstream and decreases in velocity and depth, the magnitude of the damage and potential risk to life and property decreases.

In addition to structural failure, dam inundation can also occur by overtopping, i.e., when the level of the water being held on the dam's upstream side (in its reservoir) exceeds the height of the dam itself. When this happens, water ends up flowing over the top of the dam (instead of through it) in an uncontrolled manner, possibly resulting in flooding downstream depending on the volume. This type of flow can also lead directly to failure of the dam itself with additional flooding the result. However, since dam reservoir heights are closely monitored and controlled, this type of dam inundation is quite rare in the U.S. For levees and canals (which can be considered a type of dam that line a river course), this scenario is a common cause of flooding hazard, particularly for large rivers.

1. Major Facilities With Dams in Riverside

Under the California Water Code, dam safety is regulated by the DWR, which delegates the program to the Division of Safety of Dams. Neither Riverside County nor FEMA have jurisdiction over dam inundation areas. Among other duties, the California Emergency Management Agency runs a Dam Safety Program (established by CGC Section 8589.5 in 1972), which collects and reviews dam failure inundation maps and evaluated waivers from the inundation mapping requirement. It is also the designated repository of the official dam failure inundation maps used in California's Natural Hazard Disclosure statement for real estate transactions, pursuant to Civil Code Section 1103.

The following locales/facilities represent major flood risk management efforts in Riverside County or affect downstream lands within Riverside County. Also covered are water storage facilities (reservoirs) that have one or

more dams associated with them that could cause dam inundation damage within Riverside County in the unlikely event it failed. For dams, only the largest ones in or affecting Riverside County, i.e., those over 100 feet high or impounding over 100,000 acre-feet, are described in detail below. See Table 4.11-B for the full list of regulated dams (i.e., dams meetings the size for falling under state DWR jurisdiction pursuant to CWC Sections 6000-6008) within Riverside County. Note: Dams and reservoirs owned by the federal government are generally not subject to state jurisdiction.

a. Dams and Levees

Seven Oaks Dam: The Seven Oaks Dam is located on the Santa Ana River in San Bernardino County, approximately four miles northeast of Redlands, in the southern San Bernardino Mountains. The dam was completed in 1999 by the Army Corps, Los Angeles District, as part of the Santa Ana River Mainstem Project. Operating in tandem with Prado Dam 40 miles downstream, it is an important flood control structure for the Santa Ana River channel through northwestern Riverside County. Historical flood flows on the Santa Ana have exceeded 300,000 cfs. Together, these dams protect the burgeoning populations of western San Bernardino and Riverside counties, as well as northern Orange County.

The Seven Oaks Dam consists of a zoned, earth-filled embankment that is 40 feet wide at its crest and over 2,200 feet wide at the base. In total, the dam is 550 feet high and nearly 3,000 feet long. There is also a spillway, outlet tunnel, air shaft, gate chamber and intake structure tower. Seven Oaks is the 12th highest dam in the country and also the 10th largest earthen dam. It has a reservoir capacity of just under 148,000 acre-feet. During the early part of each flood season, runoff is stored behind the dam in order to build a debris pool to protect the outlet works. Small releases are made on a continual basis to maintain the downstream water supply. During a flood, Seven Oaks Dam stores water destined for Prado Dam for as long as the reservoir pool at Prado Dam is rising. When the flood threat at Prado Dam has passed, Seven Oaks releases its stored flood water at a rate not exceeding the downstream channel capacity. At the end of each flood season, the reservoir at Seven Oaks gradually drains and the Santa Ana River flows through unhindered. The Army Corps reports that Seven Oaks is designed to completely contain a flood of up to 85,000 cfs, which corresponds to a 350-year flood event. Also, in view of its location in proximity to the San Andreas Fault, to ensure its safety, the dam was designed to withstand an 8.0-magnitude earthquake.

Prado Dam: Prado Dam (frequently recognized by its now-defaced Bicentennial mural) is a flood control and water conservation structure located at the upper end of Lower Santa Ana River Canyon, a natural constriction controlling 2,233 square miles of the 2,450-square mile Santa Ana River watershed. The dam embankment is approximately two miles west of the City of Corona. Portions of the reservoir are in both Riverside and San Bernardino counties. The 106-foot high dam impounds runoff from uncontrolled upstream drainage areas along with water released from other storage facilities and can store over 295,000 acre-feet. The Prado Reservoir is owned by the Army Corps. Historically, water releases above 5,000 cfs have damaged downstream improvements.

In January 2005, heavy rain lead to water seeping through an earthen extension to the dam, necessitating water release to relieve pressure on the facility. As a safety precaution, over 3,000 downstream residents were evacuated for roughly 24 hours. In 2009, downstream channel improvements were made to increase downstream channel capacity from 5,000 cfs to over 30,000 cfs as part of a three-phase improvement plan for Prado Dam that also increased freeboard height and overall reservoir capacity. The Prado Flood Control Basin (in which the dam is located) lies within the 2,000-acre Prado Regional Park, in Chino (San Bernardino County). The park offers fishing, a shooting range (site of the 1984 Olympic shooting events), archery, camping and a golf course.

