In an effort to flag areas that will generate significant controversy the environmental community has developed the following list of criteria for areas to avoid in siting renewable projects. These criteria are fairly broad. They are intended to minimize resource conflicts and thereby help California meet its ambitious renewable goals. The criteria are not intended to serve as a substitute for project specific review. They do not include the categories of lands within the California desert that are off limits to all development by statute or policy.[5]

- Locations that support sensitive biological resources, including: federally designated and proposed critical habitat; significant[6] populations of federal or state threatened and endangered species,[7] significant populations of sensitive, rare and special status species,[8] and rare or unique plant communities.[9]
- Areas of Critical Environmental Concern, Wildlife Habitat Management Areas, proposed HCP and NCCP Conservation Reserves.[10]
- Lands purchased for conservation including those conveyed to the BLM.[11]
- Landscape-level biological linkage areas required for the continued functioning of biological and ecological processes.[12]
- Proposed Wilderness Areas, proposed National Monuments, and Citizens' Wilderness Inventory Areas.[13]
- Wetlands and riparian areas, including the upland habitat and groundwater resources required to protect the integrity of seeps, springs, streams or wetlands.[14]
- National Historic Register eligible sites and other known cultural resources.
- Locations directly adjacent to National or State Park units.[15]

EXPLANATIONS

604259.1

[1] Some of these lands may be currently abandoned from those prior activities, allowing some natural vegetation to be sparsely re-established. However, because the desert is slow to heal, these lands do not support the high level of ecological functioning that undisturbed natural lands do.

[2] Based on currently available data.

[3] Urbanized areas include desert communities that welcome local industrial development but do not include communities that are dependent on tourism for their economic survival.

[4] The term "federally designated corridors" does not include contingent corridors.

[5] Lands where development is prohibited by statute or policy include but are not limited to:
National Park Service units; designated Wilderness Areas; Wilderness Study Areas; BLM National Conservation Areas; National Recreation Areas; National Monuments; private preserves and reserves; Inventoried Roadless Areas on USFS lands; National Historic and National Scenic Trails; National Wild,

Scenic and Recreational Rivers; HCP and NCCP lands precluded from development; conservation mitigation banks under conservation easements approved by the state Department of Fish and Game, U.S. Fish and Wildlife Service or Army Corps of Engineers a; California State Wetlands; California State Parks; Department of Fish and Game Wildlife Areas and Ecological Reserves; National Historic Register sites.

[6] Determining "significance" requires consideration of factors that include population size and characteristics, linkage, and feasibility of mitigation.

[7] Some listed species have no designated critical habitat or occupy habitat outside of designated critical habitat. Locations with significant occurrences of federal or state threatened and endangered species should be avoided even if these locations are outside of designated critical habitat or conservation areas in order to minimize take and provide connectivity between critical habitat units.

[8] Significant populations/occurrences of sensitive, rare and special status species including CNPS list 1B and list 2 plants, and federal or state agency species of concern.

[9] Rare plant communities/assemblages include those defined by the California Native Plant Society's Rare Plant Communities Initiative and by federal, state and county agencies.

[10] ACECs include Desert Tortoise Desert Wildlife Management Areas (DWMAs). The CDCA Plan has designated specific Wildlife Habitat Management Areas (HMAs) to conserve habitat for species such as the Mohave ground squirrel and bighorn sheep. Some of these designated areas are subject to development caps which apply to renewable energy projects (as well as other activities).

[11] These lands include compensation lands purchased for mitigation by other parties and transferred to the BLM and compensation lands purchased directly by the BLM.

[12] Landscape-level linkages provide connectivity between species populations, wildlife movement corridors, ecological process corridors (e.g., sand movement corridors), and climate change adaptation corridors. They also provide connections between protected ecological reserves such as National Park units and Wilderness Areas. The long-term viability of existing populations within such reserves may be dependent upon habitat, populations or processes that extend outside of their boundaries. While it is possible to describe current wildlife movement corridors, the problem of forecasting the future locations of such corridors is confounded by the lack of certainty inherent in global climate change. Hence the need to maintain broad, landscape-level connections. To maintain ecological functions and natural history values inherent in parks, wilderness and other biological reserves, trans-boundary ecological processes must be identified and protected. Specific and cumulative impacts that may threaten vital corridors and trans-boundary processes should be avoided.

[13] Proposed Wilderness Areas: lands proposed by a member of Congress to be set aside to preserve wilderness values. The proposal must be: 1) introduced as legislation, or 2) announced by a member of Congress with publicly available maps. Proposed National Monuments: areas proposed by the President or a member of Congress to protect objects of historic or scientific interest. The proposal must be: 1) introduced as legislation or 2) announced by a member of Congress with publicly available maps. Citizens' Wilderness Inventory Areas: lands that have been inventoried by citizens groups, conservationists, and agencies and found to have defined "wilderness characteristics." The proposal has been publicly announced.

[14] The extent of upland habitat that needs to be protected is sensitive to site-specific resources. For example: the NECO Amendment to the CDCA Plan protects streams within a 5-mile radius of Townsend big-eared bat maternity roosts; aquatic and riparian species may be highly sensitive to changes in groundwater levels.

[15] Adjacent: lying contiguous, adjoining or within 2 miles of park or state boundaries. (Note: lands more than 2 miles from a park boundary should be evaluated for importance from a landscape-level linkage perspective, as further defined in footnote 12).

AIR POLLUTION: Battle still on for clean air

Amid mounting research detailing the harm of bad air, the Inland region still fails to meet federal health standards

BY DAVID DANELSKI / STAFF WRITER

Published: Sept. 5, 2013 Updated: 6:36 p.m.

STAN LIM, STAFF PHOTOGRAPHER

People who have lived for decades in the Inland region describe summer days in the 1960s and â70s when burning eyes and painful lungs were routine, the price paid for living in what was then one of the most polluted regions in the nation.

Few dwelled on the long-term harm of breathing toxic air.

Air quality has improved dramatically since the 1970s, but still, on more than 100 days a year, Southern California is failing to meet clean air standards â" and Inland residents are getting the biggest dose of pollution.

Children appear to suffer the most.

New avenues of discovery show that air pollution not only harms hearts, lungs and sinuses, it also penetrates the bodyâs natural defenses to invade brains and other vital tissues, laying the groundwork for multiple health problems.

Several studies focusing on the consequences of air pollution for Inland children have documented reduced lung function, a greater incidence of asthma and increased medical costs.

Even air considered clean under federal benchmarks may be causing harm.

âAt the current levels we are still seeing health effects,â said Ed Avol, a preventive medicine professor at the University of Southern California medical school. âEverybody breathes, so in terms of the number of people who are affected, we are talking about millions and millions of people.â

The expanding list of serious health consequences is especially troubling in the Inland region, where civic and business leaders struggle to breathe life into an economy crushed in the Great Recession. Inland unemployment is about 11 percent, worse than the stateâs 8.7 percent and nationâs 7.4 percent.

unhealthful.days.chart

Some business and local government leaders say warehouses are the best answer, because of the regionâs location, its freeways and rail lines, its cheap land and its vast need for jobs that can be filled by workers without a college education. Moreno Valley, with ample land available, has made warehouse construction one of its main economic development goals.

The down side is that warehouses bring diesel truck traffic.

Diesel trucks, ships, locomotives and other cargo-handling equipment account for about half the ozone and fine-particle pollution in the Inland region â" and 93 percent of the regionâs cancer risk from air pollution, according to the South Coast Air Quality Management District.

air.fallingshortvideo

The Inland region is hit especially hard by pollution because of weather patterns and topography. Emissions from ships, trucks, cars, construction equipment, power plants, refineries, manufacturing, dry cleaners, paint, lawnmowers and other sources throughout Southern California blow east with sea breezes. Blocked by the San Bernardino Mountains, the airborne muck collects over the Inland area, cooking in the sunlight to become more harmful.

AIR POLLUTION: Battle still on for clean air

g+1 Email Share

(Page 2 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

In 2012, the annual averages for fine-particle pollution, a category that includes diesel soot, exceeded the federal clean air standards at monitoring stations in Mira Loma and Rubidoux in northwest Riverside County and Fontana and Ontario in western San Bernardino County.

Ozone, a corrosive gas, exceeded the federal standard 111 times somewhere within Southern Californiaâs sea-to-mountains air basin in 2012. The most violations were in Riverside and San Bernardino counties, including 80 unhealthful days in Redlands, 47 in Jurupa Valley and 46 in Perris.

People living closest to freeways, busy streets and rail yards get the worst of it. Because of the increased health risks, air district officials recommend that homes and schools be located at least 500 feet from freeways and other heavy traffic areas.

The science documenting the harm of air pollution is vast.

Itâs not just lungs that are affected. Like a Trojan horse, pollution carried inside the body in the simple, constant and necessary act of breathing is penetrating natural defenses and triggering an array of consequences

In children, pollution can sabotage the biochemistry vital to the development of growing organs. In the womb, pollution is a suspected factor in miscarriage, birth defects and autism. And in a childâs formative years, breathing difficulties can develop and other diseases may take root in the brain and elsewhere.

Learning deficits have been found in children living in polluted areas. And new research finds that pregnant women exposed to certain pollution are more likely to have children who become obese, a condition with its own disease complications.

Children hurt by air pollution can face chronic illnesses, such as asthma, and a shorter lifespan than their own genes might have predicted.

Adults can suffer lung damage, cancer, heart disease, heart attacks, strokes and other illnesses.

RAIL YARD REALITY

Increasing volumes of cargo flowing from the sea ports in Los Angeles have put more trucks on the freeways and more trains on rails â" major veins in the nationâs commerce network. Some 80 freight trains pass through the Inland area daily, and the number is expected to increase as the economy improves.

Researchers from USC and Loma Linda University have visited Inland schools and homes over the years, taking medical histories and measuring lung function. Their conclusions: Asthma and reduced lung capacity afflict a greater percentage of children in areas with higher concentrations of air pollution.

In southwest San Bernardino, a team put together by Loma Linda University ran tests last year on nearly 500 school children who live in a neighborhood that shares property lines with a BNSF Railway cargo-transfer yard.

It had been a locomotive repair and maintenance station yard that was revamped in 1995 to be a hub for cargo transfers between trains and trucks. In 2008, a state analysis found that diesel pollution from trucks, trains and yard equipment exposed the neighboring community to the highest cancer risk of all the rail yards in the state.

AIR POLLUTION: Battle still on for clean air

(Page 3 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

Almost half the children examined had symptoms of asthma or had been diagnosed with it â" twice the rate of children who lived five miles away in Fontana. By comparison, San Bernardino Countyâs childhood asthma rate is about 15 percent; the national rate is about 9 percent.

During a public presentation earlier this year, Rhonda Spencer-Hwang, an assistant professor at the Loma Linda University public health school who helped conduct the study, said she was alarmed by the findings, especially since many of the children were not being treated.

The study is pending publication in a scientific journal.

BNSF, which has questioned the researchersâ findings and methods, has invested more than $24.5 million to reduce air pollution at the San Bernardino yard and elsewhere in California.

The yard uses the newest and cleanest switch engines, the light-duty locomotives used to move rail cars to assemble freight trains.

The company has deployed its newest, cleanest locomotives to California at a cost of $1.8 billion, said Lena Kent, a BNSF spokeswoman.

The railroad also put new, lower-emissions diesel engines in 12 cranes used to lift 40-foot steel cargo containers as theyâre moved to trucks or freight trains.

BNSF has invested millions more making changes to reduce the amount of time trucks spend idling in the rail yard; training employs in more efficient practices; and taking other pollution-cutting measures, Kent said.

The changes have slashed pollution from the yard by 54 percent since 2005, Kent said.

Residents of the neighborhood believe the air is still making them sick.

AIR POLLUTION: Battle still on for clean air

(Page 4 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

A few doors down, Soledad Serapio,13, said she takes medication for chronically burning eyes and coughing. Her mother, Nohemi Hernandez, lamented that many trucks idle on a dirt lot next to the trailer park.

TOUGH BUSINESS ENVIRONMENT

It is up to elected officials, with input from experts and the public, to weigh the risks and benefits of warehouses and decide what is right for the Inland region. Warehouses already have proliferated along freeways in western San Bernardino and Riverside counties and on former dairy land in Jurupa Valley.

Trucking, railroad and warehouse industry officials say air pollution reduction efforts threaten a necessary and job-creating sector of the economy.

California, for instance, has set an aggressive schedule for diesel truck owners to switch to newer models or retrofit their vehicles with special filters to cut diesel pollution. The rules cost the stateâs trucking industry about $1 billion a year, said Michael D. Shaw, vice president of external affairs for the California Trucking Association.

Truckers have been forced to give up older trucks that are still strong road warriors or pay $10,000 to $20,000 to retrofit them, he said.

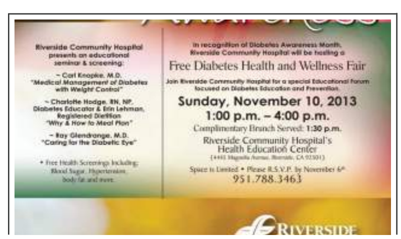
âWe are very willing to do our part to reduce emissions and clean up the air,â Shaw said. âTrucks are 98 percent cleaner than they were 30 years ago.â

Truckers serving the Los Angeles County ports now must drive a 2007 model or newer.

In Moreno Valley, developer Iddo Benzeevi has said he welcomes input from air district officials on how make his proposed 41.6-million-square-foot warehouse complex as environmental friendly as possible.

Plans under consideration would allow only newer trucks to serve the World Logistics Center, as his project is known. He also plans to provide natural-gas fueling facilities and other clean-air measures.

Industry officials say they are frustrated that air pollution rules keep getting tougher every time the U.S. Environmental Protection Agency revises health standards for various pollutants.



Inland economist John Husing blames such regulations for driving manufacturers out of Southern California. He contends that such regulations and community opposition now threaten the transportation and warehousing industries that the Inland region needs to provide thousands of jobs for workers without college educations.

Dora Barilla, an assistant professor at Loma Linda Universityâs school of public health, said the Inland region needs a balanced approached as it looks for ways to reduce air pollution.

Warehouses may attract polluting big-rig trucks, but they also provide jobs to help move people out of poverty, said Barilla, who has asthma. Poverty leads to poorer community health, she said.

âWe need to bring together the different factions and have a rational discussion on how improve the environment as well as provide job growth,â Barilla said in an interview.

AIR POLLUTION: Battle still on for clean air

(Page 5 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

She added that a big part of the equation is improving education among the poor.

VULNERABLE BRAINS

A decade ago in Mexico City, Lilian CalderÃ³n-GarciдueÃ±as , a neuropathologist-toxicologist, started investigating the effects of Mexico Cityâs severe pollution on the brains of young dogs. She found that microscopic particles were able to move through the snouts of canines and into their brains â" penetrating a defensive line called the blood-brain barrier.

She next began looking at childrenâs brains, through brain scans or by examining the brains of children who had died accidentally. She concluded that the brains of children exposed to high levels of pollution showed some of the same changes observed in the brains of people in the early stages of Alzheimerâs and Parkinsonâs diseases.

Pollution may cause problems in childrenâs brains as the gray and white matter is growing, CalderÃ³n-GarciдueÃ±as said in an interview earlier this year with Montana Public Radio.

âIf anything goes wrong with these children at that period, you will have serious health effects later on,â said CalderÃ³n-GarciдueÃ±as, an assistant professor at the University of Montanaâs medical school.

She said the children exposed to high pollution levels could face intelligence and attention deficits.

In a 2012 article in âFrontiers in Psychology,â CalderÃ³n-GarciдueÃ±as and co-author Ricardo Torres-JardÃ³n advocate for a concerted effort to take better care of children, especially poor children, through better education, improved nutrition and less pollution in their environments.

âUnfortunately, while we wait for governmental sectors to address these endemic issues, there are no coverings for our childrenâs noses, nor for their lungs, hearts or vulnerable brains,â she wrote.

Many researchers have focused on freeway pollution.

Official air-monitoring stations are deliberately placed away from busy roadways, where pollution is highest, so that an areaâs ambient pollution isnât skewed by traffic emissions that tend to disperse within a few hundred yards.

In one study, rats exposed to freeway pollution in Riverside showed the earliest signs of brain tumors. The brains cells of the animals started producing genes associated with tumors. Whatâs not known is whether the bodyâs immune system can stop the tumors from developing, said Michael Kleinman, a UC Irvine environmental toxicology professor and co-author of the study.

kidssickvideo

Several recent studies have linked a womanâs exposure to pollution during pregnancy to a higher risk of having an autistic child.

The disorder strikes an estimated 1 in 50 children and, depending on the severity, can bring heartache for families and elevated costs for schools.

AIR POLLUTION: Battle still on for clean air

(Page 6 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

UCLA public health researchers studied records of more than 7,000 women in Los Angeles County. Those exposed to higher estimated air pollution levels during their pregnancies had a 12 to 15 percent greater chance of having an autistic child, according to the study published in March.

The results substantiated an earlier USC study that found children born to mothers living within about 300 yards of a freeway appeared to be twice as likely to have a child who developed autism.

In June, Harvard University researchers provided even more evidence supporting a link between air pollution and autism.

Based on a nationwide study, Harvard scientists found that women who live in areas with polluted air have as much as twice the chance of giving birth to an autistic child than those living in communities with cleaner air.

FAT CHILDREN

One of the newest avenues of study is air pollutionâs possible role in obesity. Like autism, itâs a condition that has multiple causes and an array of related problems. In California, about 17 percent of low-income preschoolers are obese, according to a recent analysis by the U.S. Centers for Disease Control and Prevention.

Researchers with Columbia University's Mailman School of Public Health found that when pregnant women exposed to higher levels of a type of air pollution called polycyclic aromatic hydrocarbons, or PAHs, their children were about twice as likely to become obese.

PAHs are hydrocarbons released when fuel burns.

The researchers followed 763 non-smoking African-American and Hispanic women whose children were born in the Bronx or Northern Manhattan between 1998 and 2006.

Each participant wore a small backpack containing a portable air monitor during her third trimester. They kept the monitors at their bedsides when they slept.

When the children reached their seventh birthdays, one-fourth of them were obese â" the children exposed to higher pollution levels were twice as likely as the others to be obese.

âHigher prenatal PAH exposures were significantly associated with higher childhood body size,â said a paper published last year in the American Journal of Epidemiology.

The authors said laboratory studies have shown that PAHs interfere with the process of lipolysis, the breaking down of fats inside the body. The less fat a person can break down, the more it stays in the body.

Air pollutionâs possible role in obesity and diabetes is an emerging area of discovery, and much more study is needed before itâs certain pollution causes or contributes to such health problems, said Avol, the USC scientist.

But its link to heart disease, lung cancer and other illness is well established.

AIR POLLUTION: Battle still on for clean air

(Page 7 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

When the EPA last year set a more stringent health standard for fine-particle pollution, its official statement said that âthousand of studies show particle pollution can harm human health.â

The agency summarized the volumes of research by saying that particle pollution shortens lives by impeding the function of blood vessels, leading to heart attacks, stroke and congestive heart failure.

In children and adults alike, the EPA said, it aggravates chronic respiratory diseases and causes short-term bouts of coughing, wheezing and shortness of breath.

LIFE AMONG WAREHOUSES

The literal fallout of poor public planning â" decision-making that put residents in the path of harmful pollution â" is plainly evident in a neighborhood called Mira Loma Village in northwest Riverside County.

The villageâs 101 homes, built in the late 1950s and early 1960s, are surrounded by a 15-square-mile warehouse district that grew up around them in the Jurupa Valley, Ontario and Fontana.

The people who live there talk about illnesses and irritations they blame on the soot that invades the neighborhood.

Shortly after President Richard Nixon signed the Clean Air Act in 1970, maintenance worker Gene Proctor bought a small home in the neighborhood and started raising a family. For Proctor, the landmark law has been an empty promise.

He and many of his neighbors say their air quality actually got worse during the past 20 years as they watched the farm fields and dairies around their homes disappear, to be replaced by warehouses. Mira Loma Village does not have an air-monitoring station, but the regionâs air quality district confirms that truck traffic degraded the air in Riverside County between 1998 and 2005.

Diesel trucks hauling cargo to and from the warehouses incessantly roll up and down Etiwanda Avenue just outside the block wall surrounding the tract. Highway 60 is a block to the south, and Interstate 15 is a mile and half to the west.

The diesel soot leaves a fine black film that residents wipe from clothes lines and hose off of patios and cars.

For Proctor, now 72, retirement in 2006 from his job in Fullerton meant giving up jogging, since he could no longer run in the much cleaner air near the Kimberly-Clark factory where he worked.

Running at home was out of the question.

âIf youâre able to run a seven-minute mile, here it takes you nine minutes,â he said, leaning on a chain link fence outside his home. âYou feel a weight. My lungs would tighten up. And my heart would feel like it was going to jump out of my chest.â

Respiratory ailments have many causes, and itâs difficult to say with certainty that air pollution is to blame for a particular personâs illness. But some in Mira Loma Village believe the diesel fumes are making them sick.

AIR POLLUTION: Battle still on for clean air

(Page 8 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

Norma Rivera, who lives five doors from Proctor, said in Spanish that she, her husband and 12-year-old daughter all have breathing problems.

âAs traffic went up, our symptoms went up,â Rivera said.

She worries about Miguel Jr., her 4-year-old son.

âHe gets really bad allergies,â she said. âThey (doctors) give him medication.â

His symptoms have taken away some of the simple joys of childhood.

âWhen he runs around too much, he starts coughing. I canât let him go out too often,â his mother said.

The boy loved to jump on a trampoline. âI had to take it away because he would be coughing a lot,â she said.

Another resident, Socorro Ledezma, said she moved from Orange County about 18 years ago.

âIt was more open and much quieter, and less people,â she said in Spanish. âBut now, with all the warehousing, the traffic exhaust has been awful.

âWhen it is foggy and the cars get wet, you see the black stuff on the cars and on the concrete. â¦ It is black when you wash off the car or the patio.â

Allergies worsened as truck traffic increased, and now she frequently feels ill

âIt started about 15 years ago,â she said. She used to get by with medications she could buy over the counter, but no longer. âNow I have to see the doctor to get prescription drugs for the allergies. I have eye drops for my eyes. And I have the nose spray. And I take pills.â

Her voice broke as she described how the ailments have changed her daily life. Itâs difficult to do housework, or visit people or go to parties because of her constantly running nose and other symptoms.

Sometimes she feels better. âBut it just keeps coming back again.â

AIR POLLUTION: Battle still on for clean air

g+1 Email Share

(Page 9 of 9)

Published: Sept. 5, 2013 Updated: 6:36 p.m.

Cleaner air is an elusive goal for Mira Loma Village. Warehouses canât function without the trucks that serve them. And more warehouses are on the way.

Already approved is Mira Loma Commerce Center, a complex of 1.1 million square feet of warehouse and industrial space on 65 acres just northeast of Mira Loma Village. It is expected to generate 1,500 truck trips a day.

air.warehousevideo

A settlement this year of a lawsuit over the projectâs environmental reviews requires the developer to pay $1,700 per home to install air filtering systems in every home in the tract.

The residents at least will have safe indoor air, said Penny Newman, executive director of the Center for Community Action and Environment Justice, which helped negotiate the settlement. Just as important, she added, are plans under review by Jurupa Valley city officials to route trucks away from the neighborhood.

Proctor said he has mixed emotions about the air filters. âI think they (warehouse developers) are just throwing us a bone. What are the kids going to do? Are they going to spend 24-7 indoors?â

Proctor, who said he hasnât smoked in more than 40 years, said he has had trouble breathing and visited a doctor recently. Lung X-rays indicated he may have emphysema, a disease caused by damage to lung tissue. He has been putting off follow-up medical exams.

âI donât want to face the music,â he said. âIt is too late for me.â

Rachel Lopez of Jurupa Valley provided Spanish interpreting for this article.

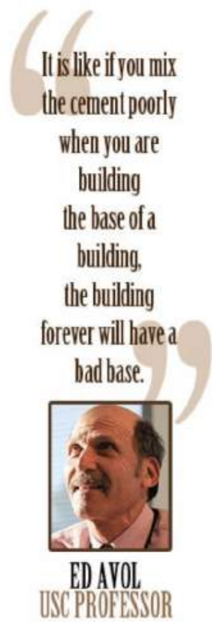
HEALTH: Children are more vulnerable to air pollution effects

Children breathe more air per pound of body weight than adults

BY DAVID DANELSKI / STAFF WRITER
Published: Sept. 5, 2013 Updated: 3:36 p.m.

STAN LIM, STAFF PHOTOGRAPHER

Biologically speaking, âchildren are not just little adults,â says Ed Avol, a USC preventive medicine professor and member of national science committee that advises the U.S. Environmental Protection Agency on outdoor air health standards.



Because their brains and other organs are still developing, the toxic effects of pollution can cause damage that has the potential to affect them for the rest of their lives.

âIt is like if you mix the cement poorly when you are building the base of a building, the building forever will have a bad base,â Avol said.

Â

Children also get a bigger dose of whatever is in the air:

Compared with adults, they breathe more air per pound of body weight.

They also spend more time outside and are more physically active, which further increases their exposure to air pollution.

Their internal air passageways are smaller, which means more lung tissue surface is exposed per volume of air.

STAN LIM, STAFF PHOTOGRAPHER

Between the moment when a microscopic piece of soot flies out of a tailpipe or smokestack and enters a personâs lungs, it undergoes an array of complex chemical reactions.

It essentially becomes an airborne vessel make of black âelementalâ carbon that can carry hundreds of varieties of toxic compounds.

As the soot travels with sea breezes and churns above streets, homes, campuses, workplaces and shopping centers, it reacts with other pollutants in a process aided by sunlight, said Michael Kleinman, environmental toxicology professor at UC Irvine.

Kleinman has been studying the journeys and transformations of airborne particles for decades. He spent many of the Cold War years probing the behavior of radioactive fallout for the federal government.

AIR OF RISK A PRESS-ENTERPRISE PE.com SPECIAL REPORT BACK TO MAIN INDEX

When soot particles encounter ozone â" an invisible gas created when other pollutants combine in sunlight â" one of the outcomes is the creation of especially toxic oxygen-containing compounds called quinones, he said.

An epic battle begins when the particles are inhaled. The invaders are so small that they penetrate the bodyâs first lines of defense â" the nasal passage and the lungs, which normally send in a bath of fluids to help a person cough or snort out harmful substances.

They are so tiny they pass through lung tissue and enter the bloodstream, a highway that carries them to other tissues and organs, including the brain.

The bodyâs immune system rallies to fight back.

âThe inflammatory cells now come out,â Kleinman said. âIt is almost like an army. These guys will attack anything that is foreign.â

Cells called macrophages come first. They try to engulf and digest the intruders. Then the body sends in the second line of defenders: the more aggressive neutrophils, white blood cells on a suicide mission to stop the invasion. The neutrophils make âoxygenated and nitrogen compounds that can literally burn a pathogen and destroy it,â Kleinman said.

The cellular battle, however, generates collateral damage.

The invaders may be neutralized, but free radicals â" unstable atoms or molecules created during inflammation to help destroy the invading particles â" can begin attacking and harming healthy cells. The process can trigger a chain reaction of cell injury.

âFree radicals are associated with cancer and heart disease, and brain disease,â Kleinman said.

Free radicals can damage fat cells and create plaque in blood vessels. Too much plaque leads to heart attacks and stroke.

The best defenses for people who canât avoid air pollution are common-sense: minimize exposure as much as possible â" avoid diesel fumes; donât exercise when pollution levels are higher; and maintain a healthful lifestyle by eating wisely, exercising and not smoking.

CLEAN AIR: A promise still elusive for Inland region

The federal Clean Air Act of 1970 prompted changes that led to dramatic air quality improvements, but some Inland communities still don't meet standards

LAKE ELSINORE: 3-acre fire burns near mountains

RIVERSIDE COUNTY: 8 arrested in DUI operations

FILE PHOTO

Guaranteeing healthful air for all Americans was a political no-brainer for Congress back in 1970.

The Clean Air Act spurred a new era of tailpipe and smokestack regulations and had bipartisan support unheard of today. It sailed through the House and Senate with just one dissenting vote. President Richard Nixon signed it eagerly.

âThis is the most important piece of legislation, in my opinion, dealing with the problem of clean air that we have this year and the most important in our history,â Nixon said at the bill signing ceremony.

Nixon had created the U.S. Environmental Protect Agency earlier that year.

At the time, public attention focused on smog-choked Southern California, on Midwest rivers so polluted that they caught fire, and on the devastating effects of pesticides like DDT on eagles and other wildlife

Nixon felt that a strong federal role in cleaning up the environment was a political inevitability, so he embraced it, said S. David Freeman, who was an attorney in the Nixon administration and later served as the head of the Los Angeles Department of Water and Power.

Nixonâs motives also were political, Freeman said an interview. The president feared that if he didnât take strong actions to protect the environment, Democrats would seize the issue and use it against him in the 1972 election.

quote

The Clean Air Act set health standards, which are essentially legal limits, for various pollutants in all regions of the nation.

President Jimmy Carter later amended the act by requiring the EPA to review scientific studies on air pollution health effects every five years and then adjust the health standards for each major pollutant as needed to protect people.

One of the most persistent air pollutants in Southern California is ozone, a lung-irritating, corrosive gas that forms when airborne emissions cook in the summer heat. The current health standard for ozone â" .075 parts per million parts of air averaged over eight hours â" was set by the George W. Bush administration in 2008.

President Barack Obama angered environmentalists in 2011 by delaying the EPAâs plan to impose a tougher ozone standard recommended by the agencyâs science advisers. The panel of scientists from around the nation reviewed scientific research and concluded that the Bush standard didnât sufficiently protect people.

Obama said in 2011 that he wanted to wait until this year to give the economy time to improve. Now the EPA isnât expected to propose a new standard until sometime next year.

So far in 2013, ozone levels in Southern California have surpassed the current ozone standard on 83 days. The smog season got off to a fast start â" in June, only two days met the federal ozone standard in the air basin between the Pacific Ocean and the San Bernardino Mountains.

project_bar

Riverside as seen from Box Springs Mountain. Ozone levels in Southern California have surpassed the current standard of 83 days so far this year.

The region faces a 2024 deadline to meet the ozone standard every day.

The most recent data also shows that the average levels of fine-particle pollution still exceed the federal standard in Mira Loma, Rubidoux, Fontana, Ontario, South Central Los Angeles and parts of the San Gabriel Valley. Fine particles are linked to heart attacks, brain ailments and shorter lives, among other harm.

We have a long way to go before we realize the vision of the Clean Air Act, Freeman said.

Failure to meet health standards means that some people are getting sick and dying from the air they breathe, Freeman said in an address to health and environmental journalists last year at USC.

A Massachusetts Institute of Technology study released this month estimated that more than 200,000 people die each year because of air pollution.

âThe house is still burning down,â Freeman said, yet âThere is no sense of urgency.â

This report was produced in part with a grant from the Lucile Packard Foundation for Children's Health Journalism Fund, awarded by The California Endowment Health Journalism Fellowships at the USC Annenberg School of Journalism.

CLEAN AIR: Reducing air pollution extends lives

Researchers have seen measurable improvements in longevity when fine-particle pollution dropped

BY DAVID DANELSKI / STAFF WRITER

Published: Sept. 5, 2013 4:09 p.m.

STAN LIM, STAFF PHOTOGRAPHER

Air quality improvements can be measured in human health.

Douglas Dockery, epidemiology department chair at Harvard Universityâs School of Public Health, was among the researchers who discovered that more people die on days when fine-particle pollution is high. The finding, made in the 1990s, helped persuade the Clinton administration to set clean-air standards for fine particles, despite industry objections about the potential costs.

AIR OF RISK
A PRESS-ENTERPRISE PE.com SPECIAL REPORT
BACK TO MAIN INDEX

In a recent interview, Dockery said he is upbeat about how overall health is improving as fine-particle levels drop in the nationâs urban areas.

In a paper published this year in the journal âEpidemiology,â Dockery and his colleagues found that people are living longer because of the reductions.

The researchers analyzed lifespan and pollution data from 2000 and 2007 gathered from 545 counties throughout the nation. They accounted for other factors such as cigarette smoking, demographics and socioeconomic status.

People on average lived four months longer when fine-particle pollution dropped by 10 micrograms per cubic meter of air. Since particle pollution is decreasing in Southern California, residents are enjoying longer lives, Dockery said.

Based on data from the South Coast Air Quality Management District and Dockeryâs finding, Inland area residents could be living four to six months longer than the population did a decade ago.

Further pollution reductions would bring additional benefit, Dockery added.

His data also showed that when pollution levels dropped in areas that already meet federal health standards, people in those places lived longer, too.

One study found that cutting air pollution, in addition to improving health and longevity, also produced economic benefits.

In 2003, pollution controls were installed at coal-fired power plants in the East that greatly reduced nitrogen oxide emissions.

A collaboration among UC Santa Barbara and Massachusetts Institute of Technology economists tracked the air quality and various statistics, discovering that the improvements made a noticeable difference.

After five years, the number of days of unhealthful ozone pollution in 18 Eastern states declined by about 25 percent, and spending on prescription drugs dropped in those states by $900 million annually, the study found. Most of the savings were the result of lower demand for heart and respiratory medications.

They also found that people lived longer, boosting the Eastern statesâ economies by $900 million annually.

This report was produced in part with a grant from the Lucile Packard Foundation for Children's Health Journalism Fund, awarded by The California Endowment Health Journalism Fellowships at the USC Annenberg School of Journalism.

RIVERSIDE: Former King High star Kawhi Leonard is NBA Finals MVP

BY DAVID DANELSKI / STAFF WRITER

Published: Sept. 6, 2013 Updated: Sept. 7, 2013 2:01 a.m.

STAN LIM, STAFF PHOTOGRAPHER

Jose Rodriguez cared for calves at Inland dairies for about 20 years, until an exodus of the farms from Chino, Ontario and Jurupa Valley left him looking for work.

After some construction jobs, he saw a chance for a new career. In 2001, he spent about $2,000 for training to become commercial driver and soon was hired by a trucking company.

He saved his money and, in 2004, bought a truck â" a 2000 model Peterbilt tractor with a flatbed trailer â" and went into business for himself. He has since added a second truck, providing work for a cousin and his son, Roberto, who is a student at Cal State San Bernardino.

âThis is better,â Rodriguez, 53, said of his trucking business. On this day, he was headed east from Los Angeles on Highway 60, on his way to Phoenix with a load of heavy machinery strapped to his flatbed.

âI make more money, and I can sometimes take two or three days off,â he said.

Rodriguez can attest that the flow of goods through the Inland region provides job opportunities. He also knows that cutting air pollution from trucks is a priority â" and, in some cases, a hardship.

He has until Jan. 1 to retrofit his Peterbilt with a state-approved particle trap that will greatly cut the truckâs soot emissions.

As he navigated late-afternoon traffic in the San Gabriel Valley, he said he didnât know whether it be would better for him to invest in a new truck or buy the particle trap.

He eventually opted for the filter, which will cost him about $15,000, said his son, Roberto. âWe are going to have to finance it. We have to have working capital.â

The particle traps are required under California AirResource Board rules approved in 2008. They call for a phase-in of truck and bus particle traps or replacement of older vehicles; the goal is a 90 percent reduction in toxic diesel soot emissions by 2023.

project_bar

Jose Rodriguez prepares his truck for a job. California Air Resource Board rules call for a phase-in of costly truck and bus particulate traps or replacement of older vehicles.

State officials estimated the new rules would cost the California trucking industry $5.5 billion by 2023, but the California Trucking Association said the cost would be much higher, as much as $1 billion a year.

The resulting pollution cuts are expected to save about 9,400 lives in California between 2010 and 2025 and at least $48 billion in illness-related costs, according to air board estimates.

Jose Rodriguez has little trouble staying busy, a testament to the tremendous volume of goods that need to be moved through Southern California every day.

During one week earlier this year, he picked up a load of pipe in Rialto and hauled it to Idaho. After making the delivery, he took on a shipment of composite decking material in Meridian, Idaho, and by Thursday, he had delivered it to a Home Depot warehouse in La Mirada.

Then it was off to Long Beach to load up and secure several tarp-shrouded heavy machines from China. Getting the machines on board and tied down took about three hours.

With extra room left on flatbed, he headed to Fullerton, intending to retrieve additional cargo.

He changed direction, however, when Roberto, his son, advised him by cell phone of a better opportunity. By checking Internet listings of loads available for independents, Roberto Rodriguez found a better-paying load in Los Angeles, where plastic containers of boiler cleaning fluids were destined for Phoenix.

Roberto Rodriguez said he finds loads for others truckers, too, allowing him to earn brokerage fees.

His father had been gone about 12 hours by the time he returned to a truck yard in Jurupa Valley to drop off his rig. After a dinner break, he would head east to Phoenix after dark to make his deliveries. And his son was on a hunt for a load to take back California the next day.

âEconomically, we live better because he works as a truck driver,â his wife, Maria, said in Spanish through an interpreter. âBut it is hard because â¦ he works longer is gone more.â

This report was produced in part with a grant from the Lucile Packard Foundation for Children's Health Journalism Fund, awarded by The California Endowment Health Journalism Fellowships at the USC Annenberg School of Journalism.

AIR POLLUTION: Winning the battle involves government, technology, lifestyle

Cleaning up Southern California's requires an array of changes; in the meantime, residents can protect themselves with healthy choices

BY JANET ZIMMERMAN / STAFF WRITER

Published: Sept. 6, 2013 Updated: 4:57 p.m.

STAN LIM, STAFF PHOTOGRAPHER

Much has been done to improve air quality in recent decades, but more work is needed to reduce levels of the Inlandâs worst pollutants â" nitrogen oxides, ozone and particulate matter â" that threaten residentsâ health, regulators said.

Federal, state and regional air quality officials have imposed rules to reduce emissions from cars, diesel trucks and buses, refineries, power production, factories and even nail polish and fireplaces. In the coming years, there will be further changes to the cars we drive and the way our communities are laid out to facilitate walking and ease congestion.

One of the key measures by the regionâs air pollution control agency, the South Coast Air Quality Management District, is a residential wood-burning ban when air quality reaches unhealthful levels, spokesman Sam Atwood said.

Harmful fine-particle pollution, known as PM2.5, is released when wood is burned in fireplaces; it is similar to the soot from diesel engines. The âCheck Before You Burnâ program took effect in 2011, but rules will be tightened this fall to further limit when residents can light a fire at home between November and February.

The air district is developing its 2015 air quality management plan for ozone. The driving force behind the document is an ambitious vision for the next 20 years and beyond of low- to no-emission standards for just about everything, Atwood said.

Among other efforts:

--The air district is helping develop a one-mile demonstration project for zero-emission truck lanes in the Port of Long Beach and along Interstate 710. In the port, trucks would run on overhead electric catenary lines, like those used to power light-rail trains; they would burn compressed natural gas while on the road.

Bruce MacRae, vice president of government affairs for UPS, introduces the company's new fleet of electric delivery trucks in July. A 2010 study has found that powering cars with electricity instead of gasoline would reduce smog-forming volatile organic compounds by 93 percent and nitrogen oxides by 31 percent.

--Expect a switch from gasoline-powered cars and trucks to more electric vehicles and plug-in hybrids. A 2010 study by the U.S. Department of Energyâs Pacific Northwest National Laboratory found that powering cars with electricity instead of gasoline would reduce smog-forming volatile organic compounds by 93 percent and nitrogen oxides by 31 percent.

--The future will bring increased generation of power from renewable sources such as solar and wind to reduce the burning of fossil fuels in energy production that contribute to emissions of nitrous oxides, ozone and fine particles.

Under state law, utilities are required to have 20 percent of their retail sales from renewable sources by the end of this year, 25 percent by the end of 2016 and 33 percent by the end of 2020.

--In the works is a change in land-use planning that minimizes residentsâ exposure to road and industrial pollution through thoughtful placement of schools, homes and industry.

The Southern California Association of Governments, the policy and planning organization for six counties and 191 cities, is implementing Senate Bill 375, which encourages âmore compact, complete and efficientâ communities to reduce driving.

quote

âReducing air pollution in the region takes a coordinated effort,â said Hasan Ikhrata, the associationâs executive director. âTechnology like zero-emission cars and solar panels are important. But we also need to look at ways to reduce congestion and give people more transportation choices. This involves locating housing closer to employment centers or transit centers, or investing in infrastructure to make sure that the capacity can meet the demand.â

In the meantime, individuals can take steps to protect themselves from the effects of air pollution, such as eating healthy foods and not living or exercising near busy roadways, experts said.

In a study last year, doctors at the Imperial College of London found that vitamin C, an antioxidant, can neutralize free radicals that contribute to cancer and respiratory diseases such as asthma and chronic obstructive pulmonary disorder.

Dr. Lilian Calderon-Garciduenas, an environmental toxicology professor at the University of Montana, has studied children living in highly polluted areas. She found inflammation of the brain, similar to the process involved in developing Alzheimerâs and Parkinsonâs diseases. The children also exhibited cognitive deficits and structural brain abnormalities and had respiratory and cardiovascular damage.

To combat such problems, Calderon-Garciduenas recommends providing children with good quality food, reading and physical exercise to stimulate their brains, and to reduce their exposure to passive activities such as video games.

Elsewhere, she had recommended that people exposed to pollution consume foods high in anti-oxidants, such as broccoli and dark chocolate, she said in an interview with Montana Public Radio.

Abstract**—**In 2004, the first American Heart Association scientific statement on "Air Pollution and Cardiovascular Disease" concluded that exposure to particulate matter (PM) air pollution contributes to cardiovascular morbidity and mortality. In the interim, numerous studies have expanded our understanding of this association and further elucidated the physiological and molecular mechanisms involved. The main objective of this updated American Heart Association scientific statement is to provide a comprehensive review of the new evidence linking PM exposure with cardiovascular disease, with a specific focus on highlighting the clinical implications for researchers and healthcare providers. The writing group also sought to provide expert consensus opinions on many aspects of the current state of science and updated suggestions for areas of future research. On the basis of the findings of this review, several new conclusions were reached, including the following: Exposure to PM _2.5 _m in diameter (PM2.5) over a few hours to weeks can trigger cardiovascular disease–related mortality and nonfatal events; longer-term exposure (eg, a few years) increases the risk for cardiovascular mortality to an even greater extent than exposures over a few days and reduces life expectancy within more highly exposed segments of the population by several months to a few years; reductions in PM levels are associated with decreases in cardiovascular mortality within a time frame as short as a few years; and many credible pathological mechanisms have been elucidated that lend biological plausibility to these findings. It is the opinion of the writing group that the overall evidence is consistent with a causal relationship between PM2.5 exposure and cardiovascular morbidity and mortality. This body of evidence has grown and been strengthened substantially since the first American Heart Association scientific statement was published. Finally, $PM_{2.5}$ exposure is deemed a modifiable factor that contributes to cardiovascular morbidity and mortality. (***Circulation*****. 2010;121:2331-2378.)**

MARIN COUNTYWIDE PLAN UPDATE

Final Environmental Impact Report

COUNTY OF MARIN
COMMUNITY DEVELOPMENT AGENCY

State Clearinghouse No. 2004022076

NOVEMBER 2007

4.3 AIR QUALITY

4.3 AIR QUALITY

Air Quality – Environmental Setting

Existing air quality conditions are described in the *Air Quality Background Report*, April 2002, updated December 2005, which is included in **Appendix 1** to the ~~Draft~~ EIR. This background report is incorporated by reference, and summarized below.

Air quality is described by the concentration of various pollutants in the atmosphere. Units of concentration are generally expressed in parts per million (ppm) or micrograms per cubic meter ($\mu g/m^3$). The significance of a pollutant concentration is determined by comparing the concentration to an appropriate ambient air quality standard. The standards represent the allowable pollutant concentrations designed to ensure that the public health and welfare are protected, while including a reasonable margin of safety to protect more sensitive individuals in the population.

REGIONAL AIR QUALITY

The ambient air quality in a given area depends on the quantities of pollutants emitted within the area, transport of pollutants to and from surrounding areas, local and regional meteorological conditions, and the surrounding topography of the air basin. Marin County is part of the nine-county San Francisco Bay Air Basin. The federal Clean Air Act, 42 USC 7401 et seq., governs air quality in the United States. In addition to being subject to federal requirements, air quality in California is also governed by more stringent regulations under the California Clean Air Act, Health and Safety Code sections 39000-44385. At the federal level, the United States Environmental Protection Agency (USEPA) administers the Clean Air Act (CAA). The California Clean Air Act is administered by the California Air Resources Board (CARB) at the State level and by the Air Quality Management Districts at the regional and local levels. The Bay Area Air Quality Management District (BAAQMD) regulates air quality at the regional level, which includes the nine-county Bay Area.

AIR QUALITY STANDARDS

The federal and California Clean Air Acts have established ambient air quality standards for several pollutants. National ambient air quality standards are for *criteria pollutants*. Criteria pollutants include Carbon Monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), inhalable particulate matter (PM_{10} and $PM_{2.5}$), sulfur dioxide (SO_2), and lead (Pb). California established ambient air quality standards as early as 1969 through the Mulford-Carrell Act. Pollutants regulated under the California Clean Air Act are similar to those regulated under the federal Clean Air Act. In many cases, California standards are more stringent than the national ambient air quality standards for criteria pollutants. State and federal ambient air quality standards are shown in **Exhibit 4.3-1**.

Exhibit 4.3-1
Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	California Standard	Federal Primary Standard	Pollutant Health and Atmospheric Effects	Major Pollutant Sources
Ozone (O_3)	1 hour	0.09 ppm	---	Irritation and possibly permanent lung damage.	Motor vehicles, including refining and gasoline delivery.
	8 hours	0.07 ppm	0.08 ppm		
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm	Deprives body of oxygen in the blood. Causes headaches and worsens respiratory problems.	Primarily gasoline-powered internal combustion engines.
	8 hours	9 ppm	9.0 ppm		
Nitrogen Dioxide (NO_2)	Annual Avg.	---	0.05 ppm	Irritating to eyes and respiratory tract. Colors atmosphere reddish-brown.	Motor vehicles, petroleum-refining, power plants, aircraft, ships, and railroads.
	1 hour	0.25 ppm	---		
Sulfur Dioxide (SO_2)	Annual Avg.	---	0.03 ppm	Irritates and may permanently injure respiratory tract and lungs. Can damage plants, destructive to marble, iron, and steel. Limits visibility and reduces sunlight.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
	1 hour	0.25 ppm	---		
	24 hours	0.04 ppm	0.14 ppm		
Respirable Particulate Matter (PM_{10})	24 hours	50 ug/m3	150 ug/m^3	May irritate eyes and respiratory tract, is associated with decreased lung capacity, increased cancer and mortality rates. Produces haze and limits visibility.	Industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g. wind-raised dust and ocean sprays).
	Annual Arithmetic Mean	20 ug/m3	--		
Fine Particulate Matter ($PM_{2.5}$)	24 hours	---	35ug/m^3		
	Annual Arithmetic Mean	12 ug/m3	15 ug/m^3		
Lead (Pb)	Monthly	1.5 ug/m^3	---	Disturbs gastrointestinal system, and causes anemia, kidney disease, and neuromuscular and neurologic dysfunction (in severe cases).	Present source: lead smelters, battery manufacturing & recycling facilities. Past source: combustion of leaded gasoline.
	Quarterly	---	1.5 ug/m^3		
Sulfates (SO_4)	24 hours	25 ug/m^3	---	Similar to sulfur dioxide.	Industrial processes refineries.
Hydrogen Sulfide (H_2S)	1 hour	0.03 ppm (42 ug/m^3)	---	Very pungent odor similar to rotten eggs. Annoying and irritating – high concentrations fatal.	Sources include industrial processes, oil production, and geothermal wells.

Note: ppm = parts per million; ug/m3 = micrograms per cubic meter.

Source: California Air Resources Board, November, 2005.

Ozone is the primary constituent of urban smog. Ozone is considered a secondary pollutant since it is not emitted directly into the atmosphere. Rather, ozone is produced through photochemical reactions of precursor compounds, known as volatile organic compounds (VOC) and nitrogen oxides (NO_x). Because ozone precursors are transported and diffused by wind and have the capacity to form smog miles from their emission source, ozone is regarded as a regional air pollutant. Exposure to ozone smog can cause adverse health impacts.

Carbon monoxide (CO) is an odorless, colorless gas, which can be lethal in high concentrations. The primary source of carbon monoxide is motor vehicles and concentrations of this gas are greatest in areas near the intersections of roadways that carry high volumes of traffic. Residential wood combustion is also a substantial source of CO emissions that can lead to high ambient levels of CO on cold nights where wood burning stoves are popular.

Oxides of Nitrogen (NO_x) are produced through fuel combustion and contribute to the formation of ozone smog. NO_x is shorthand for a class of chemicals that includes nitrogen oxide, nitrogen dioxide (NO_2), dinitrogen pentoxide, peroxyacetylnitrate (PAN), and other compounds. PAN is highly toxic to plants, is a powerful eye irritant, and can persist for long periods. At higher concentrations, NO_2, the red-brown gas in smog, causes eye irritation, shortness of breath, and other temporary and long-term health effects. NO_x also can undergo transformation in the atmosphere into fine respirable particulates.

The use of high sulfur fuels in petroleum refining and electricity generation may result in emissions of sulfur dioxide (SO_2). The sulfur content of fuels is extensively regulated, and controls on stationary sources have brought almost all of California into compliance with federal and State standards.

Particulates that are ten microns in diameter or less are identified as PM_{10}. Likewise, $PM_{2.5}$ is composed of fine particulate that is 2.5 microns or smaller. If inhaled deeply, these particulates can cause adverse health effects. The greatest proportion of suspended particulates originates from combustion, road dust, construction activities, and farming. During the winter, wood smoke from fireplaces can be the most substantial source, contributing up to 40 percent of ambient respirable particulate matter.

Lead has been phased out as a gasoline additive in California, and annual federal and State ambient air quality standards for lead are met in all parts of the state.

TOXIC AIR CONTAMINANTS

Toxic air contaminants (TACs) are another group of pollutants of concern in the Bay Area; however no definitive safe levels of exposure to TACs can be established. Common sources of TACs include industrial processes (e.g., petroleum refining and chrome plating operations), commercial operations (e.g., gasoline stations and dry cleaners), and motor vehicle exhaust. Diesel exhaust particulate matter has been identified as a TAC of concern. Mobile sources such as trucks, buses, automobiles, trains, ships, and farm equipment are the largest source of diesel emissions.

<u>CARB reports that recent air pollution studies have shown that diesel exhaust and other cancer-causing toxic air contaminants emitted from vehicles are responsible for much of the overall cancer risk from TACs in California. Particulate matter emitted from diesel-fueled engines (diesel particulate matter [DPM]) was found to make up much of that risk. In August 1998, CARB formally identified DPM as a TAC. Diesel particulate matter is of particular concern since it can be distributed over large regions, thus leading to widespread public exposure. The particles emitted by diesel engines are</u>

coated with chemicals, many of which have been identified by EPA as hazardous air pollutants and by CARB as TACs. Diesel engines emit particulate matter at a rate about 20 times greater than comparable gasoline engines. The vast majority of diesel exhaust particles (over 90 percent) consists of $PM_{2.5}$, which are the particles that can be inhaled deep into the lung. Like other particles of this size, a portion will eventually become trapped within the lung possibly leading to adverse health effects. While the gaseous portion of diesel exhaust also contains TACs, CARB's August 1998 action was specific to DPM that accounts for much of the cancer-causing potential from diesel exhaust.

Reducing diesel particulate emissions is one of CARB's highest priorities in protecting public health. To address the issue of diesel emissions in California, CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles* (Diesel Risk Reduction Plan) and the *Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines*. The Diesel Risk Reduction Plan was adopted by CARB in September 2000.

In addition to requiring more stringent emission standards for new on-road and non-road mobile sources and stationary diesel-fueled engines to reduce DPM emissions by 90 percent, a significant component of the Diesel Risk Reduction Plan involves application of emission control strategies to existing diesel vehicles and equipment. While the state has already experienced benefits from this plan, CARB's long-term goal is to reduce DPM emissions 85 percent by 2020. Many of the measures of the Diesel Risk Reduction Plan have been approved and adopted, including engine emission standards for new engines and adoption of requirements for ultra-low sulfur fuel throughout the United States and California.

The California diesel fuel regulations are similar to the federal regulations in that they require the maximum sulfur content to be 15 ppm, but they also require reductions in the aromatic content and apply to all diesel engines. Reductions in aromatic content reduce emissions of several toxic substances other than DPM, including benzene and polynuclear aromatic hydrocarbons or PAHs.

In 2004, BAAQMD initiated a community air risk evaluation (CARE) program to evaluate outdoor health risk associated with TACs in the Bay Area. The program, which is expected to take several years, will examine TAC emissions from point sources, area sources, and mobile sources (including both on- and off-road sources). An emphasis will be on diesel exhaust. Mitigation measures will be developed and implemented to reduce TAC emissions in areas with the highest health risk.

SENSITIVE RECEPTORS AND STATIONARY POLLUTANT SOURCES

Some groups of people are more affected by air pollution than others. The State has identified the following people who are most likely to be affected by air pollution: children under 14, the elderly over 65, athletes, and people with cardiovascular and chronic respiratory diseases. These groups are classified as *sensitive receptors*. Locations that may contain a high concentration of these sensitive population groups include residential areas, hospitals, daycare facilities, elder care facilities, elementary schools, and parks.

Children may be more vulnerable to environmental contaminants than adults. The Children's Environmental Health Protection Act (State Senate Bill 25 to amend Sections 39606, 39660, and 40451 of, to add Section 39617.5 to, to add Part 3 (commencing with Section 900) to Division 1 of, and to add Article 4.5 [commencing with Section 39669.5] to Chapter 3.5 of Part 2 of Division 26 of, the Health and Safety Code, relating to environmental health protection) established specific requirements to determine if children are adequately protected from the harmful effects of air pollution. The Act requires CARB and the Office of Environmental Health Hazard Assessment

(OEHHA) to review all health based California's Ambient Air Quality Standards to determine whether they adequately protect public health, including infants and children. Those found potentially inadequate undergo full review and possible revision. The Act also requires CARB to determine if the current air monitoring network established to measure air pollution in California adequately reflects the levels of air pollutants that infants and children are breathing. Additionally, the Act also requires that the State's list of Toxic Air Contaminants be reviewed to identify those that might cause infants and children to be especially susceptible to illness and to institute Air Toxic Control Measures (ATCM) necessary to reduce exposures. In 2005, CARB added a new eight-hour ozone standard in response to a review of the air quality standards required by this Act.

EXISTING LEVELS OF AIR POLLUTANTS

Efforts to combat air pollution began in the Bay Area in 1955 with the formation of the Bay Area Air Pollution Control District which is now known as the Bay Area Air Quality Management District (BAAQMD). State and federal ambient air quality standards cover a wide variety of pollutants. Only a few of these pollutants however, pose health issues in the Bay Area either due to the strength of the emission or the climate of the region. These are ground level ozone and particulate matter (PM_{10} and $PM_{2.5}$), which occasionally are measured at levels above health based standards. For many years, the BAAQMD has operated a multi-pollutant monitoring site in San Rafael that allows analysis of air quality trends. The number of days that air pollutant levels exceeded State or federal standards at San Rafael or the entire Bay Area is reported in **Exhibit 4.3-2**. With the exception of PM_{10}, the San Rafael station has not reported any exceedances of ambient air quality standards over the past five years. Measured exceedances of PM_{10} have occurred on zero to two sampling days per year. Since PM_{10} is measured every sixth day (in accordance with a national sampling schedule), the number of days per year that the standard is exceeded is estimated at up to 12 days.

Exhibit 4.3-2
Summary of Measured Air Quality Exceedances

		Monitoring	Days Exceeding Standard				
Pollutant	**Standard**	**Station**	**2000**	**2001**	**2002**	**2003**	**2004**
Ozone (0_3)	NAAQS 1-hr [a]	San Rafael	0	0	0	0	0
		Bay Area	3	1	2	1	0
	NAAQS 8-hr	San Rafael	0	0	0	0	0
		Bay Area	4	7	7	7	0
	CAAQS 1-hr	San Rafael	0	0	0	0	0
		Bay Area	12	15	16	19	7
Respirable Particulate Matter (PM_{10})	NAAQS 24-hr	San Rafael	0	0	0	0	0
		Bay Area	0	0	0	0	0
	CAAQS 24-hr	San Rafael	0	2	2	0	1
		Bay Area	7	10	6	6	7
Fine Particulate Matter ($PM_{2.5}$)	NAAQS 24-hr	San Rafael	0	---	---	---	---
		Bay Area	1	5	7	0	1
All Other (CO, N02, Lead, S02)	All Other	San Rafael	0	0	0	0	0
		Bay Area	0	0	0	0	0

a This standard was revoked in June 2005.

Source: BAAQMD, Bay Area Air Pollution Summaries 2000-2004.

Air pollutants of concern emitted in Marin County and the Bay Area include ozone, particulate matter (PM_{10}), and toxic air contaminants (TACs).

Currently, the Bay Area is classified as a federal and State nonattainment area for ozone. Ground level ozone, often referred to as smog, is not emitted directly, but is formed in the atmosphere through complex chemical reactions. While there have been no exceedances of federal or State ozone standards in Marin, the Bay Area as a whole has experienced unhealthy ozone levels on seven to 19 days annually. Ozone is not a pollutant that adversely affects Marin County, but emissions from motor vehicle use in the county contribute to high ozone levels in other parts of the Bay Area. Motor vehicles are the largest source of ozone precursors emissions (i.e., nitrogen oxides and reactive organic gases) in the Bay Area.

The county is classified as nonattainment for PM_{10} by CARB. There are many sources of PM_{10} emissions, including combustion, industrial processes, grading and construction, and motor vehicles. The greatest quantity of PM_{10} emissions associated with motor vehicle uses is generated by re-suspended road dust. Reductions in motor vehicle miles traveled are necessary to reduce PM_{10}

emissions, rather than changes to motor vehicle technology. Wood burning in open fireplaces and stoves is another significant source of PM_{10}.

There are no $PM_{2.5}$ monitoring data in Marin County. $PM_{2.5}$ is the very fine particulate fraction of PM_{10}. The Bay Area as a whole is considered *unclassified* in terms of attainment status for the federal standard and *nonattainment* for the State standard.

Carbon monoxide emissions from motor vehicles and stationary sources have been reduced greatly over the last 15 to 20 years, such that the entire Bay Area region has been brought into attainment for both federal and State standards. Carbon monoxide emissions from traffic along major roadway segments with high traffic volumes and poor level of service (LOS) were evaluated. This included county roadway segments operating at LOS of D, E, or F. The traffic-generated emissions of CO were predicted using the Caline4 line source dispersion model. The model requires inputs of geometry, traffic volumes, emission factors and meteorology. Existing traffic volumes for selected roadway segments were used. Emission factors used were calculated using the EMFAC2002 model, developed by the California Air Resources Board, with default assumptions for Marin County during winter that include a temperature of 45 degrees Fahrenheit. Slow speeds of five to 15 miles per hour were used to develop the emission factors. Meteorological conditions indicative of elevated CO levels in the Bay Area were used, which include a low wind speed of one meter per second, worst-case wind angle, and F stability. **Exhibit 4.3-3** shows modeled existing roadside carbon monoxide levels for four roadway segments.

Exhibit 4.3-3
Modeled Existing Roadside Carbon Monoxide Levels

Roadway Segment Description	***Modeled Level [a] (ppm)***	
	1-Hour	***8-hour***
U.S. 101 Puerto Suello Hill	7.4	4.9

National Ambient Air Quality Standard	35	9.0
California Ambient Air Quality Standard	20	9.0

a Includes background level of four ppm for one-hour and 2.5 ppm for eight-hour

Source: Illingworth & Rodkin

As shown in **Exhibit 4.3-3** existing carbon monoxide concentrations are well below the ambient air quality standards. Carbon monoxide concentrations are expected to decrease further in the future as newer and cleaner vehicles replace older vehicles on the roadway.

The health impacts associated with the exposure to toxic air contaminants are usually expressed in terms of increased risk of contracting cancer by individuals. In Marin County, truck traffic, construction equipment, and ferries are the primary sources of diesel particulate matter. According to

CARB, the overall inhalation cancer risk in the Marin County ranges from very low (less than 50 cases per million) in the western part of the county to a range of 100 to 250 excess cancer cases per million people. [1] Some localized areas in San Rafael show rates slightly greater than 250 cases per million. These risks are considerably lower than the risk in urban areas, which can exceed 1,000 excess cases per million people. The overall risk is predicted to decrease and the decrease could be substantial if CARB goals to achieve a 75 percent reduction in diesel risk are met.

Diesel particulate matter (DPM) emitted from trucks or other diesel fueled vehicles on freeways in Marin County is a toxic air contaminant that affects local air quality. Concentrations of existing diesel particulate matter emissions from trucks on Marin County freeways were modeled and reported in the *Air Quality Background Report*. [2] The modeled concentrations indicate existing risks ranging from 15 to 35 excess cancer cases per million people at a distance of 50 feet from the roadways. These levels of risk are expected to decrease in the future as newer more stringent regulations that target diesel exhaust emissions take effect. CARB's EMFAC2002 motor vehicle emission factor model, which is used to predict DPM emissions, documents this effect. [3]

Other air quality issues of concern in Marin County include nuisance impacts of odors and dust. Common sources of odors would include wastewater treatment plants, landfills, composting facilities, and agricultural activities. Similarly, nuisance dust may be generated by a variety of sources including construction, quarries, travel on unpaved roadways, and agriculture.

AIR QUALITY PLANNING

The BAAQMD along with the other regional agencies (i.e., Association of Bay Area Governments and the Metropolitan Transportation Commission) prepared the *2001 Ozone Attainment Plan* [4] to address the federal standard for ozone. Although the U.S. EPA revoked the 1-hour NAAQS for ozone in 2005, the *2001 Ozone Attainment Plan* is still a valid planning document and element of California's state implementation plan (SIP) for the national Clean Air Act. The on-road emissions budgets from the *2001 Ozone Attainment Plan* are used as surrogate budgets for transportation conformity analyses and findings until a new budget is established with an attainment or maintenance demonstration for the new 8-hour ozone standard. In addition, any commitments made in the *2001 Ozone Attainment Plan* continue to be enforceable commitments and must be implemented.

4 *Revised San Francisco Bay Area Ozone Attainment Plan for the 1-Hour National Ozone Standard*, Metropolitan Transportation Commission, Bay Area Air Quality Management District, and Association of Bay Area Governments, Adopted October 24, 2001.

The *Bay Area 2005 Ozone Strategy* is the most recently approved regional Clean Air Plan.[5] It was adopted in January 2006 to address the more stringent requirements of the California Clean Air Act with respect to ozone. This plan includes a comprehensive strategy to reduce emissions from stationary, area, and mobile sources. The plan's objective is to indicate how the region would attain the stricter State air quality standards, as mandated by the California Clean Air Act. The plan is designed to achieve a region-wide reduction of ozone precursor pollutants through the expeditious implementation of all feasible measures. Air Quality Plans addressing the California Clean Air Act are developed on a triennial basis, with the latest approved plan ~~developed~~ adopted in ~~2000~~ 2006 (~~Bay Area 2000 Clean Air Plan~~ Bay Area 2005 Ozone Strategy).[6] This plan proposes implementation of transportation control measures (TCMs) and programs such as *Spare the Air*. Some of these measures or programs rely on local governments for implementation.

In 2003 the California Legislature enacted Senate Bill 656, to reduce public exposure to PM_{10} and $PM_{2.5}$. SB 656 legislation required BAAQMD to review a list of particulate matter control measures compiled by CARB and identify measures that are most appropriate to the region. BAAQMD reviewed this list and adopted a particulate matter implementation schedule on November 16, 2005. The BAAQMD staff report along with comments on the report focused mainly on wood smoke issues. Of the 103 measures compiled by CARB, BAAQMD proposed implementing four of the measures. Many of the measures were either similar to measures already adopted by BAAQMD or the benefit of the measure would not be significant. Ten measures that target wood burning were identified for further study. These include rulemaking that could prohibit installation of open fireplaces or wood burning stoves that do not meet current EPA standards. One measure could prohibit wood burning on certain nights. BAAQMD identified additional particulate matter reduction efforts that are being implemented immediately. These include efforts aimed at characterizing and controlling wood smoke. BAAQMD plans to enhance monitoring at the neighborhood level and focus more on controlling wood smoke. One measure implemented immediately lowered the forecasted air quality index threshold used to make Spare the Air Tonight alerts and step up enforcement when complaints regarding wood smoke are received. SB 656 requires CARB to prepare a report by 2009 that describes actions taken to fulfill the requirements of the legislation as well as recommendations for further actions to assist in achieving the State particulate matter standards.

A key element in air quality planning is to make reasonably accurate projections of future human activities that are related to air pollutant emissions. Most important is vehicle activity. The BAAQMD uses population projections made by the Association of Bay Area Governments and vehicle use trends made by the Metropolitan Transportation Commission to formulate future air pollutant emission inventories. The basis for these projections comes from cities and counties. In order to provide the best plan to reduce air pollution in the Bay Area, accurate projections from local governments are necessary. When individual projects are not consistent with these projections, they cumulatively reduce the effectiveness of air quality planning in the region.

6 ~~*Bay Area 2000 Clean Air Plan*, Bay Area Air Quality Management District, December 20, 2000.~~

BUFFER ZONES

The BAAQMD recommends that general plans include buffer zones to separate sensitive receptors from sources of air toxic contaminants and odors. In April 2005, CARB released the final version of the *Air Quality and Land Use Handbook*, [7] which is intended to encourage local land use agencies to consider the risks from air pollution prior to making decisions that approve the siting of new sensitive receptors (e.g., schools, homes or daycare centers) near sources of air pollution. Unlike industrial or stationary sources of air pollution, siting of new sensitive receptors does not require air quality permits, but could create air quality problems. The primary purpose of the handbook is to highlight the potential health impacts associated with proximity to common air pollution sources, so that those issues are considered in the planning process. CARB makes recommendations regarding the siting of new sensitive land uses near freeways, truck distribution centers, dry cleaners, gasoline dispensing stations, and other air pollution sources. These "advisory" recommendations, summarized in **Exhibit 4.3-4**, are based primarily on modeling information and may not be reflective entirely of conditions in Marin County. Siting of new sensitive land uses within these recommendation distances may be possible, but only after site-specific studies are conducted to identify the actual health risks. CARB acknowledges that land use agencies have to balance other siting considerations such as housing and transportation needs, economic development priorities and other quality of life issues.

Exhibit 4.3-4
CARB Recommended Setback Distances for Common Sources of Toxic Air Contaminants

Source Type	*Recommended Buffer Distance*
Freeways and busy arterial roadways	500 feet
Distribution Centers with 100 or more daily truck trips or 40 daily truck trips that use refrigeration units	1,000 feet
Dry cleaners (onsite dry cleaning)	300 feet for any dry cleaning operation. At least 500 feet for operations with two or more machines.
Gasoline stations	50 feet for typical gas stations. Up to 300 feet for large gas stations.

Source: Air Quality and Land Use Handbook: A Community Health Perspective, California Environmental Protection Agency and California Air Resource Board, April 2005.

GREENHOUSE GAS EMISSIONS

As a part of the Countywide Plan Update, Marin County prepared a report on greenhouse gas emissions. Existing greenhouse gas emissions are described in the *Greenhouse Gas Emissions Analysis Report,* June 2003. This report is included in **Appendix 1** to the ~~Draft~~ EIR, incorporated by reference and summarized below.

---

7 *Air Quality and Land Use Handbook: A Community Health Perspective*, California Environmental Protection Agency and the California air Resources Board, April 2005.

The greenhouse gases analyzed in this report included carbon dioxide, methane, nitrous oxide, and various hydrofluorcarbons.[8] The levels of the emissions are reported in equivalent carbon dioxide (eCO2) units. Converting all emissions to carbon dioxide units allows for comparison between greenhouse gases of varying strengths. For instance, methane is 21 times more powerful than carbon dioxide in its capacity to trap heat. Therefore, one ton of methane is equal to 21 tons of carbon dioxide.

Exhibit 4.3-5 shows the tons of greenhouse gas emissions in Marin County for 1990 and 2000.

Exhibit 4.3-5
Countywide Greenhouse Gas Emissions

Location	***1990***	***2000***
	Greenhouse Gas Emissions (tons)	
Unincorporated Area	617,562	639,741
Incorporated Area	2,237,162	2,473,825
Total	2,634,003	3,113,565

Source: Marin County Community Development Agency

Greenhouse gas emissions (eCO2) increased approximately 18 percent from 1990 to 2000, from 2.6 million tons to 3.1 million tons. In 2000, the unincorporated area of Marin County accounted for approximately 21 percent of greenhouse gas emissions in the county.

By percentage, the transportation sector is the largest contributor to green house gas emissions, followed by residential and commercial energy use.

[8] The hydrofluorocarbons are HFC-23, HFC-125, HFC-134a, HFC-152a, CF_4, C_2F_6, and SF_6.

Air Quality – Significance Criteria

The Bay Area Air Quality Management District (BAAQMD) has developed guidelines and thresholds of significance for local plans. Inconsistency with the most recently adopted Clean Air Plan (CAP) is considered a significant impact. According to the BAAQMD, the following criteria must be satisfied for a local plan to be determined to be consistent with the CAP and not have a significant air quality impact: [9]

- The local plan must be consistent with the CAP population and Vehicle Miles Traveled (VMT) assumptions. This is demonstrated if the population growth over the planning period will not exceed the values included in the current CAP and the rate of increase in VMT is equal to or lower that the rate of increase in population;

- The local plan demonstrates reasonable efforts to implement the Transportation Control Measures (TCMs) included in the CAP that identify cities as implementing agencies; and

- For local plans to have a less than significant impact with respect to potential odors and / or toxic air contaminants, buffer zones must be established around existing and proposed land uses that would emit these air pollutants. Buffer zones to avoid odors and toxics impacts must be reflected in local plan policies, land use maps, and implementing ordinances.

Additionally, based on the findings of the Initial Study and the County's Appendix N *Criteria for Significance*, the project would have a significant air quality impact if it would:

> Create localized areas where concentrations of air pollutants or contaminants would exceed ambient air quality standards or present a significant risk resulting in exposure of sensitive receptors to substantial pollutant concentrations.

In regard to greenhouse gas emissions the project would have a significant impact if it would:

- Result in an increase in greenhouse gas emissions over existing levels.

---

9 *BAAQMD CEQA Guidelines,* Bay Area Air Quality Management District, April 1996 (Revised December 1999).

Air Quality – Impacts and Mitigation Measures

Impact 4.3-1 Inconsistency with Clean Air Plan

The Draft 2005 CWP Update would not be consistent with the BAAQMD Thresholds of Significance since projected VMT in Marin County would increase at a faster rate than population. This would be a significant impact.

A key element in air quality planning is to make reasonably accurate projections of future human activities that are related to air pollutant emissions. When the *Bay Area 2005 Ozone Strategy* [10] was developed for the Bay Area it utilized the most recent projections developed by the Association of Bay Area Governments (ABAG) and vehicle activity projected by the Metropolitan Transportation Commission (MTC). These projections are based on the most recent projections using land use designators developed by cities and counties through the General Plan process. The *Bay Area 2005 Ozone Strategy* is the most recent and most comprehensive plan in terms of attaining and maintaining air quality standards for ozone. The *2001 Ozone Attainment Plan* is based on slightly older regional projections and does not address the more stringent requirements of the California Clean Air Act.

Implementation of clean air planning efforts described above would aid in efforts to reduce PM_{10} and $PM_{2.5}$ throughout the region. In addition, the BAAQMD adopts and enforces rules to reduce particulate matter emissions and develops public outreach programs to educate the public to reduce PM_{10} and $PM_{2.5}$ emissions (e.g., Spare the Air Program). SB 656 requires further action to reduce public exposure to PM_{10} and $PM_{2.5}$. Efforts identified by the BAAQMD in response to SB656 are primarily targeting reductions in wood smoke emissions and adoption of new rules to further reduce NOx and particulate matter from internal combustion engines and reduce particulate matter from commercial charbroiling activities. NOx emissions contribute to ammonium nitrate formation that resides in the atmosphere as particulate matter.

Population and vehicles miles traveled (VMT) projections are shown in **Exhibit 4.3-6**. The population of unincorporated Marin County would grow with development consistent with the *Draft 2005 CWP Update*. While population projections are available for unincorporated portions of Marin County, VMT projections are only available for the entire county. Population projections are based on full buildout of the *Draft 2005 CWP Update* assuming an average household size of 2.35 people. The *Draft 2005 CWP Update* projects 121,847 housing units countywide (see **Exhibit 3.0-14**). This number of housing units would equate to a countywide population of 286,340. [11] ABAG projections indicate a 2030 population of 283,100 people, so the *Draft 2005 CWP Update* would result in population that slightly exceeds ABAG projections. The increase in population from 2005 to 2030 would be 13.0 percent. MTC predicts that VMT associated with the ABAG population projections would increase by 11.6 percent over the existing conditions, which would not exceed the rate of population growth. [12] However, travel forecasts prepared by Marin County for the *Draft 2005 CWP*

---

[10] *Bay Area 2005 Ozone Strategy,* Metropolitan Transportation Commission, Bay Area Air Quality Management District, and Association of Bay Area Governments, January 4, 2006.

[11] 121,847 housing units times an average of 2.35 persons per housing unit equals 286,340 people.

[12] The MTC projects average weekday daily VMT for Marin County in 2030 to be 7,405,400. Information accessed online at http://www.mtc.ca.gov/maps_and_data/datamart/stats/vmt.htm, May 2006.

Update indicate a VMT increase of approximately 26 percent [13] for the 2030 population forecasted by the *Draft 2005 CWP Update* and ABAG. [14] This increase in VMT would exceed the rate of population growth in Marin County.

Exhibit 4.3-6
Projected Populations and VMT Growth in Marin County

General Plan Alternative	Total Housing Units	Population	Percent Growth 2005 – 2030	Daily VMT	Percent Growth 2005-2030
Existing	105,690	253,341 [a]	--	7,003,560	
Draft 2005 CWP Update	121,847	286,340 [b]	13.0	Scenario 1 8,809,258 Scenario 2 8,827,123 Scenario 3 8,823,921	25.8 26.0 26.0
No Project (*1994 CWP*)	121,847	286,340	13.0	8,860,900	26,5

b Future population based on County projection of 2.35 persons per household.