Dams Along the Colorado River: The easternmost border between Riverside County and Arizona is formed by a stretch of the Colorado River. There is only one major dam along the segment of river abutting Riverside County. Lands along the Colorado River corridor could suffer from catastrophic failure of dams that are located far outside the borders of Riverside County. These dams include Palo Verde Diversion Dam, Headgate Rock Dam, Parker Dam, Davis Dam and Hoover Dam. For additional details on the dams along the Colorado River, see Appendix H of the General Plan.

In 1993, the U.S. Bureau of Reclamation evaluated inundation potential along the Colorado River by modeling failure of combinations of Hoover, Davis and Parker Dams. Relevant results, data and mapping from this study are presented in General Plan Appendix H and also reflected in the dam inundation mapping shown in Figure 4.11.2 (Dam Inundation Failure Zones in Riverside County). To summarize, the evaluation determined that the City of Blythe, with roughly 21,000 people, the main population concentration along the Colorado River within Riverside County, sits roughly 207 feet above sea level. This is well within the elevation under the water surface levels predicted for a catastrophic failure of any combination of Colorado River dams. However, in the event of such a catastrophic dam failure, FEMA has estimated that it would take a minimum of 23 hours before the floodwaters reach Blythe allowing ample time for any necessary evacuation efforts. Thus, these dams do not pose immediate inundation risks.

Lake Elsinore: Located at the southern end of Temescal Canyon, at roughly six miles long and one and a half miles wide, Lake Elsinore is the largest natural freshwater lake in Southern California. It is classed as the terminal lake of a partially closed basin, located at the extreme northwestern end of Temecula Valley and cut off from the Santa Margarita River watershed by a slight ridge running between the Sedco Hills and Elsinore Mountains, south of the lake. The lake lies at the lowest point in the 750-square-mile San Jacinto River watershed and is fed by that river. Leach and McVicker Canyons also contribute inflows to the lake. The lake's primary outlet is via Temescal Wash, although flows only occur under exceptionally rainy conditions. In total, the lake spans roughly 3,000 acres at normal fill levels, with depths averaging 27 feet (42 feet maximum).

Lake Elsinore's northwestern shore rises to the surrounding foothills, running along the foot of the slopes to the Alberhill Creek outlet, which passes through downtown Lake Elsinore (the city). The lake south of the outlet lies in an open area at the mouth of the San Jacinto River, although a long flood control levee running along the southeast end of the lake cuts it off from the river. As a result, the isolated section only fills after an extremely large rainfall event. Seismically, Lake Elsinore is the largest sag pond (body of water collected in the lowest parts of a depression formed between two strands of an active strike-slip fault) in the Elsinore Fault Zone.

b. Water Reservoirs

These water features were designed to function as reservoirs for Southern California's water supplies. They are listed here since each has one or more dams associated with them.

Diamond Valley Lake: Diamond Valley Lake was created by the Metropolitan Water District of Southern California (MWD) in Domenigoni Valley, four miles southwest of the City of Hemet. Built at a cost of nearly $2 billion, excavation for the three earthen dams necessary to create the lake was begun in 1995 and completed in 2002. It is reported to be the largest earth-and-rock fill project ever constructed in the United States. The reservoir's west dam is 1,200 feet long at its base and reached 285 feet high; the east (Eastside) dam is 10,500 feet long and 185 feet high; and the saddle dam is 2,300 feet long and 130 feet high along the ridgeline. Together, the reservoir created by these dams runs between 160 to 260 feet deep and has a storage capacity of 800,000 acre-feet (261 billion gallons).

Diamond Valley Lake forms Southern California's largest reservoir for storing surface water. It almost doubles Southern California's surface storage capacity and is intended to ensure a six-month water supply in the event of an emergency. The reservoir also provides additional water for drought protection and peak summer needs. Water stored at Diamond Valley comes from the Colorado River Aqueduct through the San Diego Canal and from the State Water Project through the new 12-foot diameter, 45-mile Inland Feeder Project. The lake is also used for recreational activities, including boating and fishing (for stocked bass, bluegill, crappie, catfish, shad and trout). Adjacent to the lake is a recreation park, an aquatic center and a visitor center, plus the Western Science Center (displaying fossils uncovered during the dams' construction). Other extensive plans for recreational uses have yet to be accomplished by MWD.

Lake Hemet: Located in the San Jacinto Mountains above western Riverside County, Lake Hemet serves as a water storage reservoir, impounding just over 19,000 acre-feet behind 135-foot tall Hemet Dam. When completed in 1895, at a height of 122.5 feet, Hemet Dam was the largest solid masonry dam in the world until surpassed in 1911 by construction of the Roosevelt Dam in Arizona. Lake Hemet drains an area of roughly 67 square miles. The reservoir is owned and operated by the Lake Hemet Municipal Water District. It is available for recreational uses, including fishing (from stocked trout, catfish, bluegill and bass) and boating.