Sources: Marin Travel Model and Nichols•Berman.

The *Draft 2005 CWP Update* contains numerous policies and programs that, if adopted and implemented, would act to help reduce motor vehicle use. This would reduce the rate of vehicle miles traveled from trips in Marin County. In addition, the *Draft 2005 CWP Update* contains other policies that would reduce air pollution associated with energy usage, offsetting air pollution emitted from increased population and vehicle travel in Marin County.

The Atmosphere and Climate section of the Natural Systems & Agriculture Element describe goals, policies and programs with respect to air quality. These policies and programs are intended to reduce air pollution that affects air quality at all levels; i.e., locally, regionally and globally.

Policies and programs supporting Goal **AIR-1** would help improve local and regional air quality. These policies would require that all projects be evaluated in accordance with *BAAQMD CEQA guidelines* and regional agencies are notified for their input on air quality issues. This would allow for agency input into project mitigation measures designed to reduce air pollution and VMT.

---

[13] The 2030 VMT would vary slightly between the three *Draft 2005 CWP Update* scenarios.

[14] The VMT increase based on the Marin Travel Model completed for the *Draft 2005 CWP Update* by the Marin County Department of Public Works.

Policies and programs supporting Goal **AIR-3** would implement Clean Air Plan transportation control measures (TCMs) to improve air quality. TCMs are intended to reduce vehicle trips and vehicle travel distances. The *Draft 2005 CWP Update* policies and programs that improve air quality from implementing TCMs are described in greater detail under *Impact 4.3-2 Inconsistency with Clean Air Plan Transportation Control Measures*.

The County would continue to participate in regional air quality programs such as *Spare the Air* and *Cities for Climate Protection*. Spare the Air is a program intended to reduce air pollution emissions, including those from VMT, on days when unhealthy air quality conditions are forecasted. Goals **AIR-4** and **AIR-5** would address greenhouse gas emissions and climate change. Programs supporting these goals would also improve regional air quality. Greenhouse gas emissions would be reduced from energy usage, transportation (including reduced VMT) and agriculture.

Other Elements of the *Draft 2005 CWP Update* include goals and policies that would indirectly improve air quality from future development and redevelopment by reducing VMT. The Built Environment Element contains numerous policies and implementing programs that would encourage development in urban areas served by transit. Policy **CD-1.1** would concentrate urban development in the City-Centered Corridor where infrastructure and facilities (including transit) can be provided most efficiently. Policy **CD-2.3** would establishes a housing overlay designation to encourage construction of housing units to meet the need for workforce housing, low-income housing and special needs housing near commercial and transit. Policy **CD-2.5** would locate housing near activity centers where jobs, services and transit are available. Policies **CD-2.6**, **DES-2.1**, and **HS-3.14** would concentrate and promote commercial and dense residential development in areas with high transit accessibility. Goal **CD-3** would facilitate low-vehicle use employment opportunities by allowing and encouraging the creation of studios and workspaces for artist and craftspeople including live-workspaces (Policy **CD-3.1**) and encouraging businesses and public agencies to offer telecommuting as a work alternative. Policy **DES-3.1** would promote infill by encouraging the development of vacant and underutilized parcels consistent with the neighborhood character and Policy **DES-3.2** would promote green spaces such as high-quality community plazas, gardens and neighborhood parks. Locating homes near jobs, services, recreation, and transit reduces VMT.

Policies supporting Goal **HS-3** would implement "smart" and sustainable development principles to meet the housing needs in the county. This would include a focus of providing workforce housing (Policies **HS-3.2**, **HS-3.3**, and **HS-3.4)**. The addition of workforce housing would reduce VMT associated with worker commute travel.

The Transportation section of the Built Environment Element includes numerous policies to expand pedestrian and bicycle facilities and access. Policies **TR-2.1** through **TR-2.4** would be supported by 14 programs that include incorporation of new facilities and supporting efforts to renovate and reopen train tunnels to accommodate bikes and pedestrians. Policy **TR-3.1** would support expansion of local bus service and Policy **TR-3.2** specifically would promote new rail service (i.e., SMART train) and a multi-use path that would follow that service. Program **TR-2.e** would put a high priority on obtaining funding to complete gaps in the North-South and East-West Bikeways.

The Energy and Green Building section of the Built Environment Element addresses energy conservation and green building standards. Although this would not reduce VMT, it would offset some of the air pollution generated by VMT through reduced emissions from electrical energy production and natural gas usage. Policy **EN-1.1** would integrate energy efficiency and conservation requirements in excess of State standards, while Policies **EN-1.2** and **EN-1.3** (and Policy **HS-2.5**) would encourage and promote energy efficiency and conservation. Policy **EN-1.4** would integrate energy efficiency and conservation into all County functions. Policies **EN-2.2** and **EN-2.3** would promote the use of renewable energy (e.g., through installation of rooftop photovoltaics). Policies **EN-3.1** through Policy **EN-3.4** would integrate green building requirements into new development.

Many of the policies described above would support smart growth [15] and reduce VMT. However, VMT may still increase at a rate greater than population. The emissions of ozone precursor pollutants associated with the increased VMT could affect regional efforts to attain and maintain ambient air quality standards for ozone. Therefore, this would be a significant project impact and the project would make a cumulatively significant contribution to a cumulative air quality impact.

Mitigation Measure 4.3-1 Implement Mitigation Measure 4.2-1 of *Impact 4.2-1 Increase in Vehicle Miles Traveled* to reduce VMT per person

Significance After Mitigation Even with Mitigation Measure 4.2-1 and the *Draft 2005 CWP Update* Policies, VMT may still exceed the rate of population growth, mostly because the predicted rate of VMT growth is so much higher than the rate of population growth. Therefore, this would be a significant unavoidable project and cumulative impact.

Responsibility and Monitoring The Board of Supervisors would be responsible for adopting the new policy and program as described in Mitigation Measure 4.2-1 as part of *Marin Countywide Plan 2005*. The Marin County Community Development Agency and the Marin County Department of Public Works would share responsibility for monitoring implementation.

Impact 4.3-2 Inconsistency with Clean Air Plan Transportation Control Measures

Draft 2005 CWP Update policies would not support all efforts to implement TCMs that are to be implemented by counties. This would be a significant impact.

Exhibit 4.3-7 lists the *Draft 2005 CWP Update* policies that are supportive of the Clean Air Plan Transportation Control Measures (TCMs). A description of each TCM is provided along with a listing of relevant *Draft 2005 CWP Update* policies and programs that would implement each measure.

15 Smart growth is a term that is applied to development that reflects higher densities, mixed use, and a higher proportion of housing and employment growth in urban area, particularly near transit stations and along transit corridors, as well as in town centers. *Projections 2003*, Association of Bay Area Governments, page 40.

Exhibit 4.3-7
Transportation Control Measures(TCMs) Supported by the Draft 2005 CWP Update

Transportation Control Measure	*Description*	*Examples of Relevant Draft 2005 CWP Update Policies / Implementing Programs*
TCM #1 Support Voluntary Employer-Based Trip Reduction Programs	Provide assistance to regional and local ridesharing organizations; advocate legislation to maintain and expand incentives (e.g., tax deductions/credits)	Policy **AIR-3.1**, Program **AIR-3.a** Support Voluntary Employer-Based Trip Reduction by providing assistance to regional and local ridesharing organizations and advocating legislation to maintain and expand employer ridesharing incentives. Policy **AIR-4.1**, Program **AIR-4.b** Reduce Greenhouse Gas Emissions Resulting from Transportation. Increase clean-fuel use, promote transit oriented development and alternative modes of transportation, and reduce travel demand.
TCM #9 Improve Bicycle Access and Facilities	Encourage local jurisdictions to develop safe and convenient bicycle land and route networks, provide secure bike racks and storage, and require bicycle access and amenities as conditions of approval of development projects Explore innovative bicycle programs, such as “station bike” or bike sharing programs at transit stations, downtowns and activity centers	Policy **TR-2.1** would improve the bicycle and pedestrian network Policy **TR-2.2** would require new developments to provide new bicycle and pedestrian facilities, including new trails and pathways. Policy **TR-2.3** and Policy **TR-2.4** would seek funding opportunities to construct new pedestrian and bicycle facilities and connect to urban areas and parklands. Policy **TR-3.5** would support bicycle access to all transit systems and ensure that they provide bicycle storage.
TCM #10 Youth Transportation	Encourage walking and bicycling to school through the Safe Routes to Schools Programs	Policy **CD-2.5** would locate housing near jobs, transit, schools and shopping areas. Policy **TR-2.1** and **TR-2.2** are supported by Programs **TR-2j** and **TR-2k** that would support the Safe Routes to School program through funding or incorporation of new projects to ensure safe walking and bicycling routes to schools.

Transportation Control Measure	***Description***	***Examples of Relevant Draft 2005 CWP Update Policies / Implementing Programs***
TCM #12 Arterial Management Measures	Coordinate the timing of an additional signals and continue updating timing plans	Policy **AIR-3.1** and Program **AIR-3.d** would implement BAAQMD Clean Air Plan TCMs and Program **AIR-3.e** to improve arterial management Policy **TR-3.6** would include efforts to reduce weekend traffic congestion due to park and recreation visitors.
TCM #15 Local Clean Air Policies and Programs	Develop financial and other incentives and technical assistance to encourage innovative parking strategies such as reduced parking, parking fees, parking cash-out, shared parking and other parking programs Pursue legislative changes to remove barriers and provide incentives for smart growth Promote carsharing as a way to reduce parking requirements	Policy **AIR-3.1**, Program **AIR-3.b** would utilize clean vehicle technology by promoting new technologies and other incentives, such as allowing zero or partial zero emissions vehicles in carpool lanes and replacing fleet vehicles with clean vehicles. Program **TR-1.c** of Policies **TR-1.1** through **TR-1.7** would encourage the use of car sharing and provides incentives to employers, commuters, and recreational users to support this alternative. Policy **TR-4.3** would encourage transit operators to switch to zero or low-emission transit vehicles.
TCM #19 Improve Pedestrian Access and Facilities	Review and comment on general/specific plan policies to promote development patterns that encourage walking and circulation policies Emphasize pedestrian travel and encourage amending zoning ordinances to include pedestrian-friendly design standards	See Policies supporting TCM #9. Policy **CD-1.1** would concentrate urban development in City-Centered Corridor Policy **CD-2.3** would encourage construction of housing for the workforce, low-income or special-needs in the City Centered Corridor near transit employment opportunities and services. Policy **CD-2.5** would locate housing near jobs, transit, schools and shopping areas Policy **CD-2.6** and **DES-2.1** would focus intensive (commercial or high-density residential) developments at nodes served by transit and discourages strip development.

Transportation Control Measure	***Description***	***Examples of Relevant Draft 2005 CWP Update Policies / Implementing Programs***
TCM #19 cont. Improve Pedestrian Access and Facilities		Policy **CD-6.1** would seek city review of development proposed adjacent to urban areas Policy **DES-1.1** would address design issues that would encourage walking and bicycling Policy **HS-3.11** would provide incentives for housing development located within easy walking distance of transit stops Policy **HS-3.12** would designate transit oriented housing development locations Policy **HS-3.14** would promote mixed-use developments.
TCM #20 Promote Traffic Calming	Implement traffic calming projects such as: Pedestrian-exclusive streets Residential and neighborhood traffic calming measures Arterial and major route traffic calming measures Include traffic calming strategies in the transportation and land use elements of general and specific plans Encourage area-wide traffic calming plans and programs Include traffic strategies in capital improvement programs	Goal **DES-5** would design automobile use areas to comfortably accommodate travel by pedestrians and bicyclists. Policy **DES-5.1** would ensure that roadways, parking areas, and pedestrian and bike movement are functionally and aesthetically appropriate.

Source: Illingworth & Rodkin, Inc.

The proposed policies and programs generally support and reasonably implement the applicable Clean Air Plan TCMs. However, there is no policy that would directly address parking strategies to reduce vehicle travel (TCM #15). Furthermore, based on criteria described in ***Section 4.0 Environmental Setting, Impacts, and Mitigation Measures*** some of the programs listed in **Exhibit 4.3-7** cannot be relied upon to reduce this impact. [16] Therefore, this would be a significant project impact.

Mitigation Measure 4.3-2(a) Add a new program to the Design Section of the Built Environment Element as follows:

> **DES-2.(new)** Require new office developments with more than 50 parking spaces to offer a *Parking "Cash-Out" Program*. [17] **The County shall consider the feasibility of a parking cash-out program for other new developments located in the City-Centered corridor**.

Mitigation Measure 4.3-2(b) It would be necessary to identify a funding source, make a higher priority or implemented sooner Programs **AIR-3.a** (funding source, higher priority, implement sooner), **AIR-3.d** (higher priority), **AIR-3.e** (higher priority), **TR-2.g** (higher priority, implement sooner), **TR-2.k** (higher priority, implement sooner), and **TR-1.c** (funding sources, higher priority, implement sooner).

Significance After Mitigation Mitigation Measure 4.3-2 together with the *Draft 2005 CWP Update* policies and programs would reasonably implement TCM #15 of the most recent Clean Air Plan. This measure along with other policies and implementing programs would reasonably implement all of the TCMs listed in the Clean Air Plan that cities and counties are listed as implementing agencies. This impact would be reduced to a less-than-significant level.

Responsibility and Monitoring The Board of Supervisors would be responsible for adopting the revised programs and the new program as a part of *Draft Marin Countywide Plan 2005*. The Marin County Community Development Agency would be responsible to monitor its implementation.

Impact 4.3-3 Buffer Zones for Potential Source of Odor/Toxics

Land use maps associated with the Draft 2005 CWP Update do not propose new sources of odors or toxic air contaminants. However, they show sensitive land uses near sources of odors and toxic air contaminants. This would be a significant impact.

According to the *BAAQMD CEQA Guidelines*, for a general plan to have a less-than-significant impact with respect to odors and/or toxic air contaminants buffer zones must be established around

---

[16] As described in ***Section 4.0 Environmental Setting, Impacts, and Mitigation Measures***, this Draft EIR assumes that if there is an identified funding source; if it is a medium or high priority; and will be implemented in the immediate-, short-, or medium-term, or is ongoing, that the program would be implemented and could be relied upon to reduce significant impacts to a less-than-significant level. If there is no identified funding source, is a low priority, and only would be implemented in the long-term, then this Draft EIR does not assume that the program will be implemented. In instances where such program would be required to mitigate significant impacts, this Draft EIR recommends, as a mitigation measure, that the program be funded, receive a higher priority, and be implemented in the medium-term or sooner.

[17] Such a program would require employers to have a program that either pays employees for not using their parking spaces or provides benefits, such as vouchers that can be used to purchase transit passes. Information on parking cash-out programs can be obtained from *http://www.arb.ca.gov/planning/tsaq/cashout/cashout.htm.*

existing and proposed land uses that would emit these air pollutants. Buffer zones to avoid odors and toxics impacts must be reflected in local plan policies, land use maps, and implementing ordinances.

The *Draft 2005 CWP Update* includes policies and programs to reduce exposure of existing and future sensitive receptors from existing and future sources of odors and air toxic contaminants. Policy **AIR-2.1** would consider potential air pollution and odor impacts from land uses that may emit pollution and / or odors when locating (a) air pollution point sources, and (b) residential and other pollution-sensitive land uses in the vicinity of air pollution point sources. Program **AIR-2.a** would require a separation between air pollution point sources and other land uses consistent with BAAQMD guidelines.

Policy **AIR-2.1** and Program **AIR-2.a** would only address point sources of air pollution and would not protect sensitive land uses such as residences from mobile source emissions. Trucks, buses and some smaller vehicles using freeways emit diesel particulate matter (DPM), which is a known toxic air contaminant. The only two roadways in Marin County that would have the potential to cause a significant health risk for sensitive land uses are U.S. 101 and Interstate 580. Other roadways in Marin County do not have high enough truck volumes to cause a significant health risk for residents of new housing. New freeways are not proposed in Marin, but new housing or other sensitive land uses may be located close enough to existing freeways to result in unhealthy exposures to DPM.

A screening analysis of future DPM exposure and associated health effects was conducted. The health impacts associated with the DPM exhaust are expressed in terms of increased risk of contracting cancer by individuals who reside for extended periods near the sources, such as freeways. This analysis involved the development of DPM emissions for traffic on U.S. 101 and 1-580 using the EMFAC2002 emission factor model with defaults for Marin County. The EMFAC2002 results were then adjusted to the traffic mix on U.S. 101 and 1-580 reported by Caltrans. [18] Emission factors were input to the Ca13qher dispersion model that is acceptable to the BAAQMD for this type of analysis.

Modeled concentrations were calculated for various distances from the edge of the freeway. The maximum individual cancer risks were computed using the BAAQMD recommended cancer risk factor of 3 x 10^{-4} cancer cases per $\mu g/m^3$ of diesel particulate matter, which are based on "best estimates" of plausible cancer potencies as determined by the California Office of Environmental Health Hazard Assessment. The future cancer risk posed by traffic on freeways in Marin County is expressed in terms of distance from the edge of the travel lanes. A risk of less than ten in one million is considered to be less than significant under current *BAAQMD CEQA Guidelines*. It should be noted, as discussed previously, that emission rates of DPM from traffic are predicted to decrease substantially in the future.

An analysis of existing DPM exposures indicates that significant health risks could occur at distances of up to 500 feet from U.S. 101 and Interstate 580. The actual distance would probably be less since the analysis employed screening meteorological conditions that usually result in higher concentrations. U.S. EPA and the California Air Resources Board (CARB) have required cleaner engine technologies and diesel fuel reformulation that are reducing the DPM emissions from these vehicles. The effect of these lower emissions rates reduces the area near freeways where significant DPM exposures would occur. For sensitive receptors, such as residential uses, a significant impact is considered a ten in one million chance of contracting cancer where the receptor is exposed to the source almost 24 hours per

[18] Based on *2004 Average Annual Daily Truck Traffic on the California State Highway System* – http://www.dot.ca.gov/hq/traffops/saferesr/trafdata/

day for 70 years. **Exhibit 4.3-8** shows the distances where significant exposures to DPM could occur under *Draft 2005 CWP Update* buildout conditions. The procedure used to develop the cancer risk for exposure to DPM is described in the *Air Quality Background Report*.

Exhibit 4.3-8
Summary of Future Cancer Risk along Marin County Freeway Segments

Freeway Segment	***Cancer Risk at Receptor Distance from Freeway Edge (per million persons)***		
	50 ft.	***100 ft.***	***200 ft.***
U.S. 101 Southern Marin	4.9	3.8	2.7
U.S. 101 Central Marin	14.0	10.8	7.6
U.S. 101 Northern Marin	11.8	9.2	6.4
I-580 east of San Rafael	13.9	10.5	7.3

Source: Illingworth and Rodkin, Inc.

Significant cancer risks (i.e., risks >ten in one million) would not extend much beyond the right-of-way of U.S. 101 in southern Marin County, because there would be a relatively low volume of trucks using that freeway. The cancer risk in central and northern Marin County would equal or exceed ten cases in one million at a distance of about 100 to 150 feet from the roadway edge. Residential development planned under the *Draft 2005 CWP Update* could occur within the buffer distances reported above, which could result in significant health risks from DPM exhaust.

The *Draft 2005 CWP Update* defines four environmental corridors and focuses new housing in the City-Centered Corridor. This would put new sensitive receptors closer to sources of toxic air contaminants, primarily DPM from traffic. The Housing Overlay Designation (See **Map 3-2.a** and **Map 3-2b** in *Draft 2005 CWP Update*) indicate the potential for housing near U.S. 101 in three general areas: (1) housing could be located in the Las Gallinas Valley planning area close to U.S. 101 near Lucas Valley Road, (2) housing could be provided in the Richardson Bay planning area at Strawberry Village near U.S. 101, and (3) housing could be located near U.S. 101 in Marin City. Potential housing in the Strawberry Village area and Marin City would likely be exposed to risks that are acceptable (less than ten in one million). Without proper setbacks, new sensitive receptors located near the freeways of central and northern Marin County would be exposed to significant health risks from DPM emitted along U.S. 101.

The exposure of new sensitive receptors to unhealthy levels of DPM would be a significant project impact and the project would make a cumulatively significant contribution to a cumulative impact. The following mitigation would be required to reduce project related and cumulative impacts.

Mitigation Measure 4.3-3(a) Revise Policy **AIR 2-1** of the Natural Systems & Agriculture Element as follows:

> **AIR-2.1** *Buffer Emission Sources and Sensitive Land Uses*. Consider potential air pollution and odor impacts from land uses that may emit pollution and/or odors when locating (a) air pollution ~~point~~ sources, and (b) residential and other pollution-sensitive land users in the vicinity of air pollution ~~point~~ sources (which may include freeways, manufacturing, extraction, hazardous materials storage, landfill food processing, wastewater treatment, and other similar uses).

Mitigation Measure 4.3-3(b) Revise Program **AIR-2.a** of the Natural Systems & Agriculture Element as follows:

> **AIR-2.a** *Require Separation Between* <u>*Air Pollution*</u> *~~Point~~ Sources and Other Land Uses*. Only allow (a) emission ~~point~~ sources or (b) other uses in the vicinity of air pollution or odor ~~point~~ sources if the minimum screening distances between sources and receptors established in the BAAQMD CEQA Guidelines can be met, unless detailed project-specific studies demonstrate compatibility with adjacent uses despite separations that do not meet the screening distance requirements.

Mitigation Measure 4.3-3(c) Add a new program to the Natural Systems & Agriculture Element as follows:

> <u>**AIR-2.(new)** *Health Risk Analysis for Sensitive Receptors*. Require that projects involving sensitive receptors proposed within 150 feet of freeways shall include an analysis of the potential health risks. Mitigation measures which comply with adopted standards of the BAAQMD for control of odor / toxics for sensitive receptors shall be identified to reduce these risks to acceptable levels.</u>

Significance After Mitigation Adoption and implementation of Mitigation Measures 4.3-3(a), 4.3-3(b) and 4.3-3(c) would ensure appropriate buffers between sources of air pollution or odors and sensitive receptors are maintained. The project impact would be reduced to a less-than-significant and the project's contribution to cumulative impacts would be less than cumulatively considerable.

Responsibility and Monitoring The Board of Supervisors would be responsible for adopting the policies and programs described in Mitigation Measures 4.3-3(a), 4.3-(b), and 4.3-(c) as part of the *Draft 2005 CWP Update*. The Marin County Community Development Agency would be responsible for monitoring their implementation.

Impact 4.3-4 Carbon Monoxide Concentrations Along Roadways

Traffic increases under the Draft 2005 CWP Update would result in carbon monoxide concentrations that would be below ambient air quality standards at the most congested intersections. This would be a less-than-significant impact.

Carbon monoxide emissions from traffic would be the pollutant of greatest concern at the local level. Congested intersections with a large volume of traffic have the greatest potential to cause high-localized concentrations of carbon monoxide. Since the early 1990s, carbon monoxide levels have been at healthy levels (i.e., below State and federal standards) in the Bay Area. As a result, the region has been designated as attainment for the standard.

The worst study roadway links and intersections in the county, which include the highest traffic volumes and high levels of congestion, were modeled to assess roadside carbon monoxide concentrations. The traffic-generated emissions of CO were predicted using the Caline4 line source dispersion model, as described above (also see *Air Quality Background Report*). These intersections along with the modeled concentrations are shown in **Exhibit 4.3-9**.

Exhibit 4.3-9
Modeled Carbon Monoxide Levels

Roadway Segment Description	***Existing (2005) Modeled Level*** [a] ***(parts per million [ppm])***		***Future (2030) Modeled Level (parts per million [ppm])***	
	1-Hour	***8-hour***	***1-Hour***	***8-hour***
U.S. 101 n/o I-580	7.4	4.9	4.8	3.1

California Ambient Air Quality Standard	20	9.0		

a. Includes background level of 4 ppm for 1-hour and 2.5 ppm for 8-hour.

Source: Illingworth and Rodkin, Inc. 2006.

Traffic generated by land uses and development consistent with the *Draft 2005 CWP Update* would increase carbon monoxide levels along roadways. Roadways and intersections affected by the greatest traffic changes were modeled. Although levels may increase slightly along these roadways, the overall concentrations would be well below health-based ambient air quality standards. Traffic associated with land uses and development consistent with the *Draft 2005 CWP Update* would not cause a significant air quality impact in terms of increase pollutant concentrations along roadways.

The county's worst intersections, in terms of roadside air pollutant concentrations, have levels that are currently below ambient air quality standards. The concentrations are anticipated to decrease substantially in the future with improvements to exhaust systems and reformulated fuels. As a result, the impact on local air quality resulting from implementation of the *Draft 2005 CWP Update* would be less-than-significant and would make a less than cumulatively considerable contribution to cumulative impacts.

Mitigation Measure 4.3-4 None required

Impact 4.3-5 Fugitive Dust Associated with Construction Projects

Construction associated with land uses and development consistent with the Draft 2005 CWP Update would result in emissions of dust and possibly toxic air contaminants. However, existing regulations and air quality policies and programs contained in the Draft 2005 CWP Update would reduce this to a less-than-significant impact.

Construction of individual projects would involve activities that result in air pollutant emissions. Construction activities such as demolition, grading, construction worker travel to and from project sites, delivery and hauling of construction supplies and debris to and from the project site, and fuel combustion by on-site construction equipment would generate pollutant emissions. These construction activities would temporarily create emissions of dust, fumes, equipment exhaust, and other air contaminants. Dust emissions can lead to both nuisance and health impacts. PM_{10} is the pollutant of greatest concern that is emitted from construction, particularly during site preparation and grading. PM_{10} emissions from construction can vary daily, depending on various factors, such as the level of activity, type of construction activity taking place, the equipment being operated, weather conditions, and soil conditions. The BAAQMD has identified a set of feasible PM_{10} control measures for construction activities. According to the *BAAQMD CEQA Guidelines,* [19] if all of these control measures are implemented, then air pollutant emissions from construction activities would be considered a less than significant impact.

In addition, the BAAQMD and CARB have regulations that address the handling of hazardous air pollutants such as lead and asbestos. Lead and asbestos emissions could occur from demolition activities and asbestos emissions could occur from disturbance of soils with naturally occurring asbestos (found in parts of the county). BAAQMD rules and regulations address the both the handling and transport of these contaminants. An air toxic control measure adopted by CARB (California Code of Regulations Title 17, Section 93105) is enforced by the BAAQMD. The measure requires regulated operations engaged in road construction and maintenance activities, construction and grading operations, and quarrying and surface mining operations in areas where naturally occurring asbestos is likely to be found, to employ the best available dust mitigation measures in order to reduce and control dust emissions. The BAAQMD shall be consulted prior to handling materials that contain hazardous contaminants such as lead or asbestos.

Policies **AIR-1.2** and **AIR-1.3** would require that projects meet air quality standards and impacts are mitigated. Specifically, Program **AIR-1.b** would require that new projects are evaluated in accordance with the *BAAQMD CEQA Guidelines* and **AIR-1.g** would require reasonable and feasible control measures for construction and agricultural activities, which include feasible PM_{10} control measures recommended by the BAAQMD. Based on criteria described in ***Section 4.0 Environmental Setting, Impacts, and Mitigation Measures***, Programs **AIR-1.b** and **AIR-1.g** would be implemented in a timely manner and could be relied upon to reduce this impact. [20]

The *Draft 2005 CWP Update* incorporates appropriate measures to control emissions from construction activity. These measures are listed in the *Air Quality Background Report* As a result, air quality impacts associated with construction projects would be less-than-significant and would make a less than cumulatively considerable contribution to cumulative impacts.

Mitigation Measure 4.3-5 None required

[19] *BAAQMD CEQA Guidelines,* Bay Area Air Quality Management District, April 1996 (Revised December 1999), page 14.

[20] As described in **Figure 2-16** Atmosphere and Climate Program Implementation in the *Draft CWP Update*.

Impact 4.3-6 Increase in Greenhouse Gas Emissions

Land uses and development consistent with the Draft 2005 CWP Update would result in an increase in greenhouse gas emissions over existing levels. This would be a significant impact.

Human activities powered by fossil fuels such as coal, oil, and natural gas cause the waste product carbon dioxide (CO_2) to be released into the air. As discussed in the setting section the largest contributors to these emissions in Marin County are vehicular traffic and energy use in buildings. With land uses and development consistent with the *Draft 2005 CWP Update* there would be an increase in greenhouse gas emissions over existing levels. This is in part due to the projected increase in daily vehicle miles (VMT) traveled. As shown in **Exhibit 4.3-6**, daily VMT are expected to increase from an existing 7.0 million to approximately 8.8 million with the buildout of the *Draft 2005 CWP Update*.

Many different types of activities and programs can reduce Marin's carbon dioxide emissions. The most important ways to reduce emissions are through: [21]

- Changes in transportation; and
- Energy efficiency and conservation in both commercial and residential buildings.

The *Draft 2005 CWP Update* target for reducing greenhouse gas emissions countywide is 15 percent by 2015 and for County government sources 15 to 20 percent by 2015. To achieve these targets the *Draft 2005 CWP Update* contains numerous goals, policies and programs that, if adopted and implemented, would act to help minimize carbon dioxide and other greenhouse gas emissions. The Atmosphere and Climate section of the Natural Systems & Agriculture Element describes goals, policies and programs with respect to greenhouse gases. These policies and programs are intended to reduce greenhouse gas emissions countywide. Goal **AIR-4** would aim to prepare policies that promote efficient management and use of resources in order to minimize greenhouse gas emissions. Programs **AIR-4.a**, **AIR-4.b**, **AIR-4.c**, **AIR-4.d** and **AIR-4.e** would all be aimed at directly reducing greenhouse gas emissions resulting from energy use in buildings, from transportation, from waste disposal, from agriculture, and from government contributions.

As discussed in *Impact 4.3-1 Consistency with Clean Air Plan* numerous policies and programs in the *Draft 2005 CWP Update* would reduce the rate of vehicle miles traveled from trips in Marin County. For example, the Built Environment Element contains policies and implementing programs that would encourage development in urban areas served by transit. Policies supporting Goal **HS-3** would implement "smart" and sustainable development principles to meet the housing needs in the county. This would include a focus of providing workforce housing (e.g., Policies **HS-3.2**, **HS-3.3**, and **HS-3.4**). The addition of workforce housing would reduce VMT associated with worker commute travel. The Transportation section of the Built Environment Element includes numerous policies to expand pedestrian and bicycle facilities and access. Other policies and programs would promote energy efficiency and conservation in buildings. The Energy and Green Building section of the Built Environment Element addresses energy conservation and green building standards. Implementation of these policies and programs would reduce carbon dioxide and other greenhouse gases reduced emissions from electrical energy production and natural gas usage.

---

[21] *Measuring Marin County's Ecological Footprint*, prepared for the County of Marin Community Development Agency by Justin Kitzes, M.S. and Steve Goldfinger, Ph.D., February 2006.

The *Marin County Greenhouse Gas Reduction Plan* [22] adopted by the Board of Supervisors in October 2006 set out policies to help achieve the County's greenhouse gas emissions targets. The target has been set to reduce greenhouse gas emissions 15 to 20 percent below 1990 levels by the year 2020 for internal government and 15 percent countywide. This target exceeds the State target for greenhouse gas emissions. The *Greenhouse Gas Reduction Plan* describes measures related to building, transportation, waste, and land use. Many of these actions and measures are supported by policies in the *Draft 2005 CWP Update* and some reflect activities that are already underway and could be expanded.

Exhibit 4.3-10 provides a list of various measures that would reduce greenhouse gas emissions in Marin County, some of which are included in the *Marin County Greenhouse Gas Reduction Plan*. The exhibit describes the various types of measure and a link to a specific program in the *Draft 2005 CWP Update*. The exhibit also provides an estimate of the yearly reduction in tons of CO_2 that could be achieved by individual measures.

22 *Marin County Greenhouse Gas Reduction Plan*, Marin County Community Development Agency, October 2006.

Exhibit 4.3-10
Draft 2005 CWP Update Programs to Reduce Greenhouse Gas Emissions

Measure / Program	*Category*	*Draft 2005 CWP Update Programs*	*Emissions Reduction (tons of CO_2)*
Adopt strict residential or commercial energy code requirements	Buildings / Energy	**AIR-4.a**, **EN-1.a**, **EN-1.b**, **EN-1.c**, **EN-1.d**, **EN-3.a**, **EN-3.b**, **EN-3.f**, **EN-3.h**	-
Launch an "energy efficiency challenge" campaign for community residents	Buildings / Energy	**AIR-4.a**, **EN-1.e**	-
Install solar water heating at community swimming pool	Buildings / Energy	**AIR-4.a**, **EN-2.d**	-
Install energy-efficient cogeneration power production facilities	Buildings / Energy	**AIR-4.a**, **ED-2.d**, **EN-2.f**	-
Initiate a community biodiesel purchasing coop or fueling station	Transportation	**EN-2.d**	-
Utilize biodiesel in municipal fleet	Transportation	**AIR-3.b**, **AIR-3.c**, **TR-4.c**	-
Encourage local buses and taxis to convert to alternative fuels by subsidizing fuel conversion equipment costs	Transportation	**AIR-3.b**, **AIR-3.c**, **TR-4.c**	-
Install energy-efficient exit sign lighting	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	-
Improve water pumping energy efficiency	Buildings / Energy	**AIR-4.a**	
Install energy-efficient traffic lights	Buildings / Energy		-
Provide high school students with complementary bus tickets	Transportation	**TR-3.c**	-
Remove or replace woodstoves and fireplaces with EPA rated woodstoves	Buildings / Energy	**AIR-4.a**	-

Measure / Program	***Category***	***Draft 2005 CWP Update Programs***	***Emissions Reduction (tons of CO_2)***
Alternative Program: Carbon credits	Carbon Credits		-
Plant trees For Energy Savings	Land Use	**AIR-4.k**, **BIO-4.I**	-
Institute growth boundaries, ordinances or programs to limit suburban sprawl	Land Use	**AIR-4.l**, **AIR-4.m**, **OS-2.b**, **OS-2.c**, **OS-2.g**, **OS-2.h**, **CD-1.a**, **CD-1.b**	-
Enforce electric vehicle recharging facilities in new large parking facilities	Transportation		-
Produce electricity from agricultural waste	Waste / Recycling	**AIR-4.d**	633
Install new light rail systems	Transportation	**AIR-4.b**	82,000
Implement bus rapid transit or shuttle programs to SF	Transportation	**AIR-4.b**	29,800
Implement environmentally preferable purchasing program recycled paper, etc (energy efficient appliances are ignored here)	Waste / Recycling	**AIR-4.e**, **EC-1.i**, **EC-1.j**	36
Establish/expand recycling programs in municipal facilities	Waste / Recycling	**AIR-4.c**, **AIR-4.e**	48
Encourage telecommuting by community by offering services online or on the phone at reduced rates compared to in-person visits	Transportation	**AIR-4.b**, **TR-1.a**	3
Provide free bicycle loans for municipal staff use	Transportation	**AIR-4.b**	0
Implement green or reflective roofing	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.d**, **EN-2.f**	34
Limit idling of local transit buses and school buses	Transportation		21
Promote participation in a Green Business Program	Buildings / Energy	**EC-1.a**, **EC-1.k**	16

Measure / Program	***Category***	***Draft 2005 CWP Update Programs***	***Emissions Reduction (tons of CO_2)***
Perform energy-efficient lighting retrofits	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	22
Install energy-efficient street lights (e.g., high pressure sodium, LEDS)	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	182
Implement a form of community choice aggregation	Buildings / Energy	**EN-2.g**	294,165
Expand local or regional bus service in range and/or frequency	Transportation	**AIR-4.b**, **TR-3.a**	10,000
Offer a halogen torchiere lamp exchange to community members	Buildings / Energy	**AIR-4.a**	5
Offer an LED Christmas light trade-in to community members	Buildings / Energy	**AIR-4.a**	18
Purchase "green electricity" from solar, geothermal, wind, hydroelectric sources through green tags	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	4,260
Purchase "green electricity" from solar, geothermal, wind, hydroelectric sources through green tags	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	2,840
Purchase "green electricity" from solar, geothermal, wind, hydroelectric sources through green tags	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	1,420
Establish system for reuse or recycling of construction and demolition materials	Waste / Recycling	**EN-3.c**, **PFS-4.b**	30,000
Install solar panels on municipal facilities	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**, **EN-2.f**	736
Implement solid waste reduction program through creation of reuse facilities / programs	Waste / Recycling	**AIR-4.c**, **PFS-4.c**, **PFS-4.d**	33,000

Measure / Program	***Category***	***Draft 2005 CWP Update Programs***	***Emissions Reduction (tons of CO_2)***
Encourage community car-sharing (run a program as municipality/ support for-profits that give car-sharing services, e.g., Zipcar)	Transportation	**AIR-4.b**, **TR-1.c**	11,880
Install an anaerobic digester at the wastewater treatment facility	Waste / Recycling	**PFS-4.h**	3,200
Increase gas tax	Transportation		32,000
Promotion/informative campaign on 'How to Get Around'	Transportation	**AIR-4.b**, **TR-2.a**	319
Community energy efficiency rebate program	Buildings / Energy	**AIR-4.a**, **EN-1.e**, **EN-2.e**	830
Expand community bicycle infrastructure (e.g., dedicated bicycle lanes, additional bicycle parking spaces)	Transportation	**TR-2.b**, **TR-2.c**, **TR-2.d**, **TR-2.e**, **TR-2.g**, **TR-2.h**, **TR-2.I**, **TR-2.l**	400
Encourage car-pooling, telecommuting and the use of mass-transit by community members by billboard promotions	Transportation	**AIR-4.b**, **TR-1.a**, **TR-1.c**	159
Decrease average daily time street lights are on	Buildings / Energy		14
Encourage car-pooling or van-pooling by municipal employees	Transportation	**AIR-4.b**, **AIR-4.e**, **TR-1.c**	1,192
Establish/expand recycling programs in the community	Waste / Recycling	**AIR-4.c**, **PFS-4.d**	119,300
Perform heating, cooling and ventilation system retrofits (e.g., chillers, boilers, fans, pumps, belts, fuel-switching from electric to gas heating)	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**	48
Offer incentives for PV installations in the community	Buildings / Energy	**AIR-4.a**, **EN-2.e**	8,411

Measure / Program	***Category***	***Draft 2005 CWP Update Programs***	***Emissions Reduction (tons of CO_2)***
Produce electricity from recovered methane in local landfills	Waste / Recycling	**AIR-4.c**	5,300
Institute a lights-out-at-night policy	Buildings / Energy	**AIR-4.e**	28
Encourage telecommuting by municipal employees	Transportation	**AIR-4.b**, **TR-1.a**	48
Implement Tidal Power Project	Buildings / Energy	**AIR-4.a**, **EN-2.d**	446,408
Develop park and ride facilities	Transportation	**AIR-4.b**	16,400
Improve traffic signal synchronization / decrease stop rate and time	Transportation	**TR-2.k**	16,000
Offer prioritized parking for hybrid Cars	Transportation	**AIR-4.b**	4,615
Allow bikes on trains/busses	Transportation	**AIR-4.b**	191
Install occupancy sensors	Buildings / Energy	**AIR-4.a**, **AIR-4.e**, **EN-1.j**	28
Expand the "safe routes to school" program	Transportation	**TR-2.b**, **TR-2.j**, **TR-2.k**	239

		Total Projected CO_2 Reduction	***1,157,265***

Source: Marin Community Development Agency and International Council for Local Environmental Initiatives.

However, because of uncertainties pertaining to the timely and effective implementation of the proposed Countywide greenhouse gas reduction measures beyond the control of Marin County government this would be a significant project impact and the project would make a cumulatively significant contribution to a cumulative greenhouse gas emissions impact.

Mitigation Measure 4.3-6 In order to reduce project related and cumulative impacts the following mitigation would be required:

Mitigation Measure 4.3-6(a) Revise Program **AIR-4.f** of the Natural Systems & Agriculture Element as follows:

> **AIR-4.f** *Establish a Climate Change Planning Process*. Approve and begin implementation of the *Marin County Greenhouse Gas Reduction Plan*. Integrate *Marin County Greenhouse Gas Reduction Plan* ~~climate change planning and program implementation~~ into long range and current planning functions and other related agencies. Establish and maintain a process to implement, measure, evaluate, and modify implementing programs, using the Cities for Climate Protection Campaign as a model.

Mitigation Measure 4.3-6(b) Implement proposed State programs to reduce greenhouse gas emissions including the Renewable Portfolio Standards, California Fuel Efficiency (CAFÉ) standards and a carbon cap and trade programs.

Significance After Mitigation Implementation of the County's *Greenhouse Gas Reduction Plan*, the goals, policies, and programs of the *Draft 2005 CWP Update* and Mitigation Measures 4.3-6(a) and 4.3-3(b) and 4.3-3(c) should reduce the rate of increase in greenhouse gas emissions. It is uncertain whether greenhouse gas emissions would be reduced countywide to below existing levels within the timeframe of the Countywide Plan. This, therefore, would be a significant unavoidable project and cumulative impact.

Responsibility and Monitoring The Board of Supervisors would be responsible for adopting the program described in Mitigation Measure 4.3-6(a) as part of the *Marin Countywide Plan 2005.* Implementation would be the responsibility of both Marin County and the Marin County incorporated cities and towns. The Marin County Community Development Agency would be responsible for monitoring implementation. For mitigation measure 4.3-6(b), the California State Air Resources Board would be responsible for implementation and monitoring.

Southern California Association of Governments

2012-2035 Regional Transportation Plan/Sustainable Communities Strategy

December 2011 | State Clearinghouse # 2011051018

SOUTHERN CALIFORNIA
ASSOCIATION of GOVERNMENTS

3.2 AIR QUALITY

This section describes current air quality in the SCAG region, discusses the potential impacts of the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategies (2012-2035 RTP/SCS or Plan) on air quality, identifies mitigation measures for the impacts, and evaluates the residual impacts.

This analysis focuses on air pollution from on-road motor vehicles in two perspectives: daily emissions and pollutant concentrations. "Emissions" refer to the quantity of pollutants released into the air, measured in pounds per day (ppd). "Concentrations" refer to the amount of pollutant material per volumetric unit of air, measured in parts per million (ppm) or micrograms per cubic meter ($\mu g/m^3$). The following discussion identifies the pollutants included in this analysis.

Pollutants and Effects

Health-based air quality standards have been established by California and the federal government for the following criteria pollutants: carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO2), particulate matter 2.5 microns or less in diameter (PM2.5), particulate matter ten microns or less in diameter (PM10), and lead (Pb). California also includes standards for Hydrogen Sulfide, Vinyl Chloride, sulfate and visibility.

The following summarizes the health effects of the criteria pollutants:[1]

Carbon Monoxide (CO). CO is a colorless, odorless, relatively inert gas. It is a trace constituent in the unpolluted troposphere, and is produced by both natural processes and human activities. In remote areas far from human habitation, CO occurs in the atmosphere at an average background concentration of 0.04 ppm, primarily as a result of natural processes such as forest fires and the oxidation of methane. Global atmospheric mixing of CO from urban and industrial sources creates higher background concentrations (up to 0.20 ppm) near urban areas. The major source of CO in urban areas is incomplete combustion of carbon-containing fuels, mainly gasoline. Consequently, CO concentrations are generally highest in the immediate vicinity of major concentrations of vehicular traffic but it disperses rapidly beyond 500 feet of the vicinity.

CO is a primary pollutant, meaning that it is directly emitted into the air, not formed in the atmosphere by chemical reaction of precursors, as is the case with ozone and other secondary pollutants. Ambient concentrations of CO in the region exhibit large spatial and temporal variations due to variations in the rate at which CO is emitted and in the meteorological conditions that govern transport and dilution. Unlike O_3, CO tends to reach high concentrations in the fall and winter months. The highest concentrations frequently occur on weekdays at times consistent with rush hour traffic and late night during the coolest, most stable portion of the day.

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply to the heart.

Inhaled CO has no direct toxic effect on the lungs, but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, health conditions requiring an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses (unborn babies), and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes.

[1]SCAQMD, *Final EIR for the 2007 Air Quality Management Plan*, June 2007.

Reductions in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO resulting in COHb levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include pre-term births and heart abnormalities.[2]

Volatile Organic Compounds (VOCs). VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids. Some VOCs are also classified by the State as toxic air contaminants. While there are no specific VOC ambient air quality standards, VOC is a prime component (along with NOx) of the photochemical processes by which such criteria pollutants as ozone, nitrogen dioxide, and certain fine particles are formed. These criteria pollutants are thus regulated as "precursors" to formation of ozone.

Ozone (O_3). O_3, a colorless gas with a sharp odor, is a highly reactive form of oxygen. High O_3 concentrations exist naturally in the stratosphere. Some mixing of stratospheric O_3 downward through the troposphere to the earth's surface does occur; however, the extent of O_3 transport is limited. At the earth's surface in sites remote from urban areas, O_3 concentrations are normally very low (0.03-0.05 ppm). For comparison, one- and eight-hour O_3 concentrations in the SCAG region typically range between 0.1 and 0.15 ppm.

While O_3 is beneficial in the stratosphere because it filters out skin-cancer-causing ultraviolet radiation, it is a highly reactive oxidant. It is this reactivity which accounts for its damaging effects on materials, plants, and human health at the earth's surface.

The propensity of O_3 for reacting with organic materials causes it to be damaging to living cells, and ambient O_3 concentrations in the South Coast Air Basin (SCAB) are frequently sufficient to cause health effects. O_3 enters the human body primarily through the respiratory tract and causes respiratory irritation and discomfort, makes breathing more difficult during exercise, and reduces the respiratory system's ability to remove inhaled particles and fight infection.

Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible subgroups for O_3 effects. Short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient O_3 levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in high O_3 communities. Elevated O_3 levels are also associated with increased school absences.

O_3 exposure under exercising conditions is known to increase the severity of the above-mentioned observed responses. Animal studies suggest that exposures to a combination of pollutants which include O_3 may be more toxic than exposure to O_3 alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

Nitrogen Dioxide (NO_2). NO_2 is a reddish-brown gas with a bleach-like odor. Nitric oxide (NO) is a colorless gas, formed from the nitrogen (N_2) and oxygen (O_2) in air under conditions of high temperature and pressure which are generally present during combustion of fuels; NO reacts rapidly with the oxygen in air to form NO_2. NO_2 is responsible for the brownish tinge of polluted air. The two gases, NO and NO_2, are referred to collectively as NO_X. In the presence of sunlight, NO_2 reacts to form nitric oxide and an oxygen atom. The oxygen atom can react further to form ozone, via a complex series of chemical reactions involving hydrocarbons. Nitrogen dioxide may also react to form nitric acid (HNO_3) which reacts further to form nitrates, components of PM2.5 and PM10.

[2] SCAQMD, *Final EIR for the 2007 Air Quality Management Plan*, June 2007.

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO_2 at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO_2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma and/or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups. More recent studies have found associations between NO_2 exposures and cardiopulmonary mortality, decreased lung function, respiratory symptoms and emergency room asthma visits.

In animals, exposure to levels of NO_2 considerably higher than ambient concentrations results in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of O_3 and NO_2.

Sulfur Dioxide (SO_2). SO_2 is a colorless gas with a sharp rotten egg odor. It reacts in the air to form sulfuric acid (H_2SO_4), which contributes to acid precipitation, and sulfates, which are components of PM10 and PM2.5. Most of the SO_2 emitted into the atmosphere is produced by burning sulfur-containing fuels.

Exposure of a few minutes to low levels of SO_2 can result in airway constriction in some asthmatics. All asthmatics are sensitive to the effects of SO_2. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, is observed after acute higher exposure to SO_2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO_2.

Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO_2 levels. In these studies, efforts to separate the effects of SO_2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.

Particulate Matter. Of great concern to public health are the particles small enough to be inhaled into the deepest parts of the lung. Respirable particles (PM10, or particulate matter less than about 10 micrometers in diameter) and fine particles (PM2.5, or particulate matter less than 2.5 micrometers in diameter) can accumulate in the respiratory system and aggravate health problems such as asthma, bronchitis and other lung diseases. Children, elderly, exercising adults, and those suffering from asthma, pre-existing respiratory and/or cardiovascular disease are especially vulnerable to adverse health effects of PM10 and PM2.5.

A consistent correlation between elevated ambient particulate matter (PM10 and PM2.5) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. Studies have reported an association between long-term exposure to air pollution dominated by fine particles (PM2.5) and increased mortality (especially from lung cancer) and reduction in life-span.

Daily fluctuations in PM2.5 concentration levels have also been related to hospital admissions for acute respiratory conditions, to school and kindergarten absences, to a decrease in respiratory function in normal children and to increased medication use in children and adults with asthma. Studies have also shown lung function growth in children is reduced with long-term exposure to PM10 and PM2.5.[3]

Sulfates. Sulfates are chemical compounds that contain the sulfate ion (SO_4), and are part of the mixture of solid materials that make up PM_{10}. Most of the sulfates in the atmosphere are produced by oxidation of sulfur dioxide. Oxidation of sulfur dioxide yields sulfur trioxide (SO_3) that reacts with water to form sulfuric

[3]SCAQMD, *Final EIR for the 2007 Air Quality Management Plan*, June 2007.

acid, which contributes to acid deposition. The reaction of sulfuric acid with basic substances such as ammonia yields sulfates, a component of PM10 and PM2.5.

Most of the health effects associated with PM2.5 and sulfur dioxide at ambient levels are also associated with sulfates. Thus, both mortality and morbidity effects have been observed with an increase in ambient sulfate concentrations. However, efforts to separate the effects of sulfates from the effects of other pollutants have generally not been successful.

Clinical studies of asthmatics exposed to sulfuric acid suggest that adolescent asthmatics are possibly a subgroup susceptible to acid aerosol exposure. Animal studies suggest that acidic particles such as sulfuric acid aerosol and ammonium bisulfate are more toxic than non-acidic particles like ammonium sulfate. Whether the effects are attributable to acidity or to PM10/PM2.5 remains unresolved.

Lead (Pb). Pb in the atmosphere is present as a mixture of a number of Pb compounds. Leaded gasoline and Pb smelters have been the main sources of Pb emitted into the air. Due to the phasing out of leaded gasoline, there was a dramatic reduction in atmospheric Pb in the SCAB over the past two decades.

Fetuses, infants, and children are more sensitive than others to the adverse effects of Pb exposure. Exposure to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased Pb levels are associated with increased blood pressure.

Pb poisoning can cause anemia, lethargy, seizures, and death. It appears that there are no direct effects of lead on the respiratory system. Pb can be stored in the bone from early-age environmental exposure, and elevated blood lead levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland), and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of Pb because of previous environmental Pb exposure of their mothers.

Toxic Air Contaminants (TACs). TACs, also referred to as hazardous air pollutants (HAPs), are generally defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects; however, the emission of a toxic chemical does not automatically create a health hazard. Other factors, such as the amount of the chemical; its toxicity, and how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust and may exist as PM10 and PM2.5 or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources.

The emission of toxic substances into the air can be damaging to human health and to the environment. Human exposure to these pollutants at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. Pollutants deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer.

The public's exposure to TACs is a significant public health issue in California. The Air Toxics "Hotspots" Information and Assessment Act is a state law requiring facilities to report emissions of TACs to air districts. The program is designated to quantify the amounts of potentially hazardous air pollutants released, the location of the release, the concentrations to which the public is exposed, and the resulting health risks.

The State Air Toxics Program (AB 2588) identified over 200 TACs, including the 188 TACs identified in the federal Clean Air Act. The Unites States Environmental Protection Agency (USEPA) has assessed this expansive list of toxics and identified 21 TACs as Mobile Source Air Toxics (MSATs). MSATs are compounds emitted from highway vehicles and nonroad equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. USEPA also extracted a subset of these 21 MSAT compounds that it now labels as the six priority MSATs: benzene, formaldehyde, acetaldehyde, diesel particulate matter/diesel exhaust organic gases, acrolein, and 1,3-butadiene. While these six MSATs are considered the priority transportation toxics, USEPA stresses that the lists are subject to change and may be adjusted in future rules.[4]

The California-specific transportation air quality analysis model, EMFAC, is designed to model MSATs at the project-level. Health effects from MSATs/TACs, i.e., cancer risks and chronic non-cancer risks from on-road traffic, have been associated primarily with diesel PM, benzene, and 1,3-butadiene. EMFAC can be used to estimate diesel particulate matter, benzene, and 1,3-butadiene emissions. In addition to diesel particulate matter (diesel PM), benzene, 1,3-butadiene, acetaldehyde, carbon tetrachloride, hexavalent chromium, paradichlorobenzene, formaldehyde, methylene chloride, and perchloroethylene pose the greatest existing ambient TAC risk, for which data are available, in California.

MSATs/TACs may threaten public health even at low concentrations due to their high toxicity. Therefore, no exposure levels are considered safe for TACs/MSATs. For federal highway projects, FHWA has established the following interim policy for the impact analysis of TACs and MSATs: "Given the emerging state of the science and of project-level analysis techniques, there are no established criteria for determining when MSAT emissions should be considered a significant issue in the NEPA context."

The California Office of Environmental Health Hazard Assessment (OEHHA) has established protocols and methods for performing health risk analyses (HRAs) for stationary sources and some area sources; however, highway sources are mobile sources.

To date, the most comprehensive study of air toxics in the SCAB is the Multiple Air Toxics Exposure Study (MATES-III), conducted by Southern California Air Quality Management District (SCAQMD). The monitoring program measured more than 30 air pollutants, including both gases and particulates. The monitoring study was accompanied by a computer modeling study in which SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. MATES-III found that the cancer risk in the region from carcinogenic air pollutants ranges from about 870 in a million to 1,400 in a million, with an average regional risk of about 1,200 in a million.

Air Dispersion. TACs/MSATs impact those located closest to the emission sources more than those located further away. A California law passed in 2003 (Public Resources Code Section 21151.8) prohibits the siting of a school within 500 feet of a freeway unless, "the school district determines, through analysis based on appropriate air dispersion modeling, that the air quality at the proposed site is such that neither short-term nor long-term exposure poses significant health risks to pupils."

USEPA has issued a number of regulations that will dramatically decrease MSATs through cleaner fuels and cleaner engines. According to an FHWA analysis, even if the number of vehicle miles traveled (VMT) increases by 64 percent, reductions of 57 percent to 87 percent in MSATs are projected from 2000 to 2020. These are national figures, and data for California, the SCAG region, and individual roadways may vary.

[4]FHWA, *Memorandum. Information: Interim Guidance on Air Toxic Analysis in NEPA Documents*, September 30, 2009.

Diesel Particulate Matter (diesel PM). According to the 2006 California Almanac of Emissions and Air Quality, the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from the exhaust of diesel-fueled engines (diesel PM). Diesel PM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances.

Diesel exhaust is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of many of the urban hazardous air pollutants, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra fine diesel particulates are of the greatest health concern, and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on road diesel engines of trucks, buses and cars and the off road diesel engines that include locomotives, marine vessels and heavy duty equipment. Although diesel PM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present.

The most common exposure to diesel PM is breathing the air that contains diesel PM. The fine and ultra-fine particles are respirable (similar to PM2.5), which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. Exposure to diesel PM comes from both on-road and off-road engine exhaust that is either directly emitted from the engines or lingering in the atmosphere.

Diesel exhaust causes health effects from both short-term or acute exposures, and long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel PM but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.

Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat and lungs, some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Chronic exposure to diesel PM in experimental animal inhalation studies have shown a range of dose-dependent lung inflammation and cellular changes in the lung and immunological effects. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a likely carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings.[5]

USEPA's National Scale Assessment uses several types of health hazard information to provide a quantitative "threshold of concern" or a health benchmark concentration at which it is expected that no adverse health effects occur at exposures to that level. Health effects information on carcinogenic, short- and long-term non-carcinogenic end points are used to establish selective protective health levels to compare to the modeled exposures levels. Unfortunately the exposure response data in human studies are considered too uncertain to develop a carcinogenic unit risk for USEPA's use. There is a Reference Concentration (RFC) that is used as a health benchmark protective of chronic non-carcinogenic health effects but it is for diesel exhaust and not specifically set for diesel PM. The RFC for diesel exhaust, which includes diesel PM, is 5 $\mu g/m^3$.[6] This value is similar to the National Ambient Air Quality Standard established for fine particulate matter (PM2.5), which is 15 $\mu g/m^3$.

[5]USEPA, Diesel Particulate Matter. Available at *http://www.epa.gov/region1/eco/airtox/diesel.html.*
[6]*Ibid.*

Unlike other TACs, no ambient monitoring data are available for diesel PM because no routine measurement method currently exists. However, California Air Resources Board (ARB) has made preliminary concentration estimates based on a PM exposure method. This method uses the ARB emissions inventory's PM10 database, ambient PM10 monitoring data, and the results from several studies to estimate concentrations of diesel PM.

Diesel PM poses the greatest health risk among these ten TACs mentioned. Based on receptor modeling techniques, SCAQMD estimated that diesel PM accounts for 84 percent of the total risk in the SCAB.[7]

Recent studies of the potential effect of roadway emissions on air quality sensitive receptors. Vehicle emissions contain a number of substances that can be harmful, including TACs such as benzene and diesel PM. A growing body of scientific evidence shows that living or going to school near roadways with heavy traffic volumes is associated with a number of adverse effects. These include increased respiratory symptoms, increased risk of heart and lung disease, and elevated mortality rates.[8]

While most of the initial studies were conducted in Europe, a number of research projects conducted in the United States and California are finding similar results. For example, as of 2005, the Children's Health Study, a ten-year study conducted by the University of Southern California School of Medicine, found strong evidence that exposure to pollutants related to vehicle emissions such as $NO_2$and elemental carbon (or soot) is linked to a slowing of lung function growth. The researchers concluded that the resulting deficits in lung function are likely permanent and may increase the risk for respiratory and other diseases later in life. The study also found that the children in the study who lived nearest to roadways with heavy traffic, such as freeways, showed increased risk for having asthma.[9]

The East Bay Children's Respiratory Health Study. The East Bay Children's Respiratory Health Study, conducted in 2001, included more than 1,100 students between the 3rd and 5th grades.[10] The study included ten neighborhoods with school sites located upwind and downwind from major roads. The San Francisco ay area has strong prevailing winds, and this study found that downwind direction and proximity to major roads was an important determinant of increased exposure to traffic pollutants. This study found higher concentrations of black carbon, oxides of nitrogen, and nitrogen oxide at schools located downwind from freeways as compared with those schools upwind or farther from major traffic sources.

For children residing at their current address for at least one year, investigators found a modest but significant increase of five to eight percent in bronchitis and asthma symptoms in children in neighborhoods with higher concentrations of traffic pollutants.

California Office of Environmental Health Hazard Assessment (OEHHA) School Study. The OEHHA studied public schools in California, various socioeconomic factors, and their proximity to major roads. The study found that about two percent of all the public schools in California, incorporating about 150,000 students, are within 150 meters (500 feet) of a very busy roadway. The study also provided recommendations on ways to mitigate exposure of students to traffic-related pollutants in the event that a school is located near busy roadways. The related fact sheet includes the following:

- Where are people exposed to air pollution from nearby traffic?

  Motor vehicles are part of our everyday lives. We breathe air with higher levels of traffic pollutants while:
  - Driving in heavy traffic, such as on main city streets and on busy highways/freeways.
  - Standing near idling cars, trucks, or buses.

[7]SCAQMD, *Multiple Air Toxics Exposure Study in the South Coast Air Basin*, September 2008.
[8]SCAQMD, *Traffic Pollutants and Health Effects*. May 20, 2005.
[9]*Ibid*.
[10]ARB, *The East Bay Children's Health Study; Traffic-Related Air Pollution Near Busy Roads*, June 7, 2004.

- Spending time at places near roads that have heavy traffic, whether it is at home, school, work, or play. Studies have found that places within 150 meters (500 feet) of main city streets, highways, and freeways generally have higher traffic pollutant levels, especially if the location is "downwind" of the road. ("Downwind" means that the wind generally blows from the road toward your location.)

- If a school is near a street with very heavy traffic, does it mean that children are exposed to high levels of traffic-related air pollution?

  Not necessarily. The prevailing wind direction strongly affects exposure to air pollution from nearby traffic. Locations that are both near and "downwind" of a freeway tend to have higher levels of traffic pollution compared with locations that tend to be "upwind" of a freeway. ("Downwind" means that the wind generally blows from the road toward your location. "Upwind" means that the wind generally blows away from your location, toward the road.)

Air Quality and Land Use Handbook. The studies described in the above paragraphs, along with other similar studies, were considered by the ARB in the preparation of the publication, Air Quality and Land Use Handbook: A Community Health Perspective.[11] In the discussion of traffic emissions and health effects, the key health findings included the following:

- Reduced lung function in children was associated with traffic density, especially trucks, within 1,000 feet and the association was strongest within 300 feet;
- Increased asthma hospitalizations were associated with living within 650 feet of heavy traffic and heavy truck volume;
- Asthma symptoms increased with proximity to roadways and the risk was greatest within 300 feet;
- Asthma and bronchitis symptoms in children were associated with proximity to high levels of traffic in a San Francisco Bay Area community with good overall regional air quality; and
- A San Diego study found increased medical visits in children living within 550 feet of heavy traffic.

The ARB concludes their analysis with the following recommendation: Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day.

Childhood Asthma. A study published in 2006 examined the relationship of residence near a freeway and susceptibility to childhood asthma.[12] This study found residence within 75 meters (245 feet) of a major road was associated with an increased risk of lifetime asthma, prevalent asthma, and wheeze. The higher risk of asthma near a major road decreased to background rates at 150 to 200 meters (490 to 655 feet) from the road. In children with a parental history of asthma and in children moving to the residence after two years of age, there was no increased risk associated with exposure. A similar pattern of effects was observed with traffic-modeled exposure. These results indicate that residence near a major road is associated with asthma.

Traffic and Lung Development. One of the most recent studies was published in February 2007, Effect of Exposure to Traffic on Lung Development from 10 to 18 Years of Age: A Cohort.[13] This study examined the pulmonary function of more than 3,500 children over a period of eight years. The studies were conducted in 12 California communities. Health effects related to distance from freeways were divided into three groups: less than 500 meters (1,640 feet) from the freeway, 500 to 1,500 meters (1,640 to 4,920 feet) from the freeway, and greater than 1,500 meters (4,920 feet) from the freeway.

[13]Gauderman, W. J., H. Vora, R. McConnell, K. Berhane, F. Gilliland, D. Thomas, F. Lurmann, E. Avol, N. Kunzli, M. Jerrett, and J. Peters, *Effect of Exposure to Traffic on Lung Development from 10 to 18 Years of Age: A Cohort Study*, The Lancet, Volume 369. February 17, 2007.

The study shows that the residential proximity to freeway traffic is associated with substantial deficits in lung-function development in children. The effects were greater for those children who lived within 500 meters (1,640 feet) of a freeway than for those who lived at least 1,500 meters (4,920 feet) from a freeway. Since lung development is nearly complete by age 18 years, an individual with a deficit at this time will probably continue to have less than healthy lung function for the remainder of his or her life. The study did not find any evidence that traffic effects varied depending on background air quality, which suggests that even in an area with low regional pollution, children living near a major roadway are at increased risk of health effects. The results also suggest that children who live close to a freeway in a high pollution area experience a combination of adverse developmental effects because of both local and regional pollution.

Particulates at a Sacramento School Site. A multi-year study in the Sacramento area, described in a 2006 report, analyzed atmospheric particulate matter at a school site downwind of a busy secondary road.[14] The study was not a health effects study. The study is of interest for the following reasons: (1) The study indicates that exhaust from automobiles may be a greater source of toxic pollutants than diesel exhaust, and (2) a barrier of dense vegetation can be one element in a pollutant mitigation strategy.

The study also emphasizes that the most important mitigation for exposure near roadways is the distance from the road to the receptor. Many of the health studies described above are related to residential exposure, with a few studies occurring all or partially at schools; none were at parks. The school studies are considered most relevant to the Hall Property Community Park analysis because they involve children who would be involved in very active play at schools, similar to many activities at the proposed park, and because exposure time at schools is less than full-time residency, although still more than would be anticipated at the park. The East Bay Children's Respiratory Health Study is of particular interest because it is one of the few studies reporting health effects correlated with upwind or downwind location.

REGULATORY FRAMEWORK

Air quality is regulated at the federal, State, and regional levels. The following summarizes relevant air quality regulations and regulatory agencies.

Federal

United States Environmental Protection Agency (USEPA). The Federal Clean Air Act (CAA) governs air quality in the United States. USEPA is responsible for enforcing the CAA and for establishing the National Ambient Air Quality Standards (NAAQS). NAAQS are required under the 1977 CAA and subsequent amendments. USEPA regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain types of locomotives. USEPA has jurisdiction over emission sources outside state waters (e.g., beyond the outer continental shelf) and establishes various emission standards, including those for vehicles sold in states other than California. Automobiles sold in California must meet stricter emission standards established by the California Air Resources Board (ARB).

As required by the CAA, NAAQS have been established for seven major air pollutants: CO, NO_2, O_3, PM2.5, PM10, SO_2, and Pb. The CAA requires USEPA to designate areas as attainment, nonattainment, or maintenance (previously nonattainment and currently attainment) for each criteria pollutant based on whether the NAAQS have been achieved. The federal and state standards are summarized in **Table 3.2-1**.

TABLE 3.2-1: STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS				
Pollutant	**Averaging Period**	**California /a/**	**Federal /b/**	
		Concentration /c/	**Primary /c,d/**	**Secondary /c,e/**
Ozone (O_3)	1-hour	0.09 ppm (180 μg/m^3)	--	Same as Primary Standard
	8-hour	0.070 ppm (137 μg/m^3)	0.075 ppm (147 μg/m^3)	
Respirable Particulate Matter (PM10)	24-hour	50 μg/m^3	150 μg/m^3	Same as Primary Standard
	Annual Arithmetic Mean	20 μg/m^3	--	
Fine Particulate Matter (PM2.5)	24-hour	--	35 μg/m^3	Same as Primary Standard
	Annual Arithmetic Mean	12 μg/m^3	15.0 μg/m^3	
Carbon Monoxide (CO)	8-hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	None
	1-hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.030 ppm (57 μg/m^3)	53 ppb (100 μg/m^3)	Same as Primary Standard
	1-hour	0.18 ppm (338 μg/m^3)	100 ppb (190 μg/m^3) /f/	None
Sulfur Dioxide (SO_2)	24-hour	0.04 ppm (105 μg/m^3)	--	--
	3-hour	--	--	0.5 ppm (1300 μg/m^3) /g/
	1-hour	0.25 ppm (655 μg/m^3)	75 ppb (196 μg/m^3)	--
Lead (Pb) /h/	30-day average	1.5 μg/m^3	--	--
	Calendar Quarter	--	1.5 μg/m^3	Same as Primary Standard
	Rolling 3-Month Average /i/	--	0.15 μg/m^3	

TABLE 3.2-1: STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS

Pollutant	Averaging Period	California /a/	Federal /b/	
		Concentration /c/	Primary /c,d/	Secondary /c,e/
Visibility Reducing Particles	8-hour	Extinction coefficient of 0.23 per kilometer — visibility of ten miles or more (0.07 — 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta Attenuation and Transmittance through Filter Tape.	No Federal Standards	
Sulfates	24-hour	25 $\mu g/m^3$		
Hydrogen Sulfide	1-hour	0.03 ppm (42 $\mu g/m^3$)		
Vinyl Chloride	24-hour	0.03 ppm (42 $\mu g/m^3$)		

/a/ California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, suspended particulate matter—PM_{10}, $PM_{2.5}$, and visibility reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
/b/ National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest eight hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For $PM_{2.5}$, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact USEPA for further clarification and current federal policies.
/c/ Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas
/d/ National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
/e/ National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
/f/ Reference method as described by the USEPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the USEPA.
/g/ On June 2, 2010, the U.S. EPA established a new 1-hour SO_2 standard, effective August 23, 2010, which is based on the 3-year average of the annual 99th percentile of 1-hour daily maximum concentrations. USEPA also proposed a new automated Federal Reference Method (FRM) using ultraviolet technology, but will retain the older pararosaniline methods until the new FRM have adequately permeated State monitoring networks. The USEPA also revoked both the existing 24-hour SO_2 standard of 0.14 ppm and the annual primary SO_2 standard of 0.030 ppm, effective August 23, 2010. The secondary SO_2 standard was not revised at that time; however, the secondary standard is undergoing a separate review by USEPA. Note that the new standard is in units of parts per billion (ppb). California standards are in units of ppm. To directly compare the new primary national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
/h/ The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
/i/ National lead standard, rolling 3-month average: final rule signed October 15, 2008.
SOURCE: ARB, *Ambient Air Quality Standards*, and *Attainment Status*, September 8, 2010.

Most of the SCAG region is classified as non-attainment for some criteria pollutants. The boundaries of the SCAG region federal non-attainment/maintenance areas are:

- Ventura County Portion of the South Central Coast Air Basin (SCCAB) - The entire county is a non-attainment area for 8-hour ozone.
- South Coast Air Basin (SCAB) - The entire basin is a non-attainment area for PM10, PM2.5 and 8-hour ozone and a maintenance area for CO and NO_2.
- Antelope Valley and Victor Valley portion of Mojave Desert Air Basin (MDAB) - Non-attainment areas for 8-hour ozone.
- San Bernardino County Portion of MDAB – Part of the basin is a non-attainment area for 8-hour ozone, PM10, and PM2.5.
- The Riverside County Portion of Salton Sea Air Basin (SSAB) - The entire Riverside County portion of SSAB (Coachella Valley) is a non-attainment area for PM_{10} and 8-hour ozone.

- Portions of Imperial County within SSAB – Portions of Imperial County within SSAB are designated as non-attainment for PM10, and PM2.5. The entire portion is maintenance for 8-hour ozone.

The 1970 Amendments to the CAA included a provision to address air toxics. Under Title III of the CAA, USEPA establishes and enforces National Emissions Standards for Hazardous Air Pollutants (NESHAPs), which are nationally uniform standards oriented towards controlling particular hazardous air pollutants (HAPs). Title I, Section 112(c) of the CAA further directed USEPA to develop a list of sources that emit any of 189 HAPs, and to develop regulations for these categories of sources. To date, USEPA has listed 174 categories and developed a schedule for the establishment of emission standards.[15] Rather than promulgating NESHAPs for each pollutant, the CAA directs USEPA to set source category, technology based, standards requiring companies to sharply reduce emissions of toxic air contaminants. These standards require industries to install Maximum Achievable Control Technology (MACT), which is defined as the control technology achieving the maximum degree of reduction in the emission of HAPs, taking into account cost and other factors. USEPA is required to establish and phase in specific performance based standards for all of the industries that emit one or more of the pollutants in significant quantities

State Implementation Plans/Air Quality Management Plans. To comply with the CAA in achieving the National Ambient Air Quality Standards (NAAQS), the California Air Resources Board (ARB) develops State Implementation Plans (SIPs) for federal non-attainment and maintenance areas. In California, SIP development is a joint effort of the local air agencies and ARB working with federal, State, and local agencies (including the MPOs). Local Air Quality Management Plans (AQMPs) are prepared in response to federal and State requirements. Since the CCAA does not specify attainment dates but rather requires meeting the California standards the earliest practicable date, SIPs in California typically serve as the control strategy to meet the more stringent State standards.

In California, all SIPs have to go through three steps: air district action, ARB action, and finally, USEPA action. Each air district submits its respective AQMPs/SIPs to ARB. ARB is the official State agency that submits the SIPs to USEPA for all federal non-attainment and maintenance areas in California.

Transportation Conformity. Transportation conformity is required under CAA section 176(c) to ensure that federally supported highway and transit project activities are consistent with ("conform to") the purpose and requirements of the SIP. Conformity currently applies to areas that are designated non-attainment, and those re-designated to attainment after 1990 ("maintenance areas" with plans developed under CAA section 175A) for the following transportation-related criteria pollutants: ozone, particulate matter (PM2.5 and PM10), CO, and NO_2. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. The transportation conformity regulation is found in 40 CFR Part 93.

Conformity requires reporting on the timely implementation of Transportation Control Measures (TCMs)[16] in ozone nonattainment areas designated as serious or worse, thus reinforcing the link between AQMP/SIPs and the transportation planning process. TCMS are expected to be given funding priority and to be implemented on schedule and, in the case of any delays, any obstacles to implementation have been or are being overcome. In the SCAG Region, there are two areas for which the ozone SIPS contain TCMs: SCAB and the Ventura County portion of SCCAB. (It is noted that the Ventura County SIP does not claim emission

[15] USEPA, Office of Compliance, Office of Enforcement and Compliance Assurance, *EPA Office of Compliance Sector Notebook Project: Air Transportation Industry*, October 1998.

[16] A TCM is any measure that is specifically identified and committed to in the applicable implementation plan, including a substitute or additional TCM that is incorporated into the applicable SIP through the process established in CAA section 176(c)(8), that is either one of the types listed in CAA section 108, or any other measure for the purpose of reducing emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. Notwithstanding the first sentence of this definition, vehicle technology-based, fuel-based, and maintenance-based measures which control the emissions from vehicles under fixed traffic conditions are not TCMs for the purposes of this subpart.

reduction credits from TCM projects. They have been included to assist transportation and air quality agencies to identify projects that have the potential of reducing vehicle emissions, vehicle trips and vehicle miles traveled.)

State

California Air Resources Board (ARB). In addition to being subject to the requirements of CAA, air quality in California is also governed by more stringent regulations under the California Clean Air Act (CCAA). In California, the CCAA is administered by ARB at the State level and by the air quality management districts and air pollution control districts at the regional and local levels. ARB, which became part of the California Environmental Protection Agency in 1991, is responsible for meeting the State requirements of the CAA, administering the CCAA, and establishing the California Ambient Air Quality Standards (CAAQS). The CCAA, as amended in 1992, requires all air districts in the State to endeavor to achieve and maintain the CAAQS. CAAQS are generally more stringent than the corresponding federal standards and incorporate additional standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles.