Lake Mathews: Lake Mathews is located approximately five miles south of the City of Riverside and is the terminal reservoir of the Colorado River Aqueduct. It is owned and operated by MWD and provides drinking water for approximately 15 million people. The dam forming the reservoir is 264 feet high and impounds 222,400 acre-feet of water. In collaboration with MWD, FCWCD is in the process of obtaining funding for a Drainage Water Quality Management Plan for the Lake Mathews Watershed Project. The objective is to reduce non-point source pollution in Lake Mathews and Cajalco Creek, which drains into Lake Mathews, through the construction of a series of wetlands. It also aims to reduce the seismic vulnerability of Lake Mathews outlet facilities to ensure a reliable supply of water following a major earthquake.

Lake Perris: Situated in a valley between the cities of Perris and Moreno Valley, the reservoir at Lake Perris was formed in 1973 with the construction of a 130-foot high and nearly two-mile long dam in Bernasconi Pass. Its main function is as the southern terminus of the State Water Project (which conveys water from the Sierra Nevada Mountains across the state). It also impounds a roughly 10-square mile watershed and holds nearly 155,000 acre-feet. At roughly three miles long and two miles across, the lake offers approximately 10 miles of accessible shoreline.

The area immediately around the lake is owned by DWR and managed by the California Department of Parks and Recreation, although DWR owns and operates the State Water Project facilities on site, including the dam and outlet facilities. The California Department of Fish and Wildlife owns the areas below the dam and manages them for habitat conservation value. The roughly 6,000-acre area surrounding the lake forms the popular Lake Perris State Recreation Area (SRA), offering a variety of recreational uses including fishing (the stocked lake offers bass, bluegill, trout, catfish, crappie, sunfish and carp), boating and swimming. The north shore of the lake includes park facilities, such as campgrounds, offices, the Regional Indian Museum, parking lots, a marina, group picnic areas, a horse camp and a bike trail. Along the south shore of the lake is Bernasconi Beach and picnic areas, plus camping and rockclimbing areas. The area surrounding the SRA is mainly open space, particularly conservation (OS-CH) lands. The Perris Fairgrounds operate on 108 acres at the corner of Ramona Expressway and Lake Perris Drive, west of the Lake Perris SRA. Nearly one million people visit the fairgrounds annually. The fairgrounds are home to an 8,000-seat speedway track, a BMX track, a skate park and an equestrian arena, among other attractions.

According to an extensive study conducted by the State (DWR) in 2005, there are fears that an earthquake of magnitude 7.5 or larger could breach the dam. This engineering study, combined with the reservoir's location

within a few miles of the San Jacinto Fault, makes it a key concern for seismically triggered dam failure and inundation hazards. In 2011, the State of California issued the Perris Dam Remediation Program outlining how repairs to the dam would be performed to assure its safety. According to the DWR, the program consists of remediation (upgrading roughly 700,000 cubic yards of the dam face with "cement-deep soil mixing" and a reinforcement berm), outlet tower replacement and emergency outlet extension. The construction phase is set to begin in 2014 and be completed by the end of 2015. In the interim, however, the DWR reports that there is "no imminent threat to public safety."

Lake Skinner: This large reservoir was created in 1973 along Tucalota Creek at the foot of Bachelor Mountain in the Auld Valley, northeast of Temecula. After expansion in 1991, the Skinner Clearwell Dam that created the reservoir measures 109 feet high and impounds just under 63,000 acre-feet. The lake is operated by the Riverside County Regional Park and Open-Space District (County Parks) under lease from MWD. It offers a number of recreational uses, including sailing, fishing and swimming (in an off-reservoir area), as well as horseback riding, hiking, picnicking and camping in the surrounding 1,400-acre park. The reservoir is supplied by water from both the Colorado River Aqueduct and the State Water Project, and is a source of drinking water (after treatment) for 2.5 million people in Riverside and San Diego counties.

Vail Lake: Located on Temecula Creek in the Santa Margarita River watershed, the reservoir of Vail Lake was created in 1948 by a 152-foot tall dam. The reservoir drains an area of 306 square miles and can hold 62,000 acre-feet. It has been owned and operated by the Rancho California Water District since 1978. The lake is supplied by Kolb, Temecula and Wilson creeks. The property surrounding Vail Lake is privately owned and recreational access to the lake is privately controlled. A members-only resort facility has been operated off and on at the site of a former park over the years. Seismic studies of the region show that roughly nine local faults and lineaments converge in the vicinity of Vail Lake. Little development, however, lies in the immediate vicinity downstream of the dam.

2. Dam Inventory and Failure Risks

As shown in Figure 4.11.2, within Riverside County more than 20 dam failure inundation zones have been identified for existing dams and reservoirs. Data for Riverside County dams was obtained from the National Inventory of Dams (NATDAM) 2000 based on 1998-99 data submitted by local agencies. A summary of the dam inventory data from NATDAM is presented in Table 4.11-B, below.

The NATDAM hazard classifications included in Table 4.11-B are based entirely on the downstream hazard potential. Ratings are set by FEMA and confirmed with site visits by engineers. A dam is considered a "high" hazard potential if it stores more than 1,000 acre-feet of water, is higher than 150 feet tall and has the potential for downstream property damage and/or causing downstream evacuation. These are dams where failure or mis-operation would likely cause loss of human life. Dams are considered to be of "significant" hazard potential where failure or mis-operation would result in no probable loss of human life, but could cause economic loss, environmental damage, disruption of lifeline facilities or affect other concerns. These dams are often located in predominantly rural or agricultural areas, but could also be located in areas with population and significant infrastructure. Lastly, dams with "low" hazard potential are those where failure or mis-operation would not be likely to result in loss of human life, economic or environmental losses. Losses are principally limited to the owner's property.

Table 4.11-B: National Inventory of Dam (NATDAM) Data for Riverside County

Dam Name	River	Nearest City	Dam Height (feet)	Reservoir Storage (acre-feet)[1]	Year Built	Drainage Area (sq. miles)	NATDAM Canyon Hazard Desig.[2]
Vail	Temecula Creek	Temecula	152	62,000	1949	306	H

Footnotes:
1. An acre-foot is the amount of water it takes to cover one acre to the depth of one foot. One acre-foot equals approximately 325,900 gallons.
2. NATDAM Hazard Potentials: H = High; S = Significant; L = Low. See text for further details.

Source: Earth Consultants International, General Plan Appendix H: Natural Hazard Mapping, Analysis and Mitigation: A Technical Background Report in Support of the Safety Element, 2000.

3. Earthquake Hazards for Dams

Several California dams have been tested by earthquakes. Experience has shown that dams must be made safe before earthquakes occur. After an earthquake strikes, there are many obstacles that hinder the quick detection and treatment of earthquake-damaged dams or implementation of evacuation plans. After recent earthquakes, analysis of the emergency response efforts found that key response personnel were not available, communications were blocked, equipment and operators were in short supply, helicopters were not available for inspections and access to repair materials and dams was difficult.

In 1971, the San Fernando earthquake damaged the Lower San Fernando Dam. The reservoir had to supply a large portion of the water for Los Angeles for two weeks while severe damage to the supply aqueducts was repaired. This scenario could be repeated in Riverside County following a major earthquake, as many of Riverside County's aqueduct systems cross major faults at numerous locations.

A wide variety of creative solutions have been used to improve the seismic stability of dams in California. Although there have been major advances in analysis techniques, rehabilitations have not changed radically. Multiple arch dams are still being stiffened and embankment dams buttressed. Reservoir storage restrictions are effective ways to rapidly increase dam safety, but can prove troublesome in the long term. To improve the seismic safety of dams and other flood control structures, a variety of state and federal agencies have projects planned or underway in California.

In a review of seismic dam safety, the DWR found seismic safety hazards in a portion of the Lake Perris Dam foundation. While DWR noted that there is currently no imminent threat to life or property, the State of California has taken actions to lower the lake's water level in an effort to ensure public safety. DWR has developed a plan to repair the dam and is currently awaiting certification of the Final Environmental Impact Report. DWR anticipates that construction for the repairs will begin in mid-2013 and be completed by 2016.

C. Seiche and Tsunami Hazards (Earthquake-Induced Flooding)

Seiche is simply an underwater wave that oscillates through a body of water. Small rhythmic seiche only a few inches high are almost always present on larger lakes as a result of the water body's depth, contours and water temperature. They are often imperceptible to the eye, noticeable only in periods of unusual calm. However, when an event, such as an earthquake or landslide, causes a reverberating wave or waves to form in an enclosed body of water, the motion is akin to the rocking of water in a bowl that has been moved. The resultant "slosh" when these waves reach the lake's shore can cause localized flooding. In a severe case within a man-made reservoir such waves could damage the reservoir's dam. Typically, the more shallow and elongated the waterbody, the more pronounced the seiche effect. Flooding outside the banks of the waterbody is the result of an underwater wave emerging along shallow shorelines. A big seiche on Lake Superior in 1995 caused water to fall and rise again by three feet within 15 minutes.

Larger seiche can be caused by high winds, earthquakes or underwater landslides. The magnitude of seiche caused by landslides or surface fault rupture depends on the amount of water and ground displacement. For example, modeling data produced for Lake Tahoe indicate that its deep water in conjunction with underlying fault placement and geology play large roles in seiche potential.

RIVERSIDE COUNTY PLANNING DEPARTMENT

DAM FAILURE INUNDATION ZONES

\\agency\ltmaps\Projects\Planning\Safety_Element\Dam_Inundations.mxd

This page intentionally left blank

Tsunamis are a related phenomenon in which the water waves are caused by an up-and-down movement, rather than side-to-side as in seiche. They are most commonly associated with oceans, which can generate waves of massive and devastating height upon hitting coastlines. Since Riverside County has no ocean frontage, there is no oceanic tsunami risk within the county. For the inland water bodies within the county, the discussion under 'seiche' addresses all types of waterbody wave hazards, regardless of source or type. In terms of seiche hazards within Riverside County, the region's semi-arid climate makes naturally occurring enclosed water bodies uncommon. Most enclosed water bodies in the county are reservoirs built by local municipalities and water districts to provide water service to local customers. Typically, all land surrounding the reservoirs' shorelines are in public holdings which restrict private land development and thus limit the risk of inundation from seiche. Public land holdings, such as by cities, public water agencies or the state, are not within the jurisdiction of unincorporated Riverside County. Only two waterbodies, Lake Perris and Lake Elsinore, are of any concern relative to potential hazards from seismically induced seiche.