Unlike the NAAQS, there are no set attainment deadlines to achieve the CAAQS; however, these standards are to be met as expeditiously as possible. ARB regulates mobile air pollution sources, such as motor vehicles. ARB is responsible for setting emission standards for vehicles sold in California and for other emission sources, such as consumer products and certain off-road equipment. ARB established passenger vehicle fuel specifications, which became effective in March 1996. ARB oversees the functions of local air pollution control districts and air quality management districts, which, in turn, administer air quality activities at the regional and county levels. The State standards are summarized in **Table 3.2-1**.

The CCAA requires ARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a State standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a State standard and are not used as a basis for designating areas as nonattainment. Under the CCAA, the Los Angeles County portion of the SCAB is designated as a nonattainment area for O_3, PM2.5, and PM10.[17]

Toxic Air Contaminants (TACs). ARB's statewide comprehensive air toxics program was established in the early 1980's. The Toxic Air Contaminant Identification and Control Act created California's program to reduce exposure to air toxics. Under the Toxic Air Contaminant Identification and Control Act, ARB is required to use certain criteria in the prioritization for the identification and control of air toxics. In selecting substances for review, ARB must consider criteria relating to "the risk of harm to public health, amount or potential amount of emissions, manner of, and exposure to, usage of the substance in California, persistence in the atmosphere, and ambient concentrations in the community" [Health and Safety Code Section 39666(f)]. the Toxic Air Contaminant Identification and Control Act also requires ARB to use available information gathered from the Air Toxics "Hot Spots" Information and Assessment Act program to include in the prioritization of compounds.

California has established a two-step process of risk identification and risk management to address the potential health effects from air toxic substances and protect the public health of Californians. During the first step (identification), ARB and the Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified as a TAC in California. During this process, ARB and the OEHHA staff draft a report that serves as the basis for this determination. ARB staff assesses the potential for human exposure to a substance and the OEHHA staff evaluates the health effects. After ARB

[17]ARB, Area Designation Maps website, *http://www.arb.ca.gov/desig/adm/adm.htm*, accessed June 2, 2011.

and the OEHHA staff hold several comment periods and workshops, the report is then submitted to an independent, nine-member Scientific Review Panel (SRP), who reviews the report for its scientific accuracy. If the SRP approves the report, they develop specific scientific findings which are officially submitted to ARB. ARB staff then prepares a hearing notice and draft regulation to formally identify the substance as a TAC. Based on the input from the public and the information gathered from the report, the ARB Board decides whether to identify a substance as a TAC. In 1993, the California Legislature amended the Toxic Air Contaminant Identification and Control Act by requiring ARB to identify 189 federal hazardous air pollutants as State TACs.

In the second step (risk management), ARB reviews the emission sources of an identified TAC to determine if any regulatory action is necessary to reduce the risk. The analysis includes a review of controls already in place, the available technologies and associated costs for reducing emissions, and the associated risk.

The Air Toxics "Hot Spots" Information and Assessment Act (Health and Safety Code Section 44360) supplements the Toxic Air Contaminant Identification and Control Act by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks. The "Hot Spots" Act also requires facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

California's Diesel Risk Reduction Program. The ARB identified particulate emissions from diesel-fueled engines (diesel PM) as toxic air contaminants (TACs) in August 1998. Following the identification process, the ARB was required by law to determine if there is a need for further control, which led to the risk management phase of the program.

For the risk management phase, the ARB directed staff to form the Diesel Advisory Committee to assist in the development of a risk management guidance document and a risk reduction plan. With the assistance of the Advisory Committee and its subcommittees, the ARB developed the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles and the Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines. The Board approved these documents on September 28, 2000, paving the way for the next step in the regulatory process: the control measure phase.

During the control measure phase, specific Statewide regulations designed to further reduce diesel PM emissions from diesel-fueled engines and vehicles have and continue to be evaluated and developed. The goal of each regulation is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce diesel PM emissions.

Regional

The SCAG region incorporates four air basins and five air districts. The four air basins are the South Coast Air Basin (SCAB), the Mojave Desert Air Basin (MDAB), the Salton Sea Air Basin (SSAB), and the Ventura County portion of the South Central Coast Air Basin (SCCAB). The five air districts are the South Coast Air Quality Management District (SCAQMD), Mojave Desert Air Quality Management District (MDAQMD), Imperial County Air Pollution Control District (ICAPCD), Antelope Valley Air Pollution Control District (AVAPCD), and the Ventura County Air Pollution Control District (VCAPCD). The geographic boundaries of these air basins, districts and monitoring locations are shown in are shown in **Map 3.2-1** located in Chapter 8 (Maps). Each air district established regional air quality rules and regulations. In addition, the air districts are responsible for regulating stationary sources of air emissions that require permits (e.g., industrial land uses and gas stations).

EXISTING SETTING

This section provides the environmental setting for air quality in the SCAG region, which encompasses a population exceeding 18 million persons in an area of more than 38,000 square miles within the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura and Imperial. The section includes information on climate and meteorology for the air basins in the SCAG region and existing air quality. As previously discussed, the SCAG region includes four air basins: South Coast, Mojave Desert, Salton Sea and South Central Coast (Ventura County portion). Each air basin generally has similar meteorological and geographical conditions.

Climate and Meteorology

Air quality is a function of both the rate and location of pollutant emissions under the influence of meteorological conditions and topographic features. Atmospheric conditions such as wind speed, wind direction, and air temperature gradients, along with local topography, influence the movement and dispersal of pollutants and thereby provide the link between air pollutant emissions and air quality.

South Coast Air Basin (SCAB). The SCAB incorporates approximately 12,000 square miles, consisting Orange County and the urbanized areas of San Bernardino, Riverside and Los Angeles counties. In May 1996, the boundaries of the SCAB were changed by the ARB to include the Beaumont-Banning area. In addition, the Southeast Desert Air Basin was separated into two areas and renamed as the Mojave Desert Air Basin and the Salton Sea Air Basin. The distinctive climate of the SCAB is determined by its terrain and geographic location. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the southwest and high mountains around the rest of its perimeter. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The usually mild climatological pattern is interrupted occasionally by periods of extremely hot weather, winter storms, or Santa Ana winds.[18]

The vertical dispersion of air pollutants in the SCAB is hampered by the presence of persistent temperature inversions. High-pressure systems, such as the semi-permanent high-pressure zone in which the SCAB is located, are characterized by an upper layer of dry air that warms as it descends, restricting the mobility of cooler marine-influenced air near the ground surface, and resulting in the formation of subsidence inversions. Such inversions restrict the vertical dispersion of air pollutants released into the marine layer and, together with strong sunlight, can produce worst-case conditions for the formation of photochemical smog. The basin-wide occurrence of inversions at 3,500 feet above sea level or less averages 191 days per year.[19]

The atmospheric pollution potential of an area is largely dependent on winds, atmospheric stability, solar radiation, and terrain. The combination of low wind speeds and low inversions produces the greatest concentration of air pollutants. On days without inversions, or on days of winds averaging over 15 miles per hour, smog potential is greatly reduced.[20]

Mojave Desert Air Basin (MDAB). The MDAB encompasses approximately 21,480 square miles and includes the desert portions of San Bernardino County, Palo Verde Valley, Palmdale and Lancaster in the Antelope Valley. The MDAB is bordered by the SCAB and the Riverside County line to the south, Kern County line to the west, the Arizona and Nevada borders to the north and east, and the eastern portion of Riverside County to the southeast. The Kern County portion of MDAB is not in the SCAG Region.

[18]SCAQMD, *CEQA Air Quality Handbook*, April 1993, p. A8-1.
[19]SCAQMD, *CEQA Air Quality Handbook*, April 1993, p. A8-2.
[20]*Ibid*.

The MDAB is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes.[21] Many of the lower mountains which dot the vast terrain rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the MDAB are out of the west and southwest. These prevailing winds are due to the proximity of the MDAB to coastal and central regions and the blocking nature of the Sierra Nevada Mountains to the north; air masses pushed onshore in southern California by differential heating are channeled through the MDAB. The MDAB is separated from the southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet), whose passes form the main channels for these air masses. The Antelope Valley is bordered in the northwest by the Tehachapi Mountains, separated from the Sierra Nevadas in the north by the Tehachapi Pass (3,800 feet elevation). The Antelope Valley is bordered in the south by the San Gabriel Mountains, bisected by Soledad Canyon (3,300 feet). The Mojave Desert is bordered in the southwest by the San Bernardino Mountains, separated from the San Gabriel Mountains by the Cajon Pass (4,200 feet). A lesser channel lies between the San Bernardino Mountains and the Little San Bernardino Mountains (the Morongo Valley).

The Palo Verde Valley portion of the Mojave Desert lies in the low desert, at the eastern end of a series of valleys (notably the Coachella Valley) whose primary channel is the San Gorgonio Pass (2,300 feet) between the San Bernardino and San Jacinto Mountains.

During the summer the MDAB is generally influenced by a Pacific Subtropical High cell that sits off the coast, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time the reach the desert. Most desert moisture arrives from infrequent warm, moist and unstable air masses from the south. The MDAB averages between three and seven inches of precipitation per year (from 16 to 30 days with at least 0.01 inches of precipitation). The MDAB is classified as a dry-hot desert climate, with portions classified as dry-very hot desert, to indicate at least three months have maximum average temperatures over 100.4° F.

Salton Sea Air Basin (SSAB). The SSAB includes all of Imperial County and the desert portion of Riverside County between the SCAB and the MDAB (known as the Coachella Valley area). Imperial County extends over 4,597 square miles, bordering on Mexico to the south, Riverside County to the north, San Diego County on the west, and the State of Arizona on the east.[22]

The southern portion of the SSAB is a part of the larger physiographic province of the Salton Trough. This province is a very flat basin surrounded by mountains: the Peninsular Ranges to the west, the Chocolate, Orocopia and Cargo Muchaco Mountains to the east. Most of the trough is below sea level, and consists generally of desert, with agricultural land uses located at the north and south of the Salton Sea.

Climatic conditions in the SSAB are governed by the large-scale sinking and warming of air in the semi-permanent subtropical high-pressure center of the Pacific Ocean. The high-pressure ridge blocks out most mid-latitude storms except in the winter when the high is weakest and farthest south. Similarly, the coastal mountains prevent the intrusion of any cool, damp marine air found in California coastal environs. Because of the weakened storms and the orographic barrier, the SSAB experiences clear skies, very low humidity, extremely hot summers, mild winters, and little rainfall. The flat terrain of the valley and the strong temperature differentials created by intense solar heating produce moderate winds and deep thermal convection.

The combination of subsiding air, protective mountains and distance from the ocean all combine to severely limit precipitation. Rainfall is highly variable with heavy precipitation occurring from single storms

[21]Mojave Desert Air Quality Management District, *CEQA and Federal Conformity Guidelines*, February 2009.

[22]Imperial County Air Pollution Control District, *Final 2009 1997 8-Hour Ozone Modified Air Quality Management Plan*, July 13, 2010.

followed by periods of dry air. Humidity is typically low throughout the year, ranging from 28 percent in summer to 52 percent in winter.

The SSAB occasionally experiences periods of high winds. Wind speeds exceeding 31 mph occur most frequently in April and May. On an annual basis, strong winds over 31 miles per hour are observed 0.6 percent of the time, speeds of less than 6.8 mph account for more than one-half of the observed winds. Wind statistics indicate prevailing winds are from the west-northwest through southwest; a secondary flow maximum from the southeast is also evident. Imperial County, in particular, experiences surface inversions almost every day of the year. Due to strong surface heating, these inversions are usually broken allowing pollutants to more easily disperse. Weak, surface inversions are caused by cooling of air in contact with the cold surface of the earth at night. In valleys and low-lying areas, this condition is intensified by the addition of cold air flowing downslope from the hills and pooling on the valley floor.

The presence of the Pacific high-pressure cell can cause the air mass aloft to sink. As the air descends, compressional heating warms it to a temperature higher than the air below. This highly stable atmospheric condition, termed a subsidence inversion can act as a nearly impenetrable lid to the vertical mixing of pollutants. The strength of these inversions makes them difficult to disrupt. Consequently, they can persist for one or more days, causing air stagnation and the buildup of pollutants. Highest or worst-case ozone levels are often associated with the presence of this type of inversion. Subsidence inversions are common from November through June, but appear to be relatively absent July through October.

South Central Coast Air Basin (SCCAB). The SCAG region includes the Ventura County portion of the SCCAB. Ventura County is comprised of coastal mountain ranges, the coastal shore, the coastal plain, and several inland valleys.[23] The northern half of the county (Los Padres National Forest) is extremely mountainous with altitudes up to 8,800 feet. Consequently, the climate in the northern half of the County varies a great deal depending on elevation. Therefore, the climatological and meteorological description presented for Ventura County focuses on the southern half of the county where violations of federal and State ozone standards occur. In the winter, low-pressure systems originating in the northern Pacific Ocean bring clouds, rain, and wind into Ventura County.

The average annual temperature in the coastal and inland valleys of the southern half of Ventura County ranges from the upper 50s at the coast (Point Mugu) to the mid-60s in Simi Valley. The difference between the maximum and minimum temperatures becomes greater as the distance increases from the coast. The average minimum and maximum temperatures at Point Mugu are 50°F and 60°F, respectively, while at the inland location of Simi Valley, the averages are 52°F and 77°F. The smaller range of temperatures at Point Mugu demonstrates the moderating influence of the ocean on air temperature. The ocean's ability to warm and cool the air while its temperature remains relatively unchanged produces the moderating effect. Inland area temperatures are more prone to rapid fluctuations. Almost all rainfall in Ventura County falls during the winter and early spring (November through April). Summer rainfall is normally restricted to scattered thundershowers in lower elevations, and somewhat heavier activity in the mountains. Humidity levels vary throughout the County. The range of humidity is primarily influenced by proximity to the ocean. Although the County's climate is semi-arid, average humidity levels are relatively high due to the marine influence. Coastal areas are more humid than inland areas during typical fair weather. The reverse is true during stormy periods. The lowest humidity levels are recorded during Santa Ana wind conditions.

Ventura County winds are dominated by a diurnal land-sea breeze cycle. The land-sea breeze regime is broken only by occasional winter storms and infrequent strong northeasterly Santa Ana wind flows. Since the sea breeze is stronger than the land breeze, the net wind flow during the day is from west to east. Under light land-sea breeze regimes, recirculation of pollutants can occur as emissions move westward during morning hours, and eastward during the afternoon. This can cause a build-up of pollutants over several days.

[23] VCAPCD, *1994 Air Quality Management Plan*, November 1996.

The vertical dispersion of air pollutants in Ventura County is limited by the presence of persistent temperature inversions. Approximately 60 percent of all inversions measured at Point Mugu are surface-based, with most occurring during the morning hours.

Existing Air Quality

The five air districts in the SCAG region each monitor air quality conditions in their region. **Table 3.2-2** presents the peak readings of criteria pollutants in the SCAG air basins. The data shows that O_3, PM2.5 and PM10 readings consistently exceeded the standards in each of the air basins. In addition, the PM2.5 standard was exceeded multiple times in the SCAG region.

Map 3.2-2 located in Chapter 8 (Maps), shows the average daily O_3 exposure that is in excess of the national 8-hour standard (0.075 parts per million) in the SCAG Region for years 2007 to 2009. Although the region as a whole largely experiences average daily ozone exposure exceeding the federal standard, the highest concentration of O_3 exposure can be seen mostly in southwest San Bernardino and northwest Riverside counties, and also in north Los Angeles County. **Map 3.2-3** located in Chapter 8 (Maps) shows the average annual exposure to PM2.5 for years 2007 to 2009. South Los Angeles County, northeast Orange County, southwest San Bernardino County, and northwest Riverside County experienced the highest average annual exposure to PM2.5, with average rates ranging from 14.6 to 21.4 micrograms of PM2.5 per cubic meter of air. Other high exposure areas include North Los Angeles County, east Ventura County (along the US-101 corridor), central Orange County, central Riverside County (Coachella Valley), and central Imperial County (Imperial Valley basin). Also included in this group are the areas in San Bernardino and Riverside County that are directly outside of the highest intensity areas identified previously that fall between the SR-74, I-15, and I-215 corridors.

The impact of ozone and particulate emissions on health can often be seen in the instances of cancer or poor respiratory health in a designated geographic area. The rate of cancer risk per one million people as a result of emissions in the SCAG region is displayed in **Map 3.2-4** located in Chapter 8 (Maps). The highest instance of cancer risk is exhibited in the area in and around Downtown Los Angeles, along the I-10 and SR-60 highways in San Bernardino County, at the SR-91/I-15, SR-91/I-215 intersections in Riverside County, and at the SR-57/SR-22 intersection in Orange County.

Other areas that have high instances of cancer risk in the SCAG Region are south Ventura County, south and central Los Angeles County, southwest San Bernardino County, northwest Riverside County, and all of Orange County. In addition to cancer risk, respiratory risk is also an indicator of emissions impact on public health. **Map 3.2-5** located in the Chapter 8 (Maps) shows respiratory risk in the SCAG Region. The highest areas of respiratory risk are the segments that closely follow major freeways in the most urbanized portions of the region, with the areas surrounding Downtown Los Angeles showing the highest geographic concentration of respiratory risk in the region. Respiratory risk is also present in the urbanized portions of south Ventura County, south and central Los Angeles County, southeast San Bernardino County, northwest Riverside County, Orange County, and central Imperial County.

Maps 3.2-4 and **3.2-5** are based on 2005 data and show a reasonable representation of the spatial variation of cancer and respiratory risk. The existing risk in the current year is less than presented in these maps because of State regulations implemented since 2005 designed to reduce mobile source toxic emissions. Therefore, **Maps 3.2-4** and **3.2-5** show a conservative quantitative estimate of regional risk.

Rail engines generate emissions of diesel particulate matter and other cancer-causing toxics. **Map 3.2-6** located in Chapter 8.0 (Maps) shows sensitive receptors located along regional rail lines. **Map 3.2-7** located in Chapter 8.0 (Maps) shows regional 2005 cancer risk as it relates to rail lines. Above-average cancer risk is often located near rail lines.

SOURCE: ARB, Historical Air Quality Data, 2011.

THRESHOLDS OF SIGNIFICANCE

The 2012-2035 RTP/SCS would have a significant impact related to air quality in the following circumstances:

- Projected long-term emissions of criteria pollutants are considered significant if they are substantially greater than current emission levels;
- Projected short-term emissions of criteria pollutants (construction of transportation projects and anticipated development) are considered to be significant if they would exceed the thresholds established by the local air districts;
- Projected long-term emissions of toxic air contaminants (diesel particulate matter from heavy-duty diesel trucks and other emissions from industrial activities) are considered significant if they would be greater than current emission levels;
- Localized concentrations of toxic air contaminants at sensitive receptors (short-term and/or long-term) are considered significant if they would exceed existing conditions; and/or
- Projected long-term emissions would be considered to be cumulatively significant if they are not consistent with the local air quality management plans and state implementation plans.
- If the Plan could increase the number of people residing in areas within 500 feet of rail and freeway facilities compared to existing conditions, with the potential to expose them to substantially higher than average cancer and other health risks, the impact is considered significant.

Methodology

This section summarizes the methodology used to evaluate the expected impacts of implementation of the Plan on air quality.[24]

Cumulative Analysis

The 2012-2035 RTP/SCS addresses transportation projects and land use distribution patterns, including land use scenarios. These land use distribution patterns identify growth distribution and anticipated land use development to accommodate growth projections. The Regional Travel Demand Model (RTDM) used for this analysis captures pass-through traffic that does not have an origin or destination in the region, but does impact the region, so that too is included in the project analysis. Although a similar level of development is anticipated even without the 2012-2035 RTP/SCS, this Plan would influence growth, including distribution patterns, throughout the region. To address this, the analysis in the PEIR covers overall impacts of all transportation projects and land development described in the 2012-2035 RTP/SCS. In addition, this PEIR considers cumulative impacts from other regional plans (e.g., the South Coast Air Quality Management Plan [AQMP]), which could result in additional impacts inside and outside the region.

Comparison with the No Project Alternative

The analysis of air quality includes a comparison between the expected future conditions with the Plan and the expected future conditions if no Plan (No Project Alternative) were adopted. This evaluation is not included in the determination of the significance of impacts (which is based on a comparison of future conditions with the Plan to existing conditions); however, it provides a meaningful perspective on the effects of the Plan.

---

[24]The Environmental Justice section of the Plan and associated appendix contains substantial analysis of potential air quality impacts to low income, minority and other protected groups. See Environmental Justice Appendix of the 2012-2035 RTP/SCS. However, the PEIR does not rely on this analysis as it addresses air quality impacts to the community as a whole.

Determination of Significance

The methodology for determining the significance of air quality impacts compares the existing conditions to the future 2012-2035 RTP/SCS conditions, as required in CEQA Section 15126.2(a).

Analysis of the potential air quality impacts of the Plan was conducted based on detailed modeling of on-road sources. Regional emissions from stationary and other sources are summarized from the SCAQMD AQMP and associated EIR (the most recently available information as of publication of this Draft PEIR; the AQMP and associated EIR will be updated in 2012). A mobile source health risk assessment has also been completed. Because Plan and cumulative emissions are interrelated, cumulative emissions are discussed together with Plan emissions.

IMPACTS

Impact 3.2-1: Mobile source emissions of ROG, NO_X, CO, PM 10 PM2.5, and SO_X would stay approximately the same or decrease (often substantially) when compared to existing conditions. This is considered to be a beneficial impact. Re-entrained roadway dust would increase proportionate to VMT. This would be a significant impact.

Projected long-term emissions of criteria pollutants are considered significant if they are substantially greater than the current emission levels.[25]

Criteria Pollutant Emissions Analysis

To assess the effectiveness of the improvements proposed in the Plan, estimated air emissions for the buildout year (2035) of the Plan were compared to the 2012 conditions. The calculated emissions were compiled for each county in the SCAG region.

Re-entrained roadway dust as well as roadway construction dust emissions are included in the estimation of criteria pollutant emissions for PM10 and PM2.5 for non-attainment and maintenance areas where AQMD/APCDs include inventories in their State Implementation Plans (SIPs) but are not available for the entire SCAG region (see the Transportation Conformity Appendix to the 2012-2035 RTP/SCS page 16). Thus, re-entrained road dust is accounted for in the attainment demonstrations of applicable PM10 and PM2.5 SIPs. As shown in SCAG's conformity analysis, PM10 and PM2.5 emissions meet applicable emissions budgets for the build/no build interim test (for those areas where there is no emission budget) and thus conform to the SIPs.

Re-entrained dust (PM10 and PM2.5) would be generated by roadway activity (i.e., roadway dust kicked up by moving vehicles on paved and unpaved roadways). In addition roadway construction dust and dust from construction activity, and agricultural activity would add to regional dust levels. Re-entrained roadway dust is proportional to total VMT which is expected to increase under the Plan as compared to existing conditions and, as such, re-entrained roadway dust would increase. Expected growth would also lead to new construction which, in turn, would increase regional dust. These construction emissions, although unavoidable, would be partially controlled by air districts fugitive dust rules. The compact development pattern under the Plan may result in more open/agricultural space remaining and therefore current problems with wind blown dust off agricultural fields would remain if more land stays in agricultural/open space uses under the Plan as compared to the No Project Alternative.

[25] 2012 modeled conditions are used to approximate 2011 conditions as they are readily available and are close to 2011.

Table 3.2-3 summarizes the current and projected mobile source criteria pollutant emissions estimated for the Plan as compared to the current conditions by county. As shown in **Table 3.2-3**, emissions of ozone precursors NO_X and ROG would experience a dramatic improvement over existing conditions under the Plan.

In addition, CO and PM2.5 (other than re-trained roadway and construction dust) emissions would improve over existing conditions. SO_X emissions would increase in every county but Ventura. This is not considered to result in a significant impact as the entire SCAG region is well below State and federal SO_2 standards and designated as an attainment area. Implementation of Mitigation Measures **MM-AQ1** through **MM-AQ18** would further reduce criteria pollutant emissions. Impacts are considered significant because of the increase in PM10 as a result of re-entrained roadway dust (despite the fact that as noted above applicable conformity budgets and build/no build tests would be met).

Maps 3.2-8 and **3.2-9** located in Chapter 8.0 (Maps) show that the Plan would generally have fewer PM and CO emissions along freeways as compared to the No Project Alternative.

Impact 3.2-2: Under the Plan, carcinogenic health risk related to air toxics within any given distance of mobile sources in the region would decrease when compared to existing conditions. Total acute and chronic risk associated with criteria pollutants from mobile sources at given distances would also decrease when compared to existing conditions. Non-carcinogenic health incidences due to VMT-related re-entrained dust would increase under the Plan. However, increases in these health incidences would be at least partially offset by the decrease in health incidences related to air toxics and criteria pollutants generated by vehicle exhaust. (See also Impact 3.2-3 related to shifting populations.)

Regional Cancer Risk

Cancer risk in the region results from a number of sources including industrial sources, contaminated sites, as well as common carcinogens found in the home (many cleaning products, gasoline, paints, etc.). Mobile sources are a major source of cancer risk. As discussed above regional PM10 and PM2.5 from exhaust and tire wear would be expected to be similar to today, although re-entrained roadway dust would be expected to increase proportionate with VMT.

A review of air pollution studies by ARB indicates that residing close to freeways or busy roadways may result in adverse health effects beyond those typically found in urban areas. Several studies found an association between adverse non-cancer health effects (e.g., asthma) and living or attending school near heavily traveled urban roadways; however, these studies also found that the roadway and truck traffic densities were key factors affecting the strength of association with adverse health impacts. For urban roadways, the association of traffic-related emissions with adverse health impacts was generally strongest between 300 and 1,000 feet.

ARB reports that Diesel Particulate Matter (DPM) represents about 70 percent of the potential cancer risk from vehicle travel on a typical urban freeway. As shown in **Table 3.2-4,** exhaust from heavy-duty trucks is anticipated to decrease in all areas of the region as compared to today; thus DPM associated with freeways will also decrease as compared to today.

Respiratory and Other Particulate Matter Health Effects

Ambient PM10 and PM2.5, of which DPM is one component, have been associated with acute (short-term) and chronic (long-term) health effects, such as the worsening of heart and lung diseases. Elevated levels of ambient particulate matter have also been identified as one of many aggravating factors for childhood asthma. PM10 and PM2.5 are a health concern, particularly at levels above the federal and State ambient air quality standards. PM2.5 is thought to have greater effects on health because smaller particles are able to penetrate to the deepest parts of the lungs.

Scientific studies have suggested links between fine particulate matter and numerous health problems, including asthma, bronchitis, and acute and chronic respiratory symptoms such as shortness of breath and painful breathing. Children are more susceptible to the health risks of PM2.5 because their immune and respiratory systems are still developing. Very small particles of certain substances (e.g., sulfates and nitrates) can also directly cause lung damage or can contain absorbed gases (e.g., chlorides or ammonium) that may be injurious to health.

On-road vehicle traffic also produces particulate matter in the form of brake and tire wear and re-entrained roadway dust. This type of dust is comprised mainly of large particles (diameter greater than 10 microns) that settle out rapidly and are more easily filtered by human breathing passages. All dust, however, including some fraction of PM10 and PM2.5 can create localized health impacts (i.e., exceed an ambient air quality standard). Ambient concentrations of PM10 and PM2.5 are regulated directly through health-based ambient air quality standards. As with construction-related impacts, PM10 and PM2.5 impacts will be addressed on a project-by-project basis, rather than in this PEIR.

All of these factors contribute to health incidences and costs associated with air pollution from auto travel. Auto-related air pollution results in a spectrum of health incidences, including cases of chronic bronchitis; acute myocardial infarction; respiratory and cardiovascular hospitalizations; respiratory-related ER visits; acute bronchitis; work loss days; premature mortality; asthma exacerbation; and acute, lower, and upper respiratory symptoms.

Brake and tire wear and fugitive dust from paved road travel emissions are directly related to VMT. As VMT increases so does roadway PM10 and PM2.5. The Plan would increase VMT when compared to existing conditions. However, decreased regional pollution due to Plan implementation and decreased DPM emissions would improve overall regional health when compared to existing conditions. Specifically, **Table 3.2-5** shows avoided health incidences per ton of pollutant and **Table 3.2-6** shows avoided health costs per ton of pollutant.

As noted in the Environmental Setting, rail engines generate emissions of diesel particulate matter and other cancer-causing toxics. **Map 3.2-6** located in Chapter 8.0 (Maps) shows sensitive receptors located along regional rail lines. **Map 3.2-7** located in Chapter 8.0 (Maps) shows regional 2005 cancer risk as it relates to rail lines. As with freeway corridors, above-average cancer risk is often located near rail lines.

Freeway Corridor Analysis

A mobile source HRA was completed for freeways corridors under the Plan. The analysis assessed at least one freeway corridor in each of the six counties contained in the SCAG planning area. To focus on the maximum risks, the segment within each corridor that exhibited the highest daily total traffic volumes were identified and quantitatively modeled for increased cancer risk. The selected segments include:

- I-405 – in Seal Beach, east of the I-605 interchange (Orange County)
- I-710 – in Compton, north of the intersection with SR-91 (Los Angeles County)
- I-8 – in El Centro (Imperial County)
- SR-60 – in Ontario, west of the I-15 interchange (San Bernardino County)
- SR-91 – west of Corona, east of the intersection with SR-71 (Orange County, just west of Riverside County)
- U.S. 101 – in Thousand Oaks, east of SR-23 (Ventura County)
- SR-60 near Diamond Bar (Los Angeles County)
- I-15 in Ontario (San Bernardino County).

Diesel- and gasoline-powered vehicle emissions contain many compounds that have been determined to be carcinogenic. Only a few compounds, however, are emitted in sufficient quantities to contribute to significant cancer risks in areas immediately downwind of roadway segments affected by the Plan. Foremost among these compounds is diesel exhaust particulate matter (DPM), based on its designation as a toxic air contaminant by ARB. The gaseous organic compounds that significantly contribute to cancer risk include 1,3 butadiene, benzene, formaldehyde, and acetaldehyde.

Emission factors for these pollutants from operation of on-road vehicles were developed using the most recent emission factor model developed by the USEPA and CARB. On-road emission factors for DPM and total organic gas (TOG) emissions were generated through use of the ARB EMFAC2007 model. A special toxics module of USEPA's MOBILE6.2 model was used to determine the fractions of individual cancer-causing toxic compounds listed above in TOG emissions, a capability not possessed by the EMFAC2007 model.

SCAG's travel demand modeling system produces estimates of roadway link volumes for light/medium-duty vehicles (e.g., passenger cars and trucks and light/medium commercial vehicles) and heavy-duty vehicles. Since 90 to 95 percent of the TOG toxic emissions come from light/medium-duty vehicles and similar percentages of DPM are emitted by heavy-duty vehicles, emission factors from the EMFAC2007 runs (and MOBILE6 toxic fraction breakdowns) were compiled separately for light/medium duty vehicles and heavy-duty vehicles for each county/area. This approach accounted for variations in the mix of heavy-duty vehicles across roadway links contained in SCAG's travel model outputs and the relative impacts of each compound on overall cancer risk.

The quantification of cancer risk impacts resulting from vehicle operation in the vicinity of each of the selected freeway corridors in the Plan was performed using a USEPA-approved American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee-developed AERMOD modeling system. The meteorological databases recommended for use are those compiled by SCAQMD for calendar year 2005 through 2007 from 26 stations within the SCAB.

Residential cancer risk is expressed in units of increased cancer risk per 70-year exposure. Based on OEHHA guidance for workplace vs. residential exposure, the ARB's Hotspots Analysis and Reporting Program (HARP) model also produces cancer risk results based on workplace exposure. While residential risk assessment assumes 24 hour/day, 7 day/week, 52 week/year, 70-year exposure, HARP uses default workplace exposure assumptions of 8 hours per day and 245 days per year over a 40-year period.

Several simplifying assumptions were made in the health risk assessment. First, the analysis focused only on quantifying increased cancer risks—acute and non-cancer chronic health risks and mortality risks were not considered. Additionally, cancer risk values represent risk based on 70 years of exposure. However, calendar year 2035 emission factors are assumed to persist for years within the 70-year period beyond 2035, since regulations mandating future emissions reductions do not call for any new restrictions beyond 2018. If vehicle emission technology improvements continue, use of 2035 fleet emission factors to represent emissions beyond 2035 will produce conservatively higher average fleet emissions over the 70-year period than actually occur, and cancer risks for future scenarios will be conservatively over-predicted.

The HARP model reports maximum residential and workplace cancer risk at any receptor, referred to as the Maximum Exposed Individual (MEI). The cancer risks reported for each highway segment and planning scenario are for the MEI, even if no residence or workplace actually exists at the location of the MEI. This conservative assumption is designed to overestimate cancer risk. For the analysis of freeway segment operations, the cancer risk values reported by the model represent the chance of contracting cancer from exposure to freeway emissions if a person lived at the same location for a period of 70 years or worked at the same location for 40 years and if freeway emissions did not change over those periods. These risk values reflect only exposure to emissions from freeway traffic and do not include cancer risk due to other sources.

The residential cancer risk values reported for the hypothetical location of the maximum exposed individual for each of the five planning scenarios and each of the eight freeway segments studied are presented in **Table 3.2-7**. **Table 3.2-8** presents a similar summary of maximum cancer risks based on workplace exposure along each modeled corridor.

The maximum residential and workplace risks due to vehicle operation on all freeway segments are much higher under existing (2012) conditions than under the Plan. The declines in cancer risk across all freeway segments are the result of continued decreases in per-vehicle mile fleet emissions projected to occur over the next 23 years. This decrease occurs due to continued emission control technology improvements in new vehicles for which certification standards continue to tighten up through 2018.

Table 3.2-9 presents the distances from roadway boundaries at which maximum residential cancer risks drop by 50 and 90 percent. The 50 percent drop occurs at an average distance of 371 feet and the 90 percent drop occurs at an average distance of 2,009 feet.

ARB reviewed studies that found measured air pollution concentrations from motor vehicles drop off dramatically between the source and 500 feet. The above analysis is consistent with ARB air quality modeling and risk analyses performed for freeways. The estimated risk from DPM exposure was found to vary substantially due to meteorology: typical downwind areas had much higher risk than upwind areas. Freeways with low truck volumes had lower risks than those with higher truck volumes. ARB based its 500-foot buffer recommendation on a review of several studies and air dispersion modeling. ARB's modeling was based on year 2000 truck and automobile information that included higher DPM emissions rates. New vehicle standards, gasoline and Diesel fuel reformulation, and ARB-adopted Diesel Risk Reduction Measures have resulted in lower potential cancer risks near freeways. As shown by the reductions in cancer risk projected to occur between existing conditions and the Plan in 2035, these risk reduction measures will continue to reduce toxic emissions from motor vehicles and resulting cancer risks.

Impact 3.2-3: Potential to increase population within 500 feet of transportation facilities that could expose residents (schools and other sensitive receptors) to elevated (as compared to average) cancer and other health risks.

As discussed in Chapter 2, Project Description, as a result of SCS policies the anticipated growth pattern would concentrate population adjacent to transit and other transportation facilities in High Quality Transit Areas (HQTAs) that could result in more people being exposed to elevated cancer risk as compared to areas of the region more distant from such facilities. Therefore under the Plan more sensitive receptors would be located adjacent to transportation facilities and would therefore be exposed to transportation-related air toxics.

While as a result of on-going emission controls, cancer and other health risks within any given distance of mobile sources in the region would decrease substantially (see Impact 3.2-2 above), the health risks adjacent to transportation facilities would remain higher than regional averages and above desirable levels. The existing population within 500 feet of freeways is about 1,082,000. In 2035 under the Plan the population would be 1,283,000; without the Plan the population would be about 1,261,000. The 2008 population within 500 feet of railroads is about 962,000. In 2035 under the Plan the population would be about 1,159,000 and without the Plan the population would be about 1,078,000.

As noted in the discussion of Environmental Setting above, the population residing close to freeways or busy roadways may experience adverse health effects beyond those typically found in urban areas. Several studies found an association between adverse non-cancer health effects (e.g., asthma) and living or attending school near heavily traveled urban roadways. Studies also found that the roadway and truck traffic densities were key factors affecting the strength of association with adverse health impacts. For urban roadways, the association of traffic-related emissions with adverse health impacts was generally strongest between 300 and 1,000 feet. As discussed above, proximity to freeways increases cancer risk and exposure to particulate matter. Similarly proximity to heavily travelled rail corridors would expose residents to high levels of DPM. Mitigation Measure **MM-AQ19** would reduce this impact to a less-than-significant level.

Impact 3.2-4: Emissions of short-term criteria pollutants would increase under the Plan as a result of construction of Plan transportation projects and development in the region. Therefore the Plan would result in a significant impact related to construction emissions.

The Plan would involve substantial construction to implement Plan projects. In addition, construction of development that constitutes regional growth would also generate substantial emissions. While each project would result in only short-term emissions, the construction industry itself comprises one component of stationary and area source emissions addressed in the AQMPs.

Construction activities in the region would create air emissions from the following activities: (1) demolition; (2) site preparation operations (grading/excavation); (3) fuel combustion from the operation of construction equipment; (3) delivery and hauling of construction materials and supplies to and from sites; (4) the use of asphalt or other oil based substances during the final construction phases of projects; and (5) travel by construction workers to and from sites.

Construction emissions are site-specific and are based on the type and magnitude of development that would be accommodated under the project, the timeline for construction, the mix of construction equipment required to build the project, and emission factors from the SCAQMD *CEQA Air Quality Handbook* and USEPA's AP-42. Emissions of NOx, VOC, and PM10 depend upon number and type of operating vehicles and the number of hours of operation. Fugitive emissions depends upon the amount of soil disturbed, type of soil, duration, type of activity (grading, excavation, etc.), haul trips and other factors.

Most improvements in transit and system management (signal synchronization, striping, etc.) do not involve construction and are not expected to generate short-term impacts. However, a number of the projects in the Plan would involve construction activities (new goods movement capacity enhancements, arterials, and rail systems). It is very likely that some of these projects would be under concurrent construction throughout the region. Short-term construction impacts generated from the implementation of the Plan are expected to be significant. The SCAQMD has developed thresholds of significance for individual construction projects within their jurisdiction. These thresholds are shown in **Table 3.2-11**.

TABLE 3.2-11: SCAQMD AIR QUALITY SIGNIFICANCE THRESHOLDS FOR CONSTRUCTION	
Pollutant	**Mass Daily Threshold (Pounds/Day)**
NO_x	100
VOC	75
PM10	150
PM2.5	55
SO_x	150
CO	550
Lead (Pb)	3
SOURCE: SCAQMD, *CEQA Air Quality Handbook*, 1993.	

Other air quality management districts within the SCAG region have adopted similar thresholds for individual construction projects for criteria pollutants. Project-level analysis conducted for CEQA purposes would estimate construction emissions for each project based on project specifics. Mitigation measures to reduce air quality impacts would be established in project-specific environmental documents. The construction of highways or arterials would be expected to generate a significant amount of construction activity and therefore exceed the significance thresholds established in the *CEQA Air Quality Handbook*. These impacts would occur in localized areas depending on the construction site locations. Individual projects would be required to implement mitigation measures to reduce construction emissions. Other construction impacts include potential construction-related traffic impacts due to congestion from lane closures. These impacts should be addressed at the project level analysis.

The overall impact of the Plan due to construction of transportation-related projects would create substantial emissions. Implementation of Mitigation Measures **MM-AQ1** through **MM-AQ18** would reduce criteria pollutant impacts; however, impacts would remain significant.

Cumulative Impact 3.2-5: Trains, airplanes, ships and stationary and area sources substantially contribute to emissions in the region; these sources are addressed by the applicable AQMPs and not substantially affected by the Plan. All such emissions are anticipated to be consistent with applicable AQMPs and SIPs and within regional conformity emission budgets. Therefore, the Plan would result in a less-than-significant impact related to cumulatively considerable emissions.

The regional cumulative analysis assesses the impacts potential indirect effects in conjunction with other plans, programs, projects and policies that affect ambient air quality. Projected long-term emissions are considered to be cumulatively significant if they are not consistent with the local air quality management plans and state implementation plans. Consistency is demonstrated through the conformity analysis.

Regional emissions conformity is achieved if the projected emission inventories are within the budget emissions for each air basin for each milestone year (or if no budgets have been established by the interim build/no build or less than base year tests). In addition to the regional emissions analysis, conformity must show: 1) that the implementation of the Transportation Control Measures (TCM) contained in the SIPs are on schedule; 2) that the Financial Constraint Determination has been adequately prepared; and 3) that the required Interagency Consultation and Public Involvement has been adequately implemented.

The emissions budgets reflected in the AQMPs/SIPs function as the applicable emission budgets for the ozone conformity analysis for all non-attainment areas in the SCAG region. The conformity determinations based on the emission budgets for each air basin in the SCAG region, and conducted as part of the Plan development process, provide reasonable analysis of cumulative air quality impacts of the Plan. The 2012-2035 RTP/SCS should conform to the emissions budgets established in each applicable AQMPs/SIPs. Federal conformity regulations require emissions to be based on the Latest Planning Assumptions that include the latest vehicle data (fleet, age, activity) and latest socio-economic data. A conformity determination must be made for each nonattainment area in the region.

A regional analysis estimates the emissions from the implementation of the Plan and compares them to the emission budgets identified in the AQMPs/SIPs. If the estimated emissions from the Plan are greater than the emissions budget then the plan would not conform. In the absence of an emission budget, an interim test, such as the build/no build test is applied. In order to pass the build/no-build test, it must be demonstrated that emissions in the build scenario are less than or equal to the no-build scenario depending upon the non-attainment designation.

The applicable emissions budgets in the SCAG region are established by air basin, by air district, by pollutant and by years of analysis (milestone, attainment, and planning horizon years). The Transportation Conformity analysis is prepared separately from this PEIR and can be found in Appendices of the 2012-2035 RTP/SCS. The analysis concludes that the plan conforms to federal and state requirements for meeting attainment goals throughout the SCAG region.

Therefore, cumulative regional air quality impacts are considered to be less than significant with respect to consistency with applicable plans.

For purposes of comparison of on-road mobile emissions with other emission sources in the region, and to account for cumulative emissions from growth and other sources the following tables present estimated existing (the most recent year available is 2007) and 2035 emissions for the following emission sources in SCAB (which represent about 70 percent of emissions in the region): Trains (**Table 3.2-12**), Aircraft (**Table 3.2-13**), Ships and Commercial Boats (**Table 3.2-14**), Other Mobile Sources such as farm equipment, off-road vehicles, fuel handling, etc. (**Table 3.2-15**), and Stationary and Area Sources which includes all other emission sources including residential, commercial and industrial emissions and construction emissions, including 2012-2035 RTP/SCS projects (**Table 3.2-16**).

SOURCE: SCAQMD, *2007 Air Quality Management Plan*, 2007.

Since no forecast for 2035 is currently available for these emissions, the annualized growth rate between 2023 and 2030 was used to project inventory estimates in 2035. It should be noted that this forecast is approximate, as it does not separately account for the effects of fleet turnover, growth and projected controls.

The AQMP is in the process of being updated and the emissions estimations have not been revised at the time of this analysis. The ARB prepared the *8-Hour Ozone State Implementation Plan Revisions and Technical Revisions to the PM2.5 State Implementation Plan Transportation Conformity Budgets for the South Coast and San Joaquin Valley Air Basins*[26] that was recently approved by the EPA. This document provides a recent estimation 2023 ROG and NO_X emissions for the SCAB. The ROG and NO_X emissions are within one and eight percent, respectively, of the emissions presented in the 2008 AQMP.

[26]ARB, *Proposed 8-Hour Ozone State Implementation Plan Revisions and Technical Revisions to the PM2.5 State Implementation Plan Transportation Conformity Budgets for the South Coast and San Joaquin Valley Air Basins*, June 20, 2011.

MITIGATION MEASURES[27]

Mitigation Measure **MM-AQ1** facilitates implementation of Transportation Control Measures in the Plan. Mitigation Measures **MM-AQ1** through **MM-AQ20** can and should be implemented by project sponsors (for both development and transportation projects) as applicable. Project specific environmental documents may adjust these mitigation measures as necessary to respond to site-specific conditions. Projects taking advantage of CEQA Streamlining provisions of SB 375 can and should apply mitigation measures as appropriate to site-specific conditions.

MM-AQ1: Transportation Control Measures (TCMs) shall be implemented as appropriate by SCAG and can and should be implemented by local agencies and project sponsors as appropriate. TCMs included in the Plan are identified in the Transportation Conformity Appendix to the 2012-2035 RTP/SCS (starting on page 26). CAA Section 108(f)(1)(A) lists the following sixteen measures as illustrative of TCMs:

I. Programs for improved use of public transit;
II. Restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or high occupancy vehicles;
III. Employer-based transportation management plans, including incentives;
IV. Trip-reduction ordinances;
V. Traffic flow improvement programs that achieve emission reductions;
VI. Fringe and transportation corridor parking facilities, serving multiple occupancy vehicle programs or transit service;
VII. Programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration, particularly during periods of peak use;
VIII. Programs for the provision of all forms of high-occupancy, shared-ride services, such as the pooled use of vans;
IX. Programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place;
X. Programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas;
XI. Programs to control extended idling of vehicles;
XII. Programs to reduce motor vehicle emissions, consistent with Title II of the CAA, which are caused by extreme cold start conditions;
XIII. Employer-sponsored programs to permit flexible work schedules;
XIV. Programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and ordinances applicable to new shopping centers, special events, and other centers of vehicle activity;
XV. Programs for new construction and major reconstruction of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation, when economically feasible and in the public interest; and
XVI. Programs to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks.

The Plan has been prepared to facilitate implementation of TCMs that also serve as air quality mitigation measures for the purposes of the PEIR.

[27] Measures included here will also have the effect of reducing adverse impacts to environmental justice communities and have been adopted in the mitigation framework in the Environmental Justice Appendix.

MM-AQ2: Local air districts, local jurisdictions and project sponsors can and should implement measures adopted by ARB designed to attain federal air quality standards for PM2.5 and 8-hour ozone. ARB's strategy, includes the following elements:

- Set technology forcing new engine standards;
- Reduce emissions from the in-use fleet;
- Require clean fuels, and reduce petroleum dependency;
- Work with US EPA to reduce emissions from federal and state sources; and
- Pursue long-term advanced technology measures.
- Proposed new transportation–related SIP measures include:[28]

ON-ROAD SOURCES

- ✓ Improvements and Enhancements to California's Smog Check Program
- ✓ Expanded Passenger Vehicle Retirement
- ✓ Modifications to Reformulated Gasoline Program
- ✓ Cleaner In-Use Heavy-Duty Trucks
- ✓ Ship Auxiliary Engine Cold Ironing and Other Clean Technology
- ✓ Cleaner Ship Main Engines and Fuel
- ✓ Port Truck Modernization
- ✓ Accelerated Introduction of Cleaner Line-Haul Locomotives
- ✓ Clean Up Existing Commercial Harbor Craft

OFF-ROAD SOURCES

- ✓ Cleaner Construction and Other Equipment
- ✓ Cleaner In-Use Off-Road Equipment
- ✓ Agricultural Equipment Fleet Modernization
- ✓ New Emission Standards for Recreational Boats
- ✓ Off-Road Recreational Vehicle Expanded Emission Standards

MM-AQ3: Project sponsors can and should ensure that water or "toxic free" dust suppressants are applied to exposed earth surfaces to control emissions as necessary to control dust and comply with applicable regulations.

MM-AQ4: Project sponsors can and should ensure that all excavating and grading activities should cease during second stage smog alerts and periods of high winds.

MM-AQ5: Project sponsors can and should ensure that all trucks hauling dirt, sand, soil, or other loose materials off-site should be covered or wetted or should maintain at least two feet of freeboard (i.e., minimum vertical distance between the top of the load and the top of the trailer).

MM-AQ6: Project sponsors can and should ensure that all construction roads that have high traffic volumes, should be surfaced with base material or decomposed granite, or should be paved or otherwise be stabilized.

MM-AQ7: Project sponsors can and should ensure that public streets should be cleaned, swept or scraped at frequent intervals or at least three times a week if visible soil material has been carried onto adjacent public roads.

---

[28] ARB. April 26, 2007. *Proposed New SIP Measures – Descriptions. http://www.arb.ca.gov/planning/sip/2007sip/apr07draft/sipmeas.pdf*, accessed December 2011.

MM-AQ8: Project sponsors can and should ensure that construction equipment should be visually inspected prior to leaving the site and loose dirt should be washed off with wheel washers as necessary.

MM-AQ9: Project sponsors can and should ensure that water, hydroseed, or non-toxic soil stabilizers are applied to inactive construction areas as needed to reduce off-site transport of fugitive dust.

MM-AQ10: Project sponsors can and should ensure that traffic speeds on all unpaved surfaces should not exceed 25 mph.

MM-AQ11: Project sponsors can and should ensure that low sulfur or other alternative fuels or diesel powered vehicles with Tier 3 or better engines or retrofitted/repowered –to meet equivalent emissions standards as Tier 3 engines -should be used in construction equipment where feasible.

MM-AQ12: Project sponsors can and should ensure that deliveries related to construction activities that affect traffic flow should be scheduled during off-peak hours (e.g., 10:00 a.m. and 3:00 p.m.) and coordinated to achieve consolidated truck trips. When the movement of construction materials and/or equipment impacts traffic flow, temporary traffic control should be provided to improve traffic flow (e.g., flag person).

MM-AQ13: Project sponsors can and should ensure that to the extent possible, construction activity should utilize electricity from power poles rather than temporary diesel power generators and/or gasoline power generators.

MM-AQ14: Local jurisdictions or agencies can and should, as practical and feasible, revegetate exposed earth surfaces following construction. Application of xeriscape principles, including such techniques and materials as native or low water use plants and low precipitation sprinklers heads, bubblers, drip irrigation systems and timing devices, should also be considered.

MM-AQ15: Local jurisdictions can and should set specific limits on idling time for commercial vehicles, including delivery and construction vehicles.

MM-AQ16: Project sponsors can and should ensure that sandbags or other erosion control measures are installed to prevent silt runoff to public roadways as needed.

MM-AQ17: Project sponsors can and should designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite. Their duties should include holidays and weekend periods when work may not be in progress. The name and telephone number of such persons should be provided to the local air district prior to the start of construction as well as posted on-site over the duration of construction.

MM-AQ18: Project sponsors can and should ensure that appropriate wind-breaks are installed at the construction site to minimize windblown dust.

MM-AQ19: In order to comply with the California Air Resources Board Air Quality and Land Use Handbook (June 2005) and achieve an acceptable interior air quality level for sensitive receptors, project sponsors can and should identify appropriate measures, to be incorporated into project building design for residential, school and other sensitive uses located within 500 feet of freeways, heavily travelled arterials, railways and other sources of Diesel particulate Matter and other known carcinogens. The appropriate measures should include one or more of the following methods as may be appropriate:

a. The project sponsor should retain a qualified air quality consultant to prepare a health risk assessment (HRA) in accordance with the California Air Resources Board and the Office of Environmental Health and Hazard Assessment requirements to determine the exposure of project residents/occupants/users to stationary air quality polluters prior to issuance of a demolition, grading, or building permit. The HRA should be submitted to the Lead Agency for review and approval. The sponsor should implement the approved HRA recommendations, if any. If the HRA concludes that the air quality risks from nearby sources are at or below acceptable levels, then additional measures are not required.
b. The project sponsor should implement the following features that have been found to reduce the air quality risk to sensitive receptors and should be included in the project construction plans. These should be submitted to the appropriate agency for review and approval prior to the issuance of a demolition, grading, or building permit and ongoing.
   i. Do not locate sensitive receptors near distribution center's entry and exit points.
   ii. Do not locate sensitive receptors in the same building as a perchloroleythene dry cleaning facility.
   iii. Maintain a 50 foot buffer from a typical gas dispensing facility (under 3.6 million gallons of gas per year).
   iv. Install, operate and maintain in good working order a central heating and ventilation (HV) system or other air take system in the building, or in each individual residential unit, that meets the efficiency standard of the MERV 13. The HV system should include the following features: Installation of a high efficiency filter and/or carbon filter-to-filter particulates and other chemical matter from entering the building. Either HEPA filters or ASHRAE 85% supply filters should be used.
   v. Retain a qualified HV consultant or HERS rater during the design phase of the project to locate the HV system based on exposure modeling from the mobile and/or stationary pollutant sources.
   vi. Maintain positive pressure within the building.
   vii. Achieve a performance standard of at least one air exchange per hour of fresh outside filtered air.
   viii. Achieve a performance standard of at least 4 air exchanges per hour of recirculation
   ix. Achieve a performance standard of .25 air exchanges per hour of in unfiltered infiltration if the building is not positively pressurized.
c. Project sponsor should maintain, repair and/or replace HV system or prepare an Operation and Maintenance Manual for the HV system and the filter. The manual should include the operating instructions and maintenance and replacement schedule. This manual should be included in the CC&R's for residential projects and distributed to the building maintenance staff. In addition, the sponsor should prepare a separate Homeowners Manual. The manual should contain the operating instructions and maintenance and replacement schedule for the HV system and the filters. It should also include a disclosure to the buyers of the air quality analysis findings.

MM-AQ20: To the maximum extent practicable the Lead Agency can and should ensure that private (individual and common) exterior open space, including playgrounds, patios, and decks, should either be shielded from stationary sources of air pollution by buildings or otherwise buffered to further reduce air pollution exposure for project occupants.

SIGNIFICANCE OF IMPACTS AFTER MITIGATION

Criteria Pollutant Emissions

Even with implementation Mitigation Measures **MM-AQ1** through **MM-AQ18**, regional emissions of PM10 would increase in Imperial, Orange, and Riverside Counties. Therefore, the Plan would have a significant impact on regional air quality. It must be noted, however, that the SIPs for the region account for the increased fugitive dust (as well as tail pipe emissions) such that the 2012-2035 RTP/SCS conforms to the attainment demonstrations as required by the federal CAA.

Change in Risk Levels Adjacent to Freeways

Impacts related to health incidences were determined to be less than significant because of the decrease in risk at any given distance from freeways (due to emission controls).

Increased Population

Increasing population adjacent to transportation facilities could expose more people to increased cancer and other health risks. Even though cancer and other health risks adjacent to freeways and railroads would decrease considerably as compared to existing conditions, risk levels would remain above average for the region. Mitigation Measure **MM-AQ19** would reduce this impact to a level of less than significance. Mitigation Measure **MM-AQ20** would also reduce impacts associated with stationary sources of pollutants.

Construction Emissions

Even with implementation of Mitigation Measures **MM-AQ1** through **MM-AQ18**, activities related to construction of Plan projects would result in emissions exceeding thresholds for NO_X, CO, PM10, PM2.5, SO_2 and ROG. Therefore, construction of Plan projects and development would have a significant impact on regional air quality.

Cumulative Effects

Impacts related to cumulatively considerable emissions were determined to be less than significant without mitigation. Trains, airplanes, ships and stationary and area sources substantially contribute to emissions in the region; these sources are addressed by the applicable AQMPs and not substantially affected by the Plan. All such emissions are anticipated to be consistent with applicable AQMPs and SIPs and within regional conformity emission budgets. Therefore, the Plan would result in a less-than-significant impact related to cumulatively considerable emissions.

COMPARISION WITH THE NO PROJECT ALTERNATIVE

Direct Impacts

Criteria Pollutant Emissions. **Table 3.2-17** compares the existing conditions to the No Project Alternative criteria pollutant emissions by county. The No Project Alternative would result in more emissions than the Plan. **The Plan impacts would be less than the No Project impacts for Impact 3.10-1.**

Tables 3.2-4 and **3.2-5** show the residential and workplace cancer risk, respectively. The maximum residential and workplace risks due to vehicle operation on all freeway segments are much higher under existing (2012) conditions than under the No Project Alternative. The declines in cancer risk across all freeway segments are the result of continued decreases in per-vehicle mile fleet emissions projected to occur due to continued emission control technology improvements in new vehicles. When compared to the Plan, the No Project Alternative would result in a higher risk in all counties expect for Orange and Imperial Counties. Regardless, the total regional risk would be lower under the Plan than the No Project Alternative. In addition, it is estimated that the Plan would result in 293,633 annual health incidences leading to $4,952,996,222 spent on healthcare. This is a 24 percent reduction when compared to the No Project Alternative. **The Plan impacts would be less than the No Project impacts for Impact 3.10-2.**

Construction Emissions. Under the No Project Alternative, no new transportation investments would be made, beyond those that are currently programmed. As a result, fewer transportation projects would be built resulting in less construction emissions from Plan projects. However, the same growth is anticipated under the No Project Alternative as under the Plan (although under the Plan it would be more concentrated around transit routes). **The Plan impacts would be greater than the No Project impacts for Impact 3.10-3 as a result of increased construction of Plan projects.**

Indirect Impacts

The Plan includes transportation and land use strategies that focus growth along existing corridors and in urbanized areas, rather than allowing development of vacant, open space/recreation and agricultural lands. This compact development pattern included in the Plan would concentrate population in urban areas and encourage alternative modes of travel other than automobiles. Without the planned development patterns, regional emissions would be higher than under the Plan. **The Plan impacts would be less than the No Project impacts for Impact 3.10-4.**

TABLE 3.2-17: CRITERIA POLLUTANT EMISSIONS BY COUNTY – EXISTING CONDITIONS (2012) VS NO PROJECT (2035)

New concerns raised about air pollution at LAX

Effects from planes that are landing appear to play a key role in the large area of impact

by **Leslie Ridgeway**
May 30, 2014

Most previous research focused on measuring air quality near where jet takeoffs occur. (Photo/Alan Wilson)

Research conducted by scientists at the Keck School of Medicine of USC shows that airliner activity at Los Angeles International Airport worsens air quality over a far larger area than previously assumed.

The study, published on May 29 in the journal *Environmental Science and Technology* and conducted with University of Washington researchers, found a doubling of ultrafine particle number concentrations extended east more than 10 miles downwind from the airport boundary over a 20-square-mile area, encompassing Lennox, Westmont, parts of South Los Angeles, Hawthorne and Inglewood, and, in certain wind conditions, areas south of LAX.

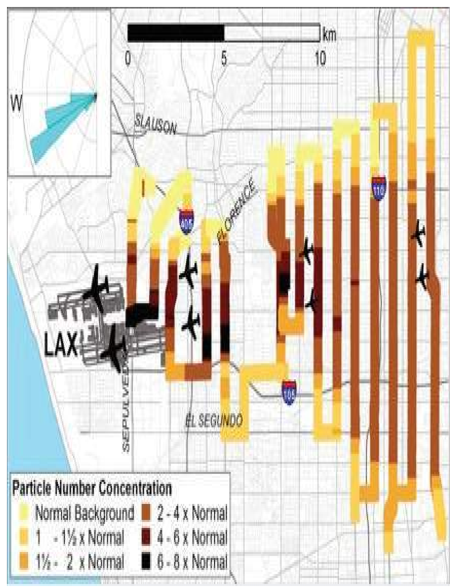
"Our research shows that airport impacts extend more than five times further than previously assumed," said Scott Fruin, lead researcher and assistant professor of preventive medicine at the Keck School of Medicine. "Effects from planes that are landing appear to play a major role in this large area of impact."

To put this large area of impact into perspective, the researchers calculated that one-quarter to one-half of the entire Los Angeles County freeway system produces an equivalent increase in ultrafine particle numbers on a concentration-weighted basis.

"LAX may be as important to LA's air quality as the freeway system," Fruin said. "The impact area is large, and the airport is busy most hours of the day. That makes it uniquely hard for people to avoid the effects of air pollution in affected areas."

A previous assumption was incorrect

Most previous research on the air quality impacts of airports focused on measuring air quality near where jet takeoffs occur. Takeoffs produce immense plumes of exhaust but only intermittently, and pollution concentrations downwind have been observed to fall off rapidly with distance. The assumption has been that total airport impacts also fall off rapidly with distance. The new research finds that this assumption is wrong.



Graphic depicting ultrafine particle increase downwind of LAX relative to urban background air quality (Graphic/Neelakshi Hudda)

The study found that concentrations of ultrafine particles were more than double over 20 square miles compared to background concentrations in nearby areas outside the area of LAX impact. Also, ultrafine particle number concentrations four times higher than background extended a distance of six miles.

"Given the existing concern about the possible health effects of urban ultrafine particle levels, living in an area with two to four times the average LA levels of ultrafine particles is of high public health concern," said first author Neelakshi Hudda, research associate in preventive medicine at the Keck School.

Ultrafine particles are currently unregulated, but are of concern because they appear to be more toxic than larger particles on an equal mass basis in animal and cellular studies, and because they appear able to enter the bloodstream, unlike large particles that lodge in the lungs.

The research team used vehicles equipped with special measurement devices to capture data not available using traditional fixed monitors. The team was able to take moving measurements for more than five hours under consistent wind conditions to fully capture the extent of the impact boundaries.

“Other airports generally have less steady wind directions, which would make these measurements more difficult,” Hudda said. “Similar impacts are probably happening, but their location likely shifts more rapidly than in Los Angeles.”

“The on-shore westerly winds cause this impact regularly in communities east of LAX because the impact’s location corresponds to the wind direction,” Hudda added. “In the winter months, when the winds were different, impacts were measured south of the airport during northerly winds.

The research was funded by the National Institute of Environmental Health Sciences.

University of Washington researchers included Tim Larson and Tim Gould in the Department of Civil Engineering and Kris Hartin in the Department of Environmental and Occupational Health Sciences.

COUNTY OF LOS ANGELES
Public Health

AIR QUALITY RECOMMENDATIONS FOR LOCAL JURISDICTIONS

Development of new schools, housing, and other sensitive land-uses in proximity to freeways

Studies indicate that residing near sources of traffic pollution is associated with adverse health effects such as exacerbation of asthma, onset of childhood asthma, non-asthma respiratory symptoms, impaired lung function, reduced lung development during childhood, and cardiovascular morbidity and mortality.[1] These associations are diminished with distance from the pollution source.

Given the association between traffic pollution and health, the California Air Resources Board recommends that freeways be sited at least 500 feet from residences, schools, and other sensitive land uses.[2] Other reputable research entities such as the Health Effects Institute indicate that exposure to unhealthy traffic emissions may in fact occur up to 300 to 500 meters (984 to 1640 feet). The range reported by HEI reflects the variable influence of background pollution concentrations, meteorological conditions, and season.[3]

Based on this large body of scientific evidence, the Los Angeles County Department of Public Health strongly recommends:

- A buffer of at least 500 feet should be maintained between the development of new schools, housing or other sensitive land uses and freeways. Consideration should be given to extending this minimum buffer zone based on site-specific conditions, given the fact that unhealthy traffic emissions are often present at greater distances.[*] Exceptions to this recommended practice should be made only upon a finding by the decision-making body that the benefits of such development outweigh the public health risks.

- New schools, housing or other sensitive land uses built within 1500 feet of a freeway should adhere to current best-practice mitigation measures to reduce exposure to air pollution which may include: the use of air filtration to enhance heating, ventilation and air conditioning (HVAC) systems, and the orientation of site buildings and placement of outdoor facilities designed for moderate physical activity as far from the emission source as possible.[4]

Development of parks and active recreational facilities in proximity to freeways

Parks and recreational facilities provide great benefits to community residents including increased levels of physical activity, improved mental health, and opportunities to strengthen social ties with neighbors.[5,6,7] However, siting parks and active recreational facilities near freeways may increase public exposure to

[*] Conditions along a freeway and on different freeways are subject to considerable variation. Vehicle types on the roadway (diesel, gas, electric, or hybrid vehicles), average speeds, average daily traffic volumes and other factors all impact the levels of pollution generated by a freeway, and thus the necessary buffer zone to reduce health risks.

harmful pollutants, particularly while exercising. Studies show that heavy exercise near sources of traffic pollution may have adverse health effects.[8, 9, 10] However, there are also substantial health benefits associated with exercise.[11] Therefore, DPH recommends the following cautionary approach when siting parks and active recreational facilities near freeways:

- New parks with athletic fields, courts, and other outdoor facilities designed for moderate to vigorous physical activity, should be sited at least 500 feet from a freeway. Consideration should be given to extending this minimum buffer zone based on site-specific conditions given the fact that unhealthy traffic emissions are often present at greater distances. Exceptions to this recommended practice should be made only upon a finding by the decision-making body that the benefits of such development outweigh the public health risks.

- New parks built within 1500 feet of freeways should adhere to best-practice mitigation measures that minimize exposure to air pollution. These include the placement of athletic fields, courts, and other active outdoor facilities as far as possible from the air pollution source.

Lesson from Jurupa Valley: Striking a balance between warehouse and your house

FEBRUARY 19, 2013 BY DAN BERNSTEIN

Mira Loma Village resident Jacinto Munoz (red shirt) gets a hug from California Attorney General Kamala Harris following a 2011 discussion about a lawsuit to a stop warehouse project that will surround his housing tract. The pollution levels in his neighborhood are nearly ten times higher than a normal neighborhood. Munoz's 15-year-old daughter died of lung cancer. (Staff Photo.)

As we headed back to Riverside along the 210 stretch paralleling the Metro Gold Line extension, my wife mused, "I bet it took less time to build the transcontinental railroad. They didn't have to get environmental permits, seismic studies, geology reports…"

We didn't Google this theory (we only have dumb phones), but it makes sense. Take any modern project: light-rail extensions, carpool lanes and, yes, warehouse villages. You can't just lay track or slap up buildings like they did in the Old West.

Just last week, warehouse developers and Jurupa Valley, a new city in the New West, settled a 2011 enviro suit filed after RivCo supes OK'd the 65-acre Mira Loma Commerce Center. The 1.1 million square-foot baby can now rumble along, but the city and/or developer must provide air-filtration systems to nearby homes, monitor air quality, install solar panels and charging stations for e-vehicles, ban heavy trucks on a major road near Mira Loma Village, a neighborhood of mostly low-income Hispanic families. And enforce all the above.

This settlement was such a big deal that California AG Kamala Harris announced it herself, calling it "a model for local governments, developers and communities."

Perhaps even a stronger voice weighed in: "This settlement has created the gold standard for settlements," said Penny Newman, leader of the suing enviro group. If you know your toxic waste history, you'll remember Newman as a key figure in the drive to clean up the Stringfellow Acid Pits.

So here we have a gold standard on a silver platter. A model for local governments, developers and communities. And a lump-of-coal reminder from the AG's spokeswoman that the J'Val settlement is not binding on other cities with Warehouse Wonderland aspirations.

But other cities, developers, enviro groups and pollution-busting agencies should look at it anyway. When Penny Newman says, "We are extremely impressed with the cooperative process that took place to arrive at this agreement," it's well worth asking, "What did they do and how did they do it?"

What finally unfolded in J'Val contrasts starkly with the MoVal Drama (Now Playing!), where the proposed 41.6 million-square-foot World Logistics Center is rolling toward a City Council vote. At the same time, the council and citizens groups are sniping at the Sierra Club. SoCal's top pollution-fighting agency is pressing MoVal to look at cancer and other health risks linked to its array of warehouse proposals. MoVal says it can't control no stinkin' diesel gunk. And a just-released draft EIR of the World Logistics project says diesel and other emissions would spread the cancer risk to Riverside, S'Berdoo and other points well beyond MoVal.

This suggests any World Logistics Center lawsuit(s) could make the just-settled J'Val case look like small claims court.

"It is a false choice," said AG Harris, "that in order for California business to thrive, public health must suffer."

J'Val shows a balance can be struck. The test: Do other cities have the will to strike it — and how much money and wasted time will it cost taxpayers and desperate job-seekers before they do?

LEED 2009 FOR NEIGHBORHOOD DEVELOPMENT

For Public Use and Display

LEED 2009 for Neighborhood Development Rating System

Created by the Congress for the New Urbanism, Natural Resources Defense Council, and the U.S. Green Building Council

(Updated October 2013)

LEED-ND™

PREFACE FROM USGBC

The built environment has a profound impact on our natural environment, economy, health, and productivity. Through its Leadership in Environmental and Energy Design (LEED®) certification programs, the U.S. Green Building Council (USGBC) is transforming the built environment. The green building movement offers an unprecedented opportunity to respond to the most important challenges of our time, including global climate change, dependence on nonsustainable and expensive sources of energy, and threats to human health. The work of innovative building planning professionals is a fundamental driving force in the green development movement. Such leadership is a critical component to achieving USGBC's mission of a sustainable built environment for all within a generation.

USGBC MEMBERSHIP

USGBC's greatest strength is the diversity of our membership. USGBC is a balanced, consensus-based nonprofit with more than 20,000 member companies and organizations representing the entire building industry. Since its inception in 1993, USGBC has played a vital role in providing a leadership forum and a unique, integrating force for the building industry. USGBC's programs have three distinguishing characteristics:

Committee-based

The heart of this effective coalition is our committee structure, in which volunteer members design strategies that are implemented by staff and expert consultants. Our committees provide a forum for members to resolve differences, build alliances, and forge cooperative solutions for influencing change in all sectors of the building industry.

Member-driven

Membership is open and balanced and provides a comprehensive platform for carrying out important programs and activities. We target the issues identified by our members as the highest priority. We conduct an annual review of achievements that allows us to set policy, revise strategies, and devise work plans based on members' needs.

Consensus-focused

We work together to promote green buildings and neighborhoods, and in doing so, we help foster greater economic vitality and environmental health at lower costs. We work to bridge ideological gaps between industry segments and develop balanced policies that benefit the entire industry.

PARTNERSHIP

The Congress for the New Urbanism and the Natural Resources Defense Council collaborated with the U.S. Green Building Council in creating the LEED for Neighborhood Development Rating System. USGBC's consensus-focused approach to rating system development was furthered by these organizations' expertise in New Urbanism and smart growth strategies.

DISCLAIMER

None of the parties involved in the funding or creation of the LEED Rating System, including USGBC, its members, volunteers, or contractors, assume any liability or responsibility to the user or any third parties for the accuracy, completeness, or use of or reliance on any information contained in the LEED Rating System, or for any injuries, losses, or damages (including, without limitation, equitable relief) arising from such use or reliance. Although the information contained in the LEED Rating System is believed to be reliable and accurate, all materials set forth within are provided without warranties of any kind, either express or implied, including but not limited to warranties of the accuracy or completeness of information or the suitability of the information for any particular purpose.

As a condition of use, the user covenants not to sue and agrees to waive and release the U.S. Green Building Council, its members, volunteers, and contractors from any and all claims, demands, and causes of action for any injuries, losses, or damages (including, without limitation, equitable relief) that the user may now or hereafter have a right to assert against such parties as a result of the use of, or reliance on, the LEED Rating System.

TRADEMARKS

ACKNOWLEDGMENTS

The LEED 2009 for Neighborhood Development Rating System has been made possible only through the efforts of many dedicated volunteers, staff members from USGBC and the two partner organizations, consultants, and others in the USGBC community. The rating system development work was managed and implemented by USGBC staff and the LEED for Neighborhood Development Core Committee and included review and input by many Technical Advisory Group (TAG) members with oversight by the LEED Steering Committee. We extend our deepest gratitude to all of our LEED committee members who participated in the development of this rating system, and especially the LEED for Neighborhood Development Core Committee, for their tireless volunteer efforts and support of USGBC's mission:

LEED Steering Committee

Scot Horst, Former Chair	U.S. Green Building Council
Joel Ann Todd, Vice-Chair	Joel Ann Todd

LEED 2009 FOR NEIGHBORHOOD DEVELOPMENT PROJECT CHECKLIST

Smart Location and Linkage — 27 possible points

☑	Prerequisite 1	Smart Location	Required
☑	Prerequisite 2	Imperiled Species and Ecological Communities	Required
☑	Prerequisite 3	Wetland and Water Body Conservation	Required
☑	Prerequisite 4	Agricultural Land Conservation	Required
☑	Prerequisite 5	Floodplain Avoidance	Required
☐	Credit 1	Preferred Locations	10
☐	Credit 2	Brownfield Redevelopment	2
☐	Credit 3	Locations with Reduced Automobile Dependence	7
☐	Credit 4	Bicycle Network and Storage	1
☐	Credit 5	Housing and Jobs Proximity	3
☐	Credit 6	Steep Slope Protection	1
☐	Credit 7	Site Design for Habitat or Wetland and Water Body Conservation	1
☐	Credit 8	Restoration of Habitat or Wetlands and Water Bodies	1
☐	Credit 9	Long-Term Conservation Management of Habitat or Wetlands and Water Bodies	1

Neighborhood Pattern and Design — 44 possible points

☑	Prerequisite 1	Walkable Streets	Required
☑	Prerequisite 2	Compact Development	Required
☑	Prerequisite 3	Connected and Open Community	Required
☐	Credit 1	Walkable Streets	12
☐	Credit 2	Compact Development	6
☐	Credit 3	Mixed-Use Neighborhood Centers	4
☐	Credit 4	Mixed-Income Diverse Communities	7
☐	Credit 5	Reduced Parking Footprint	1
☐	Credit 6	Street Network	2
☐	Credit 7	Transit Facilities	1
☐	Credit 8	Transportation Demand Management	2
☐	Credit 9	Access to Civic and Public Spaces	1
☐	Credit 10	Access to Recreation Facilities	1
☐	Credit 11	Visitability and Universal Design	1
☐	Credit 12	Community Outreach and Involvement	2
☐	Credit 13	Local Food Production	1
☐	Credit 14	Tree-Lined and Shaded Streets	2
☐	Credit 15	Neighborhood Schools	1

Green Infrastructure and Buildings — 29 possible points

☑	Prerequisite 1	Certified Green Building	Required
☑	Prerequisite 2	Minimum Building Energy Efficiency	Required
☑	Prerequisite 3	Minimum Building Water Efficiency	Required
☑	Prerequisite 4	Construction Activity Pollution Prevention	Required

☐	Credit 1	Certified Green Buildings	5
☐	Credit 2	Building Energy Efficiency	2
☐	Credit 3	Building Water Efficiency	1
☐	Credit 4	Water-Efficient Landscaping	1
☐	Credit 5	Existing Building Reuse	1
☐	Credit 6	Historic Resource Preservation and Adaptive Use	1
☐	Credit 7	Minimized Site Disturbance in Design and Construction	1
☐	Credit 8	Stormwater Management	4
☐	Credit 9	Heat Island Reduction	1
☐	Credit 10	Solar Orientation	1
☐	Credit 11	On-Site Renewable Energy Sources	3
☐	Credit 12	District Heating and Cooling	2
☐	Credit 13	Infrastructure Energy Efficiency	1
☐	Credit 14	Wastewater Management	2
☐	Credit 15	Recycled Content in Infrastructure	1
☐	Credit 16	Solid Waste Management Infrastructure	1
☐	Credit 17	Light Pollution Reduction	1

Innovation and Design Process **6 possible points**

☐	Credit 1	Innovation and Exemplary Performance	1–5
☐	Credit 2	LEED® Accredited Professional	1

Regional Priority Credit **4 possible points**

☐	Credit 1	Regional Priority	1–4

LEED 2009 for Neighborhood Development Certification Levels

100 base points plus 6 possible Innovation and Design Process and 4 possible Regional Priority Credit points

Certified	40–49 points
Silver	50–59 points
Gold	60–79 points
Platinum	80 points and above

TABLE OF CONTENTS

INTRODUCTION

I. THE CASE FOR GREEN NEIGHBORHOOD DEVELOPMENTS

As the U.S. population continues to expand rapidly, consumption of land grows exponentially—currently, three times the rate of population growth. At this breathtaking pace, two-thirds of the development on the ground in 2050 will be built between now and then.[1] The way we grow—especially how and where we grow—will have a profound effect on our planet and on us.