Lake Perris: As noted previously, Lake Perris SRA surrounds the lake and draws thousands of visitors each year. Its active use, plus the very popular Perris Fairgrounds below the reservoir (with roughly a million visitors a year), make it of concern for seiche risks. The lake's fully enclosed shores makes it potentially subject to seiche, but its rounded shape (two miles by three miles) reduces the likelihood of standing wave propagation. The longer axis of the lake lies roughly northeast by southwest. The large dam stretches across the southwest end, with the Perris Fairgrounds (including the Perris Auto Speedway) located roughly a half-mile beyond and open space surrounding it all. Aside from risk of damage to the dam itself, there is no other development or vulnerable structures at the southwest end of the lake. The northeast end of the lake consists of open land (open space) that is part of the Lake Perris SRA but not developed with any specific recreational facilities (campgrounds, swimming areas, docks, etc.), although a sand-covered beach lies further to the north. Alessandro Island also lies at this end of the lake. Beyond this end of the lake lie additional expanses of conserved open space. In general, the large expanses of mostly open space surrounding the shore and lack of development at this end of the lake limit the potential seiche risks to property and human lives.

Lake Elsinore: Because of its partially enclosed basin and long, narrow shape (six miles long by 1.5 miles wide), this lake may have the potential for seismically induced seiche. If a standing wave becomes propagated on the long-axis of the lake (roughly northwest-southeast), it could lead to sudden, higher than expected, waves at these two ends of the lake, both of which have development present. The north end of the lake is within the City of Lake Elsinore and contains mostly open space and vacant lands, with the exception of the Butterfield Village Mobile Home Park at the western edge of the northwest lake end, beyond the levee consists mainly of open space and vacant land, plus the Links at Summerly golf course. These areas are almost entirely within the City of Lake Elsinore also. All of the city areas are outside Riverside County's jurisdiction. The proposed changes for Lakeland Village along Grand Avenue and its vicinity are mainly located on the southwest side of the southern end of the lake. These are not directly within the long-axis path of potential seiche waves, but close enough to that end to be possibly at risk.

D. Mudflow and Debris Flow Hazards

Mudflows~~, (or mudslides),~~ are shallow water-saturated landslides that travel rapidly down slopes in a river of liquid and flowing mud on the surfaces of normally dry land areas. The earth is carried by a current of water and deposited along the path of the current. Debris flows are similar to ~~mudslides~~ *mudflows*, except they contain a high percentage of non-soil material, such as rocks, brush, trees or other debris. A mudflow occurs naturally as a result of heavy rainfall on a slope that contains loose soil or debris. Two forces are at work on slopes: driving forces that combine to cause a slope to move and resisting forces act to stabilize the slope. When the combined driving forces exceed the resisting forces, a ~~mudslide~~ *mudflow* or landslide occurs.

There is a high potential for mudflow to occur in some areas of Riverside County as a result of large amounts of precipitation in a relatively small time frame. Areas with steep slopes or mountains are potentially subject to mudflows in the event of large amounts of precipitation. This risk is often intensified in burned areas where soil-retaining vegetation has been lost. Such areas are particularly susceptible to flashfloods and debris flows during rainstorms. Narrow canyons, arroyos and desert channels are also susceptible to flashfloods which can cause flooding damage directly or indirectly through mudflows. Human activity can also induce a slide, such as when soil becomes saturated from a broken water pipe or the improper diversion of runoff from a developed area.

Mudflows predominantly occur in mountainous areas underlain by geologic formations that produce sandy soils. Weathered gabbroic soils contain large amounts of clay that shrink and expand with exposure to water and also have a high potential for instability and sliding. Mudflows can be initiated on slopes as low as 15 degrees but more frequently occur on slopes as steep as 45 degrees. The path of a mudflow is determined by local topography and will typically follow existing drainage patterns. The fluidity and depth of the water/soil/debris mixture and the steepness of a channel are all variables that influence the rate of movement of a mudflow. At the foot of a long steep slope, a flow may move at avalanche speed (approximately 40 feet per second, that is, 27 miles per hour) and contain tremendous force capable of destroying buildings and roadways.

Debris flows, particularly when associated with alluvial fans and mountain canyons, can result from the presence of a large percentage (up to 70-90% of flow by weight) of fine sediment, such as silt and clay, in steeply-flowing floodwaters. This enables the muddy flow to transport sand, gravel, boulders and dislodged timber and brush from the surrounding watershed into the floodplain or alluvial fan's surface. Conditions favoring the formation of debris flows are: available unconsolidated silt, clay and larger rock in the basin watershed (due to minimal vegetation), heavy or sustained rainfall in the basin and the presence of a steep basin and/or alluvial fan slopes. In desert areas with finer soils, such flows create alluvial fans (see below). In mountains and other areas with heavy debris, the flow activity can result in the creation of a 'debris fan.' Such debris fans are found in areas where mountain systems are subject to tectonic forces of uplift, including parts of California.