Land use and neighborhood design patterns create a particular physical reality and compel behaviors that have a significant effect on the environmental performance of a given place. Segregated land uses accessed by high-speed roadways that necessitate the use of cars have been the predominant development pattern over the past 50 years. In the United States, transportation accounts for roughly one-third of greenhouse gas emissions, a large portion of which can be attributed to personal automobile use.[2] Burning fossil fuels for transportation increases air pollution and related respiratory diseases. Automobile-oriented neighborhoods tend to be hostile to pedestrians and unsupportive of traditional mixed-use neighborhood centers. Sprawling development patterns fragment habitat, endanger sensitive land and water bodies, destroy precious farmland, and increase the burden on municipal infrastructure.

In contrast, by placing residences and jobs proximate to each other, thoughtful neighborhood planning and development can limit automobile trips and the associated greenhouse gas emissions. Mixed-use development and walkable streets encourage walking, bicycling, and public transportation for daily errands and commuting. Environmentally responsible buildings and infrastructure are an important component of any green neighborhood, further reducing greenhouse gas emissions by decreasing energy consumption. Green buildings and infrastructure also lessen negative consequences for water resources, air quality, and natural resource consumption.

Green neighborhood developments are beneficial to the community and the individual as well as the environment. The character of a neighborhood, including its streets, homes, workplaces, shops, and public spaces, significantly affects the quality of life. Green neighborhood developments enable a wide variety of residents to be part of the community by including housing of varying types and price ranges. Green developments respect historical resources and the existing community fabric; they preserve open space and encourage access to parks. Green buildings, community gardens, and streets and public spaces that encourage physical activity are beneficial for public health. Combine the substantial environmental and social benefits and the case for green neighborhoods makes itself.

II. LEED® RATING SYSTEMS

Background on LEED®

Following the formation of the U.S. Green Building Council (USGBC) in 1993, the organization's members quickly realized that the sustainable building industry needed a system to define and measure "green buildings." USGBC began to research existing green building metrics and rating systems. Less than a year after formation, the members acted on the initial findings by establishing a committee to focus solely on this topic. The composition of the committee was diverse; it included architects, real estate agents, a building owner, a lawyer, an environmentalist, and

1 Reid Ewing, Keith Bartholomew, Steve Winkelman, Jerry Walters, and Don Chen, *Growing Cooler: The Evidence on Urban Development and Climate Change* (Washington, D.C.: Urban Land Institute, 2008).
2 "Greenhouse Gases, Climate Change, and Energy" (Energy Information Administration, May 2008).

industry representatives. This cross section of people and professions added a richness and depth both to the process and to the ultimate product, the Leadership in Energy and Environmental Design (LEED) certification system.

The first LEED Pilot Project Program, also referred to as LEED Version 1.0, was launched at the USGBC Membership Summit in August 1998. After extensive modifications, LEED Green Building Rating System Version 2.0 was released in March 2000, with LEED Version 2.1 following in 2002 and LEED Version 2.2 following in 2005.

As LEED has evolved and matured, the program has undertaken new initiatives. In addition to a rating system specifically devoted to building operational and maintenance issues (LEED for Existing Buildings: Operations & Maintenance), LEED addresses the different project development and delivery processes that exist in the U.S. building design and construction market, through rating systems for specific building typologies, sectors, and project scopes: LEED for Core & Shell, LEED for New Construction, LEED for Schools, LEED for Retail, LEED for Healthcare, LEED for Homes, and LEED for Commercial Interiors. LEED for Neighborhood Development is the latest LEED certification system to be released.

The green building and neighborhood development field is growing and changing daily. New technologies and products are being introduced into the marketplace, and innovative designs and practices are proving their effectiveness. The LEED rating systems and reference guides will evolve as well. Project teams must comply with the version of the rating system that is current at the time of their registration. USGBC will highlight new developments on its website on a continual basis, at www.usgbc.org.

Background on LEED for Neighborhood Development

The U.S. Green Building Council (USGBC), the Congress for the New Urbanism (CNU), and the Natural Resources Defense Council (NRDC)—organizations that represent leading design professionals, progressive builders and developers, and the environmental community—have come together to develop a rating system for neighborhood planning and development based on the combined principles of smart growth, New Urbanism, and green infrastructure and building. The goal of this partnership is to establish a national leadership standard for assessing and rewarding environmentally superior green neighborhood development practices within the framework of the LEED® Green Building Rating System™.

Unlike other LEED rating systems, which focus primarily on green building practices and offer only a few credits for site selection and design, LEED for Neighborhood Development places emphasis on the site selection, design, and construction elements that bring buildings and infrastructure together into a neighborhood and relate the neighborhood to its landscape as well as its local and regional context. The work of the LEED-ND core committee, made up of representatives from all three partner organizations, has been guided by sources such as the Smart Growth Network's ten principles of smart growth, the charter of the Congress for the New Urbanism, and other LEED rating systems. LEED for Neighborhood Development creates a label, as well as guidelines for both decision making and development, to provide an incentive for better location, design, and construction of new residential, commercial, and mixed-use developments.

Whereas the other LEED rating systems have five environmental categories, LEED for Neighborhood Development has three: Smart Location and Linkage, Neighborhood Pattern and Design, and Green Infrastructure and Buildings. An additional category, Innovation and Design Process, addresses sustainable design and construction issues and measures not covered under the three categories. Regional bonus credits are another feature of LEED-ND. These credits acknowledge the importance of local conditions in determining best environmental design and construction practices as well as social and health practices.

The LEED 2009 minimum program requirements define the minimum characteristics that a project must possess to be eligible for certification under LEED 2009. These requirements do not apply to LEED for Neighborhood Development projects.

LEED Credit Weightings

In LEED 2009, the allocation of points among credits is based on the potential environmental impacts and human benefits of each credit with respect to a set of impact categories. The impacts are defined as the environmental or human effect of the design, construction, operation, and maintenance of the building, such as greenhouse gas emissions, fossil fuel use, toxins and carcinogens, air and water pollutants, and indoor environmental conditions. In the LEED for Neighborhood Development Rating System, social and public health benefits were added to the impact categories, and the impact categories were then applied at the neighborhood scale. A combination of approaches, including energy modeling, life-cycle assessment, and transportation analysis, is used to quantify each type of impact. The resulting allocation of points among credits is called credit weighting.

LEED 2009 uses the U.S. Environmental Protection Agency's TRACI[3] environmental impact categories as the basis for weighting each credit. TRACI was developed to assist with impact evaluation for life-cycle assessment, industrial ecology, process design, and pollution prevention. LEED 2009 also takes into consideration the weightings developed by the National Institute of Standards and Technology (NIST); these compare impact categories with one another and assign a relative weight to each. Together, the two approaches provide a solid foundation for determining the point value of each credit in LEED 2009.

The LEED 2009 credit weightings process is based on the following parameters, which maintain consistency and usability across rating systems:

- All LEED credits are worth a minimum of 1 point.
- All LEED credits are positive, whole numbers; there are no fractions or negative values.
- All LEED credits receive a single, static weight in each rating system; there are no individualized scorecards based on project location.
- All LEED rating systems have 100 base points; Innovation and Design Process and Regional Priority credits provide opportunities for up to 10 bonus points.

Given the above criteria, the LEED 2009 credit weightings process involves three steps for LEED for Neighborhood Development:

1. A reference neighborhood is used to estimate the environmental impacts in 15 categories associated with a typical neighborhood development pursuing LEED certification.
2. The relative importance of neighborhood impacts in each category is set to reflect values based on the NIST weightings.[4]
3. Data that quantify neighborhood impacts on environmental and human health are used to assign points to individual credits.

Each credit is allocated points based on the relative importance of the neighborhood-related impacts that it addresses. The result is a weighted average that combines neighborhood impacts and the relative value of the impact categories. Credits that most directly address the most important impacts are given the greatest weight, subject to the system design parameters described above. Credit weights also reflect a decision by LEED to recognize the market implications of point allocation.

The details of the weightings process vary slightly among individual rating systems. For example, LEED for Neighborhood Development includes credits related to infill development but LEED for New Construction does not. This results in a difference in the portion of the environmental footprint addressed by each rating system and the relative allocation of points.

3 Tools for the Reduction and Assessment of Chemical and Other Environmental Impacts (TRACI) (U.S. Environmental Protection Agency, Office of Research and Development, http://www.epa.gov/nrmrl/std/sab/traci/).

4 Relative impact category weights based on an exercise undertaken by NIST (National Institute of Standards and Technology) for the BEES program, http://www.bfrl.nist.gov/oae/software/bees/.

The weightings process for each rating system is fully documented in a weightings workbook. The credit weightings process will be reevaluated over time to incorporate changes in values ascribed to different neighborhood impacts and neighborhood types, based on both market reality and evolving knowledge related to buildings and neighborhood design. A complete explanation of the LEED credit weightings system is available on the USGBC website, at www.usgbc.org.

III. OVERVIEW AND PROCESS

The LEED 2009 for Neighborhood Development Rating System is a set of performance standards for certifying the planning and development of neighborhoods. The intent is to promote healthful, durable, affordable, and environmentally sound practices in building design and construction.

Prerequisites and credits in the rating system address five topics:

- Smart Location and Linkage (SLL)
- Neighborhood Pattern and Design (NPD)
- Green Infrastructure and Buildings (GIB)
- Innovation and Design Process (IDP)
- Regional Priority Credit (RPC)

When to Use LEED for Neighborhood Development

The LEED for Neighborhood Development Rating System responds to land use and environmental considerations in the United States. It is designed to certify exemplary development projects that perform well in terms of smart growth, urbanism, and green building. Projects may constitute whole neighborhoods, portions of neighborhoods, or multiple neighborhoods. There is no minimum or maximum size for a LEED-ND project, but the core committee's research has determined that a reasonable minimum size is at least two habitable buildings and that the maximum area that can appropriately be considered a neighborhood is 320 acres, or half a square mile. A project larger than 320 acres is eligible but may find documenting certain credits difficult and may want to consider dividing the area into separate LEED-ND projects, each smaller than 320 acres. Although projects may contain only a single use, typically a mix of uses will provide the most amenities to residents and workers and enable people to drive less and safely walk or bike more. Small infill projects that are single use but complement existing neighboring uses, such as a new affordable-housing infill development in a neighborhood that is already well served by retail and commercial uses, are also good candidates for certification.

This rating system is designed primarily for the planning and development of new green neighborhoods, whether infill sites or new developments proximate to diverse uses or adjacent to connected and previously developed land. Many infill projects or projects near transit will be in urban areas, which helps direct growth into places with existing infrastructure and amenities. LEED-ND also promotes the redevelopment of aging brownfield sites into revitalized neighborhoods by rewarding connections beyond the site, walkable streets within the site, and the integration of any historic buildings and structures that will give the new neighborhood development a unique sense of place.

Existing neighborhoods can also use the rating system, and its application in this context could be especially beneficial in urban areas and historic districts. It is, however, important to point out that the owner or owners applying for certification should already own, have title to, or have significant control over a majority of the land within the project boundary and the plan for new construction or major renovation for the majority of the project's square footage. The new construction could take place on vacant land within the boundary, and the major renovations could involve existing buildings, recent or historic, within the project. In addition to guiding infill development opportunities, LEED-ND has additional relevance for existing neighborhoods, as a tool to set performance levels for a group of owners wanting to retrofit their homes, offices, or shops, and finally for shaping new green infrastructure, such as sidewalks, alleys, and public spaces. Many prerequisites or credits have a specific compliance path for existing buildings; this is highlighted in the rating system, and more detail is provided in the reference guide.

LEED-ND also can be used in suburban locations. There are tremendous opportunities to retrofit the suburbs, whether this involves reviving old shopping centers and their surrounding parking lots or adding new units and vibrant walkable town centers to existing subdivisions. Increasingly, many suburbs are well served by transit and thus should be considered good candidates for creating mixed-use, walkable developments with the potential to decrease residents' and workers' dependence on personal automobiles.

LEED for Neighborhood Development was not designed as a rating system for existing campuses, such as colleges, universities, and military bases. Many campuses have circulation patterns and building forms and placement that differ from the strategies outlined in LEED-ND. As a result, the rating system may not be appropriate for such facilities, but it could be applied in certain situations. For example, LEED-ND could be used for a civilian-style development on or adjacent to a military base, especially now that there is increased interest in developing mixed-use main streets as a focal point for new residential development in military bases. In addition, with many installations facing closure under the Base Realignment and Closure Act, LEED-ND could be used to guide the redevelopment of a base as it finds a new use. For colleges and universities, the program best lends itself to campuses that are expanding or undergoing major redevelopment. Increasingly, many universities are creating mixed-use development projects, often with local partners, to serve as catalytic projects in their communities, and LEED-ND could be a good framework and certification tool. Some universities are looking to their own campus lands for new development opportunities, particularly for housing that is affordable to faculty and staff but also walkable to campus and other amenities, and LEED-ND may be appropriate.

LEED for Neighborhood Development is not meant to be a national standard that replaces zoning codes or comprehensive plans, nor has it been designed to certify sector plans or other policy tools. Local development patterns and performance levels vary greatly across the country because land regulation is largely controlled by local governments. One city may be a leader in stormwater management, and another an innovator in traffic calming, but neither may be advanced in all areas covered by LEED-ND. The rating system should therefore not be considered a one-size-fits-all policy tool. Instead, LEED-ND is a voluntary leadership standard, and local governments should consider promoting its use by the development community or public-private partnerships. In addition, LEED-ND can be used to analyze whether existing development regulations, such as zoning codes, development standards, landscape requirements, building codes, or comprehensive plans are "friendly" to sustainable developments. By comparing a locality's development practices with the rating system, public officials and the planning department can better identify code barriers that make it onerous, costly, or even impossible to undertake some aspects of sustainable development. Finally, public sector projects (e.g., those sponsored by housing authorities, redevelopment agencies, or specialized development authorities) are eligible to use the rating system. Please visit the LEED for Neighborhood web page at www.usgbc.org for LEED-ND policy guidance for state and local governments.

“Neighborhood Development,” Defined

Based on research on the origins of neighborhood design and current best practices for locating and designing new development, the LEED for Neighborhood Development core committee has developed a rating system for smart, healthy, and green neighborhood development. Although LEED-ND does not strictly define what constitutes a neighborhood, the prerequisites and credits are written to encourage a type of development that recalls the siting and design of traditional neighborhoods and promotes best practices in new neighborhood development today.

Since ancient times, cities around the world have been spatially divided into districts or neighborhoods. Excavations of some of the earliest cities reveal evidence of social neighborhoods. Urban scholar Lewis Mumford noted that “neighborhoods, in some primitive, inchoate fashion exist wherever human beings congregate, in permanent family dwellings; and many of the functions of the city tend to be distributed naturally—that is, without any theoretical preoccupation or political direction—into neighborhoods.”[5] In basic terms, a neighborhood is an area of dwellings, employment, retail, and civic places and their immediate environment that residents and/or employees identify with in terms of social and economic attitudes, lifestyles, and institutions.

A neighborhood can be considered the planning unit of a town. The charter of the Congress for the New Urbanism characterizes this unit as “compact, pedestrian-friendly, and mixed-use.”[6] By itself the neighborhood is a village, but combined with other neighborhoods it becomes a town or a city. Similarly, several neighborhoods with their centers at transit stops can constitute a transit corridor. The neighborhood, as laid out in LEED-ND, is in contrast to sprawl development patterns, which create podlike clusters that are disconnected from surrounding areas. Existing and new traditional neighborhoods provide an alternative to development patterns that characterize sprawl, such as the single-zoned, automobile-dominated land uses that have been predominant in suburban areas since the 1950s. Instead, traditional neighborhoods meet all those same needs—for housing, employment, shopping, civic functions, and more—but in formats that are compact, complete, and connected, and ultimately more sustainable and diverse.[7] The metrics of a neighborhood vary in density, population, mix of uses, and dwelling types and by regional customs, economies, climates, and site conditions. In general, they include size, identifiable centers and edges, connectedness with the surroundings, walkable streets, and sites for civic uses and social interaction.

Size is a defining feature of a neighborhood and is typically based on a comfortable distance for walking from the center of the neighborhood to its edge; that suggests an area of 40 to 160 acres. In the 1929 Regional Plan of New York and Environs, urban planner Clarence Perry outlined a neighborhood center surrounded by civic uses, parks, residential uses, a school, and retail at the edge, all within one-quarter mile—about a 5-minute walk. This amounts to an area or pedestrian “shed” of 125 acres, or if the land area is a square, 160 acres. Although Perry’s diagram does not address many of the sustainable features of LEED-ND, such as access to multimodal transportation options, location of infrastructure, and building form, it serves as a reference point for the mix of uses and walkable scale of neighborhood development encouraged in the rating system. Most people will walk approximately one-quarter mile (1,320 feet) to run daily errands; beyond that, many will take a bicycle or car. Additional research shows that people will walk as far as a half-mile (2,640 feet) to reach heavy rail transit systems or more specialized shops or civic uses.[8] Since half a square mile contains 320 acres, the core committee has decided that this size should serve as guidance for the upper limit of a LEED-ND project.

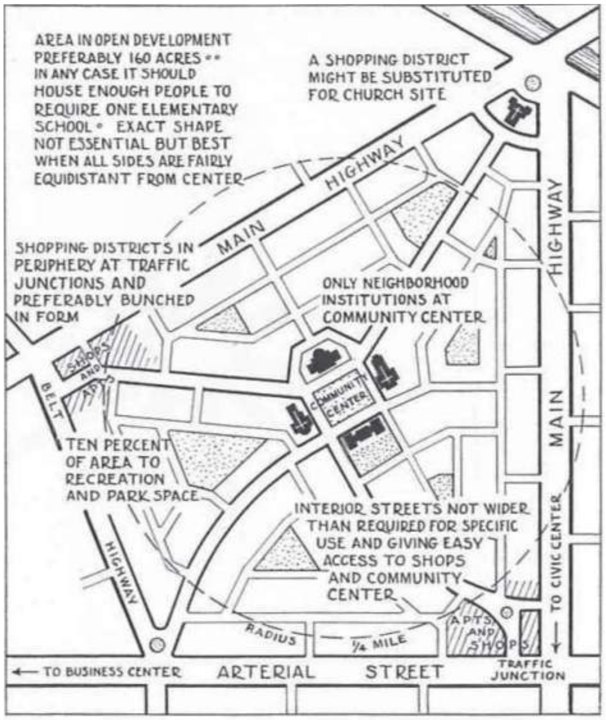

Figure 2. A "sustainable" update of Perry's neighborhood unit. Source: Douglas Farr, *Sustainable Urbanism*

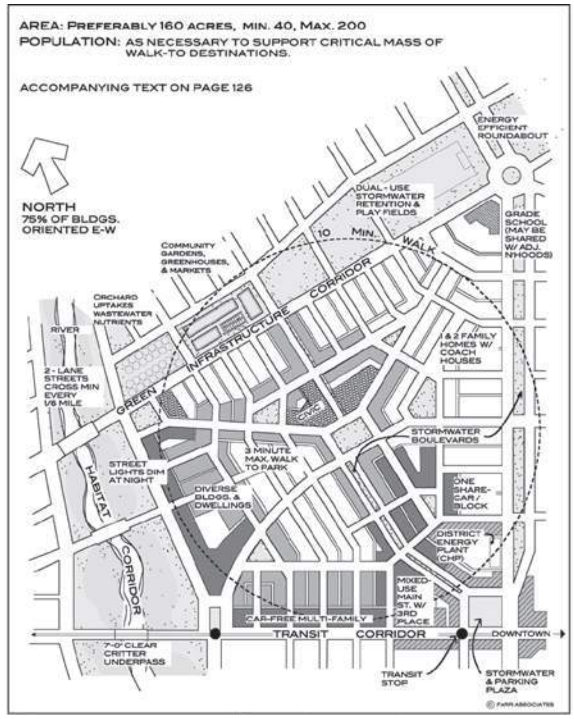
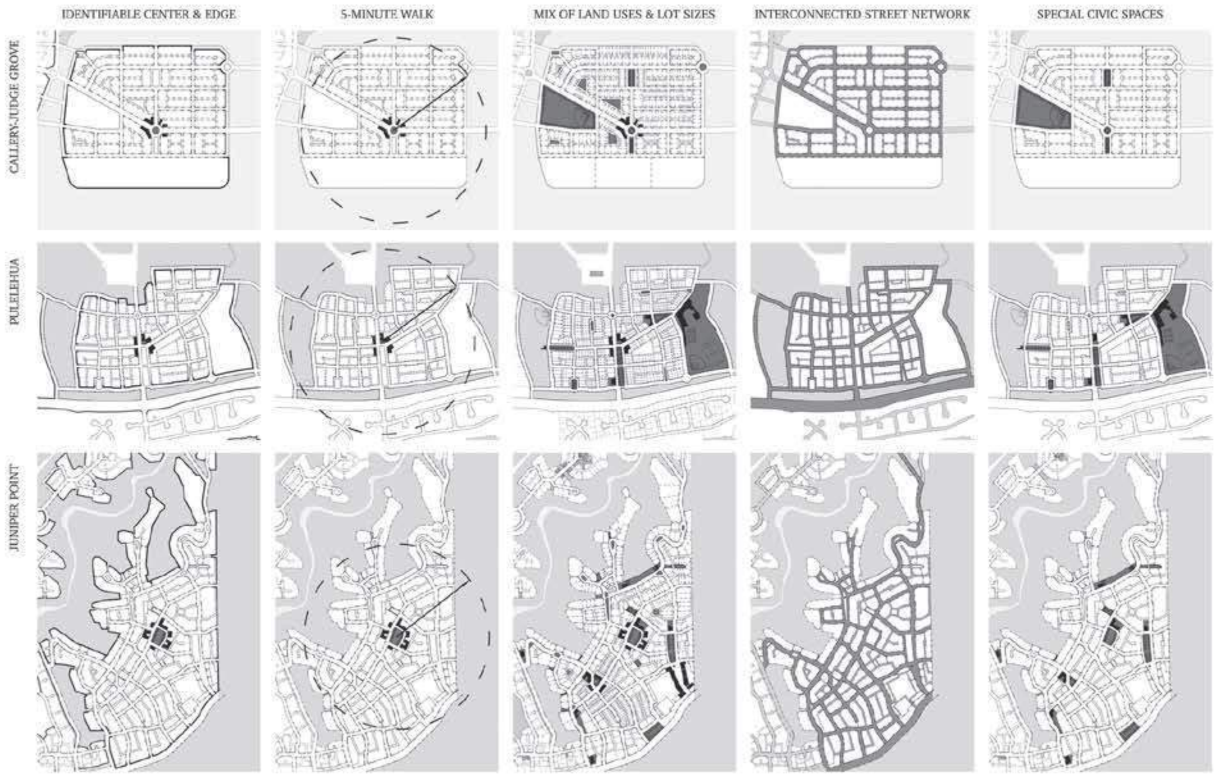


A neighborhood should have places where the public feels welcome and encouraged to congregate, recognizable as the heart of the community. A proper center has at least one outdoor public space for this purpose, designed with pedestrians in mind; this is the most well-defined outdoor "room" in the neighborhood. The best centers are within walking distance of the primarily residential areas, and typically some gradient in density is discernible from center to edge. The "center" need not be in the geographic center of the neighborhood; it can be along the edge, on an arterial or transit line. It is important for a neighborhood to have boundaries as well as a defined center, and this characteristic is often achieved through identifiable edges, either man-made or natural, such as adjacent farmland, parks, greenways, schools, major rights-of-way, or other uses.

When a neighborhood has a robust network of internal streets and good connections to surrounding communities, pedestrians, bicyclists, and drivers can move more efficiently and more safely. Multiple intersections and short blocks also give pedestrians a more interesting environment. The maximum average block perimeter to achieve an integrated network is 1,500 feet, with a maximum uninterrupted block face of ideally no more than 450 feet; intersecting streets are placed at intervals of 500 to 600 feet, and no greater than 800 feet apart along any single stretch.

The morphology of a sustainable neighborhood—the design of its blocks, streets, and buildings—can serve as the foundation of a walkable environment. Walkable streets have many features, and those elements deemed most important by the core committee are encouraged by the LEED-ND Rating System. These features, such as human-scaled buildings and street widths, wide sidewalks, buildings that are pulled up to the sidewalk to create a continuous street wall, retail storefronts and other uses, and interesting street furniture and trees, are meant to create a safe, inviting, and well-used public realm with visual interest. To keep loading docks, garage openings, and utilities away from sidewalks, neighborhoods with walkable streets often feature alleys.

Figure 3. Examples of neighborhood morphology. Source: Douglas Farr, *Sustainable Urbanism*



A mix of uses is often integral to the vitality of a neighborhood; the mix can include not only residential and commercial but also a variety of retail establishments, services, community facilities, and other kinds of "diverse uses," whether available within the neighborhood or adjacent. Urban theorist Ray Oldenburg would classify diverse uses as "Third Places"—small neighborhood grocers, coffee shops, pubs, or post offices that allow residents and workers to mingle and have social interactions. A mix of active and diverse retail uses on a walkable street can create a place that is alive day and night, and not closed down at 6 p.m.

Existing neighborhoods have the added benefit of historic buildings and events with cultural significance. Jane Jacobs argued that every neighborhood needed a mixture of newer and older buildings to allow for a variety of uses, income levels, and even ideas within the neighborhood.[9] New neighborhoods can bring some of the architectural diversity found in existing neighborhoods by including a mix of uses and housing types, each of which might need a different building type and design, thus generating visual interest. Finally, placing important civic buildings, such as churches, libraries, schools, or local government buildings at the termination of a street can create civic pride and also an interesting vista for pedestrians. With a focus on civic buildings and gathering places and the pedestrian experience in general, it is no surprise that walkable neighborhoods are often defined by the social interaction among people living and working near one another.

In conclusion, LEED for Neighborhood Development emphasizes the creation of compact, walkable, vibrant, mixed-use neighborhoods with good connections to nearby communities. In addition to neighborhood morphology, pedestrian scale, and mix of uses, the rating system also emphasizes the location of the neighborhood and the performance of the infrastructure and buildings within it. The sustainable benefits of a neighborhood increase when it offers proximity to transit and when residents and workers can safely travel by foot or bicycle to jobs, amenities,

9 Jane Jacobs, *The Death and Life of Great American Cities* (New York: Random House, 1961), p. 187.

and services. This can create a neighborhood with a high quality of life and healthy inhabitants. Likewise, green buildings can reduce energy and water use, and green infrastructure, such as landscaping and best practices to reduce stormwater runoff, can protect natural resources. Together, well-located and well-designed green neighborhood developments will play an integral role in reducing greenhouse gas emissions and improving quality of life.

Certification

To earn LEED certification, the applicant project must satisfy all the prerequisites and qualify for a minimum number of points to attain the project ratings listed below. Having satisfied the basic prerequisites of the program, applicant projects are then rated according to their degree of compliance within the rating system.

LEED for Neighborhood Development certifications are awarded according to the following scale:

Certified	40–49 points
Silver	50–59 points
Gold	60–79 points
Platinum	80 points and above

Stages of Certification

LEED for Neighborhood Development involves projects that may have significantly longer construction periods than single buildings, and as a result the standard LEED certification process has been modified. To provide developers of certifiable projects with conditional approval at an early stage, LEED 2009 for Neighborhood Development certification is divided into a three-stage process. A land-use entitlement, referred to below, is the existing or granted right to use property for specific types and quantities of residential and nonresidential land uses.

Stage 1. Conditional Approval of a LEED-ND Plan. This stage is optional for projects at any point before the entitlement process begins, or when no more than 50% of a project's total new and/or renovated building square footage has land-use entitlements to use property for the specific types and quantities of residential and nonresidential land uses proposed, either by right or through a local government regulatory change process. Projects with more than 50% of new and/or renovated square footage already entitled must complete the local entitlement process for 100% of new and/or renovated square footage and apply under Stage 2. If conditional approval of the plan is achieved, a letter will be issued stating that if the project is built as proposed, it will be eligible to achieve LEED for Neighborhood Development certification. The purpose of this letter is to help the developer build a case for entitlement among land-use planning authorities, as well as attract financing and occupant commitments.

Stage 2. Pre-Certified LEED-ND Plan. This stage is available after 100% of the project's total new and/or renovated building square footage has been fully entitled by public authorities with jurisdiction over the project. The project can also be under construction or partially completed, but no more than 75% of the total square footage can be constructed; projects that are more than 75% constructed must finish and use Stage 3. Any changes to the conditionally approved plan that could affect prerequisite or credit achievement must be communicated as part of this submission. If precertification of the plan is achieved, a certificate will be issued stating that the plan is a Pre-Certified LEED for Neighborhood Development Plan and it will be listed as such on the USGBC website.

Stage 3. LEED-ND Certified Neighborhood Development. This final step takes place when the project can submit documentation for all prerequisites and attempted credits, and when certificates of occupancy for buildings and acceptance of infrastructure have been issued by public authorities with jurisdiction over the project. Any changes to the Pre-Certified LEED-ND Plan that could affect prerequisite or credit achievement must be communicated as part of this submission. If certification of the completed neighborhood development is achieved, a plaque or similar award for public display at the project site will be issued and it will be listed as certified on the USGBC website.

Since the location of a project cannot be changed, whereas its design and technologies can, a review is offered to determine a project's compliance with the Smart Location and Linkage (SLL) prerequisites and inform the team whether the location qualifies. If it does, a project team can proceed; if it doesn't, the team can end its participation in the program before investing more time. This optional review of the SLL prerequisites is available to projects in advance of a Stage 1, Stage 2, or Stage 3 application.

IV. EXEMPLARY PERFORMANCE

Exemplary performance strategies result in performance that greatly exceeds the performance level or expands the scope required by an existing credit. To earn an exemplary performance point, teams must meet the performance level defined by the next step in the threshold progression. For a credit with more than one compliance path, an Innovation and Design Process point can be earned by satisfying more than one compliance path if their benefits are additive.

The credits for which exemplary performance points are available are listed in the LEED Reference Guide for Green Neighborhood Development, 2009 Edition.

V. REGIONAL PRIORITY

To provide incentive to address geographically specific environmental issues, USGBC regional councils and chapters, the Congress for the New Urbanism chapters, and representatives of Smart Growth America's State and Local Caucus have identified 6 credits per rating system that are of particular importance to specific areas. Each Regional Priority credit is worth an additional 1 point, and a total of 4 additional points may be earned by achieving Regional Priority credits, with 1 point earned per credit. If the project achieves more than 4 Regional Priority credits, the team can choose the credits for which these points will apply. The USGBC website contains a searchable database of Regional Priority credits.

SMART LOCATION AND LINKAGE

SLL Prerequisite 1: Smart Location

Required

Intent

To encourage development within and near *existing* communities and public transit infrastructure. To encourage improvement and redevelopment of existing cities, suburbs, and towns while limiting the expansion of the *development footprint* in the region to appropriate circumstances. To reduce vehicle trips and *vehicle miles traveled* (VMT). To reduce the incidence of obesity, heart disease, and hypertension by encouraging daily physical activity associated with walking and bicycling.

Requirements

FOR ALL PROJECTS

Either (a) locate the *project* on a site served by existing *water and wastewater infrastructure* or (b) locate the project within a legally adopted, publicly owned, planned water and wastewater service area, and provide new water and wastewater infrastructure for the project.

AND

OPTION 1. Infill Sites

Locate the project on an *infill site*.

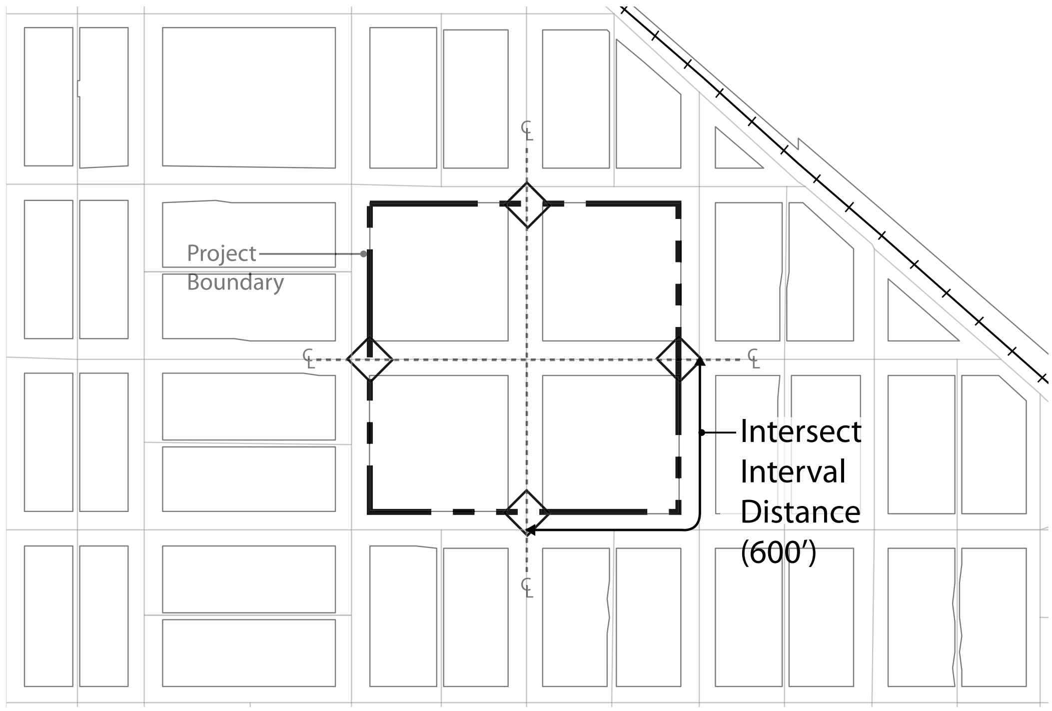
OR

OPTION 2. Adjacent Sites with Connectivity

Locate the project on an *adjacent site* (i.e., a site that is adjacent to *previously developed* land; see Definitions) where the *connectivity* of the site and adjacent land is at least 90 intersections/square mile as measured within a 1/2-mile distance of a continuous segment of the *project boundary*, equal to or greater than 25% of the project boundary, that is adjacent to previous development. Existing external and internal intersections may be counted if they were not constructed or funded by the project *developer* within the past ten years. Locate and/or design the project such that a through-*street* and/or nonmotorized right-of-way intersects the project boundary at least every 600 feet on average, and at least every 800 feet, connecting it with an existing street and/or right of way outside the project; nonmotorized rights-of-way may count for no more than 20% of the total. The exemptions listed in NPD Prerequisite 3, Connected and Open Community, do not apply to this option.

Figure 1. Adjacent and connected project site based on minimum 25% of perimeter adjacent to previously developed parcels and at least 90 eligible intersections per square mile within 1/2 mile of boundary segment adjacent to previous development

Figure 2. Project site with through-street right-of-way intersecting project boundary at least every 600 feet on average



OR

OPTION 3. Transit Corridor or Route with Adequate Transit Service

Locate the project on a site with existing and/or planned transit service such that at least 50% of *dwelling units* and nonresidential building entrances (inclusive of existing buildings) are within a 1/4 mile *walk distance* of bus and/or streetcar stops, or within a 1/2 mile walk distance of *bus rapid transit* stops, light or heavy rail stations, and/or ferry terminals, and the transit service at those stops in aggregate meets the minimums listed in Table 1 (both weekday and weekend trip minimums must be met).

Weekend trips must include service on both Saturday and Sunday. Commuter rail must serve more than one *metropolitan statistical area* (MSA) and/or the area surrounding the core of an MSA.

Table 1. Minimum daily transit service

	Weekday trips	Weekend trips
Projects with multiple transit types (bus, streetcar, rail, or ferry)	60	40
Projects with commuter rail or ferry service only	24	6

If transit service is planned but not yet operational, the project must demonstrate one of the following:

a. The relevant transit agency has a signed full funding grant agreement with the Federal Transit Administration that includes a revenue operations date for the start of transit service. The revenue operations date must be no later than the occupancy date of 50% of the project's total building square footage.

b. For bus, streetcar, bus rapid transit, or ferry service, the transit agency must certify that it has an approved budget that includes specifically allocated funds sufficient to provide the planned service at the levels listed above and that service at these levels will commence no later than occupancy of 50% of the project's total building square footage.

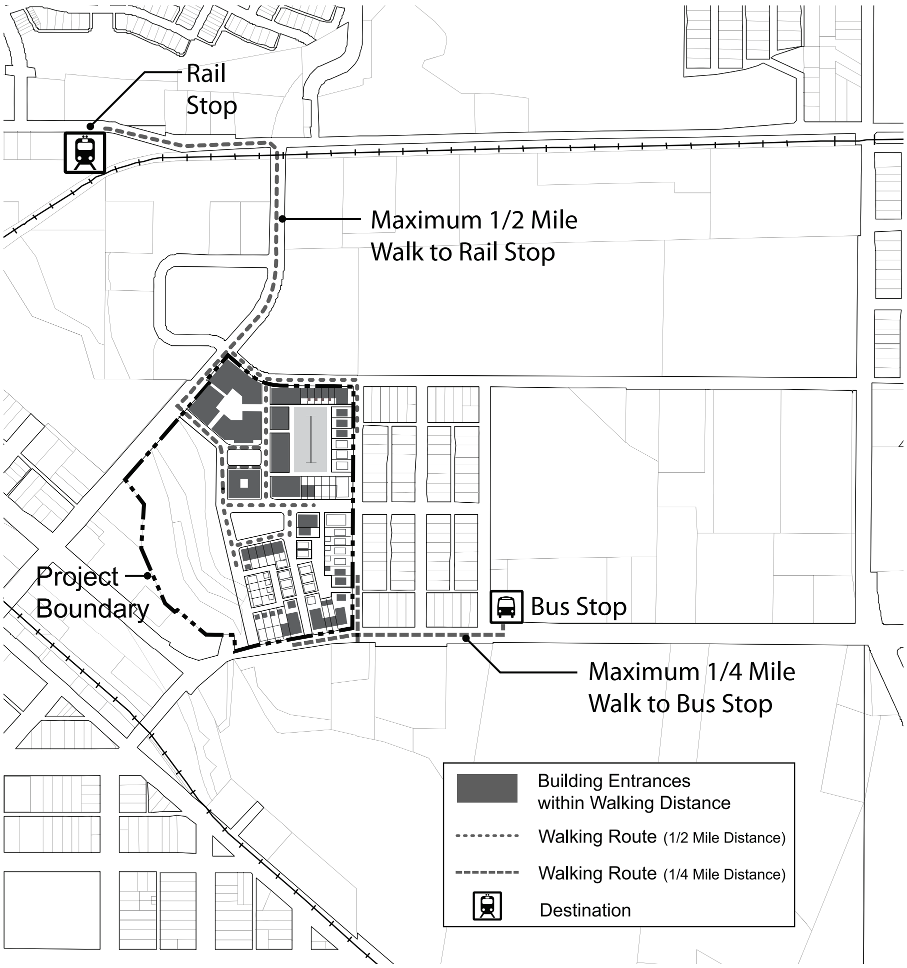
c. For rail service other than streetcars, the transit agency must certify that preliminary engineering for a rail line has commenced. In addition, the service must meet either of these two requirements:

   - A state legislature or local subdivision of the state has authorized the transit agency to expend funds to establish rail transit service that will commence no later than occupancy of 50% of the project's total building square footage.

   OR

   - A municipality has dedicated funding or reimbursement commitments from future tax revenue for the development of stations, platforms, or other rail transit infrastructure that will service the project no later than occupancy of 50% of the project's total building square footage.

Figure 3. Walking routes on pedestrian network showing distances from dwellings and nonresidential uses to transit stops



OR

OPTION 4. Sites with Nearby Neighborhood Assets

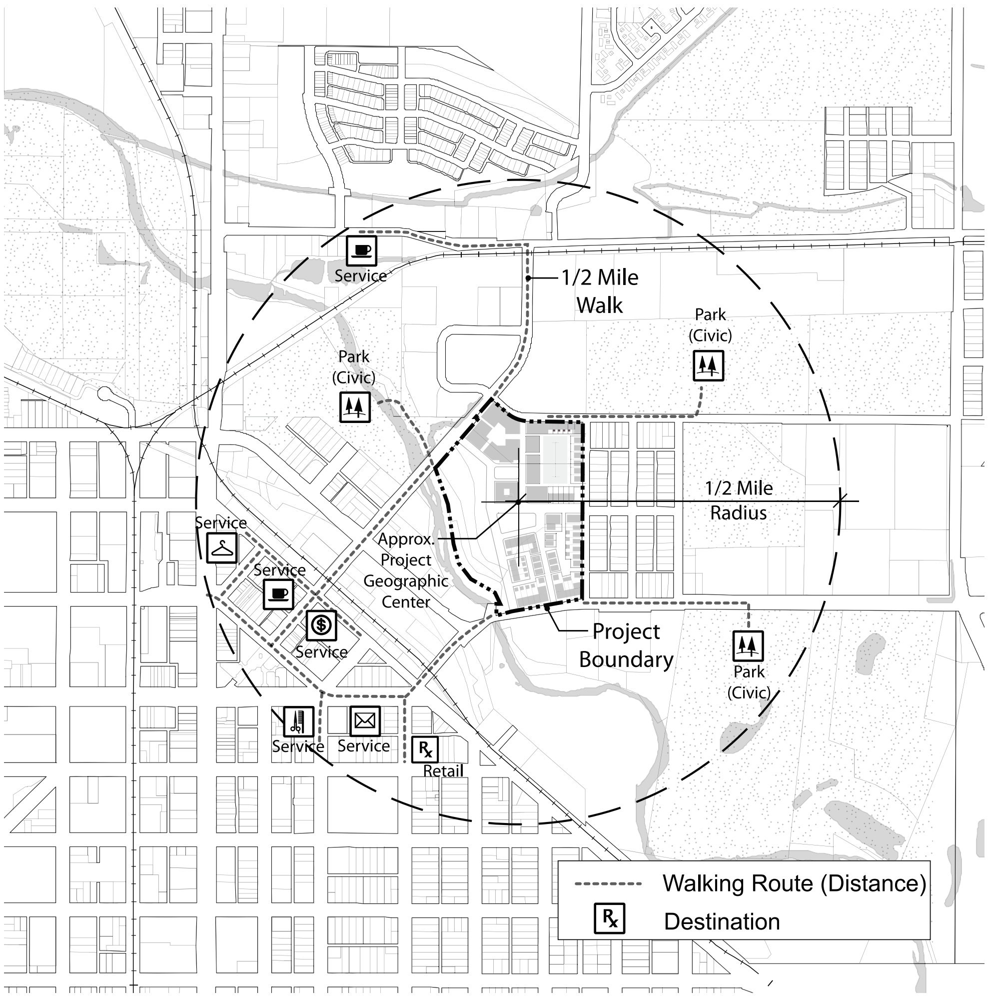
Include a residential component equaling at least 30% of the project's total building square footage (exclusive of portions of parking structures devoted exclusively to parking), and locate the project near existing neighborhood shops, uses, and facilities ("diverse uses"; see Appendix) such that the project boundary is within 1/4-mile walk distance of at least five diverse uses, or such that the project's geographic center is within 1/2-mile walk distance of at least seven diverse uses. In either case the qualifying uses must include at least one food retail establishment and at least one use from each of two other categories, with the following limitations:

a. A single establishment may not be counted in two categories (e.g., a place of worship may be counted only once even if it also contains a daycare facility, and a retail store may be counted only once even if it sells products in several categories).

b. Establishments in a mixed-use building may each count if they are distinctly operated enterprises with separate exterior entrances, but no more than half of the minimum number of diverse uses can be situated in a single building or under a common roof.

c. Only two establishments in a single category may be counted (e.g., if five restaurants are within the required distance, only two may be counted).

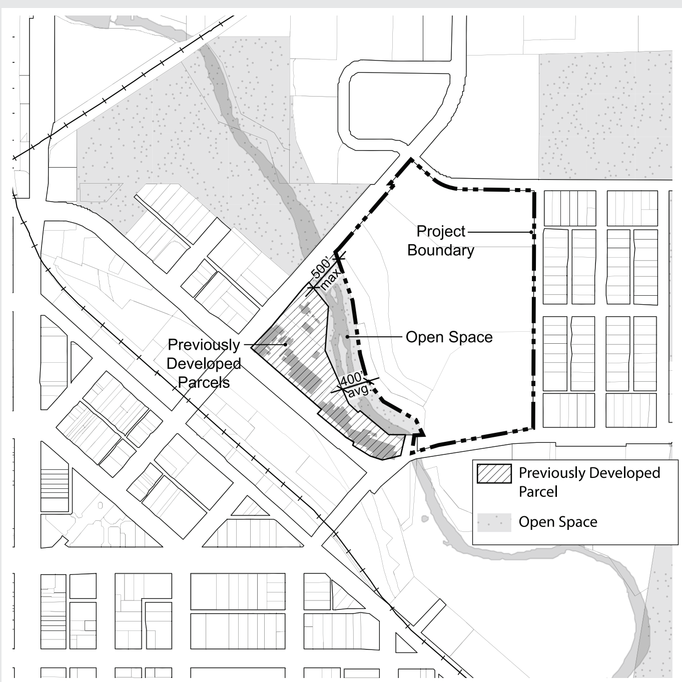
Figure 4. Walking routes on pedestrian network showing distances from dwellings and nonresidential uses to diverse use destinations



Key Definitions

adjacent site a site having at least 25% of its boundary bordering parcels that are each at least 75% *previously developed*. A *street* or other right-of-way does not constitute previously developed land; instead, it is the status of the property on the other side of the street or right-of-way that matters. Any fraction of the boundary that borders waterfront other than a stream is excluded from the calculation. A site is still considered adjacent if the 25% adjacent portion of its boundary is separated from previously developed parcels by undeveloped, permanently protected land averaging no more than 400 feet in width and no more than 500 feet in any one place. The undeveloped land must be permanently preserved as natural area, riparian corridor, *park*, greenway, agricultural land, or designated *cultural landscape*. Permanent pedestrian paths connecting the project through the protected parcels to the bordering site may be counted to meet the requirement of SLL Prerequisite 1, Option 2 (that the *project* be connected to the adjacent parcel by a through-street or nonmotorized right-of-way every 600 feet on average, provided the path or paths traverse the undeveloped land at no more than a 10% grade for walking by persons of all ages and physical abilities).

Adjacent project site based on minimum 25% of perimeter adjacent to previously developed parcels, including allowance for permanently protected land between project boundary and previously developed parcels



connectivity the number of publicly accessible intersections per square mile, including any combination of streets, dedicated alleys, transit rights-of-way, and nonmotorized rights-of-way. If one must both enter and exit an area through the same intersection, such an intersection and any intersections beyond that point are not counted; intersections leading only to culs-de-sac are also not counted. The calculation of square mileage excludes water bodies, parks larger than 1/2 acre, public facility campuses, airports, rail yards, slopes over 15%, and areas nonbuildable under codified law or the rating system. Street rights-of-way may not be excluded.

infill site a site that meets any of the following four conditions:

a. At least 75% of its boundary borders parcels that individually are at least 50% *previously developed,* and that in aggregate are at least 75% previously developed.

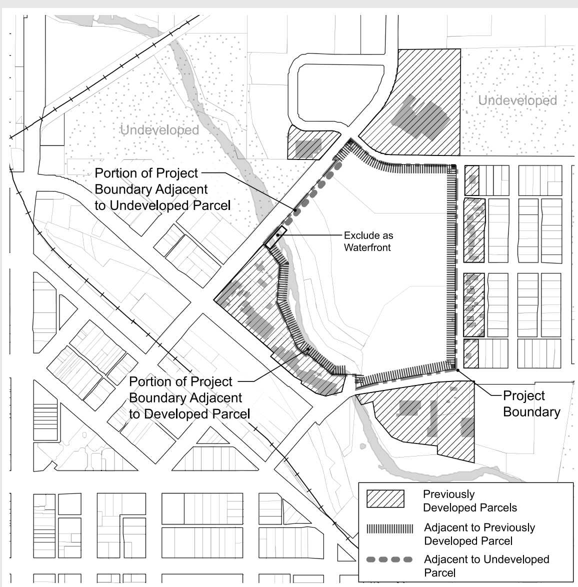
b. The site, in combination with bordering parcels, forms an aggregate parcel whose boundary is 75% bounded by parcels that individually are at least 50% previously developed, and that in aggregate are at least 75% previously developed.

c. At least 75% of the land area, exclusive of rights-of-way, within a 1/2 mile distance from the *project boundary* is previously developed.

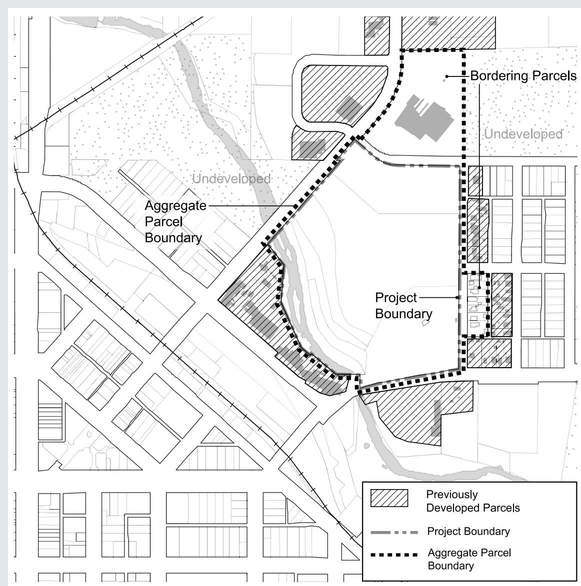
d. The lands within a 1/2 mile distance from the project boundary have a *preproject connectivity* of at least 140 intersections per square mile.

A *street* or other right-of-way does not constitute previously developed land; it is the status of property on the other side or right-of-way of the street that matters. For conditions (a) and (b) above, any fraction of the perimeter that borders waterfront other than a stream is excluded from the calculation.

(a). Infill project site based on minimum 75% of perimeter adjacent to previously developed parcels

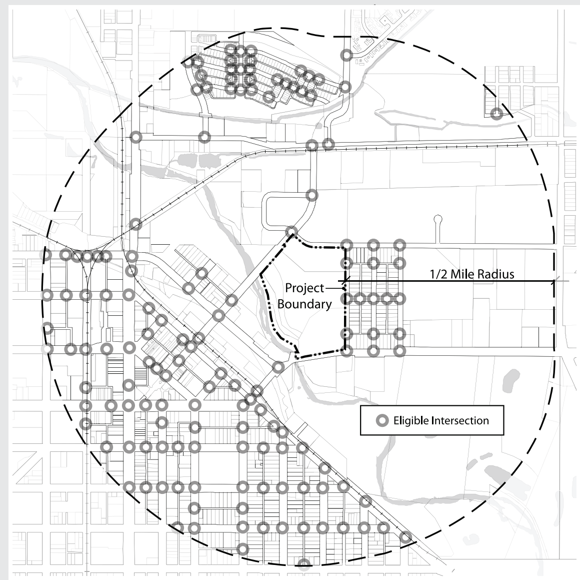


(b). Infill project site based on minimum 75% adjacent to previously developed parcels using project boundary and selected bordering parcels



(c). Infill project site based on minimum 75% of land area within 1/2 mile of project boundary being previously developed

(d). Infill project site based on minimum 140 intersections/sq.mi. within 1/2 mile of project boundary



previously developed altered by paving, construction, and/or land use that would typically have required regulatory permitting to have been initiated (alterations may exist now or in the past). Previously developed land includes a platted lot on which a building was constructed if the lot is no more than 1 acre; previous development on lots larger than 1 acre is defined as the *development footprint* and land alterations associated with the footprint. Land that is not previously developed and altered landscapes resulting from current or historical clearing or filling, agricultural or forestry use, or preserved natural area use are considered undeveloped land. The date of previous development permit issuance constitutes the date of previous development, but permit issuance in itself does not constitute previous development.

SLL Prerequisite 2: Imperiled Species and Ecological Communities Conservation

Required

Intent

To conserve imperiled species and ecological communities.

Requirements

FOR ALL PROJECTS

Consult with the state Natural Heritage Program and state fish and wildlife agencies to determine whether species listed as threatened or endangered under the federal Endangered Species Act, the state's endangered species act, or species or ecological communities classified by NatureServe as GH (possibly extinct), G1 (critically imperiled), or G2 (imperiled) have been or are likely to be found on the *project* site because of the presence of suitable habitat and nearby occurrences. If the consultations are inconclusive and site conditions indicate that imperiled species or ecological communities could be present, using a qualified biologist, perform biological surveys using accepted methodologies during appropriate seasons to determine whether such species or communities occur or are likely to occur on the site.

OPTION 1. Sites without Affected Species or Ecological Community

The prerequisite is satisfied if the consultation and any necessary biological surveys determine that no such imperiled species or ecological communities have been found or have a high likelihood of occurring.

OR

OPTION 2. Sites with Affected Species or Ecological Community: Habitat Conservation Plan

Comply with an approved habitat conservation plan under the Endangered Species Act for each identified species or ecological community.

OR

OPTION 3. Sites with Affected Species or Ecological Community: Habitat Conservation Plan Equivalent

Work with a qualified biologist, a nongovernmental conservation organization, or the appropriate state, regional, or local agency to create and implement a conservation plan that includes the following actions:

a. Identify and map the extent of the habitat and the appropriate buffer, not less than 100 feet, according to best available scientific information.

b. To the maximum extent practicable, protect the identified habitat and buffer in perpetuity by donating or selling the land or a conservation easement on the land to an accredited land trust or relevant public agency.

c. If on-site protection can be accomplished, analyze threats from development and develop a monitoring and management plan that eliminates or significantly reduces the threats.

d. If any portion of the identified habitat and buffer cannot be protected in perpetuity, quantify the effects by acres or number of plants and/or animals affected, and protect from development in perpetuity habitat of similar or better quality, on-site or off-site, by donating or selling a conservation easement on it to an accredited land trust or relevant public agency. The donation or easement must cover an amount of land equal to or larger than the area that cannot be protected.

SLL Prerequisite 3: Wetland and Water Body Conservation

Required

Intent

To preserve water quality, natural hydrology, habitat, and biodiversity through conservation of *wetlands* and *water bodies*.

Requirements

Limit development effects on wetlands, water bodies, and surrounding buffer land according to the requirements below.

OPTION 1. Sites with No Wetlands, Water Bodies, Land within 50 Feet of Wetlands, or Land within 100 Feet of Water Bodies

Locate the *project* on a site that includes no wetlands, no water bodies, no land within 50 feet of wetlands, and no land within 100 feet of water bodies.

OR

OPTION 2. Sites with Wetlands, Water Bodies, Land within 50 Feet of Wetlands, or Land within 100 Feet of Water Bodies

a. Locate the project such that *preproject* wetlands, water bodies, land within 50 feet of wetlands, and land within 100 feet of water bodies is not affected by new development, unless the development is minor improvements or is on *previously developed* land.

OR

b. Earn at least 1 point under GIB Credit 8, Stormwater Management, and limit any impacts beyond minor improvements to less than the percentage of buffer land listed in Table 1.

Table 1. Maximum allowable area of impacts within buffer zone, by density

Residential density (DU/acre)*	Nonresidential density (FAR)*	Percentage of buffer land** where impacts beyond minor improvements are allowed
> 25	> 1.75	≤ 20%
> 18 and ≤ 25	> 1.25 to ≤ 1.75	≤ 15%
> 10 and ≤ 18	> .75 to ≤ 1.25	≤ 10%
≤ 10	≤ .75	≤ 5%
DU = dwelling unit; FAR = floor-area ratio.		
* For this option, a mixed-use project may use either its residential or its nonresidential *density* to determine the percentage of allowable impacts, regardless of which is higher.		
** For this option, buffer width may vary as long as the total buffer area is equal to the area within 50 feet of wetlands and/or within 100 feet of water bodies, minus excluded features (see below). The minimum buffer width, however, is 25 feet for wetlands and 50 feet for water bodies, measured from the edge. In the minimum buffer, only minor improvements and/or improvements that result in no ecological impairment of the wetland or water body, as determined by a qualified biologist, are allowed.		

AND

FOR ALL PROJECTS

Comply with all local, state, and federal regulations pertaining to wetland and water body conservation.

The following features are not considered wetlands, water bodies, or buffer land that must be protected for the purposes of this prerequisite:

a. Previously developed land.

b. Man-made water bodies (such as industrial mining pits, concrete-lined canals, or stormwater retention ponds) that lack natural edges and floors or native ecological communities in the water and along the edge.

c. Man-made linear wetlands that result from the interruption of natural drainages by *existing* rights-of-way.

d. Wetlands that were man-made incidentally and have been rated "poor" for all measured wetland functions. Wetland quality assessment must be performed by a qualified biologist using a method that is accepted by state or regional permitting agencies.

Minor improvements within the buffer may be undertaken to enhance appreciation for the wetland or water body, provided such facilities are open to public access. Only the following improvements are permitted:

a. Bicycle and pedestrian pathways no more than 12 feet wide, of which no more than 8 feet may be impervious.

b. Activities to maintain or restore native natural communities and/or natural hydrology.

c. One single-story structure not exceeding 500 square feet per 300 linear feet of buffer, on average.

d. Grade changes necessary to ensure public access.

e. Clearings, limited to one per 300 linear feet of buffer on average, not exceeding 500 square feet each, for tables, benches, and access for nonmotorized recreational watercraft. Off-street parking is not considered a minor improvement.

f. Removal of hazardous trees; up to 75% of dead trees; trees less than 6 inches diameter at breast height; trees under 40% condition rating; and up to 20% of trees more than 6 inches diameter at breast height with a condition rating of 40% or higher. The condition rating must be based on an assessment by an arborist certified by the International Society of Arboriculture (ISA) using ISA standard measures.

g. *Brownfield* remediation activities.

Direct impacts to wetlands and water bodies are prohibited, except for minimal-impact structures, such as an elevated boardwalk, that allow access to the water for educational and recreational purposes. Structures that protrude into wetlands or water bodies may be replaced, provided the replacement structure has the same or smaller footprint and a similar height.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

previously developed altered by paving, construction, and/or land use that would typically have required regulatory permitting to have been initiated (alterations may exist now or in the past). Previously developed land includes a platted lot on which a building was constructed if the lot is no more than 1 acre; previous development on lots larger than 1 acre is defined as the d*evelopment footprint* and land alterations associated with the footprint. Land that is not previously developed and altered landscapes resulting from current or historical clearing or filling, agricultural or forestry use, or preserved natural area use are considered undeveloped land. The date of previous development permit issuance constitutes the date of previous development, but permit issuance in itself does not constitute previous development.

SLL Prerequisite 4: Agricultural Land Conservation

Required

Intent

To preserve irreplaceable agricultural resources by protecting prime and unique soils on farmland and forestland from development.

Requirements

FOR ALL PROJECTS

Locate the *project* on a site that is not within a state or locally designated agricultural preservation district, unless any changes made to the site conform to the requirements for development within the district (as used in this requirement, district does not equate to land-use zoning).

AND

OPTION 1. Protected Soils Not Impacted

Locate the project *development footprint* such that it does not disturb *prime soils*, *unique soils*, or soils of state significance as identified in a state Natural Resources Conservation Service soil survey.

OR

OPTION 2. Infill Sites

Locate the project on an *infill site*.

OR

OPTION 3. Sites Served by Transit

Comply with SLL Prerequisite 1, Option 3, Transit Corridor or Route with Adequate Transit Service.

OR

OPTION 4. Development Rights Receiving Area

Locate the project within a designated receiving area for development rights under a publicly administered farmland protection program that provides for the transfer of development rights from lands designated for conservation to lands designated for development.

OR

OPTION 5. Sites with Impacted Soils

If development footprint affects land with prime soils, unique soils, or soils of state significance, as identified in a state Natural Resources Conservation Service soil survey, mitigate the loss through the purchase of easements providing permanent protection from development on land with comparable soils in accordance with the ratios based on densities per acre of *buildable land* as listed in Tables 1 and 2.

Table 1. Mitigation ratios for projects in metropolitan or micropolitan statistical areas, pop. 250,000 or more

Residential density (DU per acre of buildable land available for residential use)	Nonresidential density (FAR of buildable land available for nonresidential use)	Mitigation ratio (acres of easement : acres of project on prime, unique, or significant soil)
> 7 and ≤ 8.5	> 0.50 and ≤ 0.67	2 to 1
> 8.5 and ≤ 10	> 0.67 and ≤ 0.75	1.5 to 1
> 10 and ≤ 11.5	> 0.75 and ≤ 0.87	1 to 1
> 11.5 and ≤ 13	> 0.87 and ≤ 1.0	.5 to 1
> 13	> 1.0	No mitigation

Table 2. Mitigation ratios for projects in metropolitan or micropolitan statistical areas, pop. less than 250,000

Residential density (DU/acre of buildable land available for residential use)	Nonresidential density (FAR of buildable land available for nonresidential use)	Mitigation ratio (acres of easement : acres of project on prime, unique, or significant soil)
> 7 and ≤ 8	> 0.50 and ≤ 0.58	2 to 1
> 8 and ≤ 9	> 0.58 and ≤ 0.67	1 to 1
> 9 and ≤ 10	> 0.67 and ≤ 0.75	0.5 to 1
> 10	> 0.75	No mitigation
DU = dwelling unit; FAR = floor-area ratio.		

All off-site mitigation must be located within 100 miles of the project.

Up to 15% of the impacted soils area may be exempted from the *density* requirements if it is permanently dedicated for community gardens, and may also count toward the mitigation requirement for the remainder of the site. Portions of parking structures devoted exclusively to parking must be excluded from the numerator when calculating the *floor-area ratio* (FAR).

The mitigation ratio for a mixed-use project is calculated as follows:

1. Determine the total square footage of all residential and nonresidential uses.
2. Calculate the percentage residential and percentage nonresidential of the total square footage.
3. Determine the density of the residential and nonresidential components as measured in *dwelling units* per acre and FAR, respectively.
4. Referring to Tables 1 and 2, find the appropriate mitigation ratios for the residential and nonresidential components.
5. If the mitigation ratios are different, multiply the mitigation ratio of the residential component by its percentage of the total square footage, and multiply the mitigation ratio of the nonresidential component by its percentage.
6. Add the two numbers produced by Step 5. The result is the mitigation ratio.

Key Definitions

buildable land the portion of the site where construction can occur, including land voluntarily set aside and not constructed upon. When used in *density* calculations, buildable land excludes public rights-of-way and land excluded from development by codified law or LEED for Neighborhood Development prerequisites. An *applicant* may exclude additional land not exceeding 15% of the buildable land base defined above, provided the following conditions are present:

a. The land is protected from residential and nonresidential construction by easement, deed restriction, or other enforceable legal instrument.

AND

b. Either 25% or more of the boundary of each contiguous parcel proposed for exclusion borders a *water body* or areas outside the *project boundary* that are protected by codified law; or ownership of, or management authority over, the exclusion area is transferred to a public entity.

infill site a site that meets any of the following four conditions:

a. At least 75% of its boundary borders parcels that individually are at least 50% *previously developed*, and that in aggregate are at least 75% previously developed.

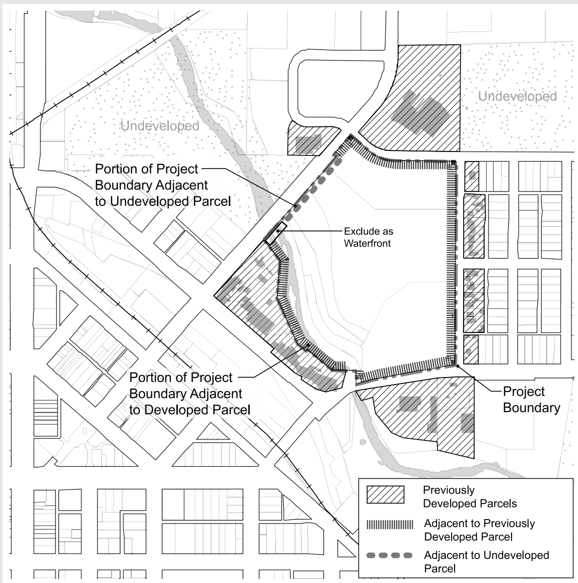
b. The site, in combination with bordering parcels, forms an aggregate parcel whose boundary is 75% bounded by parcels that individually are at least 50% previously developed, and that in aggregate are at least 75% previously developed.

c. At least 75% of the land area, exclusive of rights-of-way, within a 1/2 mile distance from the *project boundary* is previously developed.

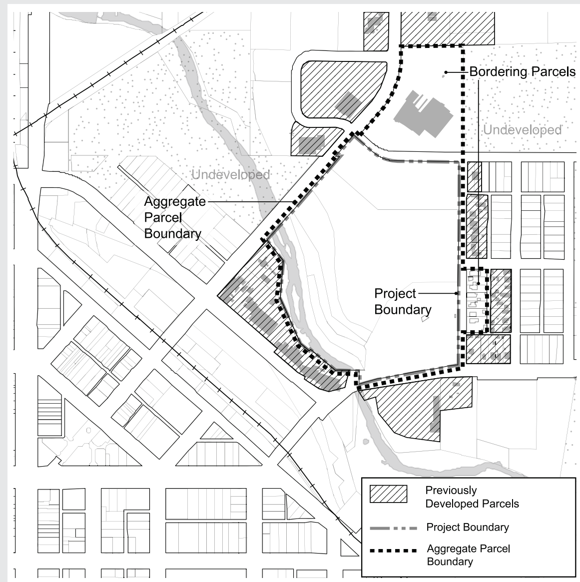
d. The lands within a 1/2 mile distance from the project boundary have a *preproject connectivity* of at least 140 intersections per square mile.

A *street* or other right-of-way does not constitute previously developed land; it is the status of property on the other side or right-of-way of the street that matters. For conditions (a) and (b) above, any fraction of the perimeter that borders waterfront other than a stream is excluded from the calculation.

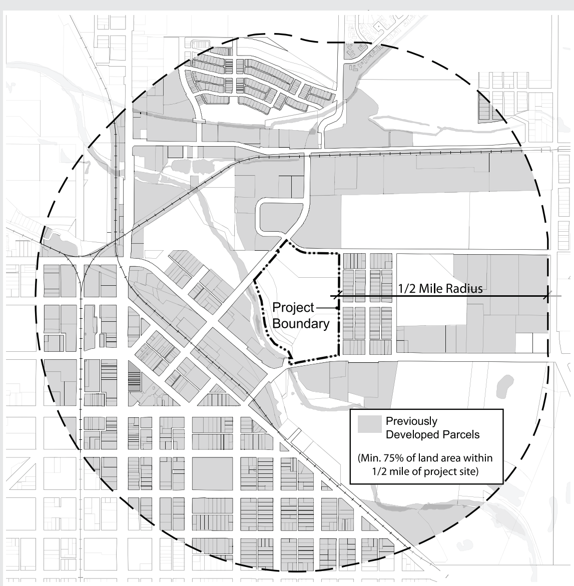
(a). Infill project site based on minimum 75% of perimeter adjacent to previously developed parcels



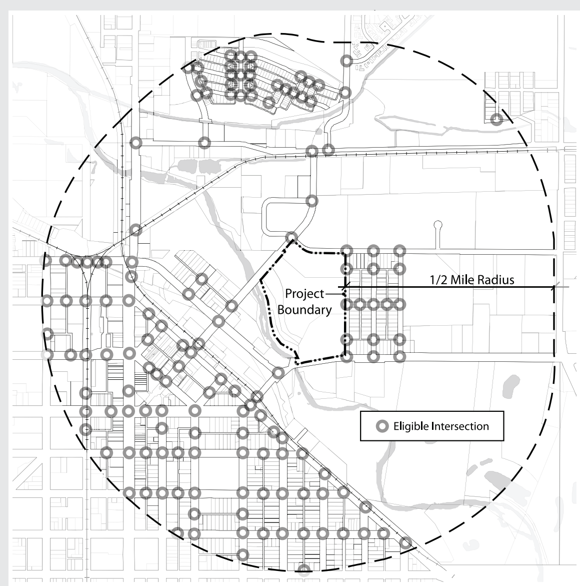
(b). Infill project site based on minimum 75% adjacent to previously developed parcels using project boundary and selected bordering parcels



(c). Infill project site based on minimum 75% of land area within 1/2 mile of project boundary being previously developed



(d). Infill project site based on minimum 140 intersections/sq.mi. within 1/2 mile of project boundary



SLL Prerequisite 5: Floodplain Avoidance

Required

Intent

To protect life and property, promote open space and habitat conservation, and enhance water quality and natural hydrological systems.

Requirement

OPTION 1. Sites without Floodplains

Locate on a site that does not contain any land within a 100-year high- or moderate-risk floodplain as defined and mapped by the Federal Emergency Management Agency (FEMA) or a state or local floodplain management agency, whichever is more recent.

OR

OPTION 2. Infill or Previously Developed Sites with Floodplains

Locate the *project* on an *infill site* or a *previously developed site* or in a nonconveyance area of river or coastal floodplain without storm surge potential where compensatory storage is used in accordance with a FEMA-approved mitigation plan. Comply with the National Flood Insurance Program (NFIP) requirements for developing any portions of the site that lie within a 100-year high-or moderate-risk floodplain, as defined in Option 1. If the project includes construction of any critical facility, such as a hospital, water and sewage treatment facility, emergency center, or fire or police station, the critical facility must be designed and built so as to be protected and operable during a 500-year event, as defined by FEMA.

OR

OPTION 3. All Other Sites with Floodplains

If any part of the site is located within a 100-year high- or moderate-risk floodplain, as defined above, develop only on portions of the site that are not in the floodplain, or that have been previously developed, or that are in a nonconveyance area of river or coastal floodplain without storm surge potential where compensatory storage is used in accordance with a FEMA-approved mitigation plan. Previously developed portions in the floodplain must be developed according to NFIP requirements. If development includes construction of any critical facility, as described above, the critical facility must be designed and built so as to be protected and operable during a 500-year event, as defined by FEMA.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

infill site a site that meets any of the following four conditions:

a. At least 75% of its boundary borders parcels that individually are at least 50% *previously developed,* and that in aggregate are at least 75% previously developed.

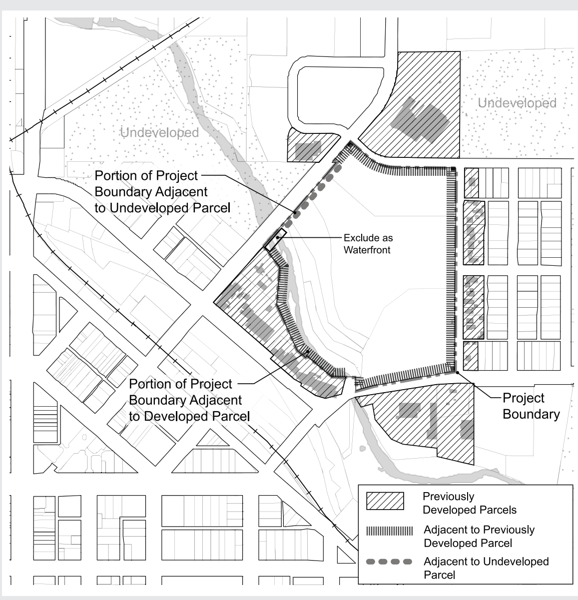
b. The site, in combination with bordering parcels, forms an aggregate parcel whose boundary is 75% bounded by parcels that individually are at least 50% previously developed, and that in aggregate are at least 75% previously developed.

c. At least 75% of the land area, exclusive of rights-of-way, within a 1/2 mile distance from the *project boundary* is previously developed.

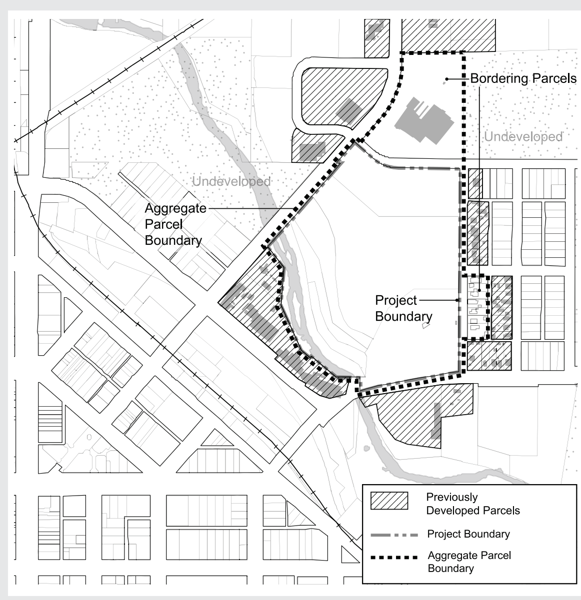
d. The lands within a 1/2 mile distance from the project boundary have a *preproject connectivity* of at least 140 intersections per square mile.

A *street* or other right-of-way does not constitute previously developed land; it is the status of property on the other side or right-of-way of the street that matters. For conditions (a) and (b) above, any fraction of the perimeter that borders waterfront other than a stream is excluded from the calculation.

(a). Infill project site based on minimum 75% of perimeter adjacent to previously developed parcels

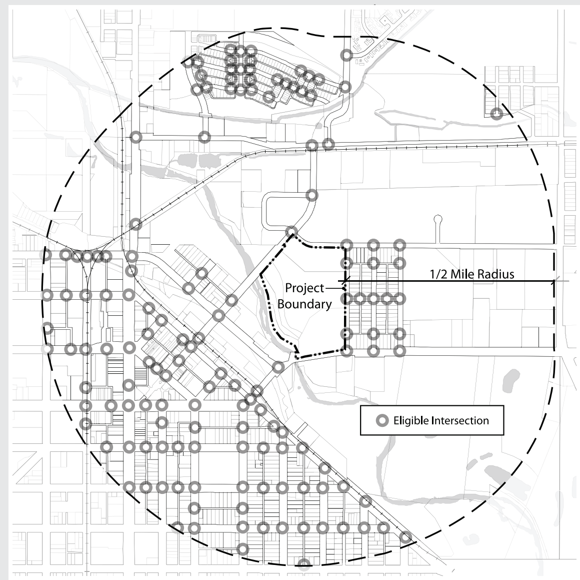


(b). Infill project site based on minimum 75% adjacent to previously developed parcels using project boundary and selected bordering parcels



(c). Infill project site based on minimum 75% of land area within 1/2 mile of project boundary being previously developed

(d). Infill project site based on minimum 140 intersections/sq.mi. within 1/2 mile of project boundary



SLL Credit 1: Preferred Locations

1–10 points

Intent

To encourage development within *existing* cities, suburbs, and towns to reduce adverse environmental and public health effects associated with sprawl. To reduce development pressure beyond the limits of existing development. To conserve natural and financial resources required for construction and maintenance of infrastructure.

Requirements

Achieve any combination of requirements in the following three options:

OPTION 1. Location Type

Locate the *project* in one of the following locations:

a. A *previously developed site* that is not an *adjacent site* or *infill site* (1 point).

b. An adjacent site that is also a previously developed site (2 points).

c. An infill site that is not a previously developed site (3 points).

d. An infill site that is also a previously developed site (5 points).

AND/OR

OPTION 2. Connectivity

Locate the project in an area that has existing *connectivity* within 1/2 mile of the *project boundary*, as listed to Table 1.

Table 1. Points for connectivity within 1/2 mile of project

Intersections per square mile	Points
≥ 200 and < 250	1
≥ 250 and < 300	2
≥ 300 and < 350	3
≥ 350 and < 400	4
≥ 400	5

Intersections within the site may be counted if the intersections were not constructed or funded by the *developer* within the past ten years.

AND/OR

OPTION 3. Designated High-Priority Locations

Achieve the following (3 points):

- Earn at least 2 points under NPD Credit 4, Mixed-Income Diverse Communities, Option 2, Affordable Housing.

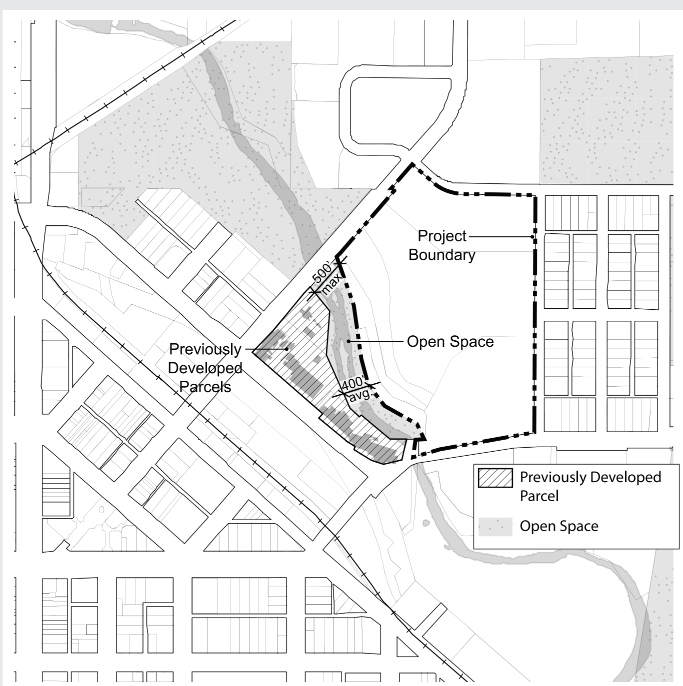
- In addition, locate the project in one of the following high-priority redevelopment areas: EPA National Priorities List, Federal Empowerment Zone, Federal Enterprise Community, Federal Renewal Community, Department of Justice Weed and Seed Strategy Community, Department of the Treasury Community Development Financial Institutions Fund Qualified Low-Income Community (a subset of the New Markets Tax Credit Program), or the U.S. Department of Housing and Urban Development's Qualified Census Tract (QCT) or Difficult Development Area (DDA).

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

adjacent site a site having at least 25% of its boundary bordering parcels that are each at least 75% *previously developed*. A *street* or other right-of-way does not constitute previously developed land; instead, it is the status of the property on the other side of the street or right-of-way that matters. Any fraction of the boundary that borders waterfront other than a stream is excluded from the calculation. A site is still considered adjacent if the 25% adjacent portion of its boundary is separated from previously developed parcels by undeveloped, permanently protected land averaging no more than 400 feet in width and no more than 500 feet in any one place. The undeveloped land must be permanently preserved as natural area, riparian corridor, *park*, greenway, agricultural land, or designated *cultural landscape*. Permanent pedestrian paths connecting the project through the protected parcels to the bordering site may be counted to meet the requirement of SLL Prerequisite 1, Option 2 (that the *project* be connected to the adjacent parcel by a through-street or nonmotorized right-of-way every 600 feet on average, provided the path or paths traverse the undeveloped land at no more than a 10% grade for walking by persons of all ages and physical abilities).

Adjacent project site based on minimum 25% of perimeter adjacent to previously developed parcels, including allowance for permanently protected land between project boundary and previously developed parcels



connectivity the number of publicly accessible intersections per square mile, including any combination of streets, dedicated alleys, transit rights-of-way, and nonmotorized rights-of-way. If one must both enter and exit an area through the same intersection, such an intersection and any intersections beyond that point are not counted; intersections leading only to culs-de-sac are also not counted. The calculation of square mileage excludes water bodies, parks larger than 1/2 acre, public facility campuses, airports, rail yards, slopes over 15%, and areas nonbuildable under codified law or the rating system. Street rights-of-way may not be excluded.

infill site a site that meets any of the following four conditions:

a. At least 75% of its boundary borders parcels that individually are at least 50% *previously developed,* and that in aggregate are at least 75% previously developed.

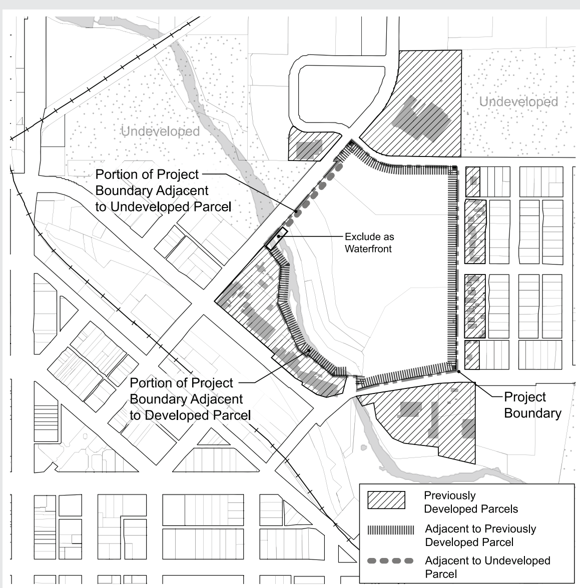
b. The site, in combination with bordering parcels, forms an aggregate parcel whose boundary is 75% bounded by parcels that individually are at least 50% previously developed, and that in aggregate are at least 75% previously developed.

c. At least 75% of the land area, exclusive of rights-of-way, within a 1/2 mile distance from the *project boundary* is previously developed.

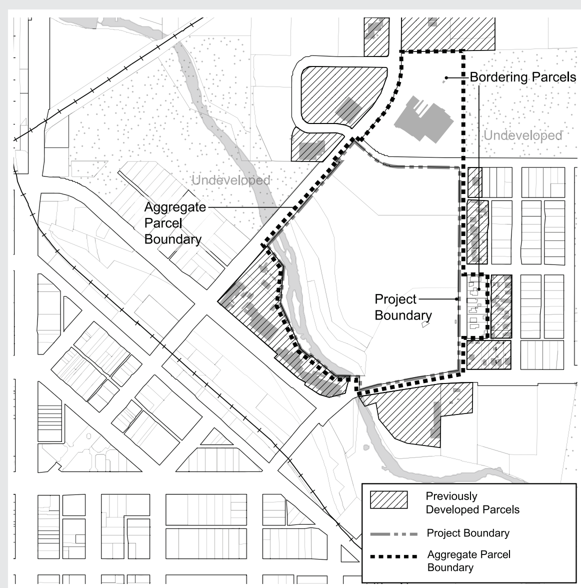
d. The lands within a 1/2 mile distance from the project boundary have a *preproject connectivity* of at least 140 intersections per square mile.

A *street* or other right-of-way does not constitute previously developed land; it is the status of property on the other side or right-of-way of the street that matters. For conditions (a) and (b) above, any fraction of the perimeter that borders waterfront other than a stream is excluded from the calculation.

(a). Infill project site based on minimum 75% of perimeter adjacent to previously developed parcels

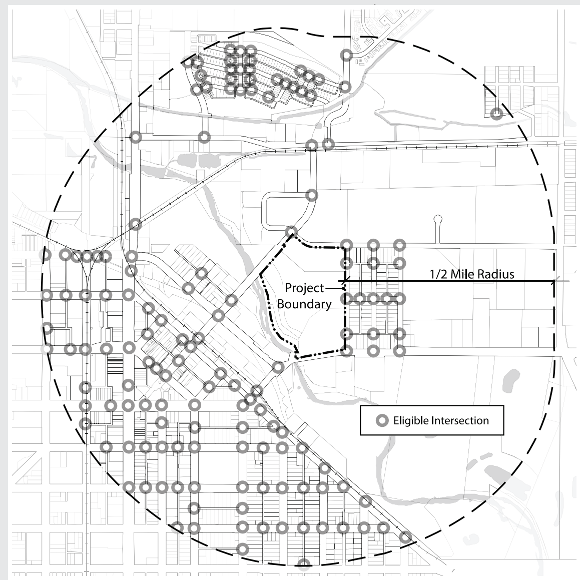


(b). Infill project site based on minimum 75% adjacent to previously developed parcels using project boundary and selected bordering parcels



(c). Infill project site based on minimum 75% of land area within 1/2 mile of project boundary being previously developed

(d). Infill project site based on minimum 140 intersections/sq.mi. within 1/2 mile of project boundary



SLL Credit 2: Brownfields Redevelopment

1–2 points

Intent

To encourage the reuse of land by developing sites that are complicated by environmental contamination, thereby reducing pressure on undeveloped land.

Requirements

OPTION 1. Brownfield Sites (1 point)

Locate the *project* on a site, part or all of which is documented as contaminated (by means of an ASTM E1903-97 Phase II Environmental Site Assessment or a local Voluntary Cleanup Program), or on a site defined as a *brownfield* by a local, state, or federal government agency; and remediate site contamination such that the controlling public authority approves the protective measures and/or cleanup as effective, safe, and appropriate for the future use of the site.

OR

OPTION 2. High-Priority Redevelopment Areas (2 points)

Achieve the requirements in Option 1;

AND

Locate the project in one of the following high-priority redevelopment areas: EPA National Priorities List, Federal Empowerment Zone, Federal Enterprise Community, Federal Renewal Community, Department of Justice Weed and Seed Strategy Community, Department of the Treasury Community Development Financial Institutions Fund Qualified Low-Income Community (a subset of the New Markets Tax Credit Program), or the U.S. Department of Housing and Urban Development's Qualified Census Tract (QCT) or Difficult Development Area (DDA).

SLL Credit 3: Locations with Reduced Automobile Dependence

1–7 points

Intent

To encourage development in locations shown to have multimodal transportation choices or otherwise reduced motor vehicle use, thereby reducing greenhouse gas emissions, air pollution, and other adverse environmental and public health effects associated with motor vehicle use.

Requirements

OPTION 1. Transit-Served Location

Locate the *project* on a site with *existing* transit service such that at least 50% of *dwelling units* and nonresidential building entrances (inclusive of existing buildings) are within a 1/4-mile *walk distance* of bus or streetcar stops, or within a 1/2-mile walk distance of *bus rapid transit* stops, light or heavy rail stations, or ferry terminals, and the transit service at those stops in aggregate meets the minimums listed in Tables 1 and 2. Both weekday and weekend trip minimums must be met to earn points at a particular threshold.

Projects larger than 125 acres can meet the requirements by locating on a site with existing transit service such that at least 40% of dwelling units and nonresidential building entrances (inclusive of existing buildings) are within a 1/4-mile walk distance of bus or streetcar stops, or within a 1/2-mile walk distance of bus rapid transit stops, lightor heavy rail stations, or ferry terminals, and the transit service at those stops in aggregate meets the minimums listed in Tables 1 and 2 (both weekday and weekend trip minimums must be met to earn points at a particular threshold), as long as the 40% complies with NPD Prerequisite 2 and any portion of the project beyond the 1/4-mile and/or 1/2-mile walk distances meets SLL Prerequisite 1, Option 3-compliant planned transit service.

Projects greater than 500 acres can meet the requirements by locating on a site with existing transit service such that at least 30% of dwelling units and nonresidential building entrances (inclusive of existing buildings) are within a 1/4-mile walk distance of bus or streetcar stops, or within a 1/2-mile walk distance of bus rapid transit stops, light or heavy rail stations, or ferry terminals, and the transit service at those stops in aggregate meets the minimums listed in Tables 1 and 2 (both weekday and weekend trip minimums must be met to earn points at a particular threshold), as long as the 30% complies with NPD Prerequisite 2 and any portion of the project beyond the 1/4-mile and/or 1/2-mile walk distances meets SLL Prerequisite 1, Option 3-compliant planned transit service.

For all projects, weekend daily trips must include service on both Saturday and Sunday. Commuter rail must serve more than one *metropolitan statistical area* (MSA) and/or the area surrounding the core of an MSA.

Table 1. Minimum daily transit service for projects with multiple transit types (bus, streetcar, rail, or ferry)

Weekday trips	Weekend trips	Points
60	40	1
76	50	2
100	65	3
132	85	4
180	130	5
246	150	6
320	200	7

Table 2. Minimum daily transit service for projects with commuter rail or ferry service only

Weekday trips	Weekend trips	Points
24	6	1
40	8	2
60	12	3

Projects served by two or more transit routes such that no one route provides more than 60% of the prescribed levels may earn 1 bonus point, up to the maximum 7 points.

Projects where existing transit service is temporarily rerouted outside the required distances for less than 2 years may meet the requirements if the local transit agency has committed to restoring the compliant routes with service at or above the prior level.

OR

OPTION 2. Metropolitan Planning Organization Location with Low VMT

Locate the project within a region served by a metropolitan planning organization (MPO) and within a transportation analysis zone (TAZ) where either a) the current annual home-based vehicle miles traveled (VMT) per capita (if TAZ is 100% residential) or b) the annual non-home-based VMT per employee (if TAZ is 100% non-residential) does not exceed 90% of the average of the equivalent metropolitan region value. The research must be derived from household or employment transportation surveys conducted by the MPO within ten years of the date of submission for LEED for Neighborhood Development certification. Additional credit may be awarded for increasing levels of performance, as indicated in Table 3. Mixed-use TAZs must use whichever TAZ VMT is greater, either residential per capita or non-residential per employee.

Table 3. Points for low-VMT location

Percentage of average regional VMT per capita	Points
81–90%	1
71–80%	2
61–70%	3
51–60%	4
41–50%	5
31–40%	6
30 or less	7
VMT = vehicle miles traveled.	

Points earned under Options 1 and 2 may not be combined.

SLL Credit 4: Bicycle Network and Storage

1 point

Intent

To promote bicycling and transportation efficiency, including reduced *vehicle miles traveled* (VMT). To support public health by encouraging utilitarian and recreational physical activity.

Requirements

BICYCLE NETWORK

Design and/or locate the *project* to meet at least one of the three requirements below:

a. An *existing bicycle network* of at least 5 continuous miles in length is within 1/4-mile bicycling distance of the *project boundary*.

b. If the project is 100% residential, an existing bicycle network begins within 1/4-mile bicycling distance of the project boundary and connects to a *school* or *employment center* within 3 miles' bicycling distance.

c. An existing bicycle network within 1/4-mile bicycling distance of the project boundary connects to at least ten diverse uses (see Appendix) within 3 miles' bicycling distance from the project boundary.

AND

BICYCLE STORAGE

Provide bicycle parking and storage capacity to new buildings as follows:

a. **Multiunit residential.** Provide at least one secure, enclosed bicycle storage space per occupant for 30% of the *planned occupancy* but no fewer than one per unit. Provide secure visitor bicycle racks on-site, with at least one bicycle space per ten *dwelling units* but no fewer than four spaces per project site.

b. **Retail.** Provide at least one secure, enclosed bicycle storage space per new retail worker for 10% of retail worker planned occupancy. Provide visitor or customer bicycle racks on-site, with at least one bicycle space per 5,000 square feet of retail space, but no fewer than one bicycle space per business or four bicycle spaces per project site, whichever is greater. Provide at least one on-site shower with changing facility for any development with 100 or more new workers and at least one additional on-site shower with changing facility for every 150 new workers thereafter.

c. **Nonresidential other than retail.** Provide at least one secure, enclosed bicycle storage space per new occupant for 10% of planned occupancy. Provide visitor bicycle racks on-site with at least one bicycle space per 10,000 square feet of new commercial nonretail space but not fewer than four bicycle spaces per building. Provide at least one on-site shower with changing facility for any development with 100 or more new workers and at least one additional on-site shower with changing facility for every 150 new workers thereafter.

Secure, enclosed bicycle storage areas must be locked and easily accessible to residents and/or workers. Provide informational signage on using the storage facilities.

Visitors' and customers' bicycle racks must be clearly visible from a main entry, located within 100 feet of the door, served with night lighting, and protected from damage from nearby vehicles. If the building has multiple main entries, bicycle racks must be proportionally dispersed within 100 feet of each.

Shower and changing facility requirements may be met by providing the equivalent of free access to on-site health club shower facilities, if the health club can be accessed without going outside. Provide informational signage on using the shower facilities.

SLL Credit 5: Housing and Jobs Proximity

1–3 points

Intent

To encourage balanced communities with a diversity of uses and employment opportunities.

Requirements

OPTION 1. Project with Affordable Residential Component (3 points)

Include a residential component equaling at least 30% of the *project*'s total building square footage (exclusive of parking structures), and locate and/or design the project such that the geographic center (or boundary if the project exceeds 500 acres) is within 1/2-mile *walk distance* of *existing* full-time-equivalent jobs whose number is equal to or greater than the number of *dwelling units* in the project; and satisfy the requirements necessary to earn at least one point under NPD Credit 4, Mixed-Income Diverse Communities, Option 2, Affordable Housing.

OR

OPTION 2. Project With Residential Component (2 points)

Include a residential component equaling at least 30% of the project's total building square footage (exclusive of parking structures), and locate and/or design the project such that the geographic center (or boundary if the project exceeds 500 acres) is within 1/2-mile walk distance of existing full-time-equivalent jobs whose number is equal to or greater than the number of dwelling units in the project.

OR

OPTION 3. Infill Project with Nonresidential Component (1 point)

Include a nonresidential component equaling at least 30% of the project's total building square footage (exclusive of parking structures), and locate on an *infill site* whose geographic center (or boundary if the project exceeds 500 acres) is within 1/2-mile walk distance of an existing rail transit, ferry, or tram stop and within 1/2-mile walk distance of existing dwelling units whose number is equal to or greater than 50% of the number of new full-time-equivalent jobs created as part of the project.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

infill site a site that meets any of the following four conditions:

a. At least 75% of its boundary borders parcels that individually are at least 50% *previously developed,* and that in aggregate are at least 75% previously developed.

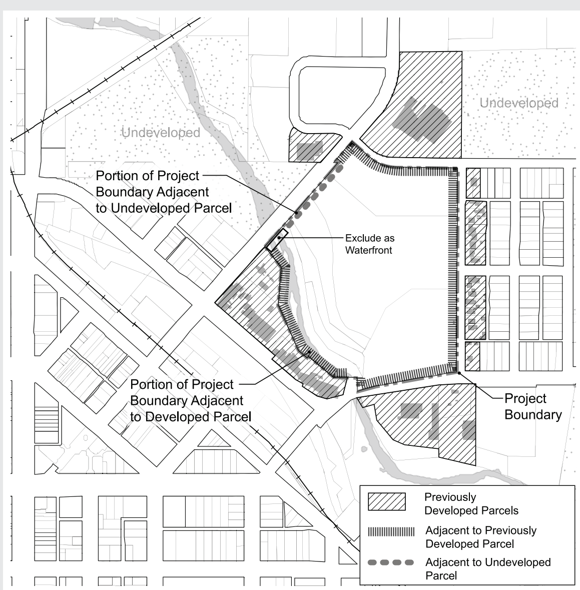
b. The site, in combination with bordering parcels, forms an aggregate parcel whose boundary is 75% bounded by parcels that individually are at least 50% previously developed, and that in aggregate are at least 75% previously developed.

c. At least 75% of the land area, exclusive of rights-of-way, within a 1/2 mile distance from the *project boundary* is previously developed.

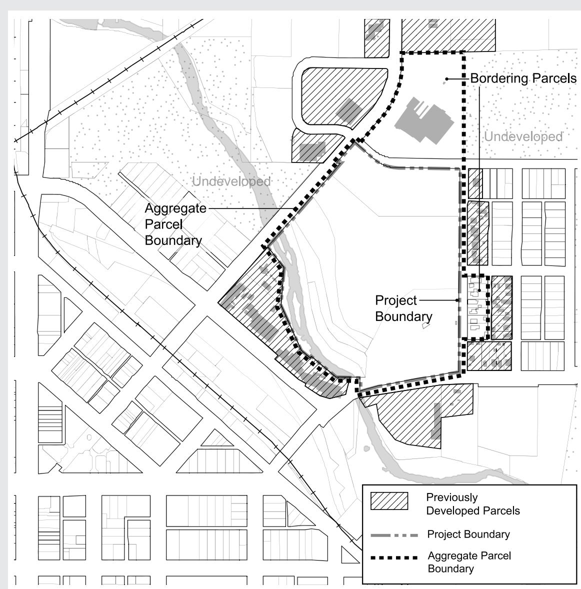
d. The lands within a 1/2 mile distance from the project boundary have a *preproject connectivity* of at least 140 intersections per square mile.

A *street* or other right-of-way does not constitute previously developed land; it is the status of property on the other side or right-of-way of the street that matters. For conditions (a) and (b) above, any fraction of the perimeter that borders waterfront other than a stream is excluded from the calculation.

(a). Infill project site based on minimum 75% of perimeter adjacent to previously developed parcels

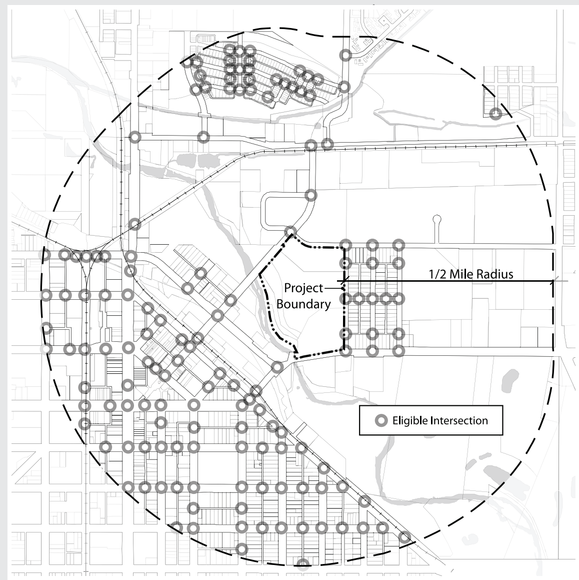


(b). Infill project site based on minimum 75% adjacent to previously developed parcels using project boundary and selected bordering parcels



(c). Infill project site based on minimum 75% of land area within 1/2 mile of project boundary being previously developed

(d). Infill project site based on minimum 140 intersections/sq.mi. within 1/2 mile of project boundary



SLL Credit 6: Steep Slope Protection

1 point

Intent

To minimize erosion to protect habitat and reduce stress on natural water systems by preserving steep slopes in a natural, vegetated state.

Requirements

FOR ALL PROJECTS

All options apply to *existing* natural or constructed slopes. Portions of *project* sites with slopes up to 20 feet in elevation, measured from toe (a distinct break between a 40% slope and lesser slopes) to top, that are more than 30 feet in any direction from another slope greater than 15% are exempt from the requirements, although more restrictive local regulations may apply.

OPTION 1. No Disturbance of Slopes Over 15%

Locate on a site that has no existing slopes greater than 15%, or avoid disturbing portions of the site that have existing slopes greater than 15%.

OR

OPTION 2. Previously Developed Sites with Slopes Over 15%

On portions of *previously developed sites* with existing slopes greater than 15%, restore the slope area with *native plants* or noninvasive *adapted plants* according to Table 1.

Table 1. Required restoration area of slope

Slope	Restoration
> 40%	100%
26% to 40%	60%
< 15% to 25%	40%

In addition, develop *covenants, conditions, and restrictions* (CC&R); development agreements; or other binding documents that will protect the specified steep slope areas in perpetuity. Comply with the requirements of Option 3 on any slope over 15% that has not been previously developed.

OR

OPTION 3. Sites Other than Previously Developed Sites with Slopes Over 15%

On sites that are not previously developed sites, protect existing slopes over 15% as follows:

a. Do not disturb slopes greater than 40% and do not disturb portions of the project site within 50 feet horizontally of the top of the slope and 75 feet horizontally from the toe of the slope.

b. Limit development to no more than 40% of slopes between 25% and 40% and to no more than 60% of slopes between 15% and 25%.

c. Locate development such that the percentage of the *development footprint* that is on existing slopes less than 15% is greater than the percentage of *buildable land* that has existing slopes less than 15%.

d. Develop CC&R, development agreements, or other binding documents that will protect steep slopes in perpetuity.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

buildable land the portion of the site where construction can occur, including land voluntarily set aside and not constructed upon. When used in *density* calculations, buildable land excludes public rights-of-way and land excluded from development by codified law or LEED for Neighborhood Development prerequisites. An *applicant* may exclude additional land not exceeding 15% of the buildable land base defined above, provided the following conditions are present:

a. The land is protected from residential and nonresidential construction by easement, deed restriction, or other enforceable legal instrument.

AND

b. Either 25% or more of the boundary of each contiguous parcel proposed for exclusion borders a *water body* or areas outside the *project boundary* that are protected by codified law; or ownership of, or management authority over, the exclusion area is transferred to a public entity.

SLL Credit 7: Site Design for Habitat or Wetland and Water Body Conservation

1 point

Intent

To conserve *native plants*, wildlife habitat, *wetlands*, and *water bodies*.

Requirements

OPTION 1. Sites without Significant Habitat or Wetlands and Water Bodies

Locate the *project* on a site that does not have significant habitat, as defined in Option 2 of this credit, or land within 100 feet of such habitat, and fulfill the requirements of Options 1 or 2(a) under SLL Prerequisite 3, Wetland and Water Body Conservation.

OR

OPTION 2. Sites with Significant Habitat

Work with both the state's Natural Heritage Program and the state fish and wildlife agency to delineate identified significant habitat on the site. Do not disturb significant habitat or portions of the site within an appropriate buffer around the habitat. The geographic extent of the habitat and buffer must be identified by a qualified biologist, a nongovernmental conservation organization, or the appropriate state or regional agency. Protect significant habitat and its identified buffers from development in perpetuity by donating or selling the land, or a conservation easement on the land, to an accredited land trust or relevant public agency (a deed covenant is not sufficient to meet this requirement). Identify and commit to ongoing management activities, along with parties responsible for management and funding available, so that habitat is maintained in *preproject* condition or better for a minimum of three years after the project is built out. The requirement for identifying ongoing management activities may also be met by earning SLL Credit 9, Long-Term Conservation Management of Wetlands and Water Bodies.

Significant habitat for this credit includes the following:

a. Habitat for species that are listed or are candidates for listing under state or federal endangered species acts, habitat for species of special concern in the state, and/or habitat for those species and/or ecological communities classified as GH, G1, G2, G3, and/or S1 and S2 species by NatureServe.

b. Locally or regionally significant habitat of any size, or patches of predominantly native vegetation at least 150 acres (even if some of the 150 acres lies outside the *project boundary*).

c. Habitat flagged for conservation under a regional or state conservation or green infrastructure plan.

OR

OPTION 3. Sites with Wetlands and Water Bodies

Design the project to conserve 100% of all water bodies, wetlands, land within 100 feet of water bodies, and land within 50 feet of wetlands on the site. Using a qualified biologist, conduct an assessment, or compile *existing* assessments, showing the extent to which those water bodies and/or wetlands perform the following functions: (1) water quality maintenance, (2) wildlife habitat protection, and (3) hydrologic function maintenance, including flood protection. Assign appropriate buffers (not less than 100 feet for water bodies and 50 feet for wetlands) based on the functions provided, contiguous soils and slopes, and contiguous land uses. Do not disturb wetlands, water bodies, and their buffers, and protect them from development in perpetuity by donating or selling the land, or a conservation easement on the land, to an accredited land trust or relevant public agency (a deed covenant is not sufficient to meet this requirement). Identify and commit to ongoing management activities, along with parties responsible for management and funding available, so that habitat is maintained in preproject condition or better for a minimum of three years after the project is built out. The requirement for identifying ongoing management activities may also be met by earning SLL Credit 9, Long-Term Conservation Management of Wetlands and Water Bodies. The project does not meet the requirements if it has negative effects on habitat for species identified in Option 2(a).

FOR ALL PROJECTS

The following features are not considered wetlands, water bodies, or buffer land that must be protected:

a. *Previously developed* land.

b. Man-made water bodies (such as industrial mining pits, concrete-lined canals, or stormwater retention ponds) that lack natural edges and floors or native ecological communities in the water and along the edge

c. Man-made linear wetlands that result from the interruption of natural drainages by existing rights-of-way.

d. Wetlands that were created incidentally by human activity and have been rated "poor" for all measured wetland functions. Wetland quality assessment must be performed by a qualified biologist using a method that is accepted by state or regional permitting agencies.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

previously developed altered by paving, construction, and/or land use that would typically have required regulatory permitting to have been initiated (alterations may exist now or in the past). Previously developed land includes a platted lot on which a building was constructed if the lot is no more than 1 acre; previous development on lots larger than 1 acre is defined as the *development footprint* and land alterations associated with the footprint. Land that is not previously developed and altered landscapes resulting from current or historical clearing or filling, agricultural or forestry use, or preserved natural area use are considered undeveloped land. The date of previous development permit issuance constitutes the date of previous development, but permit issuance in itself does not constitute previous development.

SLL Credit 8: Restoration of Habitat or Wetlands and Water Bodies

1 point

Intent

To restore *native plants*, wildlife habitat, *wetlands*, and *water bodies* that have been harmed by previous human activities.

Requirements

Using only native plants, restore *predevelopment* native ecological communities, water bodies, or wetlands on the *project* site in an area equal to or greater than 10% of the *development footprint*. Work with a qualified biologist to ensure that restored areas will have the native species assemblages, hydrology, and other habitat characteristics that likely occurred in predevelopment conditions. Protect such areas from development in perpetuity by donating or selling the land, or a conservation easement on the land, to an accredited land trust or relevant public agency (a deed covenant is not sufficient to meet this requirement). Identify and commit to ongoing management activities, along with parties responsible for management and funding available, so that restored areas are maintained for a minimum of three years after the project is built out or the restoration is completed, whichever is later. The requirement for identifying ongoing management activities may also be met by earning SLL Credit 9, Long-Term Conservation Management of Wetlands and Water Bodies. The project does not meet the requirements if it has negative effects on habitat for species identified in Option 2(a) of SLL Credit 7, Site Design for Habitat or Wetland and Water Body Conservation.

SLL Credit 9: Long-Term Conservation Management of Habitat or Wetlands and Water Bodies

1 point

Intent

To conserve *native plants*, wildlife habitat, *wetlands*, and *water bodies*.

Requirements

Create and commit to implementing a long-term (at least ten-year) management plan for new or *existing* on-site native habitats, water bodies, and/or wetlands and their buffers, and create a guaranteed funding source for management. Involve a qualified biologist or a professional from a natural resources agency or natural resources consulting firm in writing the management plan and conducting or evaluating the ongoing management. The plan must include biological objectives consistent with habitat and/or water resource conservation, and it must identify (1) procedures, including personnel to carry them out, for maintaining the conservation areas; (2) estimated implementation costs and funding sources; and (3) threats that the *project* poses for habitat and/or water resources within conservation areas (e.g., introduction of exotic species, intrusion of residents in habitat areas) and measures to substantially reduce those threats. The project does not meet the requirements if it has negative effects on habitat for species identified in Option 2(a) of SLL Credit 7, Site Design for Habitat or Wetland and Water Body Conservation.

NPD Prerequisite 1: Walkable Streets

Required

Intent
To promote transportation efficiency, including reduced *vehicle miles traveled* (VMT). To promote walking by providing safe, appealing, and comfortable *street* environments that support public health by reducing pedestrian injuries and encouraging daily physical activity.

Requirements
Design and build the *project* to achieve all of the following:

a. For 90% of new building frontage, a principal *functional entry* on the front façade faces a public space, such as a street, square, *park*, *paseo*, or *plaza*, but not a parking lot, and is connected to sidewalks or equivalent provisions for walking. The square, park, or plaza must be at least 50 feet wide at a point perpendicular to each entry.

b. At least 15% of *existing* and new street frontage within and bordering the project has a minimum building-height-to-street-width ratio of 1:3 (i.e., a minimum of 1 foot of building height for every 3 feet of street width).

   - Nonmotorized rights-of-way may be counted toward the 15% requirement, but 100% of such spaces must have a minimum building-height-to-street-width ratio of 1:1.
   - Projects with bordering street frontage must meet only their proportional share of the height-to-width ratio (i.e., only on the project side of the street).
   - Street frontage is measured in linear feet.
   - Building height is measured to eaves or the top of the roof for a flat-roof structure, and street width is measured façade to façade. For building frontages with multiple heights, use the weighted average height of all frontage segments based on each segment's height weighted by the segment's share of total building width.
   - *Alleys* and driveways are excluded.

c. Continuous sidewalks or equivalent all-weather provisions for walking are provided along both sides of 90% of streets or frontage within the project, including the project side of streets bordering the project. New sidewalks, whether adjacent to streets or not, must be at least 8 feet wide on retail or mixed-use blocks and at least 4 feet wide on all other blocks. Equivalent provisions for walking include *woonerfs* and all-weather-surface footpaths. Alleys, driveways, and reconstructed existing sidewalks are excluded from these calculations.

d. No more than 20% of the street frontages within the project are faced directly by garage and service bay openings.

Projects in a designated *historic district* subject to review by a local historic preservation entity are exempt from (b), (c), and (d) if approval for compliance is not granted by the review body. Projects in historic districts listed in or eligible for listing in a state register or the National Register of Historic Places that are subject to review by a state historic preservation office or the National Park Service are exempt from (b), (c), and (d) if approval for compliance is not granted. If the public space is a square, park, or plaza, it must be at least 50 feet deep, measured at a point perpendicular to each entry.

NPD Prerequisite 2: Compact Development

Required

Intent

To conserve land. To promote livability, walkability, and transportation efficiency, including reduced *vehicle miles traveled* (VMT). To leverage and support transit investments. To reduce public health risks by encouraging daily physical activity associated with walking and bicycling.

Requirements

OPTION 1. Projects in Transit Corridors

For *projects* with e*xisting* and/or planned transit service (i.e., service with the funding commitments specified in SLL Prerequisite 1, Smart Location) that meets or exceeds the 2-point threshold in SLL Credit 3, Locations with Reduced Automobile Dependence, Option 1, build at the following densities, based on the *walk distances* to the transit service specified in SLL Credit 3:

a. For residential components located within the walk distances: 12 or more *dwelling units* per acre of buildable land available for residential uses.

b. For residential components falling outside the walk distances: 7 or more dwelling units per acre of buildable land available for residential uses.

c. For nonresidential components located within the walk distances: 0.80 *floor-area ratio* (FAR) or greater of buildable land available for nonresidential uses.

d. or nonresidential components falling outside the walk distances: 0.50 FAR or greater of buildable land available for nonresidential uses.

If the project location is served by a transit agency that has specified guidelines for minimum service densities that are greater than the densities required by this prerequisite, the project must achieve those service densities instead.

OR

OPTION 2. All Other Projects

Build any residential components of the project at a *density* of 7 dwelling units per acre of *buildable land* available for residential uses.

AND

Build any nonresidential components of the project at a density of 0.50 FAR or greater of buildable land available for nonresidential uses.

FOR ALL PROJECTS

Density calculations include all planned and existing buildings within the *project boundary*, excluding those portions of parking structures devoted exclusively to parking.

The specified density must be achieved within five years of the date that the first building of any type is occupied.

If one component of the project, residential or nonresidential, meets the minimum density requirement but the other component does not, include only the qualifying density. Use that component's dwelling units or nonresidential floor area in the numerator and the total buildable land area in the denominator. If the resulting density meets the minimum requirement, the prerequisite is achieved.

NPD Prerequisite 3: Connected and Open Community

Required

Intent

To promote *projects* that have high levels of internal *connectivity* and are well connected to the community at large. To encourage development within *existing* communities that promote transportation efficiency through multimodal transportation. To improve public health by encouraging daily physical activity.

Requirements

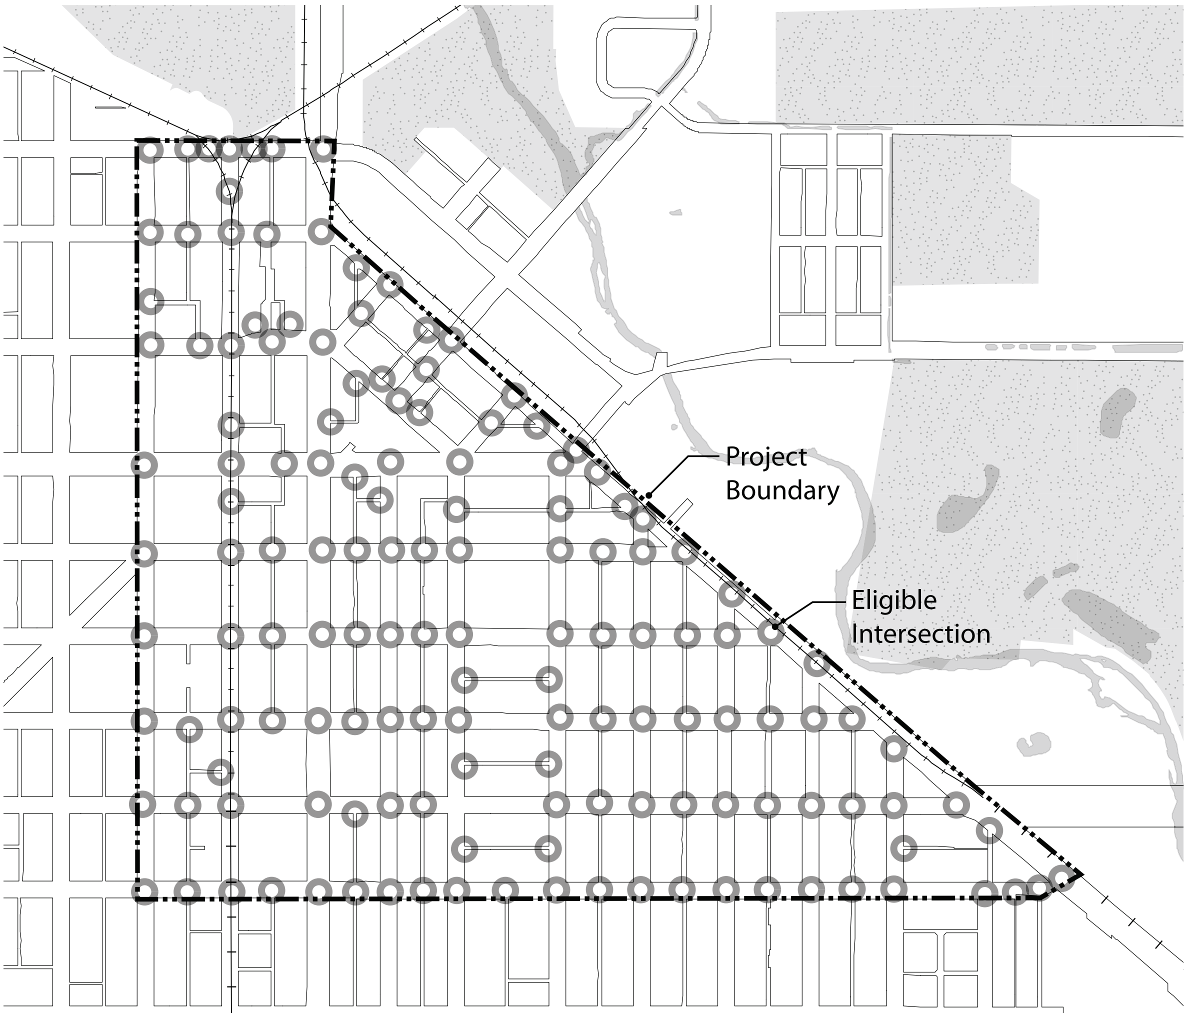
OPTION 1. Projects with Internal Streets

Design and build the project such that its internal connectivity is at least 140 intersections per square mile. All *streets* and sidewalks that are counted toward the connectivity requirement must be available for general public use and not gated. Gated areas are not considered available for public use, with the exception of education and health care campuses and military bases where gates are used for security purposes.

AND

Design and build the project with at least one through-street and/or nonmotorized right-of-way intersecting or terminating at the *project boundary* at least every 800 feet, or at existing abutting street intervals and intersections, whichever is the shorter distance. Nonmotorized rights-of-way may count for no more than 20% of the total. This does not apply to portions of the boundary where connections cannot be made because of physical obstacles, such as prior platting of property, construction of existing buildings or other barriers, slopes over 15%, *wetlands* and *water bodies*, railroad and utility rights-of-way, existing limited-access motor vehicle rights-of-way, and parks and dedicated open space.

Figure 1. Project site design with 140 eligible intersections per square mile on streets that are not gated

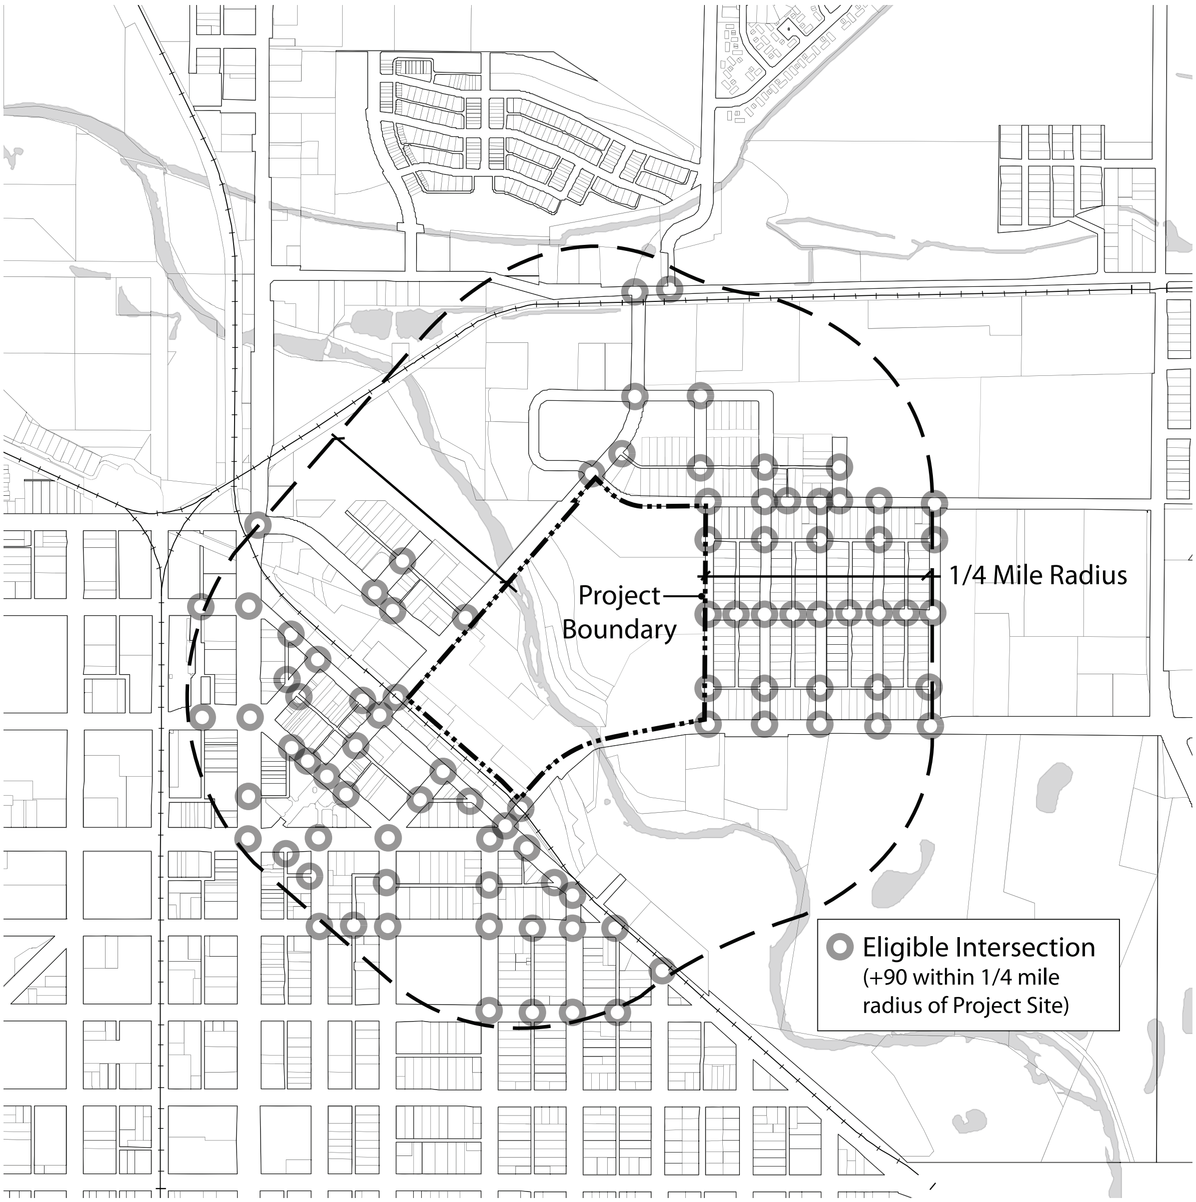


OR

OPTION 2. Projects without Internal Streets

Locate the project such that the connectivity of the existing streets within 1/4 mile of the project boundary is at least 90 intersections per square mile. All streets and sidewalks that are counted toward the connectivity requirement must be available for general public use and not gated. Gated areas are not considered available for public use, with the exception of education and health care campuses and military bases where gates are used for security purposes.

Figure 2. Project site with at least 90 eligible intersections per square mile within 1/4 mile of project boundary



Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

connectivity the number of publicly accessible intersections per square mile, including any combination of streets, dedicated alleys, transit rights-of-way, and nonmotorized rights-of-way. If one must both enter and exit an area through the same intersection, such an intersection and any intersections beyond that point are not counted; intersections leading only to culs-de-sac are also not counted. The calculation of square mileage excludes water bodies, parks larger than 1/2 acre, public facility campuses, airports, rail yards, slopes over 15%, and areas nonbuildable under codified law or the rating system. Street rights-of-way may not be excluded.

NPD Credit 1: Walkable Streets

1–12 points

Intent

To promote transportation efficiency, including reduced *vehicle miles traveled* (VMT). To promote walking by providing safe, appealing, and comfortable *street* environments that support public health by reducing pedestrian injuries and encouraging daily physical activity.

Requirements

A *project* may earn a maximum of 12 points according to the schedule in Table 1:

Table 1. Points for walkable street features

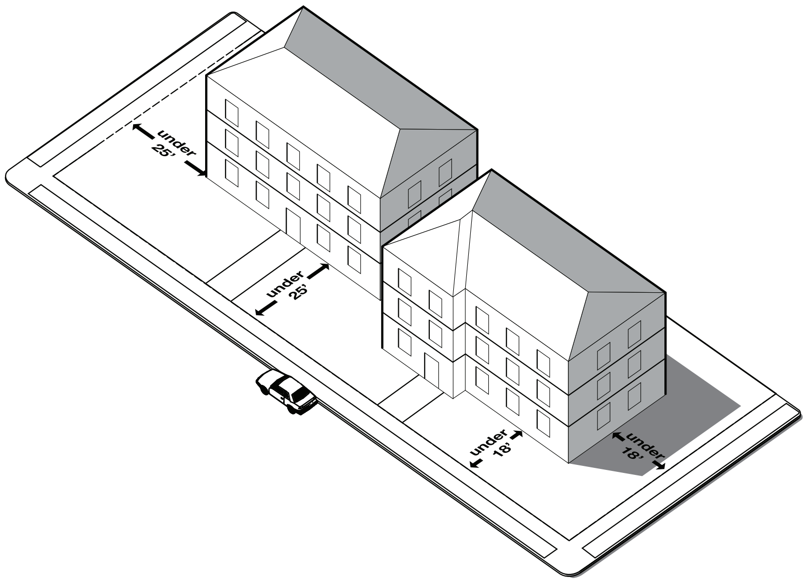
Items achieved	Points
2–3	1
4–5	2
6–7	3
8–9	4
10	7
11	8
12	9
13	10
14	11
15–16	12

Façades and Entries

a. At least 80% of the total linear feet of street-facing building façades in the project is no more than 25 feet from the property line.

b. At least 50% of the total linear feet of street-facing building façades in the project is no more than 18 feet from the property line.

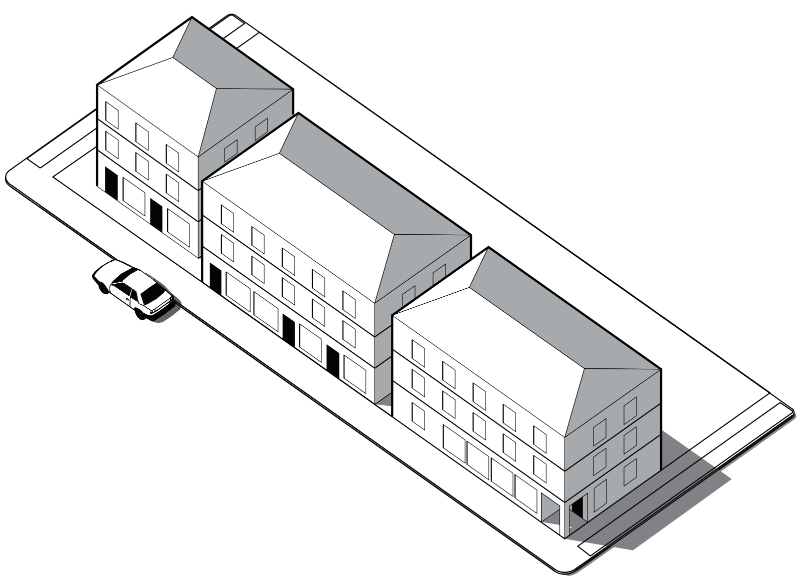
Figure 1. Minimal street-facing building façade setbacks



c. At least 50% of the total linear feet of mixed-use and nonresidential street-facing building façades in the project is within 1 foot of a sidewalk or equivalent provision for walking.

d. *Functional entries* to the building occur at an average of 75 feet or less along nonresidential or mixed-use buildings or *blocks*.

Figure 2. Functional building entries at minimum average distances along blocks



e. Functional entries to the building occur at an average of 30 feet or less along nonresidential or mixed-use buildings or blocks (items d and e are cumulative).

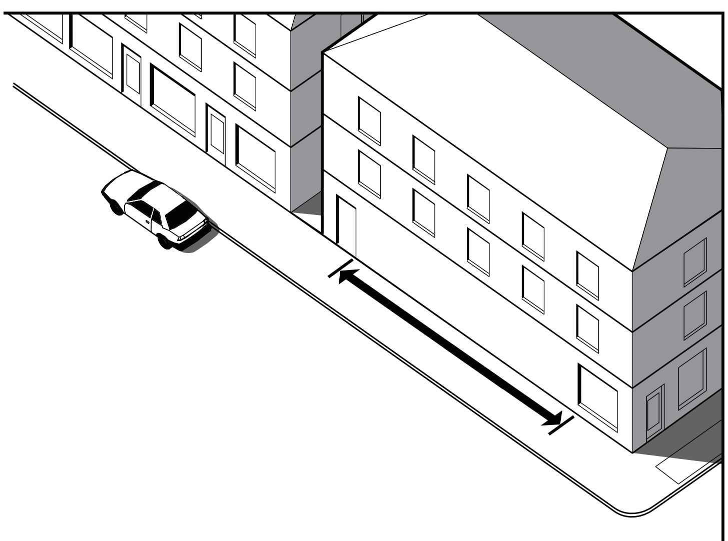
Ground-Level Use and Parking

f. All ground-level retail, service, and trade uses that face a public space have clear glass on at least 60% of their façades between 3 and 8 feet above grade.

Figure 3. Ground-level retail and service uses with minimum amounts of clear glass façades

g. If a façade extends along a sidewalk, no more than 40% of its length or 50 feet, whichever is less, is blank (without doors or windows).

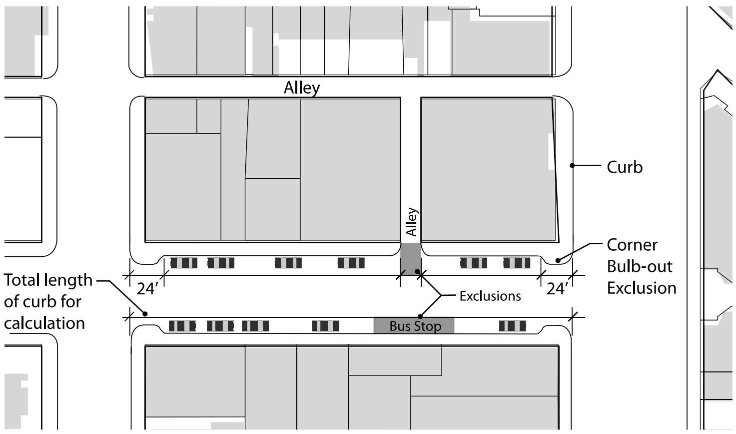
Figure 4. Limits on length of blank walls along sidewalks



h. Any ground-level retail, service, or trade windows must be kept visible (unshuttered) at night; this must be stipulated in *covenants, conditions, and restrictions* (CC&R) or other binding documents.

i. On-street parking is provided on a minimum of 70% of both sides of all new and *existing* streets, including the project side of bordering streets. The percentage of on-street parking is calculated by dividing the length of street designated for parking by the total length of the curb along each street, including curb cuts, driveways, and intersection radii. Space within the parking lane that is occupied by corner bulb-outs (within 24 feet of an intersection), transit stops, and motorcycle or bicycle parking may be counted as designated for parking in this calculation. *Woonerfs* are not considered streets for this subsection.

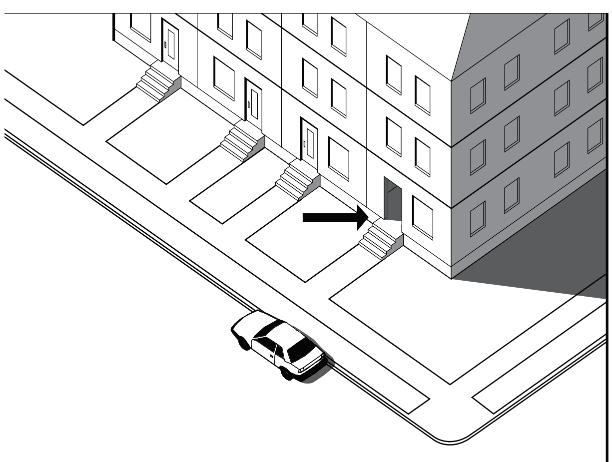
Figure 5. On-street parking requirements



j. Continuous sidewalks or equivalent provisions for walking are available along both sides of all streets within the project, including the project side of streets bordering the project. New sidewalks, whether adjacent to streets or not, must be at least 10 feet wide on retail or mixed-use blocks and at least 5 feet wide on all other blocks. Equivalent provisions for walking include woonerfs and all-weather-surface footpaths at least 5 feet wide. Note that these requirements specify wider sidewalks than required by NPD Prerequisite 1, Walkable Streets.

k. If the project has ground-floor *dwelling units*, the principal floor of at least 50% of those units must have an elevated finished floor no less than 24 inches above the sidewalk grade. Below-grade basement spaces and/or *accessory dwelling units* are exempt from this requirement.

Figure 6. Minimal above-grade entrance requirements



l. In nonresidential or mixed-use projects, 50% or more of the total number of office buildings include ground-floor retail along 60% of the length of the street-level façade; 100% of mixed-use buildings include ground-floor retail, live-work spaces, and/or ground-floor dwelling units along at least 60% of the street-level façade; and all businesses and/or other community services on the ground floor are accessible directly from sidewalks along a public space, such as a street, square, paseo, or plaza, but not a parking lot.

m. At least 40% of all street frontage within the project has a minimum building-height-to-street-width ratio of 1:3 (i.e., a minimum of 1 foot of building height for every 3 feet of street width).

- Nonmotorized rights-of-way may be counted toward the 40% requirement, but 100% of such spaces must have a minimum 1:1 ratio of building height to street width.
- Projects with bordering street frontage must meet only their proportional share of the height-to-width ratio (i.e., only on the project side of the street).
- Street frontage is measured in linear feet.
- Building height is measured to eaves or the top of the roof for a flat-roof structure, and street width is measured façade to façade. For building frontages with multiple heights, use the weighted average height of all frontage segments based on each segment's height weighted by the segment's share of total building width.
- *Alleys* and driveways are excluded.

Design Speeds for Safe Pedestrian and Bicycle Travel

n. 75% of residential-only streets within the project are designed for a target speed of no more than 20 mph (existing streets may be exempted from calculations).

o. 70% of nonresidential and/or mixed-use streets within the project are designed for a target speed of no more than 25 mph. A multiway boulevard, with travel lanes separated from access lanes by medians, may apply this requirement to its outer access lanes only (through-lanes are exempt), provided pedestrian crosswalks are installed across the boulevard at intervals no greater than 800 feet (existing streets may be exempted from calculations).

Sidewalk Intrusions

p. At-grade crossings with driveways account for no more than 10% of the length of sidewalks within the project.

NPD Credit 2: Compact Development

1–6 points

Intent

To encourage development in *existing* areas to conserve land and protect farmland and wildlife habitat. To promote livability, walkability, and transportation efficiency, including reduced *vehicle miles traveled* (VMT). To improve public health encouraging daily physical activity associated with alternative modes of transportation and compact development.

Requirements

Design and build the *project* such that residential and nonresidential components achieve the *densities* per acre of *buildable land* listed in Table 1 (excluding those portions of parking structures devoted to parking).

Table 1. Points for density per acre of buildable land

Residential density (DU/acre)	Nonresidential density (FAR)	Points
> 10 and ≤ 13	> 0.75 and ≤ 1.0	1
> 13 and ≤ 18	> 1.0 and ≤ 1.25	2
> 18 and ≤ 25	> 1.25 and ≤ 1.75	3
> 25 and ≤ 38	> 1.75 and ≤ 2.25	4
> 38 and ≤ 63	> 2.25 and ≤ 3.0	5
> 63	> 3.0	6
DU = dwelling unit; FAR = floor-area ratio.		

The specified densities must be achieved within five years of the date that the first building of any type is occupied.

The scoring of a mixed-use project is calculated with a weighted average, according to the following steps.

1. Determine the total square footage of all residential and nonresidential uses.
2. Calculate the percentage residential and percentage nonresidential of the total square footage.
3. Determine the density of each component as measured in *dwelling units* per acre and *floor-area ratio*, respectively.
4. Referring to Table 1, find the appropriate points for the densities of the residential and nonresidential components.
5. If the points are different, multiply the point value of the residential component by its percentage of the total square footage and multiply the point value of the nonresidential component by its percentage.
6. Add the two scores.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

buildable land the portion of the site where construction can occur, including land voluntarily set aside and not constructed upon. When used in *density* calculations, buildable land excludes public rights-of-way and land excluded from development by codified law or LEED for Neighborhood Development prerequisites. An *applicant* may exclude additional land not exceeding 15% of the buildable land base defined above, provided the following conditions are present:

a. The land is protected from residential and nonresidential construction by easement, deed restriction, or other enforceable legal instrument.

AND

b. Either 25% or more of the boundary of each contiguous parcel proposed for exclusion borders a *water body* or areas outside the *project boundary* that are protected by codified law; or ownership of, or management authority over, the exclusion area is transferred to a public entity.

NPD Credit 3: Mixed-Use Neighborhood Centers

1–4 points

Intent

To cluster diverse land uses in accessible neighborhood and regional centers to encourage daily walking, biking, and transit use, reduce *vehicle miles traveled* (VMT) and automobile dependence, and support car-free living.

Requirements

FOR ALL PROJECTS

Locate and/or design the *project* such that 50% of its *dwelling units* are within a 1/4-mile *walk distance* of the number of diverse uses (see Appendix) in Table 1, including at least one use from each of the four categories. For projects with no dwellings, 50% of dwelling units within 1/4 mile of the *project boundary* must be within a 1/4-mile walk distance of the number of diverse uses specified in Table 1, including at least one food retail store and at least one establishment from each of two other categories. Establishments may be inside or outside the project and may be *existing* or *planned diverse uses*.

The specified number of diverse uses must be in place by the time of occupancy according to the percentages indicated in Table 1 (exclusive of portions of parking structures devoted to parking):

Table 1. Points for diverse uses within 1/4-mile walk distance, by time of occupancy

Diverse uses	Percentage occupancy of total square footage	Points
4–6	20%	1
7–10	30%	2
11–18	40%	3
≥ 19	50%	4

Per neighborhood center, the following restrictions apply:

a. A single establishment may not be counted in two categories or as two types of diverse use (e.g., a place of worship may be counted only once even if it also contains a daycare facility, and a retail store may be counted only once even if it sells products in several categories).

b. Establishments in a mixed-use building may each count if they are distinctly operated enterprises with separate exterior entrances, but no more than half of the minimum number of diverse uses can be situated in a single building or under a common roof.

c. Only two establishments of a single type may be counted (e.g., if five restaurants are within the required distance, only two may be counted).

FOR PROJECTS 40 ACRES OR GREATER

Cluster diverse uses into neighborhood centers as follows:

Table 2. Points for clustering of diverse uses

Diverse uses	Minimum uses per neighborhood center	Points
4–6	3	1
7–10	5	2
11–18	7	3
≥ 19	9	4

Within each neighborhood center, the principal entries of the establishments must be within a 300-foot walk distance from a single common point that represents the center of the cluster (1 or 2 points) or within a 400-foot walk distance (3 or 4 points).

Also, projects with multiple centers must determine points earned based on the number of uses in the centers weighted by the percentage of total dwelling units within a 1/4-mile walk distance from each center's common point.

AND

FOR PROJECTS WITH REGIONAL-SERVING RETAIL OF 150,000 OR MORE SQUARE FEET

Projects with retail uses totaling 150,000 or more square feet, if they have at least one retail establishment totaling 75,000 or more square feet, must also earn a minimum of 1 point under SLL Credit 3, Reduced Automobile Dependence, Option 1, Transit-Served Location (planned transit service can be counted), and for every additional 50,000 square feet of retail above 150,000 square feet, must earn 1 additional point under SLL Credit 3.

If transit service is planned but not yet operational, the project must demonstrate one of the following:

a. The relevant transit agency has a signed full funding grant agreement with the Federal Transit Administration that includes a revenue operations date for the start of transit service. The revenue operations date must be no later than the occupancy date of 50% of the project's total building square footage.

b. For bus, streetcar, *bus rapid transit*, or ferry service, the transit agency must certify that it has an approved budget that includes specifically allocated funds sufficient to provide the planned service at the levels listed above and that service at these levels will commence no later than occupancy of 50% of the project's total building square footage.

c. For rail service other than streetcars, the transit agency must certify that preliminary engineering for a rail line has commenced. In addition, the service must meet either of these two requirements:

   - A state legislature or local subdivision of the state has authorized the transit agency to expend funds to establish rail transit service that will commence no later than occupancy of 50% of the project's total building square footage.

   OR

   - A municipality has dedicated funding or reimbursement commitments from future tax revenue for the development of stations, platforms, or other rail transit infrastructure that will service the project no later than occupancy of 50% of the project's total building square footage.

NPD Credit 4: Mixed-Income Diverse Communities

1–7 points

Intent

To promote socially equitable and engaging communities by enabling residents from a wide range of economic levels, household sizes, and age groups to live in a community.

Requirements

Meet the requirements of one or more options below.

OPTION 1. Diversity of Housing Types

Include a sufficient variety of housing sizes and types in the *project* such that the total variety of planned and *existing* housing within the project achieves a Simpson Diversity Index score greater than 0.5, using the housing categories below. Projects of less than 125 acres may calculate the Simpson Diversity Index for the area within 1/4 mile of the project's geographic center. The Simpson Diversity Index calculates the probability that any two randomly selected *dwelling units* in a project will be of a different type.

Score = $1- \sum (n/N)^2$

where n = the total number of dwelling units in a single category, and N = the total number of dwelling units in all categories.

Table 1. Points for housing diversity

Simpson Diversity Index score	Points
> 0.5 to < 0.6	1
≥ 0.6 to < 0.7	2
≥ 0.7	3

Housing categories are defined according to the dwelling unit's net square footage, exclusive of any garage, as listed in Table 2.

Table 2. Housing categories

Type	Square feet
Detached residential, large	> 1,250
Detached residential, small	≤ 1,250
Duplex or townhouse, large	> 1,250
Duplex or townhouse, small	≤ 1,250
Dwelling unit in multiunit building with no elevator, large	> 1,250
Dwelling unit in multiunit building with no elevator, medium	> 750 to ≤ 1,250
Dwelling unit in multiunit building with no elevator, small	≤ 750
Dwelling unit in multiunit building with elevator, 4 stories or fewer, large	> 1,250
Dwelling unit in multiunit building with elevator, 4 stories or fewer, medium	> 750 to ≤ 1,250
Dwelling unit in multiunit building with elevator, 4 stories or fewer, small	≤ 750
Dwelling unit in multiunit building with elevator, 5 to 8 stories, large	> 1,250
Dwelling unit in multiunit building with elevator, 5 to 8 stories, medium	> 750 to ≤ 1,250
Dwelling unit in multiunit building with elevator, 5 to 8 stories, small	≤ 750
Dwelling unit in multiunit building with elevator, 9 stories or more, large	> 1,250
Dwelling unit in multiunit building with elevator, 9 stories or more, medium	> 750 to ≤ 1,250
Dwelling unit in multiunit building with elevator, 9 stories or more, small	≤ 750
Live-work space, large	> 1,250
Live-work space, small	≤ 1,250
Accessory dwelling unit, large	> 1,250
Accessory dwelling unit, small	≤ 1,250

For the purposes of this credit, townhouse and live-work units may have individual ground-level entrances and/or be within a multiunit or mixed-use building. Double counting is prohibited; each dwelling may be classified in only one category. The number of stories in a building is inclusive of the ground floor regardless of its use.

AND/OR

OPTION 2. Affordable Housing

Include a proportion of new rental and/or for-sale dwelling units priced for households earning below the *area median income* (AMI). Rental units must be maintained at affordable levels for a minimum of 15 years. Existing dwelling units are exempt from requirement calculations. A maximum of 3 points may be earned by meeting any combination of thresholds in Table 3.

Table 3. Points for affordable housing

Rental dwelling units				For-sale dwelling units			
Priced up to 60% AMI		Priced up to 80% AMI		Priced up to 100% AMI		Priced up to 120% AMI	
Percentage of total rental units	**Points**	Percentage of total rental units	**Points**	Percentage of total for-sale units	**Points**	Percentage of total for-sale units	**Points**
5	**1**	10	**1**	5	**1**	8	**1**
10	**2**	15	**2**	10	**2**	12	**2**
15	**3**	25	**3**	15	**3**	--	**--**
AMI = area median income.							

AND/OR

OPTION 3. Mixed-Income Diverse Communities

A project may earn 1 additional point by earning at least 2 points in Option 1 and at least 2 points in Option 2 (at least one of which must be for providing housing at or below 100% AMI).

NPD Credit 5: Reduced Parking Footprint

1 point

Intent

To design parking to increase the pedestrian orientation of *projects* and minimize the adverse environmental effects of parking facilities. To reduce public health risks by encouraging daily physical activity associated with walking and bicycling.

Requirements

For new nonresidential buildings and *multiunit residential* buildings, either do not build new off-street parking lots, or locate all new off-street surface parking lots at the side or rear of buildings, leaving building frontages facing streets free of surface parking lots.

AND

Use no more than 20% of the total *development footprint* area for all new off-street surface parking facilities, with no individual surface parking lot larger than 2 acres. For the purposes of this credit, surface parking facilities include ground-level garages unless they are under *habitable building* space. Underground or multistory parking facilities can be used to provide additional capacity, and on-street parking spaces are exempt from this limitation.

AND

Provide bicycle parking and storage capacity to new buildings as follows:

a. **Multiunit residential.** Provide at least one secure, enclosed bicycle storage space per occupant for 30% of the *planned occupancy* but no fewer than one per unit. Provide secure visitor bicycle racks on-site, with at least one bicycle space per ten *dwelling units* but no fewer than four spaces per project site.

b. **Retail.** Provide at least one secure, enclosed bicycle storage space per new retail worker for 10% of retail worker planned occupancy. Provide visitor or customer bicycle racks on-site, with at least one bicycle space per 5,000 square feet of retail space, but no fewer than one bicycle space per business or four bicycle spaces per project site, whichever is greater. Provide at least one on-site shower with changing facility for any development with 100 or more new workers and at least one additional on-site shower with changing facility for every 150 new workers thereafter.

c. **Nonresidential other than retail.** Provide at least one secure, enclosed bicycle storage space per new occupant for 10% of planned occupancy. Provide visitor bicycle racks on-site with at least one bicycle space per 10,000 square feet of new commercial nonretail space but not fewer than four bicycle spaces per building. Provide at least one on-site shower with changing facility for any development with 100 or more new workers and at least one additional on-site shower with changing facility for every 150 new workers thereafter.

Secure, enclosed bicycle storage areas must be locked and easily accessible to residents and/or workers. Provide informational signage on using the storage facilities.

Visitors' and customers' bicycle racks must be clearly visible from a main entry, located within 100 feet of the door, served with night lighting, and protected from damage from nearby vehicles. If the building has multiple main entries, bicycle racks must be proportionally dispersed within 100 feet of each.

Shower and changing facility requirements may be met by providing the equivalent of free access to on-site health club shower facilities, if the health club can be accessed without going outside. Provide informational signage on using the shower facilities.

AND

Provide carpool and/or shared-use vehicle parking spaces equivalent to 10% of the total automobile parking for each nonresidential and mixed-use building on the site. Signage indicating such parking spots must be provided, and the parking spots must be within 200 feet of entrances to the buildings served.

NPD Credit 6: Street Network

1–2 points

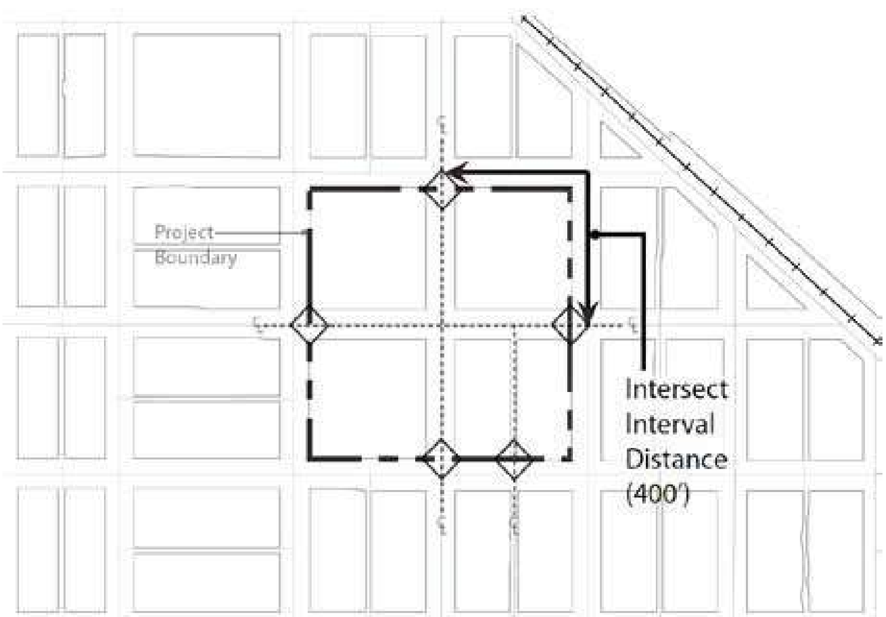
Intent

To promote *projects* that have high levels of internal connectivity and are well connected to the community at large. To encourage development within *existing* communities, thereby conserving land and promoting multimodal transportation. To improve public health by encouraging daily physical activity and reducing the negative effects of motor vehicle emissions.

Requirements

Design and/or locate the project such that a through-street and/or nonmotorized right-of-way intersects or terminates at the *project boundary* at least every 400 feet or at existing abutting street intervals and intersections, whichever is the shorter distance. Include a pedestrian or bicycle through-connection in at least 90% of any new *culs-de-sac*. This does not apply to portions of the boundary where connections cannot be made because of physical obstacles, such as prior platting of property, construction of existing buildings or other barriers, slopes over 15%, *wetlands* and *water bodies*, railroad and utility rights-of-way, existing limited-access motor vehicle rights-of-way, and parks and dedicated open space.

Figure 1. Project site with right-of-way intersects on project boundary at least every 400 feet



AND

Locate and/or design the project such that its internal *connectivity* and/or the connectivity within a 1/4-mile distance of the project boundary falls within one of the ranges listed in Table 1.