Areas recently burned by wildfires are particularly susceptible to flashfloods and debris flows during rainstorms. Just a short period of moderate rainfall on a burn scar can lead to flashfloods and debris flows. Rainfall that is normally absorbed or intercepted by vegetation can run off almost instantly, causing creeks and drainage areas to flood much sooner during a storm and with more water than normal. Additionally, the soils in a burn scar are highly erodible so flood waters can contain high amounts of mud, boulders and vegetation. The powerful force of rushing water, soil and rock both within the burned area and downstream can destroy culverts, bridges, roadways and structures, placing people and property at risk.

In 2003, post-fire debris flows occurred in San Bernardino County resulting in the tragic loss of 16 people on Christmas Day. As a result, Governor Schwarzenegger signed Assembly Bill 2141 to direct the DWR to seek federal funding for the establishment of a stakeholder-driven Alluvial Fan Task Force to develop a model ordinance and planning tools (e.g., design guidelines for development on alluvial fans) to mitigate flood hazards associated with alluvial fan flooding, a type of flooding that is prevalent after wildfires where areas remain vulnerable for five years after an incident. See the discussion on alluvial fan flood hazards, below, for more information on this hazard.

1. Warning Signs

Slope failure problems are caused by any combination of water saturation and flow, weak or heavy earth materials and steep slopes. Of these, water is the most common trigger of slope failure. There are a number of warning signs and indicators of the potential for a ~~mudslide~~ *mudflow* or landslide that may be identified or visible before an incident occurs.

Steep Slopes: Problems occur on steep slopes, especially when a slope of 1-to-1 (one foot vertical to two feet horizontal) is exceeded.

Debris: Soils and vegetation deposited at the base of a slope may be signs of erosion, flow and creep from above.

Vegetation: Vegetative characteristics reflect slope conditions. Bare slopes may show erosion and sliding. Trees tilting uphill may show deep rotational land sliding. Trees that bend downhill show creep of upper soils. Patches of newer vegetation may show former slope failure. Horsetail ferns, willow shoots or other moisture-loving plants often indicate saturated ground and springs.

Deformed Structures: Deformations, such as foundation cracks, doors and windows out of line or sticking, tilted floors, sagging decks, cracks in masonry and chimneys, cracks in driveways, curbs and roads, gaps between floors and walls, failing retaining walls and tilted power poles, can all be warnings of slope instability.

Loose Fill: Loose fill at the top of a slope due to yard waste, cut-and-fill land grading or other processes can aggravate slope instability.

Undercut Toe of Slope: When supporting material has been removed from the toe of a slope, the potential for sliding and erosion is increased.

Suspect Landforms: Landforms, such as steep slopes, are common at the top (head) of landslides. Rounded, conical mounds or lumpy ground often indicates a deposit of slide or debris material.

The National Flood Insurance Program will pay for covered damages that occur during or as a result of a qualifying mudflow event. However, the NFIP does not cover losses that result from land shrinkage, landslide, destabilization or movement of land resulting from the accumulation of water in subsurface land areas, gradual erosion or any other earth movement, except ~~mudslides~~ *mudflows*.

2. Avoiding ~~Mudslides~~ Mudflows

To prevent mudflows on a property, the discharge of concentrated water must be directed to a safe, non-erodible site, such as a storm drain, street gutter or rock stream bed. On an emergency (temporary) basis, sandbags can be used to divert water from uncontrolled spilling, such as over curbs, from gutters and downspouts, or from washing into buildings.

For major problems, more permanent solutions are necessary. The best and easiest cure is to avoid hazardous sites. Urban population pressures increase the uses of marginal building sites requiring greater investment in soil and slope stabilization measures. Steep, weak hill slopes require increased measures under the Building Code and building ordinance during site planning, building design and construction, to reduce risk to future homeowners and occupants. Professional site investigations by an engineering geologist are typically required as part of the siting and design process. A site investigation, analysis and design by a licensed professional can provide solutions to most problems. Incorporating the recommendations from the site study has been shown to reduce landslide risks and damages according to FEMA. In general, the geological survey will define and analyzed site conditions, including factors such as:

- Soil and rock types present and their characteristics (strength, stability, etc.).
- Distribution of soil types.

- Subsurface configuration (geological structure and slip plane configuration).
- Ground and surface water conditions.
- Active processes and rates of recurrence.
- Analysis of suitability of the site for the intended use.
- Specific recommendations for development.
- Further investigations required, if any.

For sites with existing issues, or where new issues arise, for example due to new development adjacent to the site or due to a wildfire, remediation efforts may be needed, as recommended by a geotechnical professional (licensed engineer, engineering geologist, etc.). Several key types of remediation are as follows:

- Drainage improvements: Providing surface protection and vegetation; installing surface drainage ditches and storm drains, curtain or French drains, perforated plastic pipe; or subsurface drains, such as wells or horizontal drains.
- Retaining structures: Applying soil stabilization materials; installing buttress fills, retaining walls with drainage, piling or riprap (rock cladding).
- Reengineering slopes: Via grading; slope contouring or terracing; removal and compaction or replacement of material; or reduction of the slope.

E. Alluvial Fan Flooding Hazards

As mentioned earlier, an alluvial fan is a gently sloping, fan-shaped landform created over time by deposition of water-eroded sediment built up by streams. These flows come from a single point source (most often a canyon or other narrow opening between hills) at the apex of the fan and can over time move to occupy many positions on the fan surface as the flows drain out onto a flatter plain. As a stream's gradient decreases, it drops coarse-grained material (the source of the "alluvial" in the name). This reduces the capacity of the channel and forces it to change direction and gradually build up a slightly mounded or shallow conical fan shape (the "fan" in alluvial fan). The deposits are usually poorly sorted due to recurrent flood action moving existing strata.

1. Alluvial Fan Floodplains

In California, alluvial fan floodplains occur most prevalently in Southern California (from San Luis Obispo and Kern counties southward). On its Alluvial Fan Task Force website, DWR estimates that as growth fuels additional development in Southern California, up to 60% of the next century's new development will occur in or on communities with alluvial fans. Given that alluvial fans tend to occur in the apparently dry conditions of arid and semiarid regions (including throughout Riverside County), homeowners are often shocked to find that they can be the sites of destructive floods. Alluvial fans are often found in desert areas subject to periodic flash floods from nearby thunderstorms in local hills, for example, many of the hills and mountains in eastern Riverside County.

The typical watercourse in an arid climate has a large, funnel-shaped basin at the top, leading to a narrow defile (pass or gorge between mountains or hills), which opens out into an alluvial fan at the bottom. Multiple braided streams are usually present and active during water flows. Although, in locations where water flows or the upstream basin have been modified through human disturbance, for example orchards or groves, the resultant flows may be more stable, resulting in the creation of a single heavily incised channel or set of braided channels. In flooding events on alluvial fans, FEMA (in FEMA Report No. 165, "Alluvial Fans: Hazards and Management," February 1989; page 4) identifies the following hazards that may be encountered:

- High-velocity flow (as high as 15-30 feet per second) producing significant hydrodynamic forces (pressure against buildings caused by the movement of flowing water).
- Erosion and scour (to depths of several feet).
- Deposition of sediment and debris (depths of 15-20 feet have been observed).
- Debris flows and impact forces.
- Mudflows.
- Inundation, producing hydrostatic/buoyant forces (pressure against buildings caused by standing water).
- Flash flooding (little, if any, warning times).

2. Historical Alluvial Fan Floods

In the book *Alluvial Fan Flooding* (Commission on Geosciences, Environment and Resources, 1996) an account by C.B. Beaty summarizes a "rare eyewitness account" of a mud and debris flow that occurred in Cottonwood Canyon in Bishop, California, in July 1952. Beatty reports that "Two hours after a heavy thunderstorm in the White Mountains to the east, a large flow of debris advanced down the alluvial fan. At and below the apex, the flow was in a pre-existent, defined channel leading from the 3.7-square mile basin. Debris spilled over channel walls and spread laterally to widths of 100 to 400 feet. One large distributary channel of debris was formed by concentrated overflow on the outside of a gradual bend. The debris deposit was about 4.3 miles long with a deposit of mud over half a mile (0.6 miles) long followed by 8 to 10 inches of silt deposits for at least a half mile near the fan toe above [the canyon]. Much of the deposited debris was remobilized by subsequent water flow during the event." (Note, all measurements translated from metric to English for consistency.)

Closer to Riverside, a number of accounts document historic alluvial fan flooding in the Cucamonga region. These include floods in Cucamonga Creek and across the large alluvial fans at the base of the San Gabriel Mountains in February 1927, the winter of 1938 and January 1969. Day Creek and Deer Creek in the Etiwanda region also flooded onto alluvial fans at levels found to be greater than the 100-year-flood level in January 1969. The capacity of a levee and several channels were exceeded by these storm flows and the structures were breeched during the event. Flooding was only minimized by the construction of flood control structures, including detention dams and percolation basins, which were fully in place by 1989, according to accounts. Lytle Creek and surrounding streams in San Bernardino also flooded and affected alluvial fans in 1927 and 1969, resulting in bank erosion that led to the failure of a bridge. In total, throughout Southern California the floods of 1969 resulted in the loss of 73 lives and over 30 million dollars in damage.

A major flood occurred in Riverside County in July of 1979 at Magnesia Spring Canyon in the Rancho Mirage area, breached a levee at the alluvial fan apex and flooded urban development in the city. This event was triggered by a massive summer thunderstorm that dumped extreme amounts of precipitation over concentrated areas in very short time frames. According to reports, the peak discharge from the roughly four-square mile mountainous drainage basin was 170 cubic meters per second, which equals just under 45 *thousand* gallons a second, nearly *three times* the magnitude of the 100-year flood. One death and 7 million dollars in damage resulted.