Table 1. Points for connectivity

Street intersections per square mile	Points
> 300 and ≤ 400	1
> 400	2

All streets and sidewalks that are counted toward the connectivity requirement must be available for general public use and not gated. Gated areas are not considered available for public use, with the exception of education and health care campuses, and military bases where gates are used for security purposes.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

connectivity connectivity the number of publicly accessible intersections per square mile, including any combination of streets, dedicated alleys, transit rights-of-way, and nonmotorized rights-of-way. If one must both enter and exit an area through the same intersection, such an intersection and any intersections beyond that point are not counted; intersections leading only to culs-de-sac are also not counted. The calculation of square mileage excludes water bodies, parks larger than 1/2 acre, public facility campuses, airports, rail yards, slopes over 15%, and areas nonbuildable under codified law or the rating system. Street rights-of-way may not be excluded.

NPD Credit 7: Transit Facilities

1 point

Intent

To encourage transit use and reduce driving by providing safe, convenient, and comfortable transit waiting areas and safe and secure bicycle storage facilities for transit users.

Requirements

Work with the transit agency or agencies serving the *project* to identify transit stop locations within and/or bordering the *project boundary* where transit agency-approved shelters and any other agency-required improvements, including bicycle racks, will be installed no later than construction of 50% of total project square footage. At those locations, install approved shelters and any required improvements, or provide funding to the transit agency for their installation. Shelters must be covered, be at least partially enclosed to buffer wind and rain, and have seating and illumination. Any required bicycle racks must have a two-point support system for locking the frame and wheels and be securely affixed to the ground or a building.

AND

Work with the transit agency or agencies serving the project to identify locations within and bordering the project boundary where the agency determines that transit stops will be warranted within two years of project completion, either because of increased ridership on *existing* service resulting from the project or because of planned future transit. At those locations, reserve space for transit shelters and any required improvements, including bicycle racks. In lieu of or in addition to new stops, this requirement can be satisfied with a commitment from the transit agency to provide increased service to the transit stops that will have been installed at the time of 50% *build-out*.

AND

Work with the transit agency or agencies serving the project to provide kiosks, bulletin boards, and/or signs that display transit schedules and route information at each public transit stop within and bordering the project.

NPD Credit 8: Transportation Demand Management

1–2 points

Intent

To reduce energy consumption, pollution from motor vehicles, and adverse public health effects by encouraging multimodal travel.

Requirements

FOR ALL PROJECTS

Earn one point for every two options achieved below, for a maximum of two points. For the purposes of this credit, *existing* buildings and their occupants are exempt from the requirements.

OPTION 1. TDM Program

Create and implement a comprehensive transportation demand management (TDM) program for the *project* that reduces weekday peak-period motor vehicle trips by at least 20% compared with a baseline case, and fund the program for a minimum of three years following *build-out* of the project. The TDM program must be prepared by a qualified transportation professional. Any trip reduction effects of Options 2, 3, 4, or 5 may not be included in calculating the 20% threshold.

OR

OPTION 2. Transit Passes

Provide transit passes valid for at least one year, subsidized to be half of regular price or cheaper, to each occupant locating within the project during the first three years of project occupancy (or longer). Publicize the availability of subsidized transit passes are available to project occupants;

OR

OPTION 3. Developer-Sponsored Transit

Provide year-round, *developer*-sponsored private transit service (with vans, shuttles, buses) from at least one central point in the project to other major transit facilities, and/or other destinations such as a retail or *employment center*, with service no less frequent than 45 daily weekday trips and 30 daily weekend trips. The service must begin by the time the project total square footage is 20% occupied and must be guaranteed for at least three years beyond project build-out. Twenty percent occupancy is defined as residents living in 20% of the *dwelling units* and/or employees working in 20% of the total nonresidential square footage.

Provide transit stop shelters and bicycle racks adequate to meet projected demand but no less than one shelter and one bicycle rack at each transit stop. Shelters must be covered, be at least partially enclosed to buffer wind and rain, and have seating and illumination. Bicycle racks must have a two-point support system for locking the frame and wheels and must be securely affixed to the ground or a building.

OR

OPTION 4. Vehicle Sharing

Locate the project such that 50% of the dwelling units and nonresidential building entrances are within a 1/4 mile *walk distance* of at least one vehicle in a vehicle-sharing program. For each vehicle, dedicate one parking space accessible to vehicle-sharing members. Through signage and other means, publicize to project occupants the availability and benefits of the vehicle-sharing program. If the project has more than 100 dwelling units and/or employees and has a minimum transit service of 60 daily weekday trips and 40 daily weekend trips, at least one additional vehicle and parking space for every 100 dwelling units and/or employees must be available. If the project has more than 100 dwelling units and/or employees but does not have transit service at the frequencies specified above, at least one additional vehicle and parking space for every 200 dwelling units and/or employees must be available. Where new vehicle locations are created, a vehicle sharing program must begin by the time the project total square footage is 20% occupied; commit to providing vehicles to the locations for at least two years. Twenty percent occupancy is defined as residents living in 20% of the project dwelling units and/or employees working in 20% of the total nonresidential square footage of the project.

OR

OPTION 5. Unbundling of Parking

For 90% of *multiunit residential* units and/or nonresidential square footage, the associated parking spaces are sold or rented separately from the dwelling units and/or nonresidential square footage.

NPD Credit 9: Access to Civic and Public Space

1 point

Intent

To improve physical and mental health and social capital by providing a variety of open spaces close to work and home to facilitate social networking, civic engagement, physical activity, and time spent outdoors.

Requirements

Locate and/or design the *project* such that a civic or passive-use space, such as a square, *park*, or *plaza*, at least 1/6 acre in area lies within a 1/4-mile *walk distance* of 90% of planned and *existing dwelling units* and nonresidential building entrances. Spaces less than 1 acre must have a proportion no narrower than 1 unit of width to 4 units of length.

AND

For projects larger than 7 acres, locate and/or design the project such that the median size of civic or passive-use spaces within and/or contiguous to the project is at least 1/2 acre.

NPD Credit 10: Access to Recreation Facilities

1 point

Intent

To improve physical and mental health and social capital by providing a variety of recreational facilities close to work and home to facilitate physical activity and social networking.

Requirements

Locate and/or design the *project* so that a publicly accessible outdoor recreation facility at least 1 acre in area, or a publicly accessible indoor recreational facility of at least 25,000 square feet, lies within a 1/2-mile *walk distance* of 90% of new and *existing dwelling units* and nonresidential building entrances. Outdoor recreation facilities must consist of physical improvements and may include "tot lots," swimming pools, and sports fields, such as baseball diamonds.

NPD Credit 11: Visitability and Universal Design

1 point

Intent

To enable the widest spectrum of people, regardless of age or ability, to more easily participate in community life by increasing the proportion of areas usable by people of diverse abilities.

Requirements

OPTION 1. Projects with Dwelling Units

For each new *project dwelling unit* of the following residential building types, design to the applicable requirements specified:

Single dwelling unit buildings. Design a minimum of 20% of the dwelling units (and not less than one) in accordance with ICC/ANSI A117.1, Type C, Visitable Unit, each of which has an open-space plan for primary functions (an area for cooking, eating, and social gathering), as well as a sleeping area and a full bathroom.

Multiunit building with two or three dwelling units. Design a minimum of 20% of the dwelling units (and not less than one) in accordance with ICC/ANSI A117.1, Type C, Visitable Unit, each of which has a kitchen, dining area, living area, full bathroom, and bedroom on the accessible level. If a project has both attached and detached single dwelling unit buildings, the requirements apply to each type separately. Similarly, if a project has both 2- and 3- dwelling unit buildings, the requirements apply to each type.

Multiunit buildings with four or more dwelling units. This category includes mixed-use buildings with dwelling units. Design a minimum of 20% of the dwelling units (and not less than one) to incorporate the universal design requirements stated below, or comply with Option 2. Choose at least one of the following three strategies for universal design:

a. Throughout the home, include at least five of the following universal design features to facilitate universal function, access, and user ability:

- Easy-to-grip lever door handles.
- Easy-to-grip cabinet and drawer loop handles.
- Easy-to-grip locking mechanisms on doors and windows.
- Easy-to-grip single-lever faucet handles.
- Easy-touch rocker or hands-free switches.
- Motion-detector lighting at entrance, in hallways and stairwells, and in closets, and motion-detector light switches in garages, utility spaces, and basements.
- Large, high-contrast print for controls, signals, and the house or unit numbers.
- A built-in shelf, bench, or table with knee space below, located outside the entry door with weather protection overhead, such as porch or stoop with roof, awning, or other overhead covering.
- A minimum 32-inch clear door opening width for all doorways.

- Tread at the entrance, on stairs, and other areas where slipping is common, with color contrast difference between stair treads and risers.
- Interior floor surfaces (e.g., low-pile carpets, hard-surface flooring) that provide easy passage for a wheelchair or walker, with color contrast between floor surfaces and trim. No carpet is permitted in a kitchen, bathroom, or other wet areas of the dwelling unit.

OR

b. On the main floor of the home (or on another floor, if an elevator or stair lift is provided), provide a kitchen with hard-surface flooring, plumbing with single-lever controls, a 5-foot turning radius, and at least four of the following universal design features to facilitate universal function, access, and user-ability:

- Variable-height (28- to 42-inch) or adjustable work surfaces, such as countertops, sinks, and/or cooktops.
- Clear knee space under sink and cooktops (this requirement can be met by installing removable base cabinets or fold-back or self-storing doors), cooktops and ranges with front or side-mounted controls, and wall-mounted ovens at a height to accommodate a seated adult.
- A toe kick area at the base of lower cabinets with a minimum height of 9 inches, and full-extension drawers and shelves in at least half (by volume) of the cabinets.
- Contrasting color treatment between countertops, front edges, and floor.
- Adjustable-height shelves in wall cabinets.
- Glare-free task lighting to illuminate work areas without too much reflectivity.

OR

c. On the main floor of the building (or on another floor, if an elevator or stair lift is provided), include all of the following:

In at least one accessible bedroom,

- Size the room to accommodate a twin bed with a 5-foot turning radius around the bed.
- Install a clothes closet with a 32-inch clear opening with adjustable-height closet rods and shelves.

In at least one full bathroom on the same floor as the bedroom,

- Provide adequate maneuvering space with a 30-by-48-inch clear floor space at each fixture.
- Center the toilet 18 inches from any side wall, cabinet, or tub, and allow a 3-foot clear space in front.
- Install broad blocking in walls around toilet, tub, and/or shower for future placement and relocation of grab bars
- Provide knee space under the lavatory (this requirement may be met by installing removable base cabinets or fold-back or self-storing doors).
- Install a long mirror whose bottom is no more than 36 inches above the finished floor and whose top is at least 72 inches high.

In addition, all bathrooms must have hard-surface flooring, all plumbing fixtures must have single-lever controls, and tubs or showers must have hand-held shower heads.

OR

OPTION 2. Projects with Noncompliant Public Rights-of-Way or Accessible Travel Routes

For projects with only nonresidential components, or residential components that are not within the scope of Option 1, but have public rights-of-way or other publicly accessible travel routes within the project that are not in compliance with Americans with Disabilities Act (for private sector and local and state government facilities) or the Architectural Barriers Act (for federally funded facilities), design, construct, and/or retrofit 100% of the rights-of-way and/or travel routes in accordance with the ADA-ABA Accessibility Guidelines, as applicable.

NPD Credit 12: Community Outreach and Involvement

1–2 points

Intent

To encourage responsiveness to community needs by involving the people who live or work in the community in *project* design and planning and in decisions about how it should be improved or how it should change over time.

Requirements

OPTION 1. Community Outreach (1 point)

Meet with adjacent property owners, residents, business owners, and workers; local planning and community development officials; and any current residents or workers at the project site to solicit and document their input on the proposed project prior to commencing a design.

AND

Work directly with community associations and/or the local government to advertise an open community meeting, other than an official public hearing, to generate comments on project design from the beginning.

AND

Host an open community meeting, other than an official public hearing, to solicit and document public input on the proposed project at the beginning of project design.

AND

Modify the project's conceptual design as a direct result of community input, or if modifications are not made, explain why community input did not generate design modifications.

AND

Establish ongoing means for communication between the *developer* and the community throughout the design and construction phases and, in cases where the developer maintains any control during the postconstruction phase.

OR

OPTION 2. Charrette (2 points)

Comply with Option 1 and conduct a design charrette or interactive workshop of at least two days and open to the public that includes, at a minimum, participation by a representative group of nearby property owners, residents, business owners, and workers in the preparation of conceptual project plans and drawings.

OR

OPTION 3. Local Endorsement Pursuant to Evaluation Program (2 points)

Comply with Option 1 and obtain an endorsement from an ongoing local or regional nongovernmental program that systematically reviews and endorses smart growth development projects under a rating and/or jury system.

NPD Credit 13: Local Food Production

1 point

Intent

To promote community-based food production, improve nutrition through increased access to fresh produce, support preservation of small farms producing a wide variety of crops, reduce the negative environmental effects of large-scale industrialized agriculture, and support local economic development that increases the economic value and production of farmlands and community gardens.

Requirements

FOR ALL PROJECTS

Establish *covenants, conditions, and restrictions* (CC&R) or other forms of deed restrictions which state that the growing of produce is not prohibited in *project* areas, including greenhouses, any portion of residential front, rear, or side yards; or balconies, patios, or rooftops. Greenhouses but not gardens may be prohibited in front yards that face the *street*.

AND

OPTION 1. Neighborhood Farms and Gardens

Dedicate permanent and viable growing space and/or related facilities (such as greenhouses) within the project according to the square footage areas specified in Table 1 (exclusive of *existing* dwellings). Provide solar access, fencing, watering systems, garden bed enhancements (such as raised beds), secure storage space for tools, and pedestrian access for these spaces. Ensure that the spaces are owned and managed by an entity that includes occupants of the project in its decision making, such as a community group, homeowners' association, or public body.

Table 1. Minimum garden space, by project density

Project density (DU/acre)	Growing space (sf/DU)
> 7 and ≤14	200
> 14 and ≤ 22	100
> 22 and ≤ 28	80
> 28 and ≤ 35	70
> 35	60
DU = dwelling unit; sf = square feet.	

Established community gardens outside the *project boundary* but within a 1/2 mile *walk distance* of the project's geographic center can satisfy this option if the garden otherwise meets all of the option requirements.

OR

OPTION 2. Community-Supported Agriculture

Purchase shares in a *community-supported agriculture* (*CSA*) program located within 150 miles of the project site for at least 80% of *dwelling units* within the project (exclusive of existing dwelling units) for two years, beginning with each dwelling unit's occupancy until the 80% threshold is reached. Shares must be delivered to a point within 1/2 mile of the project's geographic center on a regular schedule not less than twice per month at least four months of the year.

OR

OPTION 3. Proximity To Farmers' Market

Locate the project's geographic center within a 1/2-mile walk distance of an existing or planned farmers' market that is open or will operate at least once weekly for at least five months annually. Farmers' market vendors may sell only items grown within 150 miles of the project site. A planned farmers' market must have firm commitments from farmers and vendors that the market will meet all the above requirements and be in full operation by the time of 50% occupancy of the project's total square footage.

NPD Credit 14: Tree-Lined and Shaded Streets

1–2 points

Intent

To encourage walking, bicycling, and transit use and discourage excessive motoring speeds. To reduce urban heat island effects, improve air quality, increase evapotranspiration, and reduce cooling loads in buildings.

Requirements

OPTION 1. Tree-Lined Streets (1 point)

Design and build the *project* to provide street trees on both sides of at least 60% of new and *existing streets* within the project and on the project side of bordering streets, between the vehicle travel way and walkway, at intervals averaging no more than 40 feet (excluding driveways and utility vaults).

AND/OR

OPTION 2. Shaded Streets (1 point)

Trees or other structures provide shade over at least 40% of the length of sidewalks on streets within or contiguous to the project. Trees must provide shade within ten years of landscape installation. Use the estimated crown diameter (the width of the shade if the sun is directly above the tree) to calculate the shaded area.

AND

FOR ALL PROJECTS INVOLVING STREET TREE PLANTINGS

Obtain a registered landscape architect's determination that planting details are appropriate to growing healthy trees, taking into account tree species, root medium, and width and soil volume of planter strips or wells, and that the selected tree species are not considered *invasive* in the project context according to USDA or the state agricultural extension service.

NPD Credit 15: Neighborhood Schools

1 point

Intent

To promote community interaction and engagement by integrating *schools* into the neighborhood. To support students' health by encouraging walking and bicycling to school.

Requirements

Include in the *project* a residential component that constitutes at least 30% of the project's total building square footage, and locate or design the project such that at least 50% of the *dwelling units* are within a 1/2-mile *walk distance* of an *existing* or new elementary or middle school building entrance or within a 1-mile walk distance of an existing or new high school building entrance. For any new school, the school district or equivalent organization must commit in a legally binding warrant that the school will be open by the time of occupancy of 50% of the project dwelling units.

Streets within and/or bordering the *project boundary* that lead from dwelling units to the school site must have a complete network of sidewalks on both sides and either bicycle lanes or traffic control and/or calming measures. If the school is planned as part of the project, it must be designed such that pedestrians and cyclists can easily reach building entrances without crossing bus zones, parking entrances, and student drop-off areas.

AND

New school campuses must not exceed the following:

- High schools, 15 acres.
- Middle schools, 10 acres.
- Elementary schools, 5 acres.

Schools combining grade levels from more than one category may use the grade level with the higher allowable acreage.

Facilities on the school site for which there is a formal joint-use agreement with another entity, such as athletic facilities, playgrounds, and multipurpose spaces in buildings, may be deducted from the total site area of the school.

GREEN INFRASTRUCTURE AND BUILDINGS

GIB Prerequisite 1: Certified Green Building

Required

Intent

To encourage the design, construction, and retrofit of buildings that utilize green building practices.

Requirements

Design, construct, or retrofit one whole building within the *project* to be certified through LEED for New Construction, LEED for Existing Buildings: Operations & Maintenance, LEED for Homes, LEED for Schools, LEED for Retail: New Construction, or LEED for Core and Shell (with at least 75% of the floor area certified under LEED for Commercial Interiors or LEED for Retail: Commercial Interiors), or through a green building rating system requiring review by independent, impartial, third-party certifying bodies that have either been accredited by an IAF accreditation body to, or could demonstrate compliance to, ISO 17021 or ISO/IEC Guide 65, and, when subsequently available, ISO/IEC 17065.

GIB Prerequisite 2: Minimum Building Energy Efficiency

Required

Intent

To encourage the design and construction of energy-efficient buildings that reduce air, water, and land pollution and adverse environmental effects from energy production and consumption.

Requirements

The following requirement applies to 90% of the building floor area (rounded up to the next whole building) of all nonresidential buildings, mixed-use buildings, and *multiunit residential* buildings four stories or more constructed as part of the *project* or undergoing major renovations as part of the project.

New buildings must demonstrate an average 10% improvement over ANSI/ASHRAE/IESNA Standard 90.1–2007 (with errata but without addenda). Buildings undergoing major renovations must demonstrate an average 5% improvement over ANSI/ASHRAE/IESNA Standard 90.1–2007.

Projects must document building energy efficiency using one or a combination of the following:

a. Produce a LEED-compliant energy model following the methodology outlined in the LEED rating system appropriate to each building's scope, including demonstration by a whole building project computer simulation using the building performance rating method in Appendix G of ANSI/ASHRAE/IESNA Standard 90.1–2007. Appendix G requires that the energy analysis done for the building performance rating method include all energy costs associated with the building project. Projects in California may use Title 24–2005, Part 6, in place of ANSI/ASHRAE/IESNA Standard 90.1–2007.

b. Comply with the prescriptive measures of the ASHRAE Advanced Energy Design Guide listed below, appropriate to each building's scope. Comply with all applicable criteria as established in the guide for the climate zone in which the project is located.

   - ASHRAE Advanced Energy Design Guide for Small Office Buildings 2004 (office occupancy buildings less than 20,000 square feet).
   - ASHRAE Advanced Energy Design Guide for Small Retail Buildings 2006 (retail occupancy buildings less than 20,000 square feet).
   - ASHRAE Advanced Energy Design Guide for Small Warehouses and Self-Storage Buildings 2008 (warehouse or self-storage occupancy less than 50,000 square feet).
   - ASHRAE Advanced Energy Design Guide for K–12 School Buildings (K–12 school occupancy less than 200,000 square feet).

c. For buildings less than 100,000 square feet, comply with the prescriptive measures identified in the Advanced Buildings™ Core Performance™ Guide developed by the New Buildings Institute, as follows:

   - Comply with Section 1, Design Process Strategies, and Section 2, Core Performance Requirements, of the Core Performance Guide.
   - Health care, warehouse and laboratory projects are ineligible for this path.

If method (a) is used for all of the floor area evaluated in this prerequisite, the total percentage improvement is calculated as a sum of energy costs for each building compared with a baseline. If any combination of methods (a), (b), and (c) is used, the total percentage improvement is calculated as a weighted average based on building floor area. In determining the weighted average, buildings pursuing (a) will be credited at the percentage value determined by the energy model. Buildings pursuing (b) or (c) will be credited at 12% better than ANSI/ASHRAE/IESNA Standard 90.1–2007 for new buildings and 8% better for *existing* building renovations.

AND

For new *single-family residential* buildings and new multiunit residential buildings three stories or fewer, 90% of the buildings must meet ENERGY STAR or equivalent criteria. Projects may demonstrate compliance with ENERGY STAR criteria through the prescriptive requirements of a Builder Option Package, the *Home Energy Rating System* (*HERS*) index, or a combination of the two.

Project teams wishing to use ASHRAE-approved addenda for the purposes of this credit may do so at their discretion. Addenda must be applied consistently across all LEED credits.

GIB Prerequisite 3: Minimum Building Water Efficiency

Required

Intent

To reduce effects on natural water resources and reduce burdens on community water supply and wastewater systems.

Requirements

For nonresidential buildings, mixed-use buildings, and multifamily residential buildings four stories or more:

Indoor water usage in new buildings and buildings undergoing major renovations as part of the *project* must be an average 20% less than in baseline buildings. The baseline usage is based on the requirements of the Energy Policy Act of 1992 and subsequent rulings by the Department of Energy, the requirements of the Energy Policy Act of 2005, and the fixture performance standards in the 2006 editions of the Uniform Plumbing Code or International Plumbing Code as to fixture performance. Calculations are based on estimated occupant usage and include only the following fixtures and fixture fittings (as applicable to the project scope): water closets (toilets), urinals, lavatory faucets, showers, kitchen sink faucets, and prerinse spray valves.

The water efficiency threshold is calculated as a weighted average of water usage for the buildings constructed as part of the project based on their conditioned square footage. Projects may also follow the LEED for Multiple Buildings and On-Campus Building Application Guide alternative calculation methodology to show compliance with this prerequisite.

Table 1. National efficiency baselines

Commercial fixtures, fittings, or appliances	Baseline water usage
Commercial toilet	1.6 gpf[1] Except blow-out fixtures, 3.5 gpf
Commercial urinal	1.0 gpf
Commercial lavatory (restroom) faucet	2.2 gpm at 60 psi, private applications only (hotel-motel guest rooms, hospital patient rooms) 0.5 gpm at 60 psi[2] all others except private applications 0.25 gallons per cycle for metering faucets
Commercial prerinse spray valve (for food service applications)	Flow rate ≤ 1.6 gpm (no pressure specified; no performance requirement)

[1] EPAct 1992 standard for toilets applies to both commercial and residential models.
[2] In addition to EPAct requirements, the American Society of Mechanical Engineers standard for public lavatory faucets is 0.5 gpm at 60 psi (ASME A112.18.1-2005). This maximum has been incorporated into the national Uniform Plumbing Code and the International Plumbing Code.

Residential Fixtures, Fittings, and Appliances	Baseline water usage
Residential toilet	1.6 gpf[3]
Residential lavatory (bathroom) faucet	2.2 gpm at 60 psi
Residential kitchen faucet	
Residential showerhead	2.5 gpm at 80 psi per shower stall4

gpf = gallons per flush; psi = pounds per square inch.
Source: Adapted from information developed and summarized by the U.S. EPA Office of Water.
[3] EPAct 1992 standard for toilets applies to both commercial and residential models.
[4] Residential shower compartment (stall) in dwelling units: The total allowable flow rate from all flowing showerheads at any given time, including rain systems, waterfalls, bodysprays, bodyspas, and jets, shall be limited to the allowable showerhead flow rate as specified above (2.5-gpm) per shower compartment, where the floor area of the shower compartment is less than 2,500 sq.in. For each increment of 2,500 sq.in. of floor area thereafter or part thereof, an additional showerhead with total allowable flow rate from all flowing devices equal to or less than the allowable flow rate as specified above shall be allowed. Exception: Showers that emit recirculated non-potable water originating from within the shower compartment while operating are allowed to exceed the maximum as long as the total potable water flow does not exceed the flow rate as specified above.

The following fixtures, fittings, and appliances are outside the scope of the water use reduction calculation:

a. Commercial steam cookers.
b. Commercial dishwashers.
c. Automatic commercial ice makers.
d. Commercial (family-sized) clothes washers.
e. Residential clothes washers.
f. Standard and compact residential dishwashers.

AND

For new *single-family residential* buildings and new *multiunit residential* buildings three stories or fewer, 90% of buildings must use a combination of fixtures that would earn 3 points under LEED for Homes 2008 WE Credit 3, Indoor Water Use.

GIB Prerequisite 4: Construction Activity Pollution Prevention

Required

Intent

To reduce pollution from construction activities by controlling soil erosion, waterway sedimentation, and airborne dust generation.

Requirements

Create and implement an erosion and sedimentation control plan for all new construction activities associated with the *project*. The plan must incorporate practices such as phasing, seeding, grading, mulching, filter socks, stabilized site entrances, preservation of *existing* vegetation, and other best management practices (BMPs) to control erosion and sedimentation in runoff from the entire project site during construction. The plan must list the BMPs employed and describe how they accomplish the following objectives:

a. Prevent loss of soil during construction by stormwater runoff and/or wind erosion, including but not limited to stockpiling of topsoil for reuse.

b. Prevent sedimentation of any affected stormwater conveyance systems or receiving streams.

c. Prevent polluting the air with dust and particulate matter.

The erosion and sedimentation control plan must describe how the project team will do the following:

a. Preserve vegetation and mark clearing limits.

b. Establish and delineate construction access.

c. Control flow rates.

d. Install sediment controls.

e. Stabilize soils.

f. Protect slopes.

g. Protect drain inlets.

h. Stabilize channels and outlets.

i. Control pollutants.

j. Control dewatering.

k. Maintain the BMPs.

l. Manage the erosion and sedimentation control plan.

The BMPs must be selected from the Washington State Department of Ecology's *Stormwater Management Manual for Western Washington, Volume II, Construction Stormwater Pollution Prevention* (2005 edition), or a locally approved equivalent, whichever is more stringent, and must comply with all federal, state, and local erosion and sedimentation control regulations.

GIB Credit 1: Certified Green Buildings

1–5 points

Intent

To encourage the design, construction, and retrofit of buildings that utilize green building practices.

Requirements

OPTION 1. Projects with 10 or Fewer Habitable Buildings

Design, construct, or retrofit one building as part of the *project*, beyond the prerequisite, to be certified under one of the following LEED green building rating systems: LEED for New Construction, LEED for Existing Buildings, LEED for Homes, LEED for Schools, LEED for Retail: New Construction, or LEED for Core & Shell (with at least 75% of the floor area certified under LEED for Commercial Interiors or LEED for Retail: Commercial Interiors) or through a green building rating system requiring review by independent, impartial, third-party certifying bodies that have either been accredited by an IAF accreditation body to, or could demonstrate compliance to, ISO 17021 or ISO/IEC Guide 65, and, when subsequently available, ISO/IEC 17065.

OR

OPTION 2. Projects of All Sizes

Design, construct, or retrofit a percentage of the total project building square footage, beyond the prerequisite requirement, to be certified under one of the LEED green building rating systems listed above or through a green building rating system requiring review by independent, impartial, third-party certifying bodies that have either been accredited by an IAF accreditation body to, or could demonstrate compliance to, ISO 17021 or ISO/IEC Guide 65, and, when subsequently available, ISO/IEC 17065.

Table 1. Points for green building certification

Percentage of square footage certified	Points
≥ 10% and < 20%	1
≥ 20% and < 30%	2
≥ 30% and < 40%	3
≥ 40% and < 50%	4
≥ 50%	5

AND

FOR ALL PROJECTS

Detached *accessory dwelling units* must be counted as separate buildings. Accessory dwellings attached to a main building are not counted separately.

GIB Credit 2: Building Energy Efficiency

2 points

Intent

To encourage the design and construction of energy-efficient buildings that reduce air, water, and land pollution and adverse environmental effects from energy production and consumption.

Requirements

The following requirement applies to 90% of the building floor area (rounded up to the next whole building) of all nonresidential buildings, mixed-use buildings, and *multiunit residential* buildings four stories or more constructed as part of the *project* or undergoing major renovations as part of the project.

New buildings must demonstrate an average 18% (1 point) or 26% (2 points) improvement over ANSI/ASHRAE/IESNA Standard 90.1–2007 (with errata but without addenda). Buildings undergoing major renovations as part of the project must demonstrate an average 14% (1 point) or 22% (2 points) improvement over ANSI/ASHRAE/IESNA Standard 90.1–2007.

Projects must document building energy efficiency using one or a combination of the following:

a. Produce a LEED-compliant energy model following the methodology outlined in the LEED rating system appropriate to each building's scope, including demonstration by a whole building project computer simulation using the building performance rating method in Appendix G of ANSI/ASHRAE/IESNA Standard 90.1–2007. Appendix G requires that the energy analysis done for the building performance rating method include all energy costs associated with the building project. Projects in California may use Title 24–2005, Part 6, in place of ANSI/ASHRAE/IESNA Standard 90.1–2007.

b. Comply with the prescriptive measures of the ASHRAE Advanced Energy Design Guide listed below, appropriate to each building's scope. Comply with all applicable criteria as established in the guide for the climate zone in which the project is located.

   - ASHRAE Advanced Energy Design Guide for Small Office Buildings 2004 (office occupancy buildings less than 20,000 square feet).
   - ASHRAE Advanced Energy Design Guide for Small Retail Buildings 2006 (retail occupancy buildings less than 20,000 square feet).
   - ASHRAE Advanced Energy Design Guide for Small Warehouses and Self-Storage Buildings 2008 (warehouse or self-storage occupancy less than 50,000 square feet).
   - ASHRAE Advanced Energy Design Guide for K–12 School Buildings (K–12 school occupancy less than 200,000 square feet).

c. For buildings less than 100,000 square feet, comply with the prescriptive measures identified in the Advanced Buildings™ Core Performance™ Guide developed by the New Buildings Institute, as follows:

   - Comply with Section 1, Design Process Strategies, and Section 2, Core Performance Requirements, of the Core Performance Guide.
   - Health care, warehouse and laboratory projects are ineligible for this path.

If method (a) is used for all of the floor area evaluated in this prerequisite, the total percentage improvement is calculated as a sum of energy costs for each building compared with a baseline. If any combination of methods (a), (b), and (c) is used, the total percentage improvement is calculated as a weighted average based on building floor area. In determining the weighted average, buildings pursuing (a) will be credited at the percentage value determined by the energy model. Buildings pursuing (b) or (c) will be credited at 12% better than ANSI/ASHRAE/IESNA Standard 90.1–2007 for new buildings and 8% better for *existing* building renovations.

AND

For new *single-family residential* buildings and new multiunit residential buildings three stories or fewer, 90% of the buildings must achieve a *Home Energy Rating System* (*HERS*) index score of at least 75.

Project teams wishing to use ASHRAE-approved addenda for the purposes of this credit may do so at their discretion. Addenda must be applied consistently across all LEED credits.

GIB Credit 3: Building Water Efficiency

1 point

Intent

To reduce effects on natural water resources and reduce burdens on community water supply and wastewater systems.

Requirements

For nonresidential buildings, mixed-use buildings, and multifamily residential buildings four stories or more:

Indoor water usage in new buildings and buildings undergoing major renovations as part of the *project* must be an average 40% less than in baseline buildings. The baseline usage is based on the requirements of the Energy Policy Act of 1992 and subsequent rulings by the Department of Energy, the requirements of the Energy Policy Act of 2005, and the fixture performance standards in the 2006 editions of the Uniform Plumbing Code or International Plumbing Code as to fixture performance. Calculations are based on estimated occupant usage and include only the following fixtures and fixture fittings (as applicable to the project scope): water closets (toilets), urinals, lavatory faucets, showers, kitchen sink faucets, and prerinse spray valves.

The water efficiency threshold is calculated as a weighted average of water usage for the buildings constructed as part of the project based on their conditioned square footage. Projects may also follow the LEED for Multiple Buildings and On-Campus Building Application Guide alternative calculation methodology to show compliance with this credit.

Table 1. National efficiency baselines

Commercial fixtures, fittings, or appliances	Baseline water usage
Commercial toilet	1.6 gpf[1] Except blow-out fixtures, 3.5 gpf
Commercial urinal	1.0 gpf
Commercial lavatory (restroom) faucet	2.2 gpm at 60 psi, private applications only (hotel-motel guest rooms, hospital patient rooms) 0.5 gpm at 60 psi[2] all others except private applications 0.25 gallons per cycle for metering faucets
Commercial prerinse spray valve (for food service applications)	Flow rate ≤ 1.6 gpm (no pressure specified; no performance requirement)

[1] EPAct 1992 standard for toilets applies to both commercial and residential models.
[2] In addition to EPAct requirements, the American Society of Mechanical Engineers standard for public lavatory faucets is 0.5 gpm at 60 psi (ASME A112.18.1-2005). This maximum has been incorporated into the national Uniform Plumbing Code and the International Plumbing Code.

Residential Fixtures, Fittings, and Appliances	Baseline water usage
Residential toilet	1.6 gpf[3]
Residential lavatory (bathroom) faucet	2.2 gpm at 60 psi
Residential kitchen faucet	
Residential showerhead	2.5 gpm at 80 psi per shower stall4

gpf = gallons per flush; psi = pounds per square inch.
Source: Adapted from information developed and summarized by the U.S. EPA Office of Water.
[3] EPAct 1992 standard for toilets applies to both commercial and residential models.
[4] Residential shower compartment (stall) in dwelling units: The total allowable flow rate from all flowing showerheads at any given time, including rain systems, waterfalls, bodysprays, bodyspas, and jets, shall be limited to the allowable showerhead flow rate as specified above (2.5-gpm) per shower compartment, where the floor area of the shower compartment is less than 2,500 sq.in. For each increment of 2,500 sq.in. of floor area thereafter or part thereof, an additional showerhead with total allowable flow rate from all flowing devices equal to or less than the allowable flow rate as specified above shall be allowed. Exception: Showers that emit recirculated non-potable water originating from within the shower compartment while operating are allowed to exceed the maximum as long as the total potable water flow does not exceed the flow rate as specified above.

The following fixtures, fittings, and appliances are outside the scope of the water use reduction calculation:

a. Commercial steam cookers.
b. Commercial dishwashers.
c. Automatic commercial ice makers.
d. Commercial (family-sized) clothes washers.
e. Residential clothes washers.
f. Standard and compact residential dishwashers.

AND

For new *single-family residential* buildings and new *multiunit residential* buildings three stories or fewer, 90% of buildings must use a combination of fixtures that would earn 5 points under LEED for Homes 2008 WE Credit 3, Indoor Water Use.

GIB Credit 4: Water-Efficient Landscaping

1 point

Intent

To limit or eliminate the use of *potable water* and other natural surface or subsurface water resources on *project* sites, for landscape irrigation.

Requirements

Reduce water consumption for outdoor landscape irrigation by 50% from a calculated midsummer baseline case. Reductions may be attributed to any combination of the following strategies, among others:

a. Plant species, plant density, and microclimate factor.

b. Irrigation efficiency.

c. Use of captured rainwater.

d. Use of recycled wastewater.

e. Use of water treated and conveyed by a public agency specifically for nonpotable uses.

f. Use of other nonpotable water sources, such as stormwater, air-conditioning condensate, and foundation drain water.

Projects with no new or *existing* landscape irrigation requirements automatically meet the credit requirements.

Groundwater seepage that is pumped away from the immediate vicinity of buildings slabs and foundations can be used for landscape irrigation and meet the intent of this credit. However, it must be demonstrated that doing so does not affect site stormwater management systems.

GIB Credit 5: Existing Building Reuse

1 point

Intent

To extend the life cycle of *existing* building stock to conserve resources, reduce waste, and reduce adverse environmental effects of new buildings related to materials manufacturing and transport.

Requirements

Reuse the existing *habitable building* stock, achieving the greater of the following two benchmarks (based on surface area):

a. 50% of one existing building structure (including structural floor and roof decking) and envelope (including exterior skin and framing but excluding window assemblies and nonstructural roofing material).

b. 20% of the total existing building stock (including structure and envelope, as defined above).

Hazardous materials that are remediated as a part of the *project* scope must be excluded from the calculations.

AND

FOR ALL PROJECTS

Do not demolish any *historic buildings*, or portions thereof, or alter any *cultural landscapes* as part of the project.

An exception is granted only if such action has been approved by an appropriate review body. For buildings listed locally, approval must be granted by the local historic preservation review board, or equivalent. For buildings listed in a state register or in the National Register of Historic Places, approval must appear in a programmatic agreement with the State Historic Preservation Office.

GIB Credit 6: Historic Resource Preservation and Adaptive Use

1 point

Intent

To encourage the preservation and adaptive use of *historic buildings* and *cultural landscapes* that represent significant embodied energy and cultural value, in a manner that preserves historic materials and character-defining features.

Requirements

To achieve this credit, at least one historic building or cultural landscape must be present on the *project* site.

Do not demolish any historic buildings, or portions thereof, or alter any cultural landscapes as part of the project.

An exception is granted only if such action has been approved by an appropriate review body. For buildings or landscapes listed locally, approval must be granted by the local historic preservation review board, or equivalent. For buildings or landscapes listed in a state register or in the National Register of Historic Places, approval must appear in a programmatic agreement with the State Historic Preservation Office.

If any historic building in the project site is to be rehabilitated, rehabilitate in accordance with local review or federal standards for rehabilitation, whichever is more restrictive, using one of the following approaches:

a. Obtain approval, in the form of a "certificate of appropriateness," from a locally appointed historic preservation commission or architectural review board for any exterior alterations or additions.

b. If federal funds are used for the project, obtain confirmation from a state historic preservation office or the National Park Service that the rehabilitation satisfies the Secretary of the Interior's Standards for Rehabilitation.

c. If a building or site is listed in or determined eligible for the National Register of Historic Places but is not subject to federal or local review board review, include on the project team a preservation professional who meets the federal qualifications for historic architect and attests to conformance to the Secretary of the Interior's Standards for the Treatment of Historic Properties.

GIB Credit 7: Minimized Site Disturbance in Design and Construction

1 point

Intent

To preserve *existing* noninvasive trees, *native plants*, and pervious surfaces.

Requirements

OPTION 1. Development Footprint on Previously Developed Land

Locate 100% of the *development footprint* on areas that are *previously developed* and for which 100% of the *construction impact zone* is previously developed.

OR

OPTION 2. Undeveloped Portion of Project Left Undisturbed

Depending on the *density* of the *project*, do not develop or disturb a portion of the land that has not been previously developed on the site, exclusive of any land preserved by codified law or a prerequisite of LEED for Neighborhood Development; or exempt areas designated as nonbuildable in land-use comprehensive plans and stipulate in *covenants, conditions, and restrictions* (CC&R) or other binding documents that the undisturbed area will be protected from development in perpetuity. Densities and minimum percentages are as follows (mixed-use projects must use the lowest applicable density or calculate a weighted average per the methodology in NPD Credit 2, Compact Development):

Table 1. Minimum undeveloped area, by project density

Residential density (DU/acre)	Nonresidential density (FAR)	Minimum area left undisturbed
< 15	< .50	20%
15 – 21	.50 – 1.0	15%
> 21	> 1.0	10%
DU = dwelling unit; FAR = floor-area ratio.		

For portions of the site that are not previously developed, identify construction impact zones that limit disturbance to a minimum of 40 feet beyond the building perimeter; 10 feet beyond surface walkways, patios, surface parking and utilities less than 12 inches in diameter; 15 feet beyond *street* curbs and main utility branch trenches; and 25 feet beyond constructed areas with permeable surfaces (such as pervious paving areas, stormwater retention facilities, and playing fields) that require additional staging areas to limit compaction in the constructed zone.

AND

FOR ALL PROJECTS

Survey the site to identify the following:

a. Trees in good or excellent condition, as determined by an arborist certified by the International Society of Arboriculture (ISA).

b. Any heritage or champion trees of special importance to the community because of their age, size, type, historical association, or horticultural value, as defined by a government forester.

c. All trees larger than 6 inches in diameter at breast height (dbh, 4 feet 6 inches above ground).

d. Any *invasive* tree species present on the site, and whether those trees threaten the health of other trees to be preserved on the site, as determined by an ISA-certified arborist.

Preserve the following trees that are also identified as in good or excellent condition:

a. All heritage or champion trees and trees whose dbh exceeds 50% of the state champion dbh for the species.

b. A minimum of 75% of all noninvasive trees (including the above) larger than 18 inches dbh.

c. A minimum of 25% of all noninvasive trees (including the above) larger than 12 inches dbh if deciduous, and 6 inches dbh if coniferous.

Tree condition ratings must be based on assessment by an ISA-certified arborist using ISA-approved assessment measures.

Develop a plan, in consultation with and approved by an ISA-certified arborist, for the health of the trees, including fertilization and pruning, and for their protection during construction. The plan must include protective fencing located 1 foot for each 1-inch caliper from the trunk or at the tree drip line, whichever is larger, and specify that if trenching or other disturbance is necessary within the protected zone, this work must be done by hand. If disturbance includes a permanent excavation of 3 feet or deeper, the excavation must start from a point not closer than 15 feet from the tree's drip line. If an ISA-certified arborist has determined that any trees to be preserved are threatened by invasive vegetation, develop a plan to reduce the invasive vegetation to the maximum extent possible. Stipulate in CC&R or other binding documents that the undisturbed area of the preserved trees will be protected from development in perpetuity.

Key Definitions

For the meanings of other terms used in the requirements, refer to the Glossary.

previously developed altered by paving, construction, and/or land use that would typically have required regulatory permitting to have been initiated (alterations may exist now or in the past). Previously developed land includes a platted lot on which a building was constructed if the lot is no more than 1 acre; previous development on lots larger than 1 acre is defined as the *development footprint* and land alterations associated with the footprint. Land that is not previously developed and altered landscapes resulting from current or historical clearing or filling, agricultural or forestry use, or preserved natural area use are considered undeveloped land. The date of previous development permit issuance constitutes the date of previous development, but permit issuance in itself does not constitute previous development.

GIB Credit 8: Stormwater Management

1–4 points

Intent

To reduce pollution and hydrologic instability from stormwater, reduce flooding, promote aquifer recharge, and improve water quality by emulating natural hydrologic conditions.

Requirements

Implement a comprehensive stormwater management plan for the *project* that retains on-site, through infiltration, evapotranspiration, and/or reuse, the rainfall volumes listed in Table 1. Rainfall volume is based on the project's *development footprint*, any other areas that have been graded so as to be effectively impervious, and any pollution-generating pervious surfaces, such as landscaping, that will receive treatments of fertilizers or pesticides.

The percentile rainfall event (Table 1) is the total rainfall on a given day in the record that is greater than or equal to X percent of all rainfall events over a 20- to 40+-year period. For example, a 95th percentile event in a particular region might be 1.5 inches, which would then be the volume to retain. To determine the volume to be retained, projects may use NOAA's published national rainfall data, run an approved stormwater model, or independently gather local rain gauge data and rank rainfall events. One hundred percent of the water volume from rainfall events up to the X percentile event must not be discharged to surface waters unless the harvested and reused runoff is authorized for discharge or allowed to be discharged into sanitary treatment systems.

Table 1. Points for retaining stormwater on-site

Percentile rainfall event (determines total volume from development footprint to be retained)	Points
80th percentile	1
85th percentile	2
90th percentile	3
95th percentile	4

Projects that earn at least 2 points under this credit may earn 1 additional point by meeting one of the following site characteristics:

a. The project is located on a *previously developed site* (1 point).

b. The project is located on a site that meets the definition of *brownfield* in SLL Credit 2, Brownfields Redevelopment (1 point).

c. The project is designed to be transit ready by achieving the following (1 point):

- At least 2 points under NPD Credit 1, Walkable Streets.
- At least 2 points under NPD Credit 2, Compact Development.
- At least 2 points under NPD Credit 3, Mixed-Use Neighborhood Centers.

Select BMPs from the *Washington State Department of Ecology's Stormwater management Manual for Western Washington, Volume V, Run off Treatment (2005 edition)*, or locally approved equivalent, whichever is more stringent. If the BMPs are comparable in stringency, choose BMPs that are most appropriate to the project site and region. BMPs must also comply with all federal, state, and local regulations.

For stormwater reuse systems not on a combined stormwater and sewer system, the total water reused for indoor use must not exceed 90% of the average annual rainfall.

Stormwater BMPs (except cisterns) must be designed to drain down within 72 hours.

GIB Credit 9: Heat Island Reduction

1 point

Intent

To reduce heat islands to minimize effects on the microclimate and human and wildlife habitat.

Requirements

OPTION 1. Nonroof Measures

Use any combination of the following strategies for 50% of the nonroof site hardscape (including roads, sidewalks, courtyards, parking lots, parking structures, and driveways):

a. Provide shade from open structures, such as those supporting solar photovoltaic panels, canopied walkways, and vine pergolas, all with a solar reflectance index (SRI) of at least 29.

b. Use paving materials with an SRI of at least 29.

c. Install an open-grid pavement system that is at least 50% pervious.

d. Provide shade from tree canopy (within ten years of landscape installation).

OR

OPTION 2. High-Reflectance and Vegetated Roofs

Use roofing materials that have an SRI equal to or greater than the values in Table 1 for a minimum of 75% of the roof area of all new buildings within the *project*; or install a vegetated ("green") roof for at least 50% of the roof area of all new buildings within the project. Combinations of SRIcompliant and vegetated roofs can be used provided they satisfy the equation in Option 3.

Table 1. Minimum solar reflectance index value, by roof slope

Roof slope	SRI
Low (≤ 2:12)	78
Steep (> 2:12)	29

OR

OPTION 3. Mixed Nonroof and Roof Measures

Use any of the strategies listed under Options 1 and 2 that in combination meet the following criterion:

$$\frac{\text{Area of Nonroof Measures}}{0.5} + \frac{\text{Area of SRI Roof}}{0.75} + \frac{\text{Area of Vegetated Roof}}{0.5} \geq \text{Total Site Hardscape Area} + \text{Total Roof Area}$$

GIB Credit 10: Solar Orientation

1 point

Intent

To encourage energy efficiency by creating optimum conditions for the use of passive and active solar strategies.

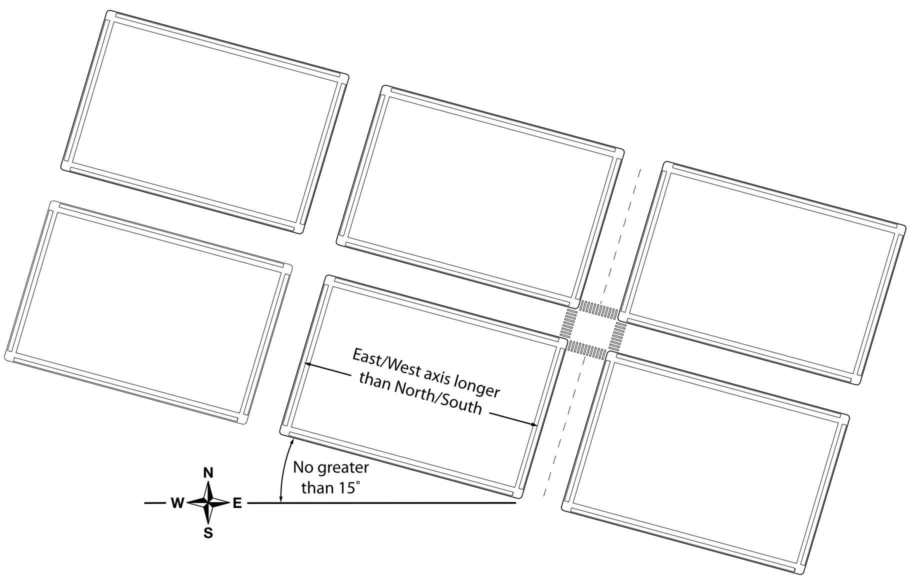
Requirements

OPTION 1. Block Orientation (For Projects Earning at Least 2 Points Under NPD Credit 2, Compact Development)

Locate the *project* on *existing block*s or design and orient the project such that 75% or more of the blocks have one axis within plus or minus 15 degrees of geographical east-west, and the east-west lengths of those blocks are at least as long as the north-south lengths of the blocks.

Earn at least 2 points under NPD Credit 2, Compact Development.

Figure 1. Solar-oriented blocks with east-west lengths equal to or greater than north-south lengths, and east-west axis within 15 degrees of geographic east-west

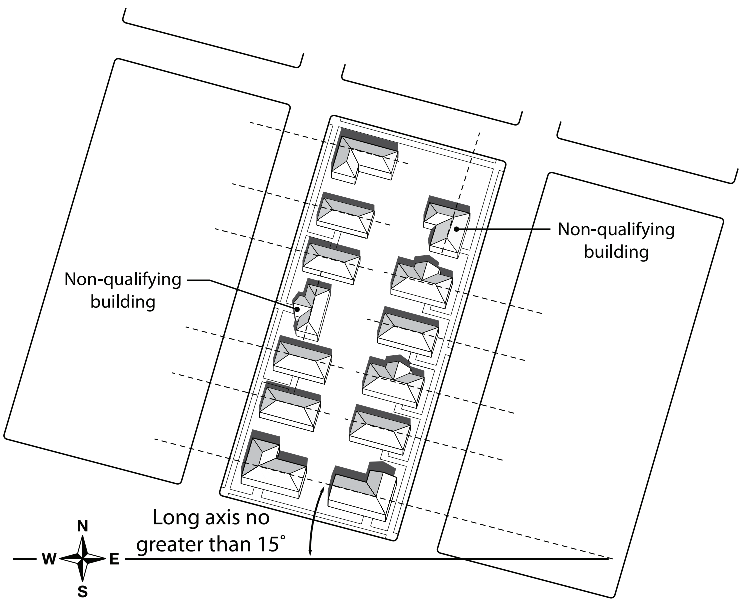


OR

OPTION 2. Building Orientation (Available For All Projects)

Design and orient 75% or more of the project's total building square footage (excluding existing buildings) such that one axis of each qualifying building is at least 1.5 times longer than the other, and the longer axis is within 15 degrees of geographical east-west. The length-to-width ratio applies only to walls enclosing conditioned spaces; walls enclosing unconditioned spaces, such as garages, arcades, or porches, cannot contribute to credit achievement. The surface area of equator-facing vertical surfaces and slopes of roofs of buildings counting toward credit achievement must not be more than 25% shaded at the time of initial occupancy, measured at noon on the winter solstice.

Figure 2. Solar-oriented buildings with longer axis (at least 1.5 times length of other axis) within 15 degrees of geographic east-west



GIB Credit 11: On-Site Renewable Energy Sources

1–3 points

Intent

To encourage on-site renewable energy production to reduce the adverse environmental and economic effects associated with fossil fuel energy production and use.

Requirements

Incorporate on-site nonpolluting renewable energy generation, such as solar, wind, geothermal, small-scale or micro hydroelectric, and/or biomass, with production capacity of at least 5% of the *project's* annual electrical and thermal energy cost (exclusive of *existing* buildings), as points are awarded as listed in Table 1.

Table 1. Points for on-site renewable energy generation

Percentage of annual electrical and thermal energy cost	Points
5%	1
12.5%	2
20%	3

GIB Credit 12: District Heating and Cooling

2 points

Intent

To encourage the development of energy-efficient neighborhoods by employing district heating and cooling strategies that reduce energy use and adverse energy-related environmental effects.

Requirements

Incorporate a district heating and/or cooling system for space conditioning and/or water heating of new buildings (at least two buildings total) such that at least 80% of the *project's* annual heating and/or cooling consumption is provided by the district plant. *Single-family residential* buildings and *existing* buildings of any type may be excluded from the calculation.

Each system component that is addressed by ANSI/ASHRAE/IESNA Standard 90.1–2007 must have an overall efficiency performance at least 10% better than that specified by the standard's prescriptive requirements. Additionally, annual district pumping energy consumption that exceeds 2.5% of the annual thermal energy output of the heating and cooling plant (with 1 kWh of electricity equal to 3,413 Btus) must be offset by increases in the component's efficiency beyond the specified 10% improvement. Combined heat and power (CHP) district systems can achieve this credit by demonstrating equivalent performance.

GIB Credit 13: Infrastructure Energy Efficiency

1 point

Intent

To reduce adverse environmental effects from energy used for operating public infrastructure.

Requirements

Design, purchase, or work with the municipality to install all new infrastructure, including but not limited to traffic lights, *street* lights, and water and wastewater pumps, to achieve a 15% annual energy reduction below an estimated baseline energy use for this infrastructure. The baseline is calculated with the assumed use of lowest first-cost infrastructure items.

GIB Credit 14: Wastewater Management

1–2 points

Intent

To reduce pollution from wastewater and encourage water reuse.

Requirements

Design and construct the *project* to retain on-site at least 25% of the average annual wastewater generated by the project (exclusive of *existing* buildings), and reuse that wastewater to replace *potable water*. An additional point may be awarded for retaining and reusing 50%. Provide on-site treatment to a quality required by state and local regulations for the proposed reuse. The percentage of wastewater diverted and reused is calculated by determining the total wastewater flow using the design case after the GIB Prerequisite 3 calculations, and determining how much of that volume is reused on-site.

Table 1. Points for reusing wastewater

Percentage of wastewater reused	Points
25%	1
50%	2

GIB Credit 15: Recycled Content in Infrastructure

1 point

Intent

To use recycled and reclaimed materials to reduce the adverse environmental effects of extracting and processing virgin materials.

Requirements

Use materials for new infrastructure such that the sum of *postconsumer* recycled content, on-site reused materials, and one-half of the *preconsumer* recycled content constitutes at least 50% of the total mass of infrastructure materials.

Count materials in all of the following infrastructure items as applicable to the *project*:

a. Roadways, parking lots, sidewalks, unit paving, and curbs.

b. Water retention tanks and vaults.

c. Base and subbase materials for the above.

d. Stormwater, sanitary sewer, steam energy distribution, and water piping.

Recycled content is defined in accordance with ISO/IEC 14021, Environmental labels and declaration, Self-declared environmental claims (Type II environmental labeling).

GIB Credit 16: Solid Waste Management Infrastructure

1 point

Intent

To reduce the volume of waste deposited in landfills. To promote the proper disposal of hazardous wastes.

Requirements

Meet at least four of the following five requirements and publicize their availability and benefits:

a. Include as part of the *project* at least one recycling or reuse station, available to all project occupants, dedicated to the separation, collection, and storage of materials for recycling; or locate the project in a local government jurisdiction that provides recycling services. The recyclable materials must include, at a minimum, paper, corrugated cardboard, glass, plastics and metals.

b. Include as part of the project at least one drop-off point, available to all project occupants, for potentially hazardous office or household wastes; or locate the project in a local government jurisdiction that provides collection services. Examples of potentially hazardous wastes include paints, solvents, oil, and batteries. If a plan for postcollection disposal or use does not exist, establish one.

c. Include as part of the project at least one compost station or location, available to all project occupants, dedicated to the collection and composting of food and yard wastes; or locate the project in a local government jurisdiction that provides composting services. If a plan for postcollection use does not exist, establish one.

d. On every mixed-use or nonresidential *block* or at least every 800 feet, whichever is shorter, include recycling containers adjacent to other receptacles or recycling containers integrated into the design of the receptacle.

e. Recycle and/or salvage at least 50% of nonhazardous construction and demolition debris. Develop and implement a construction waste management plan that, at a minimum, identifies the materials to be diverted from disposal and specifies whether the materials will be stored on-site or commingled. Excavated soil and land-clearing debris do not contribute to this credit. Calculations can be done by weight or volume but must be consistent throughout.

GIB Credit 17: Light Pollution Reduction

1 point

Intent

To minimize light trespass from *project* sites, reduce sky-glow to increase night sky access, improve nighttime visibility through glare reduction, and reduce adverse effects on wildlife environments.

Requirements

"Shared areas" of a project are spaces and facilities dedicated to common use (publicly or privately owned).

In residential areas, at least 50% of the external luminaires must have fixture-integrated lighting controls that use motion sensors to reduce light levels by at least 50% when no activity has been detected for 15 minutes.

AND

In all shared areas, install automatic controls that turn off exterior lighting when sufficient daylight is available and when the lighting is not required during nighttime hours; these lights must meet the total exterior lighting power allowance requirements in Table 3.

AND

Document which lighting zone or zones (Table 1) describe the project, and for all shared areas, follow the requirements in Table 2. If two or more different zones border the project, use the most stringent uplight requirements, and use light trespass requirements for the adjacent zone. Roadway lighting that is part of the project must meet the requirements for the appropriate zone.

For illuminance generated from a single luminaire placed at the intersection of a private vehicular driveway and public roadway accessing the site, project teams may use the centerline of the public roadway as the site boundary for a length of two times the driveway width centered at the centerline of the driveway when complying with the trespass requirements.

Compliance with the light trespass requirements may alternatively be met by using only luminaires that comply with Table 4 ratings for backlight and glare.

AND

Stipulate *covenants, conditions, and restrictions* (CC&R) or other binding documents to require continued adherence to the requirements.

Table 1. Lighting zones

Zone	Definition
LZ0	Undeveloped areas within national parks, state parks, forest land and rural areas and sites immediately adjacent to areas officially recognized as ecologically sensitive by the local zoning authority.
LZ1	Developed areas within national parks, state parks, forest land and rural areas.
LZ2	Areas predominantly consisting of residential zoning, neighborhood business districts, light industrial with limited nighttime use, and residential mixed-use areas.
LZ3	All other areas not included in LZ0, LZ1, LZ2, or LZ4 (including commercial-industrial and high-density residential).
LZ4	High-activity commercial districts in major metropolitan areas (as designated by local jurisdiction, such as local zoning authority).

Table 2. Allowable light trespass and uplight, by lighting zone

Lighting zone	Maximum horizontal and vertical illuminance (fc) at site boundary	Maximum horizontal and vertical illuminance (fc) at specified distance beyond site boundary	Maximum percentage of fixture lumens emitted above 90º or higher from nadir (straight down)
LZ0	0	0 at 0 ft.	0%
LZ1	0.01	.01 at 0 ft.	0%
LZ2*	0.10	.02 at 10 ft.	1%
LZ3*	0.20	.05 at 15 ft.	2%
LZ4*	0.60	.05 at 15 ft.	5%

fc = footcandle.
* In LZ2, LZ3, and LZ4, for project boundaries that abut public rights-of-way, light trespass requirements may be met relative to the curb line instead of the project boundary.

Table 3. Allowable lighting power densities, by lighting zone

	Lighting zone				
	LZ0	LZ1	LZ2	LZ3	LZ4
All exterior improved areas (except those listed below)	0.04 W/sf	0.04 W/sf	0.06 W/sf	0.10 W/sf	0.13 W/sf
Walkways	0.7 W/lf	0.7 W/lf	0.7 W/lf	0.8 W/lf	1.0 W/lf
Landscaping	No allowance	0.04 W/sf	0.05 W/sf	0.05 W/sf	0.05 W/sf
Entrance door (per linear foot of doorway)	20W	20W	20W	30W	30W
Entry canopy	0.25 W/sf	0.25 W/sf	0.25 W/sf	0.40 W/sf	0.40 W/sf
Illuminated building façade	No allowance	No allowance	2.5W/lf	3.75W/lf	5.0W/lf

sf = square feet; lf = linear feet.
Note: The total exterior lighting power density allowance for all shared exterior applications is the sum of the specified allowances for individual illuminated areas. The following lighting is exempted when its controls meet the above requirements and are independent of the controls for nonexempt lighting:

a. Specialized signal, directional, and marker lighting associated with transportation.
b. Advertising and directional signage.
c. Lighting integral to equipment or instrumentation and installed by its manufacturer.
d. Lighting for theatrical purposes, including performance, stage, film, and video.
e. Lighting for athletic playing fields.
f. Temporary lighting (installed for no more than 30 days and then removed for at least 30 days).
g. Lighting for industrial production, material handling, transportation sites, and associated storage areas.
h. Theme elements in theme or amusement parks.
i. Lighting to highlight features of public monuments and registered *historic buildings* or landmark structures.

Alternative method for meeting light trespass requirements in Table 2

A luminaire may be used if it is rated as follows according to the lighting zone of the site. If the luminaire is installed in other than the intended manner, the rating must account for the actual photometric geometry. An exception applies if at least 98% of a luminaire's emitted lumens are intercepted by man-made structures within the project. In either case, luminaires equipped with adjustable mounting devices permitting alteration of luminaire aiming in the field are not permitted.

Table 4. Allowable backlight and glare, by lighting zone

	Lighting zone				
Backlight luminaire rating	LZ0	LZ1	LZ2	LZ3	LZ4
> 2 mounting heights from property line	B0	B1	B2	B3	B4
1 to 2 mounting heights from property line and properly oriented*	B0	B1	B2	B3	B3
0.5 to 1 mounting height to property line and properly oriented*	B0	B0	B1	B2	B2
< 0.5 mounting height to property line adjacent to street and properly oriented*	B0	B0	B1	B2	B2
< 0.5 mounting height to property line and properly oriented*	B0	B0	B0	B1	B2
Glare luminaire rating	G0	G1	G2	G3	G4

* The luminaire must be mounted with backlight toward the property line.
Note: Backlight and glare ratings are defined based on specific lumen limits for IESNA TM-15-07 solid angles, Addendum A.

INNOVATION AND DESIGN PROCESS

IDP Credit 1: Innovation and Exemplary Performance

1–5 points

Intent

To encourage exemplary performance above the requirements set by the LEED for Neighborhood Development Rating System and/or innovative performance in green building, smart growth, or new urbanist categories not specifically addressed by the LEED for Neighborhood Development Rating System.

Requirements

In writing, identify the intent of the proposed innovation credit, the proposed requirement for compliance, the proposed submittals to demonstrate compliance, and the design approach and strategies that might be used to meet the requirements.

One point is awarded for each IDP Credit 1 earned, up to a total of 5. No more than 3 exemplary performance credits will be awarded in the Innovation and Design Process category.

IDP Credit 2: LEED Accredited Professional

1 point

Intent

To support the integrated planning and design required for a LEED for Neighborhood Development *project* and to streamline the application and certification process.

Requirements

At least one principal member of the project team must be a LEED Accredited Professional.

OR

At least one principal member of the project design team must be a professional who is credentialed in smart growth as determined by the Natural Resources Defense Council in consultation with Smart Growth America.

OR

At least one principal member of the project design team must be a professional who is credentialed in new urbanism as determined by the Congress for the New Urbanism.

Note: A separate LEED Accredited Professional exam track for professionals wanting to specialize in the LEED for Neighborhood Development Rating System will be available in early 2010; this IDP credit can be achieved if a principal member of the project design team is accredited as a result of passing the exam.

REGIONAL PRIORITY CREDIT

RPC Credit 1: Regional Priority

1–4 points

Intent

To encourage strategies that address geographically specific environmental, social equity, and public health priorities.

Requirements

Earn up to four of the six Regional Priority credits. These credits have been identified by subject matter experts representing the U.S. Green Building Council (regional councils and chapters), the Congress for the New Urbanism (chapters and membership in regions without chapters), and Smart Growth America (members of Smart Growth America's State and Local Caucus or their designees) as having additional regional importance for the project's location. A database of Regional Priority credits and their geographic applicability will be available on the USGBC website, www.usgbc.org.

One point is awarded for each Regional Priority credit earned, up to a maximum of 4. Non-U.S. projects are not eligible for Regional Priority credits.

APPENDIX. DIVERSE USES

Food Retail

Supermarket
Other food store with produce

Community-Serving Retail

Clothing store or department store selling clothes
Convenience store
Farmer's market
Hardware store
Pharmacy
Other retail

Services

Bank
Gym, health club, exercise studio
Hair care
Laundry, dry cleaner
Restaurant, café, diner (excluding establishments with only drive-throughs)

Civic and Community Facilities

Adult or senior care (licensed)
Child care (licensed)
Community or recreation center
Cultural arts facility (museum, performing arts)
Educational facility (including K–12 school, university, adult education center, vocational school, community college)
Family entertainment venue (theater, sports)
Government office that serves public on-site
Place of worship
Medical clinic or office that treats patients
Police or fire station
Post office
Public library
Public park
Social services center

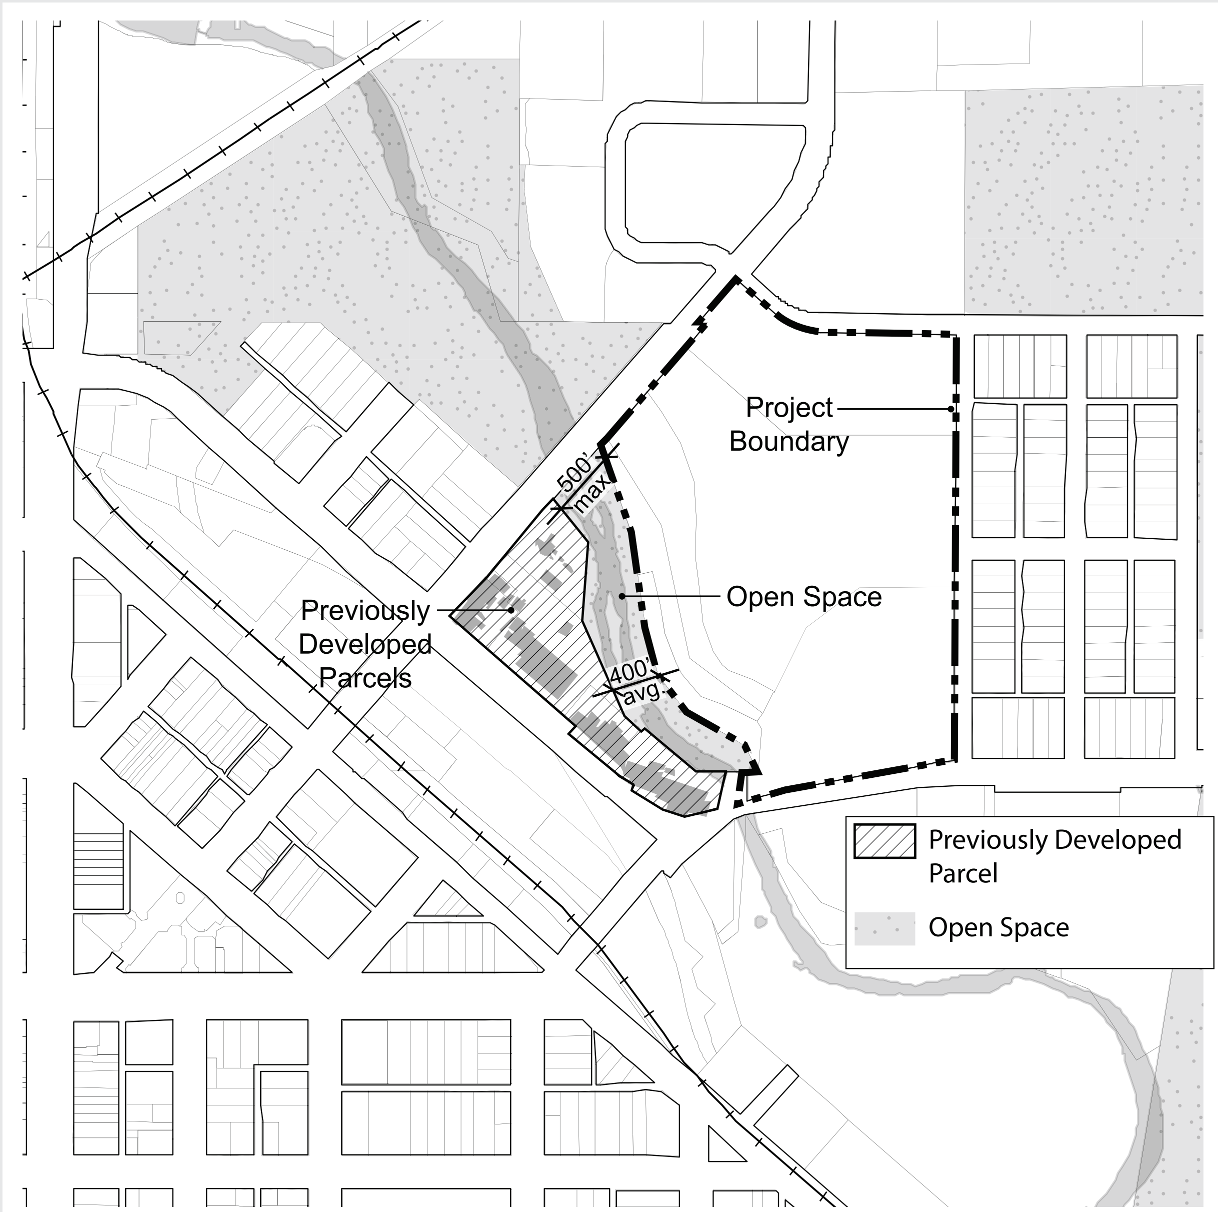
Adapted from Criterion Planners, INDEX neighborhood completeness indicator, 2005.

GLOSSARY

Key Definitions

adjacent site a site having at least 25% of its boundary bordering parcels that are each at least 75% *previously developed*. A *street* or other right-of-way does not constitute previously developed land; instead, it is the status of the property on the other side of the street or right-of-way that matters. Any fraction of the boundary that borders waterfront other than a stream is excluded from the calculation. A site is still considered adjacent if the 25% adjacent portion of its boundary is separated from previously developed parcels by undeveloped, permanently protected land averaging no more than 400 feet in width and no more than 500 feet in any one place. The undeveloped land must be permanently preserved as natural area, riparian corridor, *park*, greenway, agricultural land, or designated *cultural landscape*. Permanent pedestrian paths connecting the project through the protected parcels to the bordering site may be counted to meet the requirement of SLL Prerequisite 1, Option 2 (that the *project* be connected to the adjacent parcel by a through-street or nonmotorized right-of-way every 600 feet on average, provided the path or paths traverse the undeveloped land at no more than a 10% grade for walking by persons of all ages and physical abilities).

Adjacent project site based on minimum 25% of perimeter adjacent to previously developed parcels, including allowance for permanently protected land between project boundary and previously developed parcels



buildable land the portion of the site where construction can occur, including land voluntarily set aside and not constructed upon. When used in *density* calculations, buildable land excludes public rights-of-way and land excluded from development by codified law or LEED for Neighborhood Development prerequisites. An *applicant* may exclude additional land not exceeding 15% of the buildable land base defined above, provided the following conditions are present:

a. The land is protected from residential and nonresidential construction by easement, deed restriction, or other enforceable legal instrument.

AND

b. Either 25% or more of the boundary of each contiguous parcel proposed for exclusion borders a *water body* or areas outside the *project boundary* that are protected by codified law; or ownership of, or management authority over, the exclusion area is transferred to a public entity.

connectivity the number of publicly accessible *inter*sections per square mile, including any combination of streets, dedicated alleys, *transi*t rights-of-way, and nonmotorized rights-of-way. If one must both enter and exit an area through the same intersection, such an intersection and any intersections beyond that point are not counted; intersections leading only to culs-de-sac are also not counted. The cal*culation of* square mileage excludes water bodies, parks larger than 1/2 acre, *public facility ca*mpuses, airports, rail yards, slopes over 15%, and areas nonbuildable under codified law or the rating system. Street rights-of-way may not be excluded.

infill site a site that meets any of the following four conditions:

a. At least 75% of its boundary borders parcels that individually are at least 50% *previously developed,* and that in aggregate are at least 75% previously developed.