Lastly, alluvial fan flooding caused by heavy rains (3-4 inches in 12 hours) contributed to mudflows that took the lives of 16 people (14 at a church camp in Waterman Canyon near Crestline and two additional people in a separate incident in Devore) in San Bernardino County on Christmas Day in 2003. These mudflows resulted after two severe wildfires earlier in the year (in particular, the Old Fire) that dramatically increased the risk of debris flows from alluvial fans in the burned hillsides. The force of the mudflow was so great that, according to a report in the Press-Enterprise (October 12, 2010), one deceased victim was found 15 miles away four months after the flood. The powerful Waterman Canyon mudslide also knocked camp buildings completely off their foundations.

As a result of that tragedy, the State of California instituted the Alluvial Fan Task Force which developed a model ordinance and recommendations for an integrated development approach that provides a suite of methods for local communities to use at their discretion to assist in reducing flooding risks on alluvial fans.

3. Alluvial Fan Habitat Associations

In Riverside County, particularly the western third, alluvial fan sage scrub habitat (alluvial scrub) frequently occurs in and around alluvial fans. The key trait of such vegetation is the development of "phreatophytes," plants with long tap roots (up to 30 to 50 feet deep) that have evolved to be able to access water that has seeped through the fan and hit an impermeable layer. These stands of shrubs cling to the fan soil at their bases and often form islands of habitat for many animals as erosion moves the surrounding soil away. Also, such shrubs may be flood-adapted to survive flooding, erosion and the scouring (striping away) of their surface or crown vegetation. The anchor provided by the long, intact tap root and the energy stored in the rootstock below ground permits plant regrowth from the base. California scalebroom (*Lepidospartum squamatum)* is species of shrub very well-adapted to the extreme hydrology of alluvial fans. It has rootstock (underground stems) supported by a vigorous taproot adapted to regrow after heavy scouring and also to survive being buried under sediment as the result of flooding. So strong is this regrowth, in fact, that home foundations in Corona were damaged (uplifted and cracked) by recovering scalebroom bushes where the taproots were not completely removed during grading. The plant has even been reported to regrow through the asphalt surface of new roads.

4. Flood Risk Management on Alluvial Fans

Even though typically shallow, flooding in alluvial fans can be even more dangerous than in the upstream canyons that feed them. Floods within alluvial fans can strike with little warning, travel at extremely high speeds and carry tremendous amounts of sediment and debris. Further, the slightly convex perpendicular surfaces of the fans cause water to spread widely until there is no zone of refuge. If the gradient is steep, active transport of materials down the fan creates a moving substrate (i.e., akin to a flash flood) that is dangerous to travelers on foot or in a vehicle. As the gradient diminishes downslope, water comes down from above faster than it can flow away downstream leading to ponding to potentially hazardous depths. These factors can also make it difficult to engineer controls to contain peak flows inside man-made embankments. Often large debris basins and water retention structures are needed upstream to prevent serious flooding hazards on major alluvial fans.

As with other types of serious flooding, FEMA also designates areas as subject to alluvial fan flooding (as opposed to ordinary riverine flooding). Specifically, NFIP regulations define alluvial fan flooding to be "flooding occurring on the surface of an alluvial fan or similar landform which originates at the apex and is characterized by high-velocity flows; active processes of erosion, sediment transport and deposition; and, unpredictable flow paths." Despite the distinction, alluvial fan flooding is also based on the 100-year flood interval (i.e., a 1% probability of occurrence in a given year).

Key elements to the hazards associated with alluvial fan flooding are the uncertainty of the flow path down the fan, the slope and topography; and, the abrupt deposition and extensive erosion of sediment in the fan. Combined, these traits make the use of fill to raise a building site out of the floodplain unsuitable for alluvial fans. Rather, alluvial fan flood hazards can only be reliably offset by use of major structural flood control measures (e.g., the aforementioned large upstream debris and detention basins) or by complete avoidance of the affected area.

Should development occur on or near an alluvial fan, extra care must be taken to avoid applying flood control engineering measures that inadvertently create new flood hazards at other sites. For example, because of the variability and unpredictability of the stream path within the fan, any channelization or conveyance designs would have to take into account the entire span of the potential watercourse and all of the 100-year flows for adequate capture. The key to avoiding, reducing or minimizing alluvial fan flooding risks is site-specific evaluation (hydrological study) of conditions and the implementation of site-specific soils, slope and hydrology design and engineering recommendations to ensure flows are handled properly.

In terms of engineering flooding protections, two basic approaches are useful for alluvial fans. The first is to provide whole-fan protection via large-scale structural measures. These include the following (used either individually or in combination): levees, channels, detention basins and debris basins/ fences/deflectors/dams. Such structures generally intercept upstream watershed flow and debris and transport water and sediment around the entire (usually urbanized) fan. Structures must be designed to withstand scour, erosion, sediment deposition, hydrostatic forces, impact and hydrodynamic forces and high flow velocities.