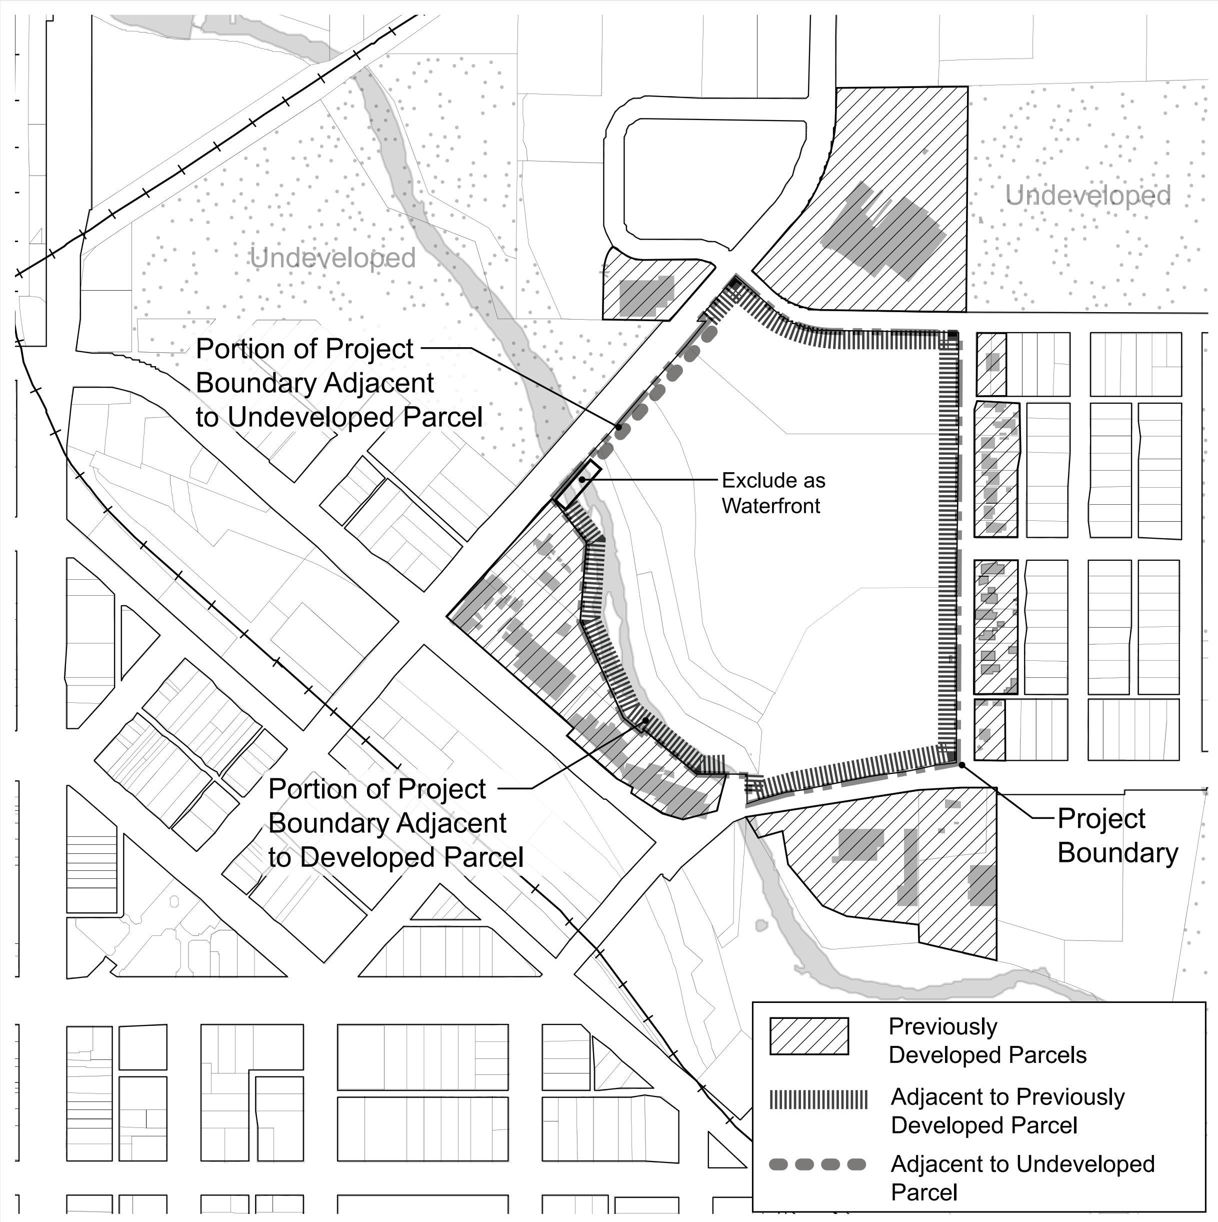
b. The site, in combination with bordering parcels, forms an aggregate parcel whose boundary is 75% bounded by parcels that individually are at least 50% previously developed, and that in aggregate are at least 75% previously developed.

c. At least 75% of the land area, exclusive of rights-of-way, within a 1/2 mile distance from the *project boundary* is previously developed.

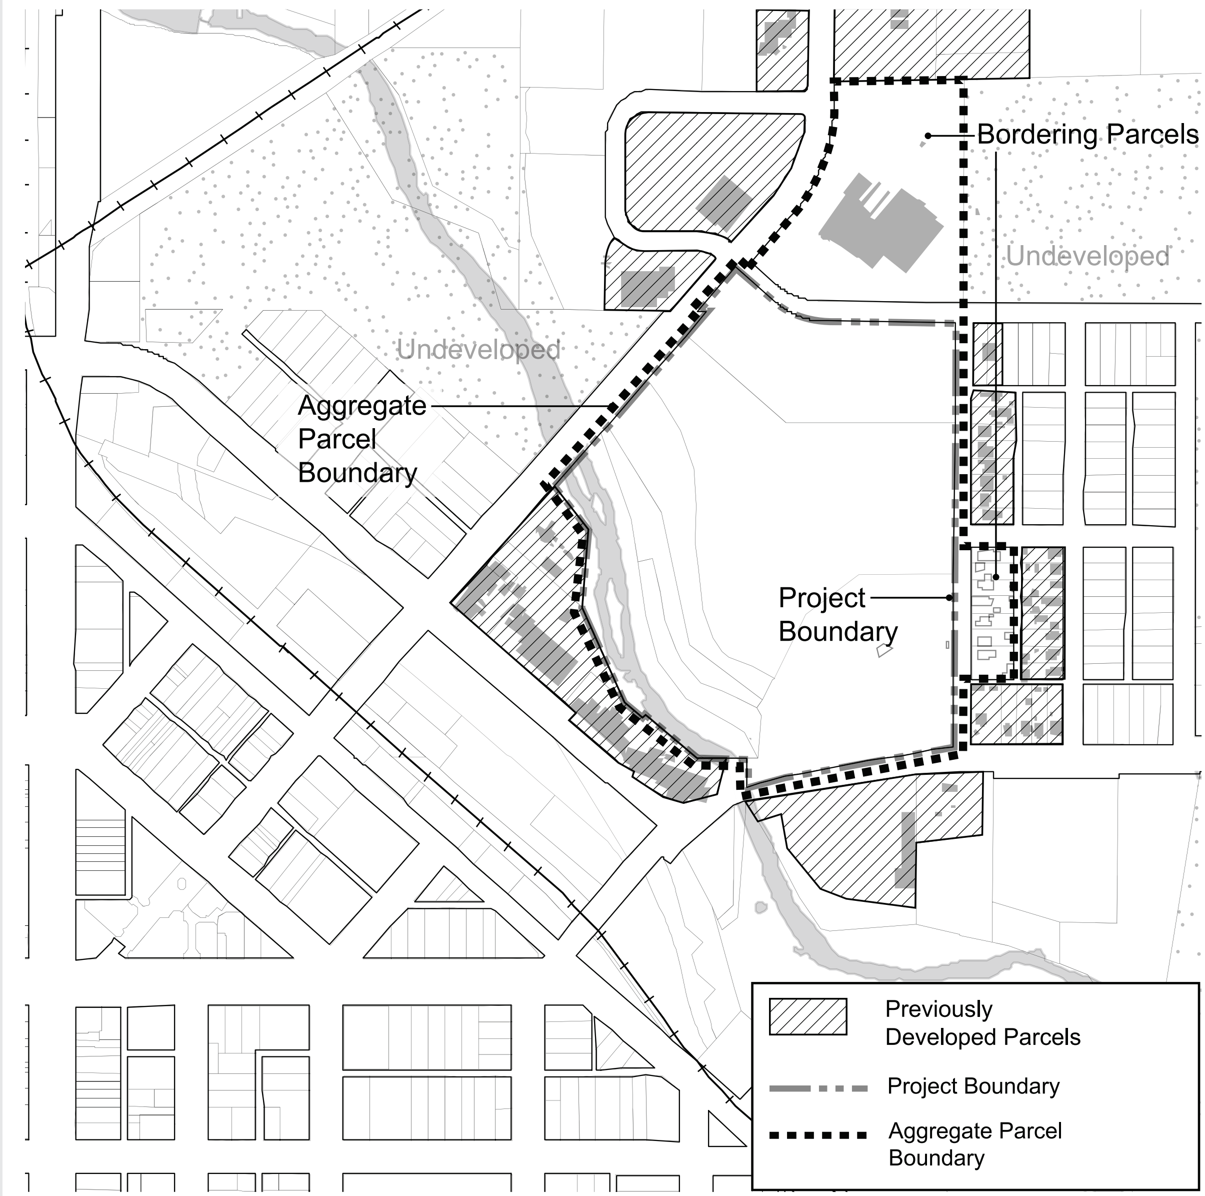
d. The lands within a 1/2 mile distance from the project boundary have a *preproject connectivity* of at least 140 intersections per square mile.

A *street* or other right-of-way does not constitute previously developed land; it is the status of property on the other side or right-of-way of the street that matters. For conditions (a) and (b) above, any fraction of the perimeter that borders waterfront other than a stream is excluded from the calculation.

(a). Infill project site based on minimum 75% of perimeter adjacent to previously developed parcels

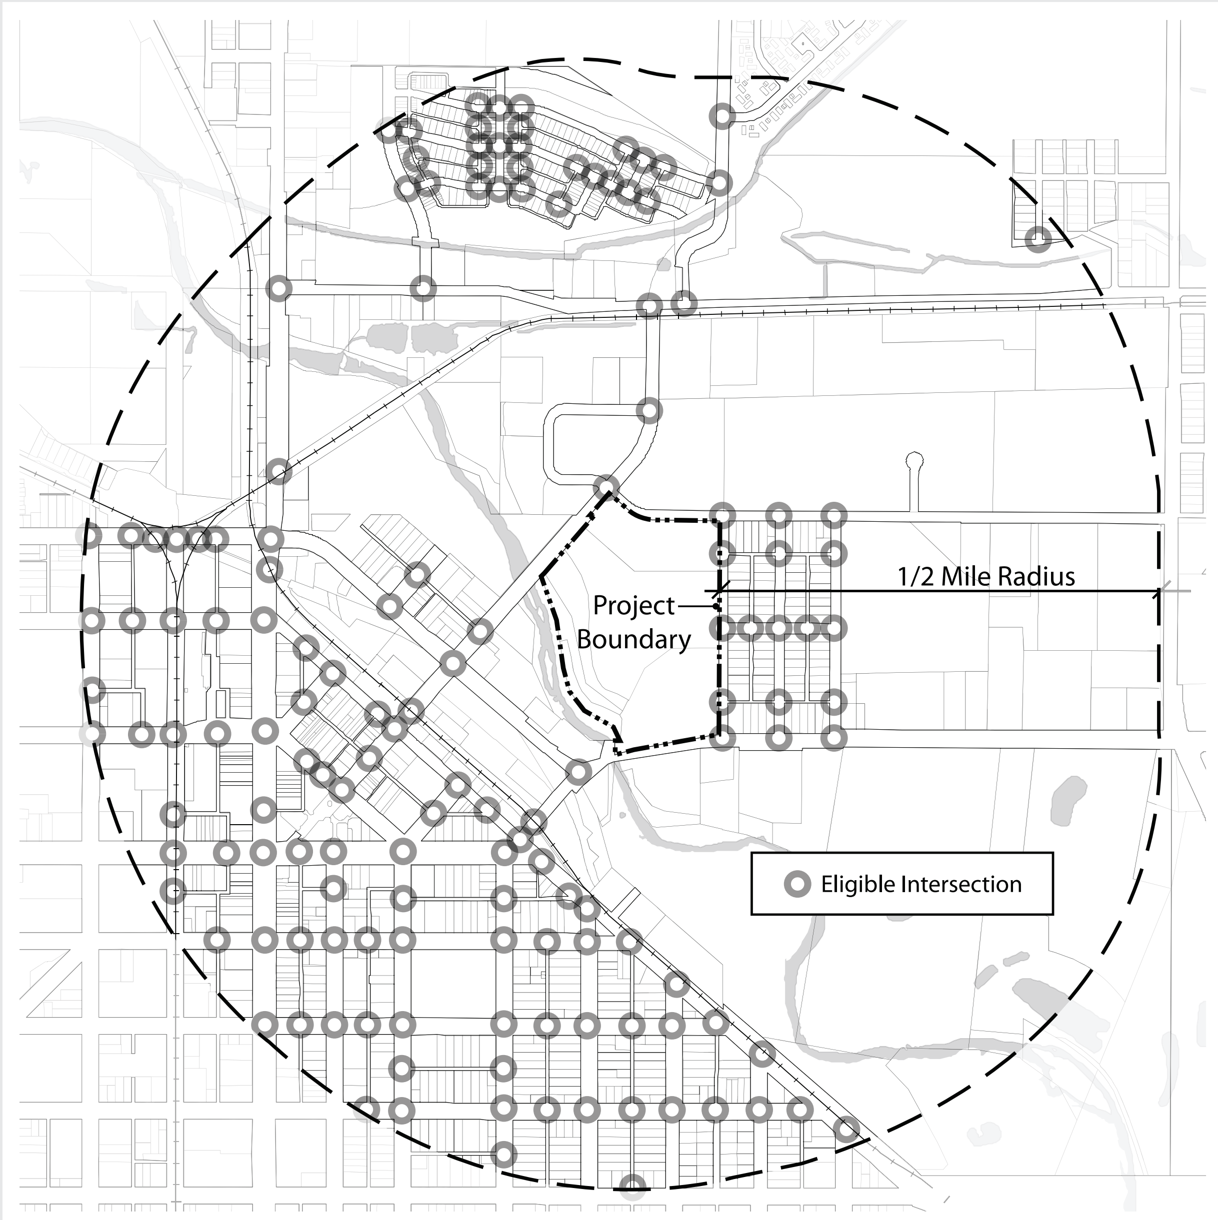


(b). Infill project site based on minimum 75% adjacent to previously developed parcels using project boundary and selected bordering parcels



(c). Infill project site based on minimum 75% of land area within 1/2 mile of project boundary being previously developed

(d). Infill project site based on minimum 140 intersections/sq.mi. within 1/2 mile of project boundary



previously developed altered by paving, construction, and/or land use that would typically have required regulatory permitting to have been initiated (alterations may exist now or in the past). Previously developed land includes a platted lot on which a building was constructed if the lot is no more than 1 acre; previous development on lots larger than 1 acre is defined as the *development footprint* and land alterations associated with the footprint. Land that is not previously developed and altered landscapes resulting from current or historical clearing or filling, agricultural or forestry use, or preserved natural area use are considered undeveloped land. The date of previous development permit issuance constitutes the date of previous development, but permit issuance in itself does not constitute previous development.

ADDITIONAL DEFINITIONS

accessory dwelling unit a subordinate *dwelling unit* that is attached to a principal building or contained in a separate structure on the same property as the principal unit.

adapted (**or introduced**) **plant** a species that reliably grows well in a given habitat with minimal attention from humans in the form of winter protection, pest protection, water irrigation, or fertilization once its root systems are established in the soil. Adapted plants are low maintenance but not invasive.

alley a publicly accessible right-of-way, generally located midblock, that can accommodate slow-speed motor vehicles, as well as bicycles and pedestrians. An alley provides access to the side or rear of abutting properties for loading, parking, and other service functions, minimizing the need for these functions to be located along streets. It may be publicly dedicated or privately owned and deeded in perpetuity for general public use.

applicant the entity that prepares the LEED-ND *project* submission and is responsible for project implementation. An applicant may be the *developer* or another cooperating entity.

area median income the median income of a county as determined by the U.S. Department of Housing and Urban Development.

bicycle network a continuous network consisting of any combination of physically designated in-*street* bicycle lanes at least 5 feet wide, off-street bicycle paths or trails at least 8 feet wide for a two-way path and at least 5 feet wide for a one-way path, and/or streets designed for a target speed of 25 miles per hour or slower.

block land bounded by the *project boundary*, transportation or utility rights-of-way that may be publicly dedicated or privately owned and deeded in perpetuity for general public use, waterfront, and/or comparable land division features.

brownfield real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or possible presence of a hazardous substance, pollutant, or contaminate.

build-out the time at which all *habitable buildings* on the *project* are complete and ready for occupancy.

bus rapid transit an enhanced bus system that operates on exclusive bus lanes or other transit rights-of-way; it is designed to combine the flexibility of buses with the efficiency of rail.

community-supported agriculture (**CSA**) a farm operation for which a community of individuals pledges support so that the farmland becomes, either legally or informally, the community's farm. The growers and consumers provide mutual support, sharing the risks and benefits of food production. Consumers receive portions of the farm's harvest throughout the growing season.

construction impact zone the *project's development footprint* plus the areas around the improvement where construction crews, equipment, and/or materials are staged and moved during construction.

covenants, conditions, and restrictions limitations that may be placed on a property and its use and are made a condition of holding title or lease.

cul-de-sac a *street* segment that terminates without intersecting another street segment.

cultural landscape an officially designated geographic area that includes both cultural and natural resources associated with a historic event, activity, or person or that exhibits other significant cultural or aesthetic values.

density the amount of building structures constructed on the *project site*, measured for residential buildings as *dwelling units* per acre of *buildable land* available for residential uses, and for non-residential buildings as the *floor-area ratio* of buildable land area available for nonresidential uses. In both cases, structured parking is excluded.

developer a public and/or private entity that controls a majority of the *project's buildable land* and is committed to making a majority of the investments required for the project implementation described in the LEED-ND submission.

development footprint the total land area of a *project* site covered by buildings, *streets*, parking areas, and other typically impermeable surfaces constructed as part of the project.

dwelling unit living quarters intended for long-term occupancy that provide facilities for cooking, sleeping, and sanitation. This does not include hotel rooms.

employment center a nonresidential area of at least 5 acres with a job density of at least 50 employees per net acre.

existing present on the date of submission of LEED-ND certification documents; similarly, an element or condition that **exists** is present on the date that LEED-ND certification documents are submitted.

floor-area ratio (**FAR**) the *density* of nonresidential land use, exclusive of parking, measured as the total nonresidential building floor area divided by the total *buildable land* area available for nonresidential structures. For example, on a site with 10,000 square feet of buildable land area, an FAR of 1.0 would be 10,000 square feet of building floor area. On the same site, an FAR of 1.5 would be 15,000 square feet of built floor area; an FAR of 2.0 would be 20,000 built square feet and an FAR of 0.5 would be 5,000 built square feet.

functional entry a building opening designed to be used by pedestrians and open during regular business hours. This does not include any door exclusively designated as an emergency exit, or a garage door not designed as a pedestrian entrance.

graywater untreated wastewater that has not come into contact with toilet waste. Graywater includes used water from bathtubs, showers, bathroom washbasins, and water from clothes washers and laundry tubs. It does not include wastewater from kitchen sinks or dishwashers, unless a graywater definition established by the authority having jurisdiction in the area has precedence.

habitable building a structure intended for living, working, or other types of occupancy. Habitable structures do not include stand-alone garages and utility structures such as pump stations.

heat island thermal gradient differences between developed and undeveloped areas.

historic building a building or structure listed or determined to be eligible as a historic structure or building or structure or as a contributing building or structure in a designated historic district, due to its historic, architectural, engineering, archeological, or cultural significance. The building or structure must be designated as historic by a local historic preservation review board or similar body, be listed in a state register of historic places, be listed in the National Register of Historic Places, or have been determined eligible for listing in the National Register.

historic district a group of buildings, structures, objects, and sites, of varying sizes, that have been designated as historically and architecturally significant and categorized as either contributing or noncontributing.

Home Energy Rating System (**HERS**) **index** a scoring system established by the Residential Energy Services Network (RESNET) in which a home built to the specifications of the HERS Reference Home (based on the 2006 International Energy Conservation Code) scores 100, and a net zero energy home scores 0. The lower a home's HERS Index, the more energy efficient it is.

invasive plant either an indigenous or nonindigenous species or strain that is characteristically adaptable, aggressive, has a high reproductive capacity, and tends to overrun the ecosystems it inhabits.

major renovations extensive alteration work in addition to work on the exterior shell of the building and/or primary structural components and/or the core and peripheral MEP and service systems and/or site work. Typically, the extent and nature of the work is such that the primary function space cannot be used for its intended purpose while the work is in progress and where a new certificate of occupancy is required before the work area can be reoccupied.

metropolitan (**metro**) and **micropolitan** (**micro**) **statistical area** a geographic entity defined by the U.S. Office of Management and Budget for use by federal statistical agencies in collecting, tabulating, and publishing federal statistics. A metro area contains a core urban area with a population of 50,000 or more, and a micro area contains an urban core with a population between 10,000 and 50,000. Each metro or micro area consists of one or more counties and includes the counties containing the core urban area, as well as any adjacent counties that have a high degree of social and economic integration (as measured by commuting to work) with the urban core. "Core-based statistical area" (CBSA) encompasses both metro and micro areas.

multiunit residential consisting of four or more residential units sharing a common entry.

native (**or indigenous**) **plant** a plant species that did or would have occurred on the site or within the subject county prior to the widespread land alterations that accompanied European settlement. Cultivars of native plants may be considered native plants.

park a publicly accessible area that is permanently maintained in a seminatural condition for human recreation and relaxation; it has soil, grass, water, flora, and/or recreation improvements.

paseo a publicly accessible pedestrian path, at least 4 feet wide and no more than 12 feet wide, that provides shortcuts between buildings and through the block, connecting *street* frontages to rear parking areas, midblock courtyards, *alleys*, or other streets. A paseo may be roofed for up to 50% of its length and may be privately owned or publicly dedicated.

planned diverse use a shop, service, or facility that has received a building permit and is under construction at the time of the first certificate of occupancy is issued for any building in the LEED-ND *project*.

planned occupancy the highest estimate of building occupants based on planned use(s) and industry standards for square foot requirements per employee (see USDOE EIA CBECS survey for suggested default nonresidential occupancies). The minimum planned occupancy for *multiunit residential* buildings is 1 person for a studio unit, 1.5 persons for a one-bedroom unit, and 1.25 persons per bedroom for a two- bedroom or larger unit.

plaza a publicly accessible gathering space that is integrated into the street network and allows vehicular, bicycle, and/or pedestrian travel. A plaza is generally paved, is spatially defined by building fronts paralleling at least two-thirds of its perimeter, and may be privately owned or publicly dedicated.

postconsumer generated by households or commercial, industrial, or institutional facilities in their role as end-users of a product, which can no longer be used for its intended purpose.

potable water water that meets or exceeds EPA's drinking water quality standards and is approved for human consumption by the state or local authorities having jurisdiction; it may be supplied from wells or municipal water systems.

preconsumer diverted from the waste stream during the manufacturing process. It does not include the reutilization of materials such as rework, regrind or scrap generated in a process and capable of being reclaimed within the same process that generated it.

predevelopment before any development occurred on the site. Predevelopment conditions describe the natural conditions of the site prior to any human alteration, such as development of roads or buildings.

previously developed site a site that, *preproject*, consisted of at least 75% *previously developed* land.

preproject before the LEED-ND *project* was initiated, but not necessarily before any development or disturbance took place. Preproject conditions describe the state of the project site on the date the *developer* acquired rights to a majority of its *buildable land* through purchase or option to purchase.

prime soil earth with chemical, hydrographic, and topological properties that make it especially suited to the production of crops, as defined by the U.S. Natural Resources Conservation Service.

project the land, water, and construction that constitutes the project application. A project *applicant* does not have to own or control all land or water within a *project boundary*, but all the area within the project boundary must comply with prerequisites and attempted credits.

project boundary the platted property line of the *project* defining land and water within it. Projects located on publicly owned campuses that do not have internal property lines must delineate a sphere-of-influence line to be used instead. *Project site* is equivalent to the land and water inside the project boundary. The project must not contain noncontiguous parcels, but parcels can be separated by public rights-of-way. Projects may also have enclaves of nonproject properties that are not subject to the rating system, but such enclaves cannot exceed 2% of the total project area and cannot be described as certified.

school a kindergarten, elementary, or secondary institution for the academic instruction of children.

single-family residential any residential unit other than *multiunit residential*, including single, duplex, triplex, row house, townhouse and semiattached residential building types.

street a dedicated right-of-way that can accommodate one or more modes of travel, excluding *alleys* and *paseos*. A street is suitable for primary entrances and provides access to the front and/or sides of buildings and lots. A street may be privately owned as long as it is deeded in perpetuity for general public use. A street must be an addressable thoroughfare (for mail purposes) under the standards of the applicable regulating authority.

square (also **green**) a publicly accessible open area for gatherings that is wholly or partially bounded by segments of the *street* network. A square can be landscaped or landscaped and paved, is spatially defined by building fronts paralleling at least 45% of its perimeter, and may be privately owned or publicly dedicated.

unique soil earth with chemical, hydrographic, and topological properties that make it especially suited to specific crops, as defined by the U.S. Natural Resources Conservation Service.

walk distance the distance that a pedestrian must travel between origins and destinations without obstruction, in a safe and comfortable environment on a continuous network of sidewalks, all-weather-surface footpaths, crosswalks, *woonerfs*, or equivalent pedestrian facilities.

water body the surface water of a stream (first-order and higher, including intermittent streams), arroyo, river, canal, lake, estuary, bay, or ocean, excluding irrigation ditches

water and wastewater infrastructure publicly owned water and wastewater infrastructure; this excludes septic and mound wastewater treatment systems.

wetland an area that is inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas, but exclude irrigation ditches unless delineated as part of an adjacent wetland.

woonerf a *street*, also known as a home zone, shared zone, or living street, where pedestrians have priority over vehicles and the posted speed limit is no greater than 10 miles per hour. Physical elements within the roadway, such as shared surfaces, plantings, street furniture, parking, and play areas, slow traffic and invite pedestrians to use the entire right-of-way.

vehicle miles traveled (**VMT**) the number of miles driven by motorists in a specified time period, such as a day or a year, in absolute or per capita terms.

COUNTY OF SAN DIEGO

GUIDELINES FOR DETERMINING SIGNIFICANCE

WILDLAND FIRE AND FIRE PROTECTION

LAND USE AND ENVIRONMENT GROUP

Department of Planning and Land Use
Department of Public Works

Second Revision
August 31, 2010

EXPLANATION

These Guidelines for Determining Significance for Wildland Fire and Fire Protection and information presented herein shall be used by County staff for the review of discretionary projects and environmental documents pursuant to the California Environmental Quality Act (CEQA). These Guidelines present a range of quantitative, qualitative, and performance levels for particular environmental effects. Normally, (in the absence of substantial evidence to the contrary), an affirmative response to any one Guideline will mean the project will result in a significant effect, whereas effects that do not meet any of the Guidelines will normally be determined to be "less than significant." Section 15064(b) of the State CEQA Guidelines states:

> "The determination whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on factual and scientific data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting."

The intent of these Guidelines is to provide a consistent, objective and predictable evaluation of significant effects. These Guidelines are not binding on any decision-maker and do not substitute for the use of independent judgment to determine significance or the evaluation of evidence in the record. The County reserves the right to modify these Guidelines in the event of scientific discovery or alterations in factual data that may alter the common application of a Guideline.

INTRODUCTION

This document provides guidance to planners, applicants, consultants, fire professionals and other interested parties for evaluating adverse environmental effects that a proposed project may have from wildland fire and establishes standards to ensure that development projects do not unnecessarily expose people or structures to a significant risk of loss, injury or death involving wildland fires. Specifically, this document addresses the following questions listed in the California Environmental Quality Act (CEQA) Guidelines:

Appendix G, VIII. Hazards and Hazardous Materials

h) Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Appendix G, XIV. Public Services

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance service ratios, response times or other performance objectives for any of the public services:

    i. Fire protection?

Appendix G, XVI. Transportation/Traffic

e) Would the project result in inadequate emergency access?

Appendix G, XVII. Utilities and Service Systems

d) Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

1.0 GENERAL PRINCIPLES AND EXISTING CONDITIONS

1.1 Wildland-Urban Interface Ignition Factors

Fires can ignite naturally or be caused by people. In the montane coniferous forests of the Southwest, lightning-ignited fires are abundant and human ignitions are far less important than in lower-elevation shrublands of southern California where lightning is uncommon and humans cause most of the fires (Keeley and Fotheringham 2003). Over 95 percent of fires in southern California shrublands are started by people, which has increased fire frequency and increased the chances of ignitions during Santa Ana winds (Keeley and Fotheringham 2003). In general, more people move to the shrublands than to the forests, since most of the development in San Diego County is on the coastal plain and in the foothills. People living in the wildlands, traveling on roads built through the wildlands, and recreating in the wildlands can ignite wildland fires inadvertently. In addition, wildland fires are sometimes ignited by arsonists. All these situations create more opportunities for potential wildland fire danger to people and their structures.

Wildland fires only spread if the wildfire meets the oxygen, fuel and heat requirements for ignition and continued combustion. In wildland fires oxygen is not limited, so the continuation of wildfire combustion relies on fuel and heat. Fuel, as mentioned above, is commonly the wildland vegetation and landscaping, but structures and accessories such as projections (i.e. decks & patio covers) can add to the fuel source. Burning fuel creates heat and heat allows fires to spread when there is sufficient fuel. Three primary means of heat transfer can result in ignition: conduction, convection and radiation.

1.1.1 Conduction

Conduction is heat transfer through a solid or from the heated surface to the interior of a solid. An example of heat conduction resulting in structure ignition would be flame impinging on the exterior metal siding of a mobile home. Like a frying pan, heat is transferred to structural components inside, resulting in ignition.

1.1.2 Convection

Convection is defined as transfer of heat by a circulating fluid – either gas or liquid. Heat rises from a wildland fire and is transferred by air currents to other objects, such as a house on a ridge top. Winds can carry heat by convection to vegetation and structures. Sufficient fuel modification zones, building setbacks from slopes and ignition-resistive construction are all important factors in limiting this risk.

1.1.3 Radiation

Radiation is energy transfer that travels across space without the need for intervening medium such as air. Examples in wildfires include ignition of light combustibles in advance of the flame front, like dry fine grasses or curtains behind a window. Radiation does not require flames to strike a structure to cause ignition. The source of flame radiation is the flame-front. Dependent on the length, height, and width of the flame-front (the leading edge of a wildland fire), and the flame duration, an unprotected structure can be ignited by radiant heat.

1.1.4 Firebrands

Firebrands are burning embers that become airborne and are blown beyond the fire front. Firebrands can be created from virtually any fuel source that is light enough to be blown upwards; however, vegetation is the most common source of firebrands. A burning structure also creates burning embers, particularly at collapse. Firebrands combine heat transfer methods of conduction and convection. Firebrands extend the boundaries of wildland fire hazard zones and present a prominent threat to structures, especially homes. Dependent on weather and the size of the ember, a firebrand can be carried far ahead of the fire front. The hazard can be worsened if structures are not ignition-resistant and cannot repel the heat of a burning ember. Flammable vegetation adjacent to (within ten feet of) a structure and other combustible materials (wood piles, combustible fences, decks, etc.) acts as a receptacle for fire brands, and will impact the structure.

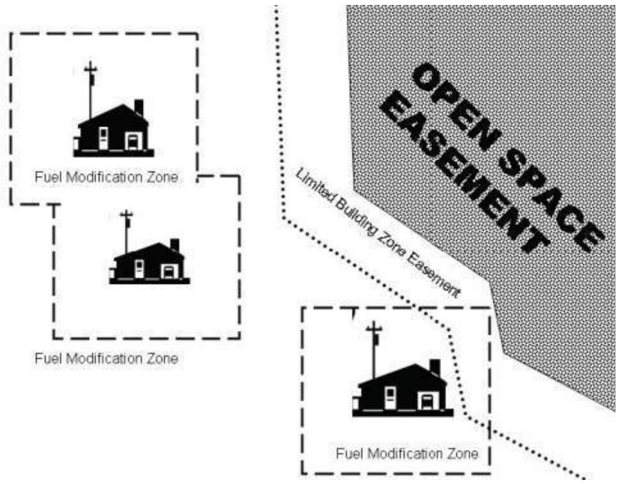
1.1.5 Flame Impingement

Flame impingement, a form of heat conduction, involves heat transfer from a flame that directly strikes a structure, potentially causing ignition of the structure. Flame size and the duration of flame impingement directly affect the potential for ignition of a structure.

1.2 Defensible Space

To improve the survivability of structures in a wildland fire, fire professionals recommend using defensible space around all structures occupied by humans or domestic animals. Defensible space creates a separation zone between wildlands and structures, a space where fuel is managed or modified to minimize the spread of fire to the structure and providing space for defending structures from burning vegetation. Fuel management includes keeping the area clear of flammable man-made materials and managing the vegetation to reduce its flammability. Vegetation management begins with correctly spacing plants to reduce fire risks to the home, and then by watering, pruning and thinning the vegetation regularly. The landscaping around a house in the WUI must be maintained. Defensible space reduces fire speed, intensity, and flame lengths, and limits the spread of a wildfire. This area is known as a fuel modification zone (FMZ), which is not to be confused with the limited building zone (LBZ). An FMZ is a protective buffer that surrounds a structure, while an LBZ is a protective buffer that surrounds a biological open space area. The FMZ and LBZ may completely overlap, partially overlap or not touch at all (Figure 2).

Figure 2. Fuel Modification Zone and Limited Building Zone



1.3 Defensible Structures

Wildfires are dangerous and unpredictable. In a wildfire, firefighting resources are often over-extended and may be unavailable. Defensible space alone does not ensure the safety of structures confronted by a wildfire. Many additional precautions will assist in the survival of structures from wildland fire threats. The California Department of Forestry and Fire Protection (CAL FIRE), County of San Diego, and local fire districts can provide guidance on preparing structures for wildfire including proper landscaping practices, construction standards and techniques, adequate emergency water supply needs and access.

2.0 EXISTING REGULATIONS AND STANDARDS

A number of existing laws, regulations, policies and programs have been enacted to prevent, manage or mitigate the threat of wildland fires to public health, safety and the environment. The following discussion is an overview of the primary existing regulations that affect wildland fire in San Diego County. The regulations discussed below have been chosen for their applicability to the typical development project encountered in San Diego County and for their usefulness in assessing potential adverse project impacts as defined by the California Environmental Quality Act (CEQA), focusing on the threat these fires would pose to people or structures.

It is important to note that the unincorporated area of the County is served by various independent fire districts, County Service Areas and CALFIRE. It is important for planners, applicants, consultants, fire professionals and other interested parties who are processing discretionary permits to understand the respective service areas and responsibilities as well as policies and procedures of the FAHJ that will eventually serve the proposed project. Communication early and often with the FAHJ throughout the entitlement process is encouraged.

2.1 Federal Regulations and Nationally Recognized Standards

[[Regulation]]

National Environmental Policy Act, [42 USC § 4321 et seq.] Federal agencies that implement the National Environmental Policy Act (NEPA) consider potential public health and safety hazards, including wildland fires, when considering the environmental impacts of proposed federal projects

[[Nationally Recognized Standard]]

International Fire Code Published by the International Code Council, it is a model code which may be adopted by a jurisdiction. It forms the basis for the current California Fire Code (CCR Title 24 part 9) The International Fire Code (IFC) is the underlying nationally recognized code that sets standards and requirements to safeguard against the threat fires may pose to public health, safety, and the environment. The IFC, when adopted by a jurisdiction, regulates the planning, construction and maintenance of development in all areas.

[[Nationally Recognized Standard]]

International Wildland-Urban Interface Code Published by the International Code Council, it is a model code addressing wildfire issues. It has not been adopted by the State of California or by the County of San Diego. It may be used as a reference for subjects not addressed within the California and County Fire Codes.

[[Nationally Recognized Standard]]

National Fire Protection Association Standards (http://nfpa.org/codes/index.asp) The National Fire Protection Association (NFPA) Standards are a product of the National Fire Protection Association (NFPA), a world-wide organization of fire industry, fire agencies, fire professionals and concerned individuals. These model standards are annually compiled from the standards, recommended practices, manuals, guides, and model laws that are prepared by the individual technical committees of the NFPA. Most are revised on a three-year cycle. The published standards are voted on by the members of the NFPA. The individual standards can be adopted by jurisdictions or modified and adopted as that jurisdiction's ordinance.

2.2 State Regulations and Standards

[[Regulation]]

California Environmental Quality Act and Guidelines [Public Resources Code, §§ 21000-21178; Guidelines for Implementation of CEQA, California Code of Regulations, Title 14, §§15000-15387, Appendix G.] Consideration of impacts relating to wildland fires is required by CEQA. The CEQA Guidelines are concerned with assessing impacts associated with exposing people or structures to wildland fires.

[[Regulation]]

California Building and Fire Codes [California Code of Regulations, Title 24 parts 2 & 9, http://osfm.fire.ca.gov/] Title 24 contains several International Codes that address fire safety including the International Fire Code, International Building Code. Additional safety regulations adopted by the California Building Standards Commission include the Uniform Mechanical Code, and Uniform Plumbing Code, which are also part of the California Code of Regulations.

[[Regulation]]
California Code of Regulations Title 14 (**SRA Fire Safe Regulations**) contains regulations that establish minimum wildfire protection standards in conjunction with building construction and development in the State Responsibility Area (SRA). Over 90 percent of the unincorporated area of the County is located within the SRA. The County has authority to approve subdivisions and issue building permits and, therefore, is the "inspection authority" authorized in Title 14 "SRA Fire Safe Regulations". However, since the state Board of Forestry and Fire Protection certified the County Fire Code and Consolidated Fire Code under 14 CCR section 1270.03, the County Fire Code and Consolidated Fire Code apply in lieu of the SRA Fire Safe Regulations.

[[Regulation]]
California Code of Regulations Title 19 (**State Fire Marshal**) contains regulations that have been developed by the State Fire Marshal for the purpose of establishing additional fire protection for group occupancies, such as places of assembly, schools, high rise buildings, hospitals and organized camps.

2.3 Local Regulations and Standards

[[Regulation]]
County of San Diego Building and Fire Codes (Title 9, Divisions 1, 2 and 6, San Diego County Code of Regulatory Ordinances).. Following the October 2003 and fall 2007 wildfires, assessments were made of damaged and destroyed homes in an effort to identify areas where codes could be strengthened in order to enhance the chances of a structure surviving a wildfire. As a result, in February 2008, the County amended the Fire Code and Building Code to include strengthened ignition-resistive construction requirements, modifying the previous two-tiered system and requiring "enhanced" standards for all new construction.

County Consolidated Fire Code (Based on Title 9, Division 6, Chapter 1 of the County Code) http://www.sdcounty.ca.gov/dplu/docs/2009_Consolidated_Fire_Code.pdf. The County Consolidated Code is based on the County Fire Code and incorporates local fire district fire codes as ratified by the Board of Supervisors into a single document. The County Consolidated Fire Code includes notations where the local fire district(s) requirements differ from the County Fire Code. The County Consolidated Fire Code is the current fire regulations approved by the Board of Supervisors that apply in the various fire districts. The County Consolidated Fire Code has been certified by the California Board of Forestry and Fire Protection for use in lieu of "SRA Fire Safe Regulations" in CCR title 14.

Memorandum of Understanding Agreement between the United States Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California

Department of Forestry and Fire Protection (CAL FIRE), San Diego County Fire Chief's Association and the Fire District's Association of San Diego County (http://www.sdcounty.ca.gov/dplu/Resource/docs/3~pdf/MemoofUnder.pdf). The MOU was created to establish guidelines by which fire agencies can continue to require abatement of flammable vegetation without violating environmental regulations for the protection of habitats and species.

[[Regulation]]
Combustible Vegetation and Other Flammable Materials Ordinance [San Diego County Code of Regulatory Ordinances, section 68.401 et seq., Removal of Combustible Vegetation and Other Flammable Materials, http://www.amlegal.com] This ordinance addresses the accumulation of weeds, rubbish, and other materials on private property found to create a fire hazard and be injurious to the health, safety, and general welfare of the public. The ordinance finds that the presence of such weeds, rubbish, and other materials is a public nuisance, which must be abated in accordance with the provisions of this ordinance.

Local Fire Agencies' Ordinances. Certain codes like the Fire Code can be amended to be more restrictive than state regulations based upon local climatic, geological and topographical features that can have a significant effect on fire protection and emergency services. These amendments are based on fire agencies' findings and local conditions within the County of San Diego. Per state law, local fire district fire code amendments are effective only after they are ratified or modified by the Board of Supervisors. Health and Safety Code, section 13869.7(a) and (c).

3.0 TYPICAL ADVERSE EFFECTS

Generally, two types of adverse effects are typically associated with wildland fires: the immediate effects that occur during a wildland fire and the effects that occur in the aftermath. During a wildfire, people and structures are exposed to risk of loss, injury or death. Assessing and ranking the level of risk is always relative; unwise human action, for example, could be life-threatening even with all other factors at reasonable levels.

Since the level and type of risk can vary from project to project, prioritizing the project deficiencies (or combination of deficiencies) that create the biggest risk is difficult. In general, however, the following circumstances can result in increased fire related risks to people and structures (not listed in any particular order):

- Projects located adjacent to and within the WUI and/or that incorporate large open space preserves within the project design;
- High population and density in the WUI;
- Responses of people during a wildland fire (human behavior);

- Emergency response services (fire stations, equipment and personnel) that are inadequate to serve the project;

- Development projects that are built without ignition-resistive construction, interior fire sprinklers, and/or sufficient water supply (volume) and pressure;

- Inadequate access and evacuation options;

- Insufficient maintenance of access roads, signage, gates; and

- Lack of appropriate landscaping restrictions, including monitoring and maintenance, FMZs, and periodic fuel management monitoring.

A wildfire's aftermath typically leaves land scorched and exposed. Until the land rehabilitates, the exposed soils may contribute to adverse environmental impacts including air and water pollution and unstable soils conditions (mudslides). The end result of uncontrolled wildfire also includes debris from burned homes, some of which can be highly toxic, and can adversely impact the environment by polluting local waterways (streams and rivers).

4.0 GUIDELINES FOR DETERMINING SIGNIFICANCE

Section 15382 of the State CEQA Guidelines states that a significant effect on the environment means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air and water. **An affirmative response to, or confirmation of any one of the following Guidelines, will generally be considered a significant impact related to Wildland Fire and Fire Protection as a result of the project, in the absence of evidence to the contrary:**

1. ***The project cannot demonstrate compliance with all applicable fire codes.***

2. ***A comprehensive Fire Protection Plan has been accepted, and the project is inconsistent with its recommendations.***

3. ***The project does not meet the emergency response objectives identified in the Public Facilities Element of the County General Plan or offer feasible alternatives that achieve comparable emergency response objectives."***

The significance guidelines listed above have been selected for the following reasons:

The **first** guideline for determining significance is based on compliance with existing wildland fire regulations. Since the applicable regulatory requirements for a project will differ based on use type and extent of the WUI, all discretionary projects may be required to prepare a Fire Protection Plan (FPP) designed to assess a project's compliance with current regulatory codes and ensure that impacts resulting from wildland fire hazards have been adequately mitigated. The FPP describes ways to minimize and mitigate the fire problems created by the project or development.

The FPP is similar in concept to a Technical Report as authorized in the Fire and Building Codes. The FPP is prepared by a wildland fire behavior and fire code expert for review by the County and FAHJ. A Technical Report, which focuses on fire code and other fire protection issues for a specific industrial, commercial or special risk occupancy, should accompany a FPP if a complex fire code issue makes it necessary. A Technical Report should be separate from, yet coordinated with, related provisions of the FPP. The County DPLU maintains a list of persons currently authorized to prepare FPPs for projects within its jurisdiction.

The authority to require FPP can be found in the County Fire Code and the County Consolidated Fire Code.

Examples of regulatory requirements that a project will be required to meet include the California Code of Regulations and County Fire Code. Given the complexity of wildland fire regulation and the numerous agencies that have regulatory responsibility related to wildland fires, applicable regulations will be determined on a project-by-project basis. Due to the potential severity of impacts from fire in wildland areas, the existing laws are stringent and regulate many aspects of wildland fire and their hazards, including building standards, fuel modification, water availability/flow, and/or access.

Because project site constraints vary from property to property, fire codes provide for modifications when the following requirements are met:

- Special individual reasons make the strict letter of the code impracticable;

- The modification is in compliance with the intent and purpose of the code; and,

- Such modification does not lessen health, life and fire safety standards.

Any project that does not show compliance with regulatory codes or does not include a valid risk assessment for the project site may result in a potentially significant impact of wildland fire hazard.

The **second** guideline applies to all projects that are required to model fire behavior in mature vegetation on and near the site (Fire Behavior Modeling) as part of its Fire Protection Plan. The Fire Behavior Model will evaluate a worst-case scenario wildland fire based on site topography, fuel loads, atmospheric conditions, and fire intensity. From the results of the model, combined with the consultant's expertise, minimum fuel modification and brush clearance distances can be determined to ensure relatively safe building sites. These fuel-modeling programs are widely accepted and used throughout the fire fighting profession as a planning tool. The models were developed by expert fire-research scientists, but do not provide a total analysis of the threat. Modeling program limitations must be taken into consideration. Fire behavior history and professional experience may require greater or lesser requirements for individual projects, and such justification should be clearly articulated in the FPP.

The fire model gives general guidance and typically calculates behavior under worst-case weather conditions over time. Any project that would not be consistent with the consultant/fire authority's recommendations based on the Fire Behavior Modeling, fire history, and personal experience or expertise for that site may result in a potentially significant impact and may present significant risk of loss, injury or death.

The **third** guideline for determining significance is based on the need to have adequate fire services available in order to provide sufficient emergency response in the event of a wildfire or other emergency. Applicants are required to obtain a Project Facility Availability Form (DPLU Form #399F) that is to be completed and signed by the Fire Authority Having Jurisdiction (FAHJ) prior to formally submitting the project application to the County. The FAHJ will review the project and determine whether existing fire services are adequate to serve the project. A Project Facility Availability Form that shows that a project is not located within the fire district boundaries and is not eligible for service, does not meet the travel time requirements specified under the County's General Plan, is unable to implement the required FMZ, or is unable to provide adequate water fireflow and pressure may result in a potentially significant impact and may present significant risk of loss, injury or death. Travel time is determined by measuring the most direct reliable route from the nearest fire station obligated to respond to the site to the most remote portion of the project with consideration given to safe operating speeds for heavy fire apparatus and the types of roads being used and neighborhoods traveled. Fire agencies typically encourage use of major roads versus traveling through private residential neighborhoods. Travel time does not include reflex or reaction time, or on-scene size-up and set-up prior to attacking the fire, all of which are critical precursors of actual fire fighting. Travel time may be calculated by using NFPA 1142 Table C.11 (b), SANDAG layering, DPLU-GIS software travel time mapping, actual emergency travel time run data, or actual driving tests using fire apparatus. Deference is typically given to the FAHJ.

4.1 FIRE PROTECTION PLANS

A Fire Protection Plan is a document that describes the level of fire hazard that would affect or be caused by a proposed development and the methods proposed to minimize that hazard. The FPP also evaluates the consistency of the proposed project with applicable fire protection regulations. In order to minimize hazards and meet fire code requirements, the FPP may include recommendations that involve limitations on future land use on the subject property, building construction standards, vegetation management, access improvements, installation of fire suppression facilities, and other design measures. The FPP must include measures to address the specific location, topography, geology, level of flammable vegetation and climate of the proposed project site. The FPP must be prepared consistent with applicable fire codes and be accepted by the FAHJ and County. The plan must demonstrate compliance with the applicable fire code or how the measures proposed to reduce fire hazards are adequate to meet the intent of the code. The following elements must be addressed in a FPP required as part of the review of a discretionary permit application:

- Emergency Services - Availability and Travel Time;
- Access for emergency services and evacuation of residents (primary and, if required, additional access);
- Firefighting Water Supply;
- Fire Sprinkler System;
- Ignition Resistant Construction; and,
- Defensible Space, Ornamental Landscaping and Vegetation Management

Each of these design considerations is detailed below and includes discussions on relevant Federal, State and local codes and the standards that are used to ensure compliance with the regulations. Failure to comply with either the fire code/regulations or the standards may result in a potentially significant impact. Refer to section 2 “Report Format and Content Requirements Wildland Fire and Fire Protection”.

4.2 PLAN ACCEPTANCE PROCESS

Fire Protection Plan preparers should work with the local FAHJ. Once the plan is prepared and submitted to the local fire agency, it will be reviewed for compliance with all applicable ordinances and regulations. If practical difficulties in achieving compliance have been identified and modifications or alternate methods are proposed, they must also be evaluated by the FAHJ. If the FAHJ determines that the plan is incomplete or inadequate, it should be sent back to the preparer with a letter explaining why. If the plan proposes modifications due to practical difficulties in meeting the code requirements, the FAHJ should determine whether to grant a modification. If the FAHJ approves a modification, the FAHJ should send a letter to the applicant and DPLU finding that special individual reasons make compliance with the strict letter of the code impracticable, the proposed modification complies with the intent and purpose of the code, and the modification does not lessen health, life and fire safety requirements. The FAHJ must include an explanation for each finding.

Concurrent with the process at the local FAHJ, the County DPLU will also review the plan. The plan will be reviewed for completeness and code compliance. If the plan is found to be complete, code compliant and to have been accepted by the FAHJ, an acceptance letter will be prepared. If the plan is found to be incomplete, to be inconsistent with code requirements or not to have been accepted by the FAHJ, DPLU will not accept the plan.

The County Fire Code and the County Consolidated Fire Code include a procedure for appealing the decision of the FAHJ relating to the application of the applicable fire code.

The County will make every effort to provide sufficient time for the FAHJ to review and comment on the proposed project and associated Fire Protection Plan. If comments are not received from the FAHJ in a timely manner, DPLU will assume that the FAHJ has no comments on the proposed Fire Protection Plan. DPLU will advise the final decision-making body of the FAHJ's failure to comment on the Fire Protection Plan.

5.0 STANDARD MITIGATION AND PROJECT DESIGN CONSIDERATIONS

To effectively mitigate wildland fire hazards in Southern California, a multi-lateral approach that involves Federal, State, and local governments and fire agencies is usually necessary. Collectively, the County and fire agencies work together to prevent the loss of life in wildland fires; prevent the ignition of structures by wildland fires; prevent the encroachment of wildland fire upon communities; prevent a wildland-caused structural conflagration; prevent the spread of a structure fire to the wildland; and to limit the size of wildland fires.

Wildland fire mitigation measures and design considerations used in the planning and land use approval process vary depending on the wildland characteristics of the site and surrounding area. In order to allow this flexibility in project design, many wildland fire regulations are written using language that is often subject to interpretation (e.g. water supply may consist of reservoirs, pressure tanks, elevated tanks, water mains or other fixed systems …") as opposed to codes that are absolute (e.g. "Class "A" roofing material shall be required"). This may allow some projects with unique geographic and topographic conditions to adequately mitigate wildland fire risks through project design.

5.1 Emergency Services

Fire protection and emergency services are among the most vital and basic of community needs. Firefighters, who are generally the first responders to disasters, must be prepared to respond quickly and effectively to all types of emergencies, including wildland fires. For this reason, the provision of adequate facilities for fire protection and emergency services is fundamental to protecting the health, safety and general welfare of the residents of San Diego County.

5.1.1 Emergency Fire Response

5.1.1.1 Applicable Codes/Regulations

San Diego County General Plan

5.1.1.2 Applied Standards

Projects must comply with the emergency travel time requirements specified in the County General Plan. Travel time is defined as the estimated time it will take for a responding agency to reach the furthest structure in a proposed development project. Travel time is determined by measuring the safest, most direct, appropriate and reliable route between the fire station and the project with consideration given to safe operating speeds for heavy fire apparatus. Travel time does not include reflex or reaction time, or on-scene size-up and set-up prior to attacking the fire, all of which are critical precursors to actual fire fighting. Travel time may be calculated by using NFPA 1142 Table C.11(b), SANDAG layering, DPLU-GIS software travel time mapping, actual emergency travel time run data or actual driving tests. If the travel time determined in the FPP is less than the travel time determined by the FAHJ, the travel time determined by the FAHJ shall take precedence.

NOTE: Stations that are seasonal (not open all year) or staffed with volunteers without legal responsibility to respond to emergencies, should not be used for determining consistency with travel time requirements of the County General Plan.

Where projects exceed these time requirements, the Director of Planning and Land Use may, upon concurrence with the FAHJ, accept mitigation measures. Acceptable mitigation may include, but is not limited to:

- Alternative construction methods and measures not otherwise required;
- Automatic Aid agreement(s);
- Upgrading existing facilities or infrastructure;
- Constructing new facilities; or
- Implementing a long-term binding agreement aimed at reducing the response time to acceptable limits

Proposed mitigation should be implemented prior to implementation of the discretionary permit (prior to recordation of the final map for subdivisions and prior to issuance of building permits or use and reliance for use permits/site plans).

If a modification is proposed, the requirements of the County Fire Code and County Consolidated Fire Code specific to modifications apply. Documentation of mitigation should appear not only in the FPP, but also in the files of the FAHJ as prescribed in the Fire Code.

5.2 Fire Access Roads

Developments with inadequate access (e.g. long roads with a single access point, roads over steep grades, improper road surfaces, and/or narrow roads) significantly contribute to the inability to effectively evacuate residents during a disaster (wildfire, earthquake, or flood) and provide necessary emergency access for fire, ambulance, or law enforcement personnel.

5.2.1 Maximum Length of Dead-End Roads

5.2.1.1 Applicable Codes/Regulations

County Fire Code and County Consolidated Fire Code [This code language coincides with the dead-end requirements found in the California Code of Regulations, Title 14, section 1273.09 (Dead-End Roads)]

5.2.1.2 Applied Standards

The intent of limiting the allowable length of a dead-end road is to ensure that firefighters have access flexibility to deal with changing dynamics in wildfires and other emergencies, and that civilians have safe, reliable and known evacuation alternatives during emergencies.

In part, the concept of dead-end road regulations relates to limiting the number of persons attempting to evacuate on the road and to limiting the time needed for safe evacuation. Steep, narrow and winding roads delay evacuation. Long dead-end roads in rural wildland areas place people and emergency personnel at increased risk. The following general standards apply to projects that utilize dead-end roads.

- Road length is measured from the beginning of the primary access road at a point where one can evacuate in two different directions (which may be off-site), measured to the end of the most remote cul-de-sac. Refer to Figure 3 for guidance on measuring dead-end road length.

- Projects with an access road that exceeds the regulations for dead-end roads should first consider providing an alternate means of access and egress before resorting to other possible alternatives (section 5.7 and 5.8).

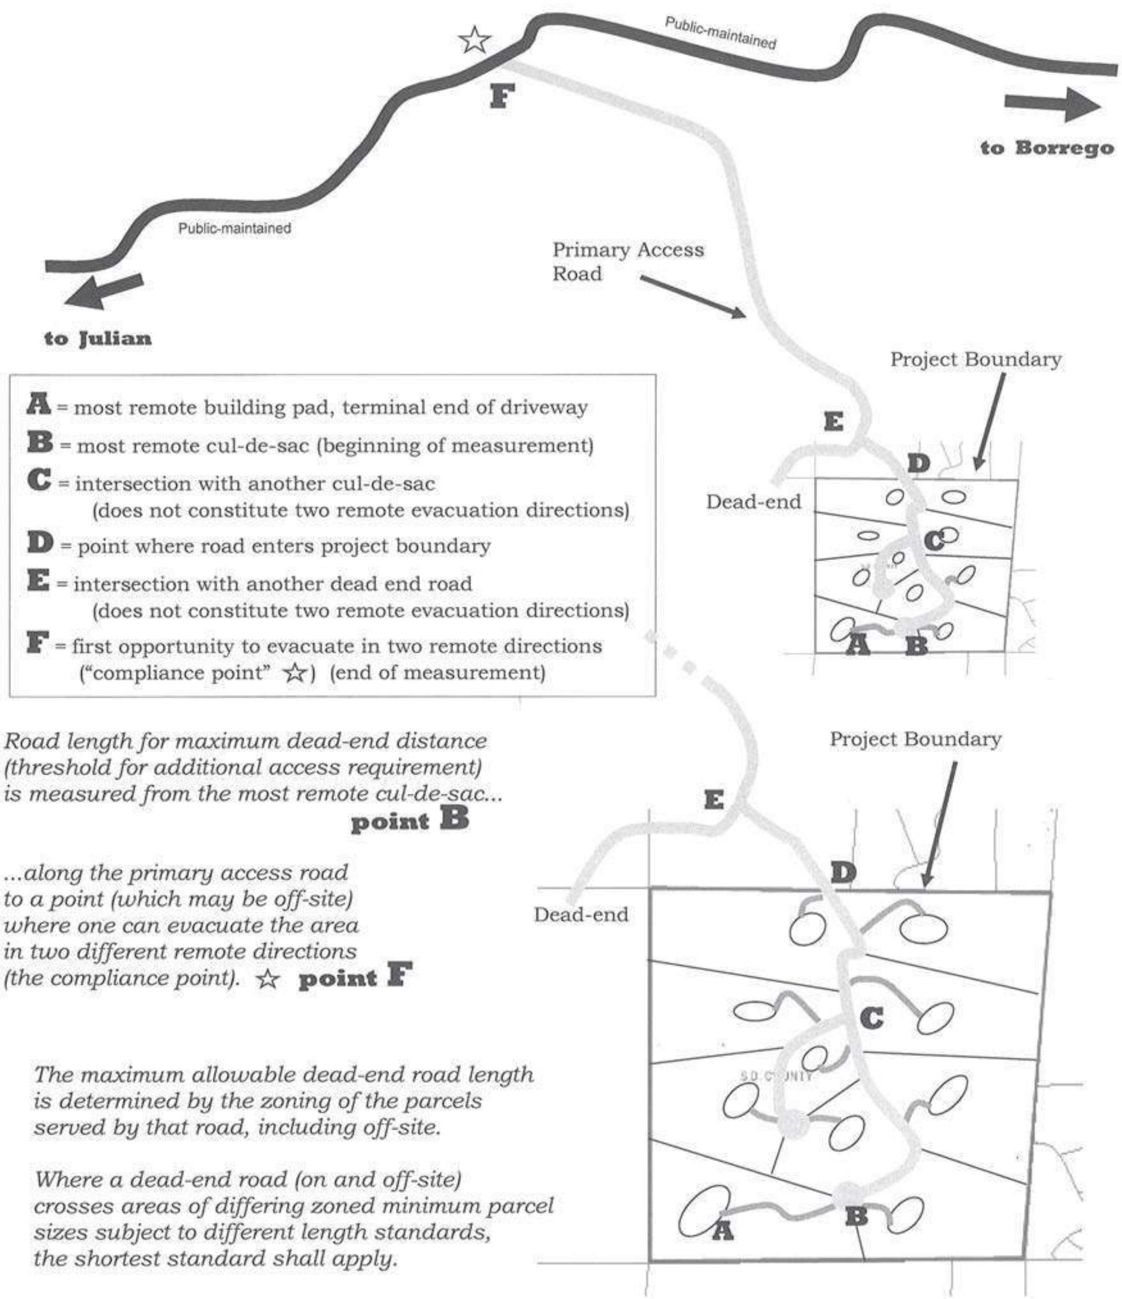
- An important factor in evaluating existing and proposed access roads is road connectivity. When feasible, projects should extend on-site roads to the edge of the property for possible future connectivity.

- In order to ensure that necessary access to the project site remains available in perpetuity, the applicant needs to provide evidence that a permanent and reliable right of access has been obtained. These rights would generally be in the form of an easement that runs with the land.

- Access may be proposed over tribal lands held in trust only if the Tribe waives its sovereign immunity and allows the Tribe to be sued in state court to enforce the right of access over the tribal lands. The requirement to waive sovereign immunity does not apply if the Bureau of Indian Affairs grants the access rights.

- Security (privacy) gates or other types of barricades are generally discouraged as they can obstruct civilian egress and responder ingress during a fire emergency. However, in certain circumstances, gates can be allowed if they provide a rapid and reliable means of firefighter ingress and unobstructed egress for civilian evacuation as determined by the FAHJ. For example, entry gates positioned at the entrance to a subdivision must provide for rapid entry by emergency responders. The rapid opening of the gate for responders may be activated by personnel stationed at the gate on a 24-hour basis, emergency vehicle traffic signal pre-emption strobe detectors, close proximity public safety radio transmissions, battery back-up with "lock open" on power failure, or key-operated electric override switch. In all cases, exiting from the subdivision through the gated entry should be unobstructed and not require any activation measures unless the FAHJ assumes responsibility to activate the gate during times of emergency. All gates must comply with County Fire Code and County Consolidated Fire Code.

Figure 3
Guidance for Determining Primary Access Road Length



5.2.2 Fire Access Road Width

5.2.2.1 Applicable Code/Regulations

County of San Diego Department of Public Works Public & Private Road Standards, County Fire Code and County Consolidated Fire Code

5.2.2.2 Applied Standards

The minimum width identified in the code section above should not be obstructed at any time. Parking should be outside the required fire access road width. The exception allowance under the code is often considered for reductions in width for a short section where extreme topographic constraints make it impossible to obtain the minimum required width or where impacts to sensitive biological resources can be avoided. This finding should be supported by the Director of Public Works, the FAHJ and the County Fire Marshal on the basis of extreme topographic or biological constraints.

5.2.3 Fire Access Road Grade

5.2.3.1 Applicable Code/Regulations

County Fire Code and County Consolidated Fire Code

5.2.3.2 Applied Standards

Full compliance with the code.

Exceptions would be considered where full compliance with the standard could not be achieved because of extremely steep terrain. An example of an exception would include a short (e.g. 100 feet) section of slightly more than 20% grade where the road is relatively straight before, during and after the exception, line-of-sight is maintained, and fire engine speed can be maintained. The grade requirement is based largely on the ability of an engine to get proper traction at a standstill and, to a lesser degree, on the potential for fire hose or other equipment to spill out of the engine because of extremes in grade.

5.2.4 Fire Access Road Surface Type

5.2.4.1 Applicable Code/Regulations

County Fire Code and County Consolidated Fire Code

5.2.4.2 Applied Standards

Full compliance with the code.

5.3 <u>Water</u>

Providing adequate water supply, volume and pressure, is crucial in fighting not only wildland fires, but smaller scale residential fires as well. History has shown that most fire related responses are to residential fires. In some cases, however, residential fires escape the confines of the house and become wildfires. As such, it is important that water resources are adequate to meet the volume and flow needs to properly fight fires either at an individual home or the surrounding neighborhood. A municipal water supply (waterlines and hydrants) is always preferable to on-site tanks.

5.3.1 Inside Water District

5.3.1.1 Applicable Code/Regulations

<u>County Fire Code and County Consolidated Fire Code</u>

5.3.1.2 Applied Standards

Full compliance with the code. (Exceptions are identified in the code.) For water main extensions, the measurement of distance to the water main should be taken from the existing main to the nearest portion of the subject parcel (to the property line), not to the proposed hydrant location.

5.3.2 Outside Water District

5.3.2.1 Applicable Code/Regulations

<u>County Fire Code and County Consolidated Fire Code</u>

5.3.2.2 Applied Standards

Full compliance with the code. Structures or clusters of structures substantially greater than roughly 5,000 square feet should provide additional water storage.

5.4 <u>Ignition-Resistive Building Construction and Fire Protection Systems</u>

Following the October 2003 wildfires, and again after the firestorm of fall 2007, the County assessed damaged and destroyed homes in an effort to identify areas where building codes could be strengthened to enhance the chances of a structure surviving a wildfire. As a result, in June 2004, and again in January 2008, the County amended the Fire Code and Building Code to improve the chances of a structure surviving a wildland fire.

5.4.1 Ignition-Resistant Construction

5.4.1.1 Applicable Code/Regulations

*County Building Code, County Fire Code and County Consolidated Fire Code*

5.4.1.2 Applied Standards

Full compliance with the code/regulations

5.5 Defensible Space, Ornamental Landscaping and Vegetation Management

History has shown through structural losses experienced in the Witch Creek, Harris, Rice, Poomacha, Cedar, Paradise, Otay, Harmony, Viejas, Gavilan and Pines Fires that defensible space is a critical factor of structure survival. By ensuring defensible space around structures, fire fighting teams are provided a line of defense to protect homes and other valued assets at risk of wildland fires. In February 2004, the Board of Supervisors adopted amendments to the County's Combustible Vegetation and Other Flammable Materials Ordinance in an effort to reduce the build-up of combustible vegetation and require adequate fuel modification around structures.

5.5.1 Fuel Modification and Setback from Property Line

5.5.1.1 Applicable Code/Regulations

*Chapter 4 of Division 8 of Title 6 of the San Diego County Code, Section 68.40 – Removal of Combustible Vegetation and other Flammable Materials;*

*County Fire Code and County Consolidated Fire Code*

*California Public Resource Code section 4291*

5.5.1.2 Applied Standards

Projects located in a Hazardous Fire Area need to include Fuel Management Zones (FMZ) surrounding all structures that are designed for human habitation or use or a building designed specifically to house farm animals. An FMZ is a 100-foot area surrounding and extending in all directions from all structures, in which all flammable vegetation or other combustible growth is managed to reduce the threat from wildfires.

The County and FAHJ may require additional FMZ or allow for modifications to the FMZ depending upon unique site characteristics. For example:

1) The FMZ should typically be accommodated within the boundaries of the project. However, where it is determined that practical difficulties make it infeasible to do that, offsite areas could be included, provided that offsite fuel

modification is assured by an enforceable easement from the neighboring property owner or another legally enforceable mechanism.

2) Normally, the FMZ will surround the immediate building area. However, a FMZ surrounding the entire development area may be considered on a project by project basis.

3) Any project that is required to prepare and implement a full FPP may also be required to prepare a **Fire Behavior Model** that evaluates a worst-case scenario wildfire based on site topography, weather and vegetation. The modeling, combined with the consultant/fire authority's expertise may result in the consultant proposing greater or lesser buffers to minimize building and occupant safety risks. Under no circumstances shall the FMZ be less than 30 feet wide.

Additionally, all ornamental landscaping needs to be consistent with County's Landscape Ordinance and Landscape Design Manual. Projects requiring landscape plans should clearly identify the type of plant materials, locations and spacing of plant materials, and irrigated and non-irrigated landscaping. The landscape consultant may recommend in the text the inclusion or exclusion of specific varieties for review by the County landscape architect.

Maintenance requirements and suggestions for landscaping in FMZs are provided in:

- The County Fire Code (http://www.amlegal.com)
- "Fire, Defensible Space *and You*…" (http://sdcounty.ca.gov/dplu/fire_resistant.html);
- "Fire-safe Landscaping Can Save your Home" (http://www.sdcounty.ca.gov/oes/docs/fswy12.pdf); and
- The California Native Plant Society's "Native Plant Landscaping to Reduce Wildfire Risk" (http://www.cnpssd.org/fire/ReduceFireRisk.pdf).
- "Ready, Set, Go" (http://www.readyforwildfire.org/)

5.6 Design Strategy – Sheltering

Shelter-in-Place Strategy. **Shelter-in-Place is a possible design concept with early relocation (early evacuation) of residents to a safe location being the preferred action.** All of the following minimum design standards must be implemented in order to qualify for consideration of a Shelter-in-Place concept. Additional standards, or modification to the standards below, may be required by the FAHJ or the Director of Planning and Land Use.

- The primary access roadway should meet or exceed minimum fire code requirements (in terms of width, paving, posting, etc.), and have no potential constraints or bottlenecks on or off-site until it reaches two directions of egress from the area;

- All new structures within the entire proposed project, regardless of distance to property line or WUI area, should be built using Ignition-Resistant Construction (County Building and Fire Codes), including fire sprinklers;

- The project should be designed with adequate and properly managed Fuel Modification Zones and properly maintained ornamental landscaping consistent with the County's Landscape Ordinance and Landscape Design Manual.

- The developer must provide evidence that resources exist to adequately and consistently enforce fuel management regulations for the life of the project (a funding mechanism should be implemented to ensure fire agency enforcement staffing in perpetuity);

- The developer must provide evidence that resources exist to provide substantial and effective annual public outreach to educate residents on fire safety and emergency response for the life of the project (a funding mechanism must be implemented to ensure fire agency has staffing for public education in perpetuity);

- Any flammable vegetation/habitat areas that are proposed within a shelter-in-place development should be carefully studied and evaluated as part of the FPP.

- Shelter-in-Place is more appropriate for projects that have a strong form of supervision and leadership, frequent and on-going fire safety training and drills, abundant fire safety measures, and full site management that is accountable for maintaining fire safety measures. Examples include organized camps or similar uses that can be regulated via an ongoing discretionary permit.

5.7 Alternatives to the Standards

Due to unique site characteristics, there may also be combinations of site/project improvements and opportunities that make adequate mitigation achievable. The standards listed below are considered a "starting point". Nothing in these standards precludes a FAHJ and/or the County from identifying other measures that would adequately mitigate unique site characteristics/conditions.

- The type and number of fire apparatus available to serve the project are reliable, well-staffed and redundant. Examples include multiple engines with full-time career or reserve staff, with travel times approximating the "first–in" engine.

- Adequate funding is legally committed in perpetuity to the fire authority for staffing inspections, enforcement and educational programs.

- Vegetation around the access and project has low fire-carrying potential and flame length.

- The project is supported with a public water system with fire hydrants along access roads at distances and with fireflow as prescribed in the fire code.

- An adequate fuel management zone separates the project and open space areas.

- The project is located in a developed area or an area with long-standing agricultural operations.

- The project provides funding in perpetuity to support adequate fire agency staffing for fire suppression, fire code enforcement and community safety education. An example would be the establishment of a Community Facilities District to assist in the long-term funding of fire district operations and management.

- An on-going discretionary permit that runs with the property that includes conditions that regulate activities/operations. An example would be a Major Use Permit or an Administrative Permit.

- Adequate road widening and improved road surfacing that generally improves the access to the subject property and surrounding uses.

- Security (privacy) gates or other types of barricades are generally discouraged as they can obstruct civilian egress and responder ingress during a fire emergency. However, in certain circumstances, gates can be allowed if they provide a rapid and reliable means of firefighter ingress and unobstructed egress for civilian evacuation as determined by the FAHJ. Refer to section 5.2.1.2 of these guidelines.

5.7.1 Required Findings for Alternatives to Standards

Certain site-specific situations may make the strict adherence to the County Fire Code or County Consolidated Fire Code either impracticable or infeasible. The fire code official is authorized to approve a modification to the fire code requirements, such as an alternative material or method of construction, where the fire code official finds that the proposed design is satisfactory and complies with the intent of the provisions of the code. If a modification is proposed, the requirements of the County Fire Code and County Consolidated Fire Code specific to modifications apply. Documentation of the modification must appear not only in the FPP, but also in the files of the FAHJ as prescribed in the Fire Code. The modification must be supported by “findings” including the following:

- That special individual reasons that make the strict letter of the code impracticable;
- That the modification is in compliance with the intent and purpose of the code; and,
- A map showing the proposed location of the mitigation/exception measures.
- That such modification does not lessen health, life and fire safety standards.

5.7.2 Scenarios where Acceptable Alternatives are Unlikely

There may be situations where a combination of site conditions/constraints, such as those listed below, are so severe that it is unlikely that sufficient mitigation could be provided.

- Project site is surrounded by large wildland areas with little existing or planned surrounding development.
- The primary access road is substandard with no proposal to adequately/reasonably improve it.
- Project site is surrounded by steep slopes and significant topographical constraints that could intensify fire behavior or limit fire suppression operational flexibility.
- Legal access rights have not been obtained for the primary access road and any necessary secondary access road.
- Fire stations available to serve the project site are located substantial distances from the project site such that response by multiple units is significantly delayed.
- The available water supply for fire suppression is limited to tanks, pools or ponds that have limited capacity and require pumping operations

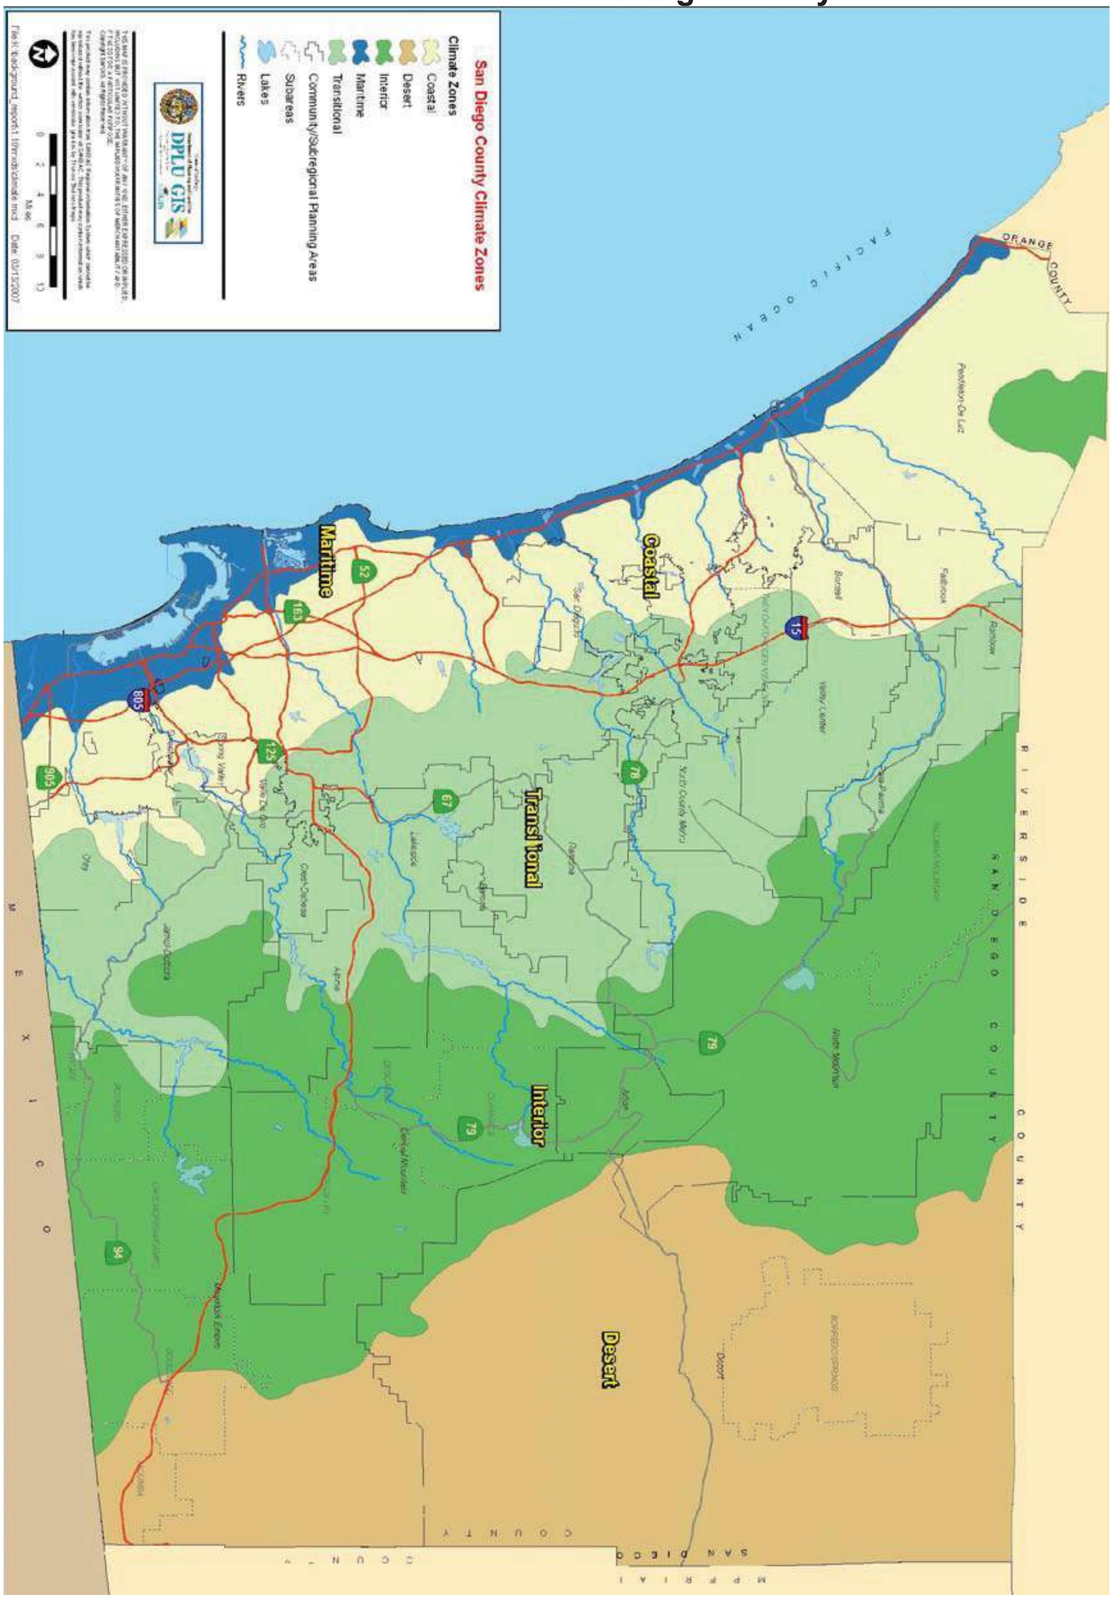
Figure 1
Climate Zones in San Diego County



[ATTACHMENT A]

DEFINITIONS

Defensible space – An area either natural or man-made, where material capable of allowing a fire to spread unchecked has been treated, cleared or modified to slow the rate and intensity of advancing wildfire. This will create an area for increased safety for emergency fire equipment and evacuating or sheltering civilians in place and a point for fire suppression to occur.

Fire authority having jurisdiction (FAHJ) – The designated entity providing enforcement of fire regulations as they relate to planning, construction and development. This entity may also provide fire suppression and other emergency services.

Fuel modification zone – A strip of land where combustible vegetation has been thinned, modified or both and partially or totally replaced with approved drought-tolerant, fire-resistant and/or irrigated plants to provide an acceptable level of risk from vegetation fires. Fuel modification reduces radiant and convective heat, thereby reducing the amount of heat exposure on the roadway or structure and providing fire suppression forces a safer area in which to take action.

Hazardous fire area – Any geographic area mapped by the State or local jurisdiction as a high, or very high fire hazard area, or as set forth by the FAHJ that contains the type and condition of vegetation, topography, weather, and structure density to potentially increase the possibility of vegetation conflagration fires shall be considered a hazardous fire area.

.

Structure – A residence and attached garage, building or related facility that is designed primarily for human habitation or buildings designed specifically to house farm animals. Decking, fences, and similar facilities are not considered structures for the purposes of establishing the limits of the fuel modification zone. Sheds, gazebos, and detached garages less than 250 square feet which are located within the fuel modification zone, shall be designed, constructed and placed such that they do not require the fuel modification zone to be increased beyond that required for the primary structures on the property.

Vegetation Maintenance – The long-term proper care and upkeep of trees in order to reduce the flammability of a tree species. Maintenance includes, but is not limited to, the pruning and removal of dead twigs, leaves or fronds and branches.

Wildland fuel – Any timber, brush, grass, or other flammable vegetation, living or dead, standing or down, that is not classified as ignition-resistive.

Wildland-urban interface – The area where structures and other human developments meet or intermingle with undeveloped wildland (as defined in the County Fire Code, County Consolidated Fire Code and County Building Code.)

[Attachment B]

SUMMARY OF REVISIONS

Guidelines for Determining Significance and Report Format and Content Requirements for Wildland Fire and Fire Protection were originally approved on March 19, 2007. The following is a summary of revisions made since original document approval.

Second Revision, August 31, 2010

- Updated to incorporate changes to the County Fire Code and County Consolidated Fire Code
- Improved standards for dead end roads
- Improved standards for Shelter-in-Place
- Various editorial changes

First Revision, December 19, 2008

- Updated to incorporate changes to the Fire Code and the Building Code
- Updated to change California Department of Forestry (CDF) to CAL FIRE
- Added standards for dead end roads
- Various editorial changes

COUNTY OF SAN DIEGO

REPORT FORMAT AND CONTENT REQUIREMENTS

WILDLAND FIRE AND FIRE PROTECTION

LAND USE AND ENVIRONMENT GROUP

Department of Planning and Land Use
Department of Public Works

Second Revision
August 31, 2010

PURPOSE

The purpose of this document is to describe the format and content of a Fire Protection Plan. These guidelines apply to maps, spreadsheets and reports completed for all privately initiated discretionary projects reviewed by the Department of Planning and Land Use. These guidelines are designed to:

- Ensure the quality, accuracy and completeness of reports and to aid in staff's ability to review reports/assessments in a consistent manner

- Provide enough information to make appropriate planning decisions and to make determinations regarding conformance with applicable regulations

- Increase the efficiency of the environmental review process and to avoid unnecessary time delays

TABLE OF CONTENTS

TABLES

1.0 INTRODUCTION

The Fire Protection Plan (FPP) shall follow the formats and guidance in this document. The overall length of the FPP and the amount of information included will vary depending on the size and scope of the project, the combustible vegetation threat, the unique topographical/geographical conditions of the site, and the type of emergency response (i.e. fire or medical). Following the submittal of a discretionary project, the County's Scoping Letter may require that one or more of the following be submitted:

- <u>Fire Protection Plan (Full Report)</u>
  May be required, pursuant to the County Fire Code and County Consolidated Fire Code, for larger projects or where the site has topographic, geographic, and/or combustible vegetation conditions that require detailed review and analysis.

- <u>Fire Fuel Assessment (Fire Behavior Model)</u>
  May be required in conjunction with a Fire Protection Plan (Full Report) for larger projects and/or projects with high fuel loads and/or steep topography.

- <u>Fire Protection Plan (Letter Report</u>)
  Can be authorized by the County for projects that are located within the State Responsibility Areas and limited to infill projects with virtually no wildlands in the immediate vicinity. The FPP – Letter Report fulfills the requirements of the County Fire Code and County Consolidated Fire Code and may be prepared by the project applicant or the applicant's representative. The FPP – Letter Report is a simple narrative documenting site information and fire code compliance, and is not intended to require the services of a Fire Consultant. If upon review of the FPP – Letter Report code issues are determined to be unresolved or inadequately addressed, a Full Report will be required.

1.1 <u>General Guidelines for Writing a Fire Protection Plan</u>

Contents

- The overall content of an FPP is outlined in the County Fire Code and the County Consolidated Fire Code.

Format

- Unless an exception is granted by the County, every draft FPP shall have the components described in this Report Format and Content Requirements document.

- **DOCUMENTS THAT DO NOT CONTAIN ALL OF THE MANDATORY SECTIONS DESCRIBED IN THIS DOCUMENT WILL NOT BE ACCEPTED AS COMPLETE BY COUNTY STAFF UNLESS AN EXCEPTION IS APPROVED BY THE DIRECTOR OF THE DEPARTMENT OF PLANNING AND LAND USE (DPLU).**

Electronic Format

- Any draft text submitted electronically to the County for comment and review shall be formatted in Microsoft Word (2003 version or later). Staff may also request draft text to be submitted in PDF files. The electronic submission of draft text should be placed on a CD.

Document Length

- The length of the draft FPP must be kept to the absolute minimum. The document shall be only as long as required to accurately convey the pertinent fire code issues and to contain the level of analysis required to legally comply with the CEQA. Extraneous and "filler" material must always be omitted from the FPP.

Editorial Matters

- The draft FPP must be properly edited for correct format, spelling, grammar, page numbering, internal consistency and other editorial matters. It must also be consistent with project submittals. The draft FPP must be prepared in a clear format, written in clear language for review and understanding by decision-makers and the public (see CEQA Guidelines, § 15140). Complex and extremely analytical materials must be summarized and simplified, with the details and harder to comprehend materials placed in the technical appendices.

- The draft FPP must be written in a factual and objective manner. The document must provide a good-faith effort of full disclosure (e.g. if code requirements are not met, that information must be stated, accompanied by proposed mitigation measures).

- The draft FPP must cite all documents used in its preparation including, the section number of any relevant codes or regulations. Other documents may be incorporated by reference, provided that the referenced document is summarized in the draft FPP and is made available for public inspection at a public place identified in the draft FPP, which shall include a County office.

1.2 General Guidance and Key Compliance Points for Preparing a Fire Protection Plan

- Include only information that is directly pertinent to the FPP. Do not include extraneous, surplus, and anecdotal information.

- Instead of simply referring to "County Policy ...," specify whether the cited document is an official Board of Supervisors Policy, a Departmental Policy, or an informal policy or practice.

- Use consistent terminology. For example, do not refer to “Fire Behavior Model” in one section of the report and “Fire Model” in another.

- Present discussion and analysis with a tone that is professional, academic and impartial, rather than argumentative or project advocacy.

- Where other documents are incorporated by reference, explain the purpose for doing so and briefly describe or summarize the part or parts incorporated. The reference should be placed in the applicable narrative sections.

- Provide factual SUPPORT and RATIONALE for all conclusions stated.

- Check the accuracy of all factual statements. For example, do not state that a County regulation sets forth a particular requirement if, in fact, it does not.

- With the exception of the FPP – Letter Report, reports should be technical in nature.

- Reports should be concise and written in a professional manner suitable for peer review. Staff may reject reports based on quality if the report is written in such a manner that a timely and accurate review cannot be completed.

- Attached plot plans and maps must be to standard engineering scale and contain a north arrow and both number and bar scales. A scale of *1" = 160 feet, or 1" = 80 feet* would not be acceptable. When maps are reduced, they must be scalable by using a standard engineering scale (e.g. 1" = 10' (or 100) thru 60' (or 600') in 10 foot intervals). Irrespective of scale, all maps and plot plans must be **clearly legible** to County staff.

- In draft copies of the report, all changes made in response to staff comments must be shown in strikeout/underline form. "Strikeout/underline" draft and "clean" copies should be submitted simultaneously. Final copies of the report must be clean, with all editing marks removed.

- The Draft Fire Protection Plan will be reviewed for technical accuracy and completeness by a County Fire Code Specialist and the fire district's Fire Marshal, if appropriate. The plan is considered to be draft until County staff determines the report to be complete.

- The FPP shall use mandatory, not permissive language, as the document will be binding on the project if the project is approved.

2.0 REPORT FORMATS

2.1 <u>Fire Protection Plan – Full Report Outline</u>

BINDER COVER & COVER PAGE

The Cover Page of the FPP Full Report shall include the following information:

- Project common name
- Project applications numbers. Must include all associated discretionary permit numbers (e.g.TM XXXX, TPM XXXXX, ZAPXX-XXX) and the environmental log number (Log No. XX-XX-XXX)
- Date of the original report, followed by the date(s) of all iterations
- Principal author's name, firm name and address
- Signature of principal author
- Project applicants' names and addresses
- A statement that reads: "*Prepared for the County of San Diego*"
- Color photo of the project site

TABLE OF CONTENTS AND HEADINGS

The table of contents must follow the order and format outlined in this document. Page numbers should be assigned when possible. Titles of each attachment/appendix should be listed in the order in which they are found in the document. The Table of Contents must be formatted in the following manner:

CHAPTER I. CHAPTERS SHALL BE SPECIFIED BY NUMBER AND SHALL BE PRESENTED IN BOLD AND IN ALL CAPS

I.I <u>First level subchapters shall be specified by number and shall be presented in upper and lower case, bold, and underlined</u>

I.I.I Second level subchapters shall be specified by number and shall be presented in upper and lower case, and bold.

I.I.I.I Third level subchapters shall be specified by number and shall be presented in upper and lower case, italics, and bold.

EXECUTIVE SUMMARY

The purpose of the Executive Summary is to provide a quick reference for the public and decision-makers. Therefore, the language should be less technical than that used in the remainder of the document and should be no more than one page in length. The Executive Summery should include a brief summary of the project, the topographic/geographic and combustible vegetation conditions/challenges of the site and surrounding areas, existing fire related services, potential project impacts/issues and proposed mitigation. The summary should include a brief discussion of anticipated fire behavior in the vicinity, based in part on fire behavior modeling (expanded in the body of the FPP). No information should be provided in the summary that is not further explained elsewhere in the document.

Chapter 1. INTRODUCTION

Every Fire Protection Plan shall include the following introductory language:

This Fire Protection Plan (FPP) has been prepared for the (***insert common name of the project here***). The purpose of the FPP is to assess the potential impacts resulting from wildland fire hazards and identify the measures necessary to adequately mitigate those impacts. As part of the assessment, the plan has considered the property location, topography, geology, combustible vegetation (fuel types), climatic conditions, and fire history. The plan addresses water supply, access (including secondary/emergency access where applicable), structural ignitability and fire resistive building features, fire protection systems and equipment, impacts to existing emergency services, defensible space, and vegetation management. The plan identifies and prioritizes areas for hazardous fuel reduction treatments and recommends the types and methods of treatment that will protect one or more at-risk communities and essential infrastructures. The plan recommends measures that property owners will take to reduce the probability of ignition of structures throughout the area addressed by the plan.

1.1 <u>Project Location, Description and Environmental Setting</u>

1.1.1 Project Location

Discuss the project location in the local and regional context. Include a copy of the site plan/plot plan with topographical overlay. If the subject site is adjacent to steep topography or dangerous fuels, additional mapping information may be required.

1.1.2 Project Description

Provide a very detailed description of the project, including all on-site and off-site components. An 8.5”x11” or 11”x17” copy of the proposed subdivision map/plot plan must be attached to the report as a numbered figure(s). The project description should be as detailed as possible and, at a minimum, include the following information (additional information may be required):

- Size of project site and area proposed for development.

- Purpose and scale of proposed uses associated with the project, such as residential development or recreational camping.
- Proposed structures (size, location, purpose, etc.).
- Location of all easements, including those for biological open space, steep slopes, riparian areas, limited building zones, utilities and roads.
- Proposed or potential uses within open space or riparian areas.
- Off-site improvements, such as for roads or utility extensions, and brief analysis of existing off-site road conditions (e.g. width, grade, and paving).

1.1.3 Environmental Setting

Describe the physical characteristics of the subject site and surrounding areas. At a minimum, the Environmental Setting section must include the following information:

- Dates of all site inspections/visits conducted
- Topography
- Vegetation (type and density)
- Fuel loads
- Fire history for the area
- Elevation
- Climate (general and seasonal)
- Public and private ownership of land in the vicinity, particularly any preserved lands adjacent or contiguous to the site
- A description of the existing land uses on site and on surrounding lands

Chapter 2. GUIDELINES FOR THE DETERMINATION OF SIGNIFICANCE

Detailed guidelines for the determination of significance are identified in section 4 of the Wildland Fire and Fire Protection Guidelines for Determining Significance. This section of the FPP must list those thresholds as described under section 4 and explain how the project complies with those thresholds.

Chapter 3. ANTICIPATED FIRE BEHAVIOR IN THE VICINITY

The applicant should provide a fairly brief narrative of anticipated fire behavior in the project vicinity in terms of fuels, terrain, weather, and intensity, both before and after mitigation (if any). This narrative should include a brief summary of fire behavior modeling results, and set the tone for project analysis and mitigation measures that follow. This is the appropriate chapter in which to review FIRE HISTORY.

Chapter 4. ANALYSIS OF PROJECT EFFECTS

This section must include an evaluation of project compliance with the Significance Guidelines listed in section 2.0, above. The project must be analyzed to identify potential adverse impacts and to identify adequate mitigation measures for impacts resulting from wildland fire hazards. At a minimum, an analysis must include an evaluation of the following areas:

4.1 Adequate Emergency Services

This section of the report must discuss the following:

- Fire jurisdiction providing service, location of the nearest fire station obligated to respond, and its emergency responsibility
- Travel distance and travel time (include methodology used)
- Compliance/non-compliance with the San Diego County General Plan
- First alarm response to wildland fire and to structure fire

4.2 Fire Access

The analysis must include a description of the existing off-site and proposed on-site road network, including the following:

- Main/additional access
- Road widths, angles of approaches/departures, obstructions (gates), fire lane marking and turnarounds, including analysis of off-site roads from a public-way and all deviations from fire code requirements
- Road grades and surface improvements
- On-going road maintenance (identify entity responsible and private funding mechanism)
- Compliance/non-compliance with codes/regulations and significance standards

4.3 Water

4.3.1 For projects inside a Public or Private Water District:

- Provide a copy of the Water Service Availability Form along with a map that shows existing and proposed hydrant locations and spacing
- Fireflow in mains in wildland areas for new development must be a minimum 2500 GPM, unless reduced by the fire authority having jurisdiction, consistent with code
- Compliance/non-compliance with codes/regulations and significance standards

4.3.2 For projects outside a Public or Private Water District:

- Demonstrate compliance with County Fire Code or Consolidated Fire Code

4.4 Ignition-Resistant Construction and Fire Protection Systems

- County Building Code specifies construction standards for all structures located within the Wildland-Urban Interface areas. Provide a list of the structures and their uses and clearly identify proposed deviations from applicable sections of the applicable codes. Justification must be provided for alternatives to code requirements; DO NOT simply repeat the code.

- Identify fire sprinkler requirements.

4.5 Fire Fuel Assessment

- Summarize the wildland and non-native fuels on and adjacent to the site and their potential threat of burning, prior to Vegetation Management.

4.6 Fire Behavior Modeling

- Summarize fire behavior modeling results, linking the results to fuel assessment and defensible space. (Details, such as data input and output, should be presented in the Technical Appendices.)

4.7 Defensible Space and Vegetation Management

This section of the report must:

- Provide an overview of flammable vegetation within and adjacent to the project site (type and density, and location relative to specific lots)
- Identify Fuel Modification Zones (with dimensions) for building pads and access roads and link to Fire Fuel Assessment, Fire Behavior Modeling.
- Include vegetation management (clearing) practices that will be implemented during the life of the project and the organization responsible for maintenance.
- Identify how boundaries of vegetation management zones will be permanently identified in the field.
- Identify plant species that are proposed as part of new landscaping, if known.
- Demonstrate compliance/non-compliance with codes/regulations and significance standards.

4.8 Cumulative Impact Analysis

This and other projects may have a cumulative impact on the ability to protect residents from wildfires. This project and other development in the area will increase the population in the rural areas, which may increase the chances of a wildfire and increase the number of people and structures exposed to risk of loss, injury or death.

Explain how the project and other proposed development in the area may contribute to this cumulative impact and what mitigation measures are proposed to address this impact (e.g. establishing/participating in a Community Facility District, project compliance with or exceeding codes/standards).

Chapter 5. MITIGATION MEASURES AND DESIGN CONSIDERATIONS

Briefly describe proposed mitigation measures and design considerations. For each measure, state the impact being mitigated. Some mitigation measures MAY require additional details or analysis of potential impacts.

Chapter 6. CONCLUSION

For each significant impact, determine if the proposed mitigation measures have reduced the significance level to “less than significant” in accordance with the stated Significance Guidelines and, if so, explain why.

Chapter 7. LIST OF PREPARERS AND PERSONS AND ORGANIZATIONS CONTACTED

Provide a list of preparers, noting each person included on the County list of approved consultants. Note that the principal author must be on the County list or the report will not be accepted.

Chapter 8. REFERENCES

Include a list of all references used in the report (not personal references for the preparer.)

TECHNICAL APPENDICES

The Table of Contents for the Appendices must list each document attached to the report in the order in which it is included. The following documents must be included in the report, either in the text (if size is appropriate) or as an appendix:

- Site Map/Plot Plan with topography overlay
- Aerial photo of site and immediate vicinity – with property lines shown
- Photos of the site at ground level
- Fire Model (if required)
- Completed and signed form “DPLU #399F – Project Facility Availability Form for Fire”

2.2 Fire Behavior Model

Summary Narrative
As part of the Fire Behavior Model, a Summary Narrative must be included that provides an overview of the assumptions and findings. Please ensure that the narrative includes discussion of wind compression, spotting potential, fire location/direction, assessment of neighboring fuel beds, and topographical impacts. The language should be less technical than that used in the Fire Model Report and should be no more than one page in length.

Use of Model Inputs - Caveat
The Fire Behavior Model is a tool for fire authorities to estimate the behavior of fire that is moving towards a structure given certain assumptions. The Fire Behavior Model is only an estimate and not designed to replace eye-witness accounts or the experience of the local FAHJ who is familiar with wildland fire behavior.

The standard weather parameters that are discussed below are designed to provide local FAHJ and fire consultants with a generally accepted set of model inputs to ensure overall fire modeling consistency for certain fuel types. The inputs are not stagnate and will constantly be revised and amended as additional information becomes available and modeling software changes. The County will post changes to these standard weather parameters on DPLU's website as the changes occur. Before finalizing modeling inputs, fire consultants must contact the local FAHJ to confirm that the model inputs proposed are reasonably accurate for the area being considered.

Note that BehavePlus is not the only recognized fire model that is available; it is identified in this report only because it is a model currently most used by fire consultants. Three fuel models are listed as a comparison of fire behavior values under BehavePlus, but other recognized models may be used. Use of these alternative models will be accepted if the consultant provides documentation that supports and justifies the assumptions that are used.

Model Inputs – Historical Background
The requirement to submit a Fire Protection Plan for development in wildland areas has demonstrated a need for a generally accepted set of weather parameters for extreme fire conditions during summer time and Santa Ana fire weather patterns.

Analysis of 44 years of weather data (1961-2005) from the USDA Forest Service's Weather Information Management System (WIMS) provides a sampling of weather patterns across San Diego County. The County is divided into five climate zones from the coast to the desert. (Climates of San Diego County, Agricultural Relationships, University of California, Agricultural Extension Service, and U.S. Weather Bureau.) Daily afternoon weather observations were manually taken at selected fire stations across the county between 1961 and the early 1990's. Remote Automated Weather Stations (RAWS) replaced manual observations beginning in 1992. http://famweb.nwcg.gov/weatherfirecd/

Fire Family Plus software (USDA Forest Service) was used to summarize and analyze historical daily fire weather observations and to compute fire danger indices based on the National Fire Danger Rating System (NFDRS).

Weather data from April 15th through December 31st was chosen to represent the general limits of the fire season. Fires have occurred between January 1st and April 14th, but while dangerous fire weather conditions occur during this period, they typically are not as severe as September and October weather conditions. Including winter weather records would dilute the data and add numerous winter storms that require manual interpretation. Summer fire conditions were derived from records beginning on June 15th and ending September 15th.

Maximum wind speed data was checked for reasonableness by comparing speed with surrounding stations. Winds associated with winter storms were identified by cross checking with precipitation and relative humidity observations and then excluded. Santa Ana wind season is assumed to start on September 15th. Wind speed is measured at 20 feet above the ground and averaged for at least 10 minutes.

Maximum wind speed was calculated by taking the difference between the maximum recorded wind speed and the 99th percentile wind speed, adding this difference to the 99th percentile wind, adding 10 percent for a safety margin, and rounding the answer up. This had the effect of throwing out the outliers while including the highest reasonable winds. A table showing days with winds over the 99th percentile is included for each zone. Peak wind for each zone is the highest recorded wind by a RAWS during the Cedar fire (October 26, 2003).

The program for calculating fire behavior and spread requires temperature and relative humidity ranges as inputs. Temperature ranges of 90°-109°F and relative humidities of 5%-9% are reasonable for most areas of the county under Santa Ana conditions.

The Burning Index graph is included for reference. It represents the relative difficulty of controlling a wildfire and is calculated from temperature, wind, relative humidity, fuel (vegetation) moisture and wind.

Actual weather records may be used in lieu of these numbers if they can be demonstrated to be representative of the actual site, recorded by a recognized system, and represent at least five years of data.

Table 1
BEHAVE Plus 5.0.1
Worst case sustained winds (10 minute average and peak) Fuel Model 1 at 50% slope

Zone	Period	Temperature	Relative Humidity	Sustained Wind Speed	Burning Index (99%)	Rate of Spread Feet/min	Flame length

* Surface Fire Only. Behave does not model crown fires in timber fuel types

.
2.3 Fire Protection Plan – Letter Report Outline

The Fire Protection Plan (**FPP**) – **Letter Report** is for project applicants who are processing minor projects that have little to no anticipated risk of loss, injury or death involving wildland fires. Discretionary permits that may qualify for a FPP – Letter Report include projects that are located within the State Responsibility Areas and are "infill" projects with virtually no wildlands in the immediate vicinity. The FPP – Letter Report may be prepared by the applicant or the applicant's representative, instead of a fire consultant. However, the applicant may employ the services of a fire consultant to prepare a Letter Report FPP. The Letter Report FPP preparer does not have to be on the County's approved list of consultants.

If upon review of the completed FPP - Letter Report, the County determines that code issues are unresolved or inadequately addressed or the project cannot comply with required conditions that are specified in the "Project Exposure to Wildland Fires" section below, the project does not qualify for a FPP – Letter Report, and a FPP – Full Report will be required. The Full FPP Report must be prepared by a consultant currently approved by the County for such reports, and must follow the prescribed format.

The FPP – Letter Report must be written in the following format. Guidance on how to complete certain sections of the report is shown in *(italics)*. Questions on how to complete the form can be directed to the DPLU Fire Service Section at (858) 694-2960.

(Date)

County of San Diego
Department of Planning and Land Use
5201 Ruffin Road, Suite B
San Diego, CA 92123

(Local Fire Agency/District Having Jurisdiction)
(Address)
(City, State, Zip)

SUBJECT: FIRE PROTECTION PLAN – LETTER REPORT
(Project Common Name)
(Project Application Number – e.g. TPM ####)
(Assessor Parcel Numbers e.g. ###-###-##-00)

This Fire Protection Plan (FPP) – Letter Report is submitted pursuant to the County Fire Code and County Consolidated Fire Code, to address the adverse environmental effects that a proposed project may have from wildland fire and to provide mitigation of those impacts to ensure that the project does not expose people or structures to a significant risk of loss, injury or death involving wildland fires.

PROJECT DESCRIPTION

(Briefly describe the project being proposed – acreage, parcel size range (e.g. "24.5 acre parcel in A-72 zone divided into four 4.0 to 6.5 acre residential lots")

ENVIRONMENTAL SETTING

1. **Location:** *(give the community where the project is located [e.g. Fallbrook] and describe the character of the area that surrounds the subject property , i.e. how it is currently developed)*
2. **Topography:** *(generally identify the terrain of the site and adjacent properties (e.g. land is generally flat immediately off Access Street for 100 yards followed by rolling hills. Unusually high steep terrain can be found in the northwestern corner of the site and beyond)*
3. **Geology:** *(describe any geological features that might affect access roads or building pad design, or increase or reduce wildfire potential on the site.)*
4. **Flammable Vegetation:** *(discuss the type and density of vegetation – this information is typically available in the project Biology Report. If a Biology Report is not required for your project, generally describe the types of plants that are found on the property and the density of vegetation.)*
5. **Climate:** *(identify general climate and seasonal events – e.g. "coastal or west sloping valley or mountainous or desert climate – subject to Santa Ana wind events, flash flooding", etc.)*

PROJECT EXPOSURE TO WILDLAND FIRES

1. **Water Supply:** *(Describe how water is going to be supplied to the project. NOTE: If the project is outside the boundaries of a water district, include the following language in this section of the FPP – Letter Report: "All proposed structures shall have a water tank, with size, location and fire department connection (FDC) consistent with the County and Consolidated Fire Code."*

   If the project is inside the boundaries of a water district, a copy of the Service Availability Form for water must be attached to this FPP – Letter Report. Furthermore, include the following language in this section of the FPP – Letter Report: "Hydrants shall be located along fire access roadways as determined by the Fire Marshal to meet operational needs, at intersections, at cul-de-sacs, and at intervals pursuant to the County and Consolidated Fire Code. Required fireflow in water main is 2500 gallons per minute.

2. **Fire Access Roads**

   Location. *(Describe the location of all access roads and the number of parcels that will access each road, include development pads and driveways). Explain how the primary access road complies with the distance thresholds specified under the County Fire Code and County Consolidated Fire Code.*

   Width: *(Describe the width of all access roads. NOTE: All fire access roads including driveways must be improved to a minimum 16' width all-weather surface suitable for travel by 50,000 lb. fire apparatus. Fire access roads serving more than two single-family dwellings shall be a minimum 24' wide with all-weather surface suitable for travel by 50,000 lb. fire apparatus.*

   Vertical Clearance: *(Include a statement that "minimum vertical clearance of 13 feet 6 inches must be maintained for the entire required width of fire access roads".)*

   Grade: *(Describe the maximum grade in percent for the roads and driveways. NOTE: Grades greater than 15% are not permitted without mitigation; grades greater than 20% are prohibited.)*

   Surface: (Describe the surface improvements for all roads and driveways. Be specific rather than quoting this entire code section).

3. **Setback from Property Lines:** *(The minimum setback from any property line in high hazard areas is 30 feet (even though Zoning Setback may be less). Exceptions may be allowed if parcels are smaller than one acre, upon review and approval from the FAHJ and County. Minimum setback from property lines abutting national forests, open space preserves, and designated riparian areas is 100 feet. The applicable statement must appear in this section, and any such forest, preserve or riparian areas must be identified.)*

4. **Building Construction:** *(The Report must include the following statement: "All structures shall comply with the ignition-resistive construction requirements: Wildland-Urban Interface areas of Chapter 7A of the County Building Code.")*

5. **Fire Protection Systems:** *(The Report must include the following statement: "All habitable structures and attached garages shall have residential fire sprinklers per County Code or County Consolidated Code requirements.")*

6. **Defensible Space:** *(The Report must include the following statement: "A minimum 100-foot Fuel Management Zone will be established and maintained around all structures over 250 square feet in size. No off-site clearing is required or authorized.")*

7. **Vegetation Management:** *(The Report must include the following statement: "Prescribed Defensible Space (fuel management zones) will be maintained by the property owners at least annually or more often as needed. Boundaries of fuel*

management zones will be clearly and permanently marked. Plants used in the Defensible Space will be from an approved fire resistant planting materials list that is maintained by County of San Diego, Department of Planning and Land Use.")

8. **Fire Behavior Computer Modeling:** Based on preliminary evaluation by the County Fire Marshal, Computer Fire Behavior Modeling is not required for this **FPP – Letter Report**-*(Note: Contact the Fire Authority Having Jurisdiction [FAHJ] to confirm).*

SUPERIOR COURT OF THE STATE OF CALIFORNIA

COUNTY OF RIVERSIDE

FRIENDS OF THE NORTHERN SAN JACINTO VALLEY and SIERRA CLUB, Petitioners, vs. COUNTY OF RIVERSIDE and BOARD OF SUPERVISORS OF RIVERSIDE COUNTY, and DOES 1-20, Respondents.	CASE NO.: RIC10007572 ~~[PROPOSED]~~ PEREMPTORY WRIT OF MANDATE
NUEVO DEVELOPMENT COMPANY, LLC, and DOES 21-40, Real Party in Interest.	

TO: Defendants and Respondents, County of Riverside and Board of Supervisors of Riverside County (collectively, "County").

The Court having entered a judgment in this proceeding directing that a peremptory writ of mandate issue from this Court,

YOU ARE HEREBY COMMANDED to comply with the following:

1. Within forty five (45) days of the service of this Writ, the County shall set aside all approvals relating to Resolution Nos. 2010-88 and 2010-89 and Ordinance No. 348.4679, and shall refrain from approving these same or new approvals relating to or implementing

the Villages of Lakeview Project ("Project") until such time as the County fully complies with CEQA and State Planning and Zoning Law.

2. Under Public Resources Code §21168.9(c), this Court does not direct the County to exercise its lawful discretion in any particular way.

3. Under Public Resources Code §21168.9(b) and Code of Civil Procedure §1097, this Court will retain jurisdiction over the County's proceedings related to this Project by way of a return to this Writ until the Court has determined that the County has complied with the provisions of CEQA, State Planning and Zoning Law.

You are further commanded to make and file a return to this writ within 60 days from the date a copy of this writ is served on you, showing what you have done to comply with this writ.

Witness the Honorable Sharon J. Waters, Judge of the Superior Court. Attest my hand and the seal of this Court this 11 day of July, 2012.

Smart Growth America

Making Neighborhoods Great Together

Measuring Sprawl 2014

April 2014

Acknowledgments

Smart Growth America is the only national organization dedicated to researching, advocating for and leading coalitions to bring smart growth practices to more communities nationwide. From providing more sidewalks to ensuring more homes are built near public transportation or that productive farms remain a part of our communities, smart growth helps make sure people across the nation can live in great neighborhoods. Learn more at www.smartgrowthamerica.org.

This report is based on original research published by the Metropolitan Research Center at the University of Utah, prepared for the National Cancer Institute at the National Institutes of Health, as well as the Ford Foundation.

The Metropolitan Research Center conducts basic and applied research on the built environment at the metropolitan scale, focusing on key forces shaping metropolitan form such as demographics, environment, technology, design, transportation, arts and culture and governance. It seeks to expand knowledge in city and metropolitan affairs to improve policy and practice and educate the general public on important issues facing communities. Learn more at www.arch.utah.edu/cgi-bin/wordpress-metroresearch/.

This report was made possible with support from the National Institutes of Health and the Ford Foundation.

Table of Contents

Executive Summary

Some places in the United States are sprawling out and some places are building in compact, connected ways. The difference between these two strategies affects the lives of millions of Americans.

In 2002, Smart Growth America released *Measuring Sprawl and Its Impact*, a landmark study that has been widely used by researchers to examine the costs and benefits of sprawling development. In peer-reviewed research, sprawl has been linked to physical inactivity, obesity, traffic fatalities, poor air quality, residential energy use, emergency response times, teenage driving, lack of social capital and private-vehicle commute distances and times.

Measuring Sprawl 2014 updates that research and analyzes development patterns in 221 metropolitan areas and 994 counties in the United States as of 2010, looking to see which communities are more compact and connected and which are more sprawling. Researchers used four primary factors—residential and employment density; neighborhood mix of homes, jobs and services; strength of activity centers and downtowns; and accessibility of the street network—to evaluate development in these areas and assign a Sprawl Index score to each. This report includes a list of the most compact and most sprawling metro areas in the country.

This report also examines how Sprawl Index scores relate to life in that community. The researchers found that several quality of life factors improve as index scores rise. Individuals in compact, connected metro areas have greater economic mobility. Individuals in these areas spend less on the combined cost of housing and transportation, and have greater options for the type of transportation to take. In addition, individuals in compact, connected metro areas tend to live longer, safer, healthier lives than their peers in metro areas with sprawl. Obesity is less prevalent in compact counties, and fatal car crashes are less common.

Finally, this report includes specific examples of how communities are building to be more connected and walkable, and how policymakers at all levels of government can support their efforts.

Introduction

As regions grow and develop, residents and their elected leaders have many decisions to make. What kind of street network should they build, and how extensive should it be? Should neighborhoods have a mix of homes, shops and offices, or should different types of buildings be kept separate? Will people be able to walk, ride a bicycle or take public transportation through the community, or will driving be the only realistic way for people to get around?

Everyone experiences the outcomes associated with these development decisions. How much families pay for housing and transportation, how long workers spend commuting home, the economic opportunities in communities and even personal health are all connected to how neighborhoods and surrounding areas are built.

Measuring Sprawl 2014 analyzes development in 221 metropolitan areas across the United States, as well as the relationship between development and quality of life indicators in those areas. This report includes a list of the most compact and most sprawling metro areas in the country.

About the research

In 2002, Smart Growth America released *Measuring Sprawl and Its Impact*, a landmark study that has been widely used by researchers to examine the costs and benefits of sprawling development. That report was made available to researchers and has been used in peer-reviewed research in the years since. From that original analysis, sprawl has been linked to physical inactivity, obesity, traffic fatalities, poor air quality, residential energy use, emergency response times, teenage driving, lack of social capital, and commute distances and times.

Measuring Sprawl 2014 is an update and refinement of that research. This report is based on research originally published in the Metropolitan Research Center at the University of Utah in April 2014. The University of Utah's report, titled *Measuring Urban Sprawl and Validating Sprawl Measures,* represents the most comprehensive effort yet undertaken to define, measure and evaluate metropolitan sprawl and its impacts. The first peer-reviewed article based on this research was published in October 2013 in the journal *Health & Place*.

The data from 2010 used in this analysis are the most recent available. The complete analysis, methodology and databases included in the University of Utah's research are available at http://gis.cancer.gov/tools/urban-sprawl/.

Measuring “sprawl”

This study analyzed development in 193 census-defined Metropolitan Statistical Areas (MSAs)—or metro areas—as well as 28 census-defined Metropolitan Divisions, which comprise MSAs, in the largest 11 MSAs. All of the analyzed areas had at least 200,000 people in 2010. MSAs with populations less than 200,000 people were not included in the study.[1] This study also analyzed development in 994 metropolitan counties.

The four factors

Development in both MSAs and metropolitan counties was evaluated using four main factors: 1) development density; 2) land use mix; 3) activity centering; and 4) street accessibility. These factors are briefly explained below.[2]

Development density
Development density is measured by combining six major factors: 1) total density of the urban and suburban census tracts; 2) percent of the population living in low-density suburban areas; 3) percent of the population living in medium- to high-density areas; 4) urban density within total built-upon land; 5) the relative concentration of density around the center of the MSA; and 6) employment density.

Land use mix
Land use mix is also measured through a combination of factors: the balance of jobs to total population and mix of job types within one mile of census block groups, plus the WalkScore of the center of each census tract.

Activity centering
The proportion of people and businesses located near each other is also a key variable to define an area. Activity centering is measured by looking at the range of population and employment size in different block groups. MSAs with greater variation (i.e., a wider difference between blocks with a high population and a low one) have greater centering. This factor also includes a measure of how quickly population density declines from the center of the MSA, and the proportion of jobs and people within the MSA’s central business district and other employment centers.

Street accessibility
Street accessibility is measured by combining a number of factors regarding the MSA’s street network. The factors are average length of street block; average block size; percent of blocks that are urban in size; density of street intersections; and percent of four-way or more intersections, which serves as a measure of street connectivity.

Scoring

Researchers used these factors to evaluate development in all 221 MSAs and 994 counties. These four factors are combined in equal weight and controlled for population to calculate each area’s Sprawl Index score. The average index is 100, meaning areas with scores higher than 100 tend to be more compact and connected and areas with scores lower than 100 are more sprawling.

MSA versus county scales

Census-defined MSAs and the Metropolitan Divisions within them include a wide variety of places within a given region. An MSA's boundaries may include one county (like the Detroit, MI Metropolitan Division, which includes only Wayne County) or many counties (like the Washington, DC MSA, which contains 16 counties).[3]

This difference has a significant impact on how a given region scores on the index, and it is important to note that these census-defined divisions create some counterintuitive outcomes. For example, the greater Washington, DC area ranks 91st on the index based on its MSA. Evaluated at the county level, however, Washington, DC ranks 6th. Many other communities face similar distinctions between scores at the MSA level versus the county level.

Our findings are presented at the MSA scale because much of the data, such as economic mobility, is only available at this level. Health data is available at the county level, so in those cases we provide analysis at that scale. Future versions of this analysis would benefit from economic mobility, transportation and housing costs and health databases available at more refined scales. For more information about index scores and findings at the county scale, see Appendix B. For information about the data sources available at different geographic scales, see Appendix C.

The 2014 Sprawl Index rankings

Based on the index standards described in the previous section, we evaluated development in 221 metro areas in the United States.

The most compact, connected metro area in the United States is, perhaps not surprisingly, New York, NY, with an index score of 203.4. The country's most sprawling metro area is Hickory, NC, with an index score of 24.9.

To provide a more comprehensive look at how communities compare, we also present here the most compact and most sprawling MSAs by size. Among large metro areas (defined as having a population more than one million people), New York, the national leader, is the most compact and connected. Atlanta, GA, is the most sprawling, with a score of 41.0.

Of medium metro areas (defined as having a population between 500,000 and 1 million), Madison, WI, is the most compact and connected with a score of 136.7 and Baton Rouge, LA, is the most sprawling, with a score of 55.6. Of small metro areas (defined as having a population less than 500,000), Atlantic City, NJ, is the most compact and connected, with a score of 150.4, whereas Hickory, NC, is the most sprawling.[4]

Most compact, connected metro areas

Tables 1–4 rank metro areas that are more compact and connected, with homes and jobs closer together.

TABLE 1

Most compact, connected metro areas, nationally

Rank	Metro area	Index score
1	New York/White Plains/Wayne, NY-NJ	203.4
2	San Francisco/San Mateo/Redwood City, CA	194.3
3	Atlantic City/Hammonton, NJ	150.4
4	Santa Barbara/Santa Maria/Goleta, CA	146.6
5	Champaign/Urbana, IL	145.2
6	Santa Cruz/Watsonville, CA	145.0
7	Trenton/Ewing, NJ	144.7
8	Miami/Miami Beach/Kendall, FL	144.1
9	Springfield, IL	142.2
10	Santa Ana/Anaheim/Irvine, CA	139.9

What sprawl means for everyday life

The researchers found that as Sprawl Index scores improved—that is, as areas became less sprawling—several quality of life factors improved along with them.[5]

- People have greater economic opportunity in compact and connected metro areas.
- People spend less of their household income on the combined cost of housing and transportation in these areas.
- People have a greater number of transportation options available to them.
- And people in compact, connected metro areas tend to be safer, healthier and live longer than their peers in more sprawling metro areas.

The researchers controlled for socioeconomic factors. Below is more information about each of these quality of life indicators.

People in more compact, connected metro areas have greater economic mobility.
Could metro areas with homes and jobs far apart and limited connections between those areas directly affect the ability of low-income children to get ahead as adults?

The researchers compared the 2014 Sprawl Index scores to models of upward economic mobility from Harvard and the University of California at Berkeley.[6] They examined the probability of a child born to a family in the bottom quintile of the national income distribution reaching the top quintile of the national income distribution by age 30, and whether communities' index score was correlated with that probability.

Compactness has a strong direct relationship to upward economic mobility.

The researchers found that compactness has a strong direct relationship to upward economic mobility. In fact, for every 10 percent increase in an index score, there is a 4.1 percent increase in the probability that a child born to a family in the bottom quintile of the national income distribution reaches the top quintile of the national income distribution by age 30.

For example, the probability of an individual in the Baton Rouge, LA area (index score: 55.6) moving from the bottom income quintile to top quintile is 7.2 percent. In the Madison, WI area (index score: 136.7) that probability is 10.2 percent.

People in more compact, connected metro areas spend less on the combined expenses of housing and transportation.
The cost of housing is often higher in compact areas compared with sprawling ones. However, families' transportation costs are often significantly lower in these places. Shorter distances to travel and a wider range of low-cost travel options means individuals and families in these places spend a smaller portion of their household budget on transportation. How do the two expense categories relate in compact areas versus sprawling ones?

The researchers found that the average percentage of income spent on housing is indeed greater in compact communities than in sprawling areas. Each 10 percent increase in an index score was associated with a 1.1 percent increase in housing costs relative to income.[7]

The researchers also found that the average percentage of income spent on transportation is smaller in compact areas than sprawling ones. Each 10 percent increase in an index score was associated with a 3.5 percent decrease in transportation costs relative to income.[8] For instance, households in the San Francisco, CA area (index score: 194.3) spend an average of 12.4 percent of their income on transportation. Households in the Tampa, FL metro area (index score: 98.5) spend an average of 21.5 percent of their income on transportation.[9]

The combined cost of housing and transportation declines as an index score increases.

Perhaps the most notable finding was that the combined cost of housing and transportation declines as an index score increases. As metropolitan compactness increases, transportation costs decline faster than housing costs rise, creating a net decline in household costs.[10] An average household in the San Francisco, CA metro area (index score: 194.3) spends 46.7 percent of its budget on housing and transportation, while an average household in the Tampa, FL metro area (index score: 98.5) spends 56.1 percent of its budget on the same items.[11]

People in more compact, connected metro areas have more transportation options.
Part of the reason transportation costs are lower in more compact areas is that these areas have a wider range of options for how to get around—nearly all of which cost less than driving or are even free.

The researchers found that people in metro areas with higher index scores walk more: For every 10 percent increase in an index score, the walk mode share (i.e., the portion of travelers who choose to walk) increases by 3.9 percent.

The researchers found that people in high-scoring metro areas take transit more: For every 10 percent increase in an index score, transit mode share (i.e., the portion of travelers who choose to use transit) increases by 11.5 percent. This means, for example, that a person in the Lincoln, NE metro area (index score: 132.0) is two and a half times more likely to choose transit for his or her transportation needs than a similar person in the Greenville, SC area (index score: 59.0).

The researchers also found that people in high-scoring metro areas own fewer cars and spend less time driving. For every 10 percent increase in an index score, vehicle ownership rates decline by 0.6 percent and drive time declines by 0.5 percent.[12]

Data about transportation options are even more compelling at the county level. See Appendix B for that information.

People in more compact, connected areas have longer, healthier and safer lives.
Health data are available at the county level; for this reason, health outcomes are assessed at this scale rather than the MSA level. At the county level, an area's compactness is also related to individuals' health.[13]

First and foremost, people in compact, connected counties tend to live longer. For every doubling in an index score, life expectancy increases by about four percent.[14] For the average American with a life expectancy of 78 years, this translates into a three-year difference in life expectancy between people in a less compact versus a more compact county.

Driving rates (and their associated risk of a fatal collision), body mass index (BMI), air quality and violent crime all contribute to this difference, albeit in different ways. Counties with less sprawl have more car crashes, but fewer of those crashes are fatal. For every 10 percent increase in an index score, fatal crashes decrease by almost 15 percent. That means a person in Walker County, GA, for example, has nearly three times the chance of being in a fatal crash as compared with a similar person in Denver County, CO.

The researchers found that BMI is strongly and negatively related to index scores. As a county's index score decrease (that is, as a metro area sprawls more), the BMI of its population increases, after accounting for sociodemographic differences. For example, a 5'10" man living in Arlington County, VA is likely to weigh four pounds less than the same man living in Charles County, MD.[15] Similarly, the likelihood of obesity increases. People in less sprawling counties also have significantly lower blood pressure and rates of diabetes.

Humboldt County General Plan Update Health Impact Assessment

March 2008

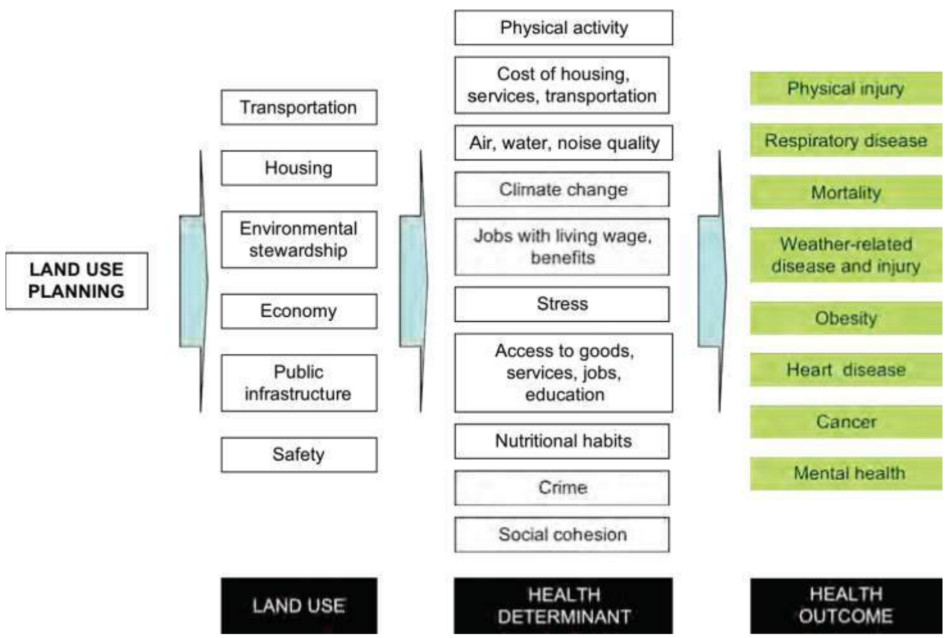
By:
Humboldt County Public Health Branch
Humboldt Partnership for Active Living
Human Impact Partners

Funded by:
The California Endowment

Introduction and Description of Methodology

Land use planning decisions are often made based on population projections, economic considerations, political realities, and community input. A substantial and growing body of evidence suggests that the way we build the world around us and the policies we implement through land use planning processes have significant impacts on public health. The goal of this report is to make the health impacts of these decisions explicit.

Planning impacts health by affecting the community determinants of health - the social, economic and environmental factors that influence well-being including for example: housing, livelihood, access to fresh produce, education, air quality, access to parks, and transportation. Economic inequality, residential segregation, substandard housing, lack of supermarkets, poor schools, insufficient public transit, and disruptions to family and social networks all have been shown to affect health negatively.



For example:

- Proximity to and mix of retail, quality destinations, and transportation mode choices are the most influential factors in people's decisions to walk.[1]
- Housing affordability is related to homelessness, overcrowding, displacement and residential segregation, all of which have important health and mental health consequences.[2 3 4]
- Access and proximity to places for physical activity, including parks, are significant predictors of physical activity levels.[5 6]
- Accessible neighborhood grocery stores reduce diet-related diseases and the distance to a full service grocery store is related to body mass index.[7 8]

<u>Land Use Planning and Health in Humboldt County</u>
In 1998, Humboldt County commenced upon a General Plan Update (GPU) to guide building and growth in Humboldt County over the next 20 years. In 2007, with the support of the Board of Supervisors, the Public Health Branch began working with the Community Development Services

Planning Division (CDS) in an effort to make sure that the General Plan would bring about the best health outcomes for current and future residents. With the encouragement of CDS and a grant from The California Endowment, the Humboldt County Public Health Branch commissioned a Health Impact Assessment (HIA) to look at how the various land use and development scenarios under consideration for the GPU would affect health.

Health Impact Assessment (HIA) is a set of tools, methods and procedures that examines a development project, a general plan, or a policy on the basis of its potential health impacts. HIA aims to make decisions accountable for their effects on health, where health is defined broadly as a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity. HIA brings together evidence for decision-makers to understand how their decisions on programs, projects, plans, or policies affect health, positively or negatively. HIA also offers recommendations to enhance the positive health impacts of policy-making and development projects and to eliminate, reduce, or mitigate negative impacts.

Participating organizations:

- Humboldt County Department of Health and Human Services, Public Health Branch, including Environmental Health
- Humboldt Partnership for Active Living (HumPAL)
- Community Development Services Planning Division
- Human Impact Partners
- Community based organizations (see Appendix A for participants)

Plan Alternatives analyzed in the HIA

The Humboldt County GPU HIA evaluated how a variety of land use indicators would change as a result of the three Plan Alternatives (A, B, and C) being considered in the GPU. These alternatives are described in detail below.

The exact number of housing units provided for in each Plan Alternative is still under discussion. The HIA used estimates (detailed below) based on information from the Community Development Services Planning Division for the number of housing units in each Plan Alternative. Based on US Census 2000 figures for the County, the HIA also assumed that, on average, 2.4 persons would live in each housing unit. For example, if 6,000 new housing units are being proposed, then it was assumed that 14,400 (6,000 X 2.4) more people would be able to live in the County.

Plan Alternative A[9]: This plan provides for "focused growth." Plan Alternative A encourages all new units to be built in existing areas that are already supported by public sewage and utilities, i.e., encouraging higher residential density and infill development. Infill development is the use of vacant land, or restoration or rehabilitation of existing structures or infrastructure in already urbanized areas, where water, sewer, and other public services are in place. Infill development maintains the continuity of the original community fabric.

Plan Alternative A provides for 6,000 additional units over the course of 25 years. Of those, 6,000 are urban and, therefore the urban population would increase by 14,400. In this Plan Alternative, non-urban development will require conditional approval. This Alternative would require additional work in implementation since it would need to deal with existing property rights.

Plan Alternative B: This plan is a compromise between an all-infill development plan and a plan that does not highly regulate the location of new development. Plan Alternative B primarily provides for building in urban centers where there is a good network of utilities, sewage, and transit, but allows for some ex-urban development as well with modest expansion of existing water service areas, focusing on areas adjoining the city centers.

Plan Alternative B provides for 12,000 additional units over the course of 25 years and would therefore provide housing for approximately 28,800 people. Of those, 6,000 (50%) are urban and the urban population would increase by 14,400. The remaining 6000 units (50%) are non-urban and the non-urban population would also increase by 14,400.

Plan Alternative C: This plan allows the most unrestricted growth, or an "expanded development pattern". Plan Alternative C allows the highest number of existing parcels to be developed for housing; it also expands water service areas beyond present boundaries to expand opportunities for housing in outlying parts of communities.

Plan Alternative C provides for 18,000 additional units over the course of the 25 years and would therefore provide housing for approximately 43,200 people. Of those, 6,000 (33%) are urban and the urban population would increase by 14,400. The remaining 12,000 units (67%) are non-urban and the non-urban population would also increase by 28,800.

Methods:
Humboldt County Public Health Branch, in an ongoing effort to insure that land use decisions are made through the lens of public health and well being, used San Francisco Department of Public Health's (SFDPH's) Healthy Development Measurement Tool (HDMT; www.thehdmt.org) as a starting point for this Health Impact Assessment. The HDMT is a new approach for evaluating land use planning and development with regard to the achievement of human health needs. The HDMT was created through a collaboration spearheaded by SFDPH with development stakeholders and public agencies. The HDMT uses public health to explicitly connect the needs of health and human development to physical and environmental conditions, and provides a systematic assessment approach to consider environmental stewardship, transportation, housing, public infrastructure, public safety, and the economy. The HDMT identifies indicators of – or ways of measuring the effects of – land use planning, an evidence base of how these indicators impact a community's health, and policies to encourage healthy land use decisions.

Humboldt County's Public Health Branch and Human Impact Partners revised the HDMT, which was developed in an urban setting, to create a rural HDMT that more accurately reflects the reality of Humboldt County. This Rural HDMT will have over 60 health and land use related indicators and the Public Health Branch will be making it available on their website.

The next step in the GPU HIA involved engaging residents, mostly from community-based organizations, in a series of focus groups about the General Plan Update and health. Based on input from the focus groups, the Humboldt County Public Health Branch and HumPAL, with guidance from Human Impact Partners, collaboratively chose 35 of the HDMT's 65 indicators to be studied in this HIA. Indicators chosen were those that have the most impact on health and are most likely to be influenced by policies likely to be part of the General Plan.

Indicators were divided into 6 categories: Housing, Transportation, Public Infrastructure, Economy, Public Safety, and Environmental Stewardship. Each of these topics is discussed in the HIA report. For each category of indicator, a four to five page summary is available as well as a longer in-depth analysis.

Definition of Urban, Non-urban, and Rural Character

Most of the analyses performed in the HIA rely on a comparison between "urban" and "non-urban" areas of Humboldt County. The US Census defines "urban" as all territory, population, and housing units in urbanized areas and in places of more than 2,500 persons outside of urbanized areas. Rural is basically all territory, population, and housing units not classified as urban. According to the US Census 2000, there are 126,518 people in Humboldt County. By their definitions, 88,127 of those people live in urban areas (70 percent), and 38,391 live in rural areas (30 percent).

However, estimations required assumptions based on access to urban resources that are typically in residentially dense areas, such as access to public water systems, sewer systems and proximity to necessary goods and services. Thus urban and non-urban estimates used here are different from the US Census. The definition of urban used in this report includes areas where the residential density is above 1,000 people per square mile. The shaded regions in the table below are the urban areas for this HIA analysis. Every urban area is included in the table below; not every non-urban area is.

Figure 1. Residential density / US Census population

Area	*People per square mile**	*US Census 2000 population (and their categories for urban/rural)*
Bayview CDP (outside Eureka)	3203 - average	2,359 (urban)
Cutten CDP (outside Eureka)	2249 - low	2,933 (urban)
Humboldt Hill CDP (outside Eureka)	778 - low	3,246 (urban)
Hydesville CDP (south of Fortuna)	164 - very low	1,209 (rural)
McKinleyville CDP	651 - low	13,599 (12,552 urban, 1,047 rural)
Myrtletown CDP (outside Eureka)	2097 - low	4,459 (urban)
Pine Hills CDP (outside Eureka)	305 - low	3,108 (1731 urban, 1377 rural)
Redway CDP (southeast, off 101)	951 - low	1,188 (rural)
Westhaven-Moonstone CDP (N of McKinleyville near Trinidad)	129 - very low	1,044 (rural)
Willow Creek CDP (near Blue Lake)	8.5 - very low	1,743 (rural)
Arcata	1841 - low	16651 (urban)
Eureka	2707 - average	26128 (urban)
Ferndale	1355 - low	1382 (rural)
Fortuna	2317 - low	10497 (urban)
Garberville	14 - very low	12194- (3763 urban, 8431 rural)
North Coastal CCD Remainder (between McKinleyville & Trinidad, inland)	39 - very low	20415- (12,963 urban, 7,452 rural)
Trinity-Klamath CCD Remainder	6 - very low	5437- (all rural)
Total County		126,518

*Source for densities: http://www.city-data.com/

The assignment of areas to urban and non-urban classes is imperfect. For example, the assignment classifies McKinleyville as a non-urban area and this does not account for the fact that it does have an urban core. Analyzing the County at the level of detail required to account for these discrepancies would be prohibitively time consuming. Overall, this classification system described above is a reasonable approximation of existing conditions.

Since some data was only available at the zip code level and/or more detailed analysis would be prohibitively time consuming, zip codes were assigned as either urban and non-urban. For this analysis, the following zip codes were considered to be urban: 95501, 95503, 95521, 95534, 95536, 95540. Again, this classification system is imperfect, but it is a reasonable approximation of existing conditions. This zip code based classification system does not completely match with the population density based classification system described above.

Using the standard of residential density of 1,000 people per square mile as living in an "urban environment" for Humboldt County 51% (64,409) is urban (shaded boxes) and 49% (62,109) is non-urban (total population minus urban).

In this HIA, the phrase "rural character" is used to mean a landscape in which the features of the natural environment and agriculture predominate.

Healthy Housing

Encompassing shelter, home, and neighborhood, housing affects health in diverse ways—positively and negatively. Healthy housing is affordable, physically safe, sufficiently spacious, stable, and located in a setting that provides access to jobs, goods, services, transportation and nature, supporting meaningful social participation. Access to affordable and well-maintained housing that provides shelter against weather is a basic health necessity. Changes in housing stock, location, and affordability can either facilitate or hinder the achievement of adequate housing needs in a city. When housing is scarce, people with the least financial resources are often deprived of adequate and/or affordable housing. According to a Humboldt County community survey, 57.6% of respondents thought that the County should be putting more effort into improving the availability of affordable housing.[10]

Examples of how housing can affect health include the following:

- Residential displacements during childhood can result in depression, academic delay, school suspensions, difficult transitions between schools, and loss of health-protective social networks.[11] [12] [13]
- Lack of affordable housing leads to segregation of poor and minority communities to areas of concentrated racial inhabitation.[14] Segregated neighborhoods have fewer institutional assets such as schools, libraries, and public transit, and more environmentally burdensome infrastructure such as highways, power plants, factories, and waste sites.[15] [16]
- Spending on housing decreases money available for other basic living needs such as food, medication, and clothing.[17]
- Homelessness takes a tremendous toll on one's health. In a study done in New York City, age-adjusted death rates were four times higher in the homeless population than the general U.S. population.[18]
- Sprawling residential development leads to overweight and obesity[19] and increasing rates of diabetes, heart disease, and high blood pressure.[20] [21]
- "Complete neighborhoods" - which are defined here as mixed-use neighborhoods that include commercial services, grocery stores, open space, and public transit within a five minute walking distance, a diversity of housing types (in terms of housing cost, size, and ownership/rental) to meet the needs of its residents, the presence of sidewalks, and connectivity of the street network – are associated with numerous health benefits. Some of the benefits related to complete neighborhoods include healthy bodyweight,[22] [23] higher consumption of fruits and vegetables,[24] [25] increased physical activity,[26] less dependence on cars,[27] and increased social capital.[28] [29] [30]

Updating the Housing Element of the Humboldt County General Plan is potentially a great opportunity for improving health and wellbeing, growth of community ties, and social cohesion. The Healthy Housing section of this HIA evaluates the following housing indicators as they relate to Plan Alternatives A, B and C:

HH.1.a	**Proportion of housing production to housing need by income category**
HH.1.b	**Proportion of households paying greater than 30% & 50% of their income on their homes**
HH.2.a	**Homeless population**

Existing Conditions

Housing production versus housing need. Existing demand for housing in Humboldt County is highest among low-income people. Only 43% of the projected new housing needs for the period between 2001 and 2006 were met by housing construction for people with very low incomes, and 74% of the needs were met for people with low incomes.[31]

Proportion of income spent on housing. Nearly 40% of all households in the county spend 25% or more of gross income on housing.[32] Varying by region, between 15 and 60 percent of renter households spend over 50% of income on housing, and between 6 and 24 percent of owner-occupied households spend over 50% of income on housing.[33]

Homeless population. Estimates of total homeless persons in Humboldt County throughout the course of one year range from 4,000 to 6,000.[34] [35] It has been estimated that at any point in time, there are between 800 and 1,100 homeless persons in the County,[36] and the number is generally higher during summer months than during winter months.[37]

Summary of Findings

All of the Plan Alternatives share the goal of creating a sufficient quantity of housing to supply the demand of populations moving to Humboldt County by 2025. However, it is essential to clarify that Plan Alternatives A, B and C are designed to meet the housing demand of *future populations only*. Unmet demand of existing populations will not necessarily be met by any of the three proposed plans. While Plan Alternative A is anticipated to provide housing for the projected population growth in the County, it is not expected to meet the demand of existing County residents. Due to their higher quantities of proposed housing units, Plan Alternatives B and C have the potential to meet existing unmet demand; however, their ability to do so depends upon the *affordability* of the housing that is developed. Thus, in addition to a quantitative evaluation comparing housing supply and demand, this assessment analyzes each Plan Alternative's impact on housing costs and proximity to affordable goods and services for current and future residents.

In light of existing and future housing demand in Humboldt County, **the development of multifamily housing in existing urbanized areas and the development of a higher quantity of affordable housing units than would be likely under Plan Alternative A would be best from a health perspective.**

Within the scope outlined by Plan Alternatives A through C, this analysis concludes the following:

Plan Alternative A

Health benefits would accrue because of the following changes in housing indicators:

- If new infill housing developments include multifamily housing and/or a higher number of housing units per unit area, new housing is likely be more affordable due to lower infrastructure costs associated with infill development. Lower housing costs would allow income to be spent on other basic living needs such as food, medication, and clothing.
- More affordable housing could lead to improvements in housing conditions for low-income people and a reduction in the homeless population.
- An increase in residential density could lead to complete neighborhoods, which are associated with increased exercise, decreased weight, increased social cohesion, and less dependence on cars.

Health would **remain the same** due to no change in the following indicators:

- The rural character of the county, which is valued by many residents, would virtually remain the same.

<u>Plan Alternative B:</u>

Health benefits would accrue because of the following changes in housing indicators:

- If new infill developments include multifamily housing, 50% of the new housing is likely to be more affordable due to lower infrastructure costs associated with infill development. Although it is the same number of units, this is half the *proportion* of new affordable housing expected under Plan Alternative A. Lower housing costs would allow more income to be spent on other basic living needs such as food, medication, and clothing.
- The proportion (50%) of new housing that is more affordable could lead to a reduction in the homeless population and improvements in housing conditions for low-income people. Access to affordable and well-maintained housing that provides shelter against weather is a basic health necessity.
- Fifty percent of new housing developments may be within existing urbanized areas characterized by complete neighborhoods, which are associated with increased exercise, decreased weight, increased social cohesion, and less dependence on cars.

Health would **remain the same** due to no change in the following indicators:

- The rural character of the county would not be affected in a major way.

Potential health hazards could increase due to changes in the following indicators:

- Fifty percent of the new housing would most likely not be affordable to many people, due to higher infrastructure costs associated with expanding development into non-urban areas. Higher housing costs would lead to a reduction of available funds for other basic living needs such as food, medication, and clothing.
- Fifty percent of new housing developments may be within low-density suburban neighborhoods, which are unlikely to be complete. Relative to people living in more complete neighborhoods, residents in these areas may have increased weight, decreased social cohesion, and more dependence on cars.

<u>Plan Alternative C:</u>

Potential health hazards could increase due to changes in the following indicators:

- Due to higher infrastructure costs and a low likelihood of developers choosing to build multifamily housing outside of urbanized areas, the lowest proportion of new housing would be affordable under Plan Alternative C. Higher housing costs would lead to a reduction of available funds for other basic living needs such as food, medication, and clothing.
- Of the three Plan Alternatives, the lowest proportion of new residents would move into urbanized areas characterized by complete neighborhoods. As a consequence, under Plan Alternative C a greater proportion of new residents would be likely to experience decreased exercise, weight-gain, decreased social cohesion, and more dependence on cars.
- Due to sprawling development, the county's rural character would be most diminished by Plan Alternative C. Maintaining rural character is a priority for many Humboldt County residents.

Potential Health-Promoting Mitigations

1) Develop policies to encourage affordable housing:
    a. Reduce home construction costs through material selection and design to reduce the price for the homebuyer;

   b. Un-bundle automobile parking from housing units in urban areas to give tenants and owners the opportunity to save money by using fewer parking spaces;
   c. Offer developer incentives for residential densities between 2.5 and 10 units per acre;
   d. Offer municipal support for first time and low-income homebuyers;
   e. Offer density bonuses to developers conditional on the provision of below market rate (BMR) housing;
   f. Allow single resident occupancy (SRO) units;
   g. Require a percentage of below market rate (BMR) housing;
   h. Establish inclusionary zoning policies for all housing development, including development beyond areas currently served by existing water and sewer infrastructure;
   i. Establish a Community Land Trust (or participate in the already established Humboldt Bay Housing Development Corporation); and
   j. Establish a Housing Trust Fund to commit public sources of revenue to affordable housing.

2) Reduce government constraints to dense residential development:
   a. Reduce local zoning regulations such as parking space requirements; and
   b. Reduce tax constraints, such as those that discourage upgrading of existing dwellings and conversion of single to multi-family units.
3) Establish programs to assist the homeless population:
   a. Offer pre-release permanent housing planning for people discharged from public institutions such as the foster care system, jail, prison, mental health programs, hospital, or drug and alcohol programs;
   b. Increase emergency, interim, transitional, and permanent housing options and programs; and
   c. Improve social services offered to the homeless population by the county, such as mental health, domestic abuse, and substance abuse resources.

Sustainable and Safe Transportation

Individual transportation choices can have a major impact on health. For example:

- The more one drives (Vehicle Miles Traveled, or VMT), the higher risk of obesity, motor vehicle collision, musculoskeletal pain[38], and stress[39], and the less one is physically active[40], and participates with family, friends and in civic life;
- Limited access to goods and services due to poor land use planning results in decreased ability to access health care[41 42], poor nutritional habits, and increased transportation expenses;
- Vehicle volume and speed predicts pedestrian injury and fatality;[43 44]
- Proximity to public transportation predicts use of public transportation. Use of public transportation results in higher levels of physical activity and lower greenhouse gas emissions from automobiles. These emissions are the largest source of mobile air pollution in California. Air quality has an impact on respiratory and cardiovascular disease;
- Urban areas where people use cars less show higher rates of walking and lower rates of obesity and hypertension.[45] Access to safe bike and pedestrian facilities (e.g., sidewalks and wide shoulders on non-urban roads) encourages physical activity.

Individual choices, however, are not made in a vacuum. The policies that municipalities adopt with regard to transportation and circulation limit the options available for individuals to make healthy choices. Humboldt County has the opportunity, in updating the General Plan, to set out standards for transportation that will protect the health of its citizens by expanding and prioritizing options that will discourage driving, encourage physical activity and social cohesion, and provide better access to health care services and healthy retail choices. The Safe and Sustainable Transportation section of this HIA evaluates the following transportation indicators as they relate to Plan Alternatives A, B and C:

ST.1.b	**Average vehicle miles traveled by Humboldt residents per day**
ST.1.e	**Average minutes traveled to work by zip code**
ST.2.a	**Proportion of commute trips made by public transit**
ST.2.b	**Proportion of households with 1/4-mile access to local bus**
ST.2.c	**Proportion of average income spent on transportation expense**
ST.3.a	**Ratio of miles of bike lanes/ pedestrian facilities to road miles**
ST.3.b	**Proportion of commute trips and trips to school made by walking or biking**
ST.3.c	**Number and rate of bicycle/pedestrian injury collisions**
ST.3.e	**Proportion of population living on residential streets with <35 mph speed limits.**
ST.3.f	**Percent of population who have access to pedestrian facilities.**

Existing Conditions

Vehicle Miles Traveled. In 2006, residents of Humboldt County travel 27 vehicle miles per day (VMT) per capita compared to 24 daily miles for Californians as a whole.[46] In 2001 in California, per capita VMT was 2.7 times higher in rural areas as compared with urban areas.[47]

Travel time to work. Residents of both urban and non-urban areas in the County have travel times to work (17.3 minutes on average) that are lower than the national and statewide average (27 minutes on average statewide). However, areas of Humboldt County that have low residential densities have a 26% higher average length of commute time to work than those in higher residential densities.

Public Transit Use. Only 1% of the population of the county overall use public transportation to commute to work.[48]

Income spent on transportation. The average Californian spends about $7,144 annually on private vehicle expenditure. Expenditures for private vehicles are not known for the County.

Bike lanes. Only 3% of the County roadways have Class I or II bike lanes, (lanes that are set off from highways specifically for bicycling or at least have enough room and signage for safe biking). When surveyed in 2003, 69% of county residents felt that the County should provide walking and biking paths closer to existing communities and 62% stated that closer access to outdoor recreation including bicycling was a major reason why they live in Humboldt.

Pedestrian injuries. There were 163 automobile crashes involving pedestrians in Humboldt County from 1999-2002; 112 of them – or almost 70% - were in either Eureka or Arcata.[49] 20 of these collisions, or 12% of all of the collisions in the County, were at the intersections of Route 101 in Eureka (4th and 5th Streets).

Multimodal transit hubs: There are few locations in the County that facilitate transferring from one mode of transportation to another, such as a car and/or bicycle parking near bus stops.

Summary of Findings:
In light of inevitable population growth in Humboldt County and the transportation challenges that growth implies, **this analysis concludes that health would be improved most by accommodating future population in areas where residents can most easily access jobs, goods, services, social and cultural events by forms of transportation other than cars, i.e., in the urban areas where there is an existing infrastructure for these root determinants of health. Plan Alternative A best exemplifies this and is the best option for reducing the ill health effects of excess reliance on cars.**

Within the scope outlined by Plan Alternatives A through C, this analysis concludes the following:

Plan Alternative A
Health benefits would accrue because of the following changes in transportation indicators:

- The average travel time to work would *decrease*, leaving more time with family and friends, as well as time to exercise, eat with more intention, be engaged in the community, and relax. Across all working adults in the County, this Alternative would reduce travel time to work by approximately 55,000 hours a year from current levels. This option also decreases per capita Vehicle Miles Traveled. This would also lead to the smallest increase in the volume of greenhouse gases produced by the County and therefore the smallest increase in the County's contribution to climate change and its associated health impacts.
- There would be an *increase* in use of public transportation simply by locating people within existing public transportation routes; the number of people within ¼ mile of a bus stop would increase from current 51% to 59%. People who use public transit spend a median of 19 minutes daily walking to and from transit; 29% achieve at least 30 minutes of physical activity a day solely by walking to and from transit.[50]

- Expenses for transportation would *decrease*, given that more population would live in proximity to schools, services, cultural offerings, jobs and retail outlets, and thus be more likely to walk, bike or take public transportation. This particularly impacts low income residents.
- There would be a slight *increase* in the percentage of people who walk to work, from the current 5.6% to 6.0%. This would have a potential impact on the number of people getting recommended levels of exercise, which is protective for cardiovascular disease, cancer, and osteoporosis.
- Pedestrian injury due to collisions with motor vehicles may *decrease*, given research that shows that when pedestrian/bike volume increase enough, it causes drivers to either slow down or take other routes.[51] Without reaching this critical point, however, there could be an *increased* risk of pedestrian injury due to the increase in vehicle volume in urban areas. Overall, there would be a *lower risk of pedestrian fatality* as speeds in urban areas are lower; the literature tells us that motor vehicle collisions with pedestrians are more often fatal in rural areas and areas with higher speeds.
- *Increase* in access to pedestrian facilities for residents of Humboldt County, given that all of the population growth will be located in urban areas where sidewalks and pedestrian facilities already exist.

<u>Plan Alternative B:</u>
Health would **remain the same due** to no change in the following indicators:

- The proportion of people taking public transportation would *remain the same* since the proportion of people living near bus stops likely remain 51%.
- Expenses for transportation would on average *stay the same or increase*, given a moderate increase in people who live in settings encouraging automobile use.
- The number of people walking to work would *remain the same*.
- The proportion of residents living on roads with lower speed limits would not change, thus injury and fatality due to motor vehicle collisions would not change.
- The proportion of residents with access to pedestrian facilities would not change. Thus there would be little change in the number of people who walk.

And potential **health hazards would increase** due to changes in the following indicators:

- The time it takes to travel to work would increase. Across all working adults in the County, this Alternative would increase travel time by approximately 55,000 hours a year from current levels. People would have about the same amount of time for exercise, family, friends, relaxation, and better nutrition.
- Vehicle Miles Traveled would increase by 16% - approximately 200 million extra miles per year traveled in the County - leading to higher rates of obesity, more cardiovascular disease, less physical activity, less time spent in civic activities or with family, and higher rates of stress. Greenhouse gas emissions and climate change contributions by the County would increase as a result.
- *Slightly lower ratio* of bike/pedestrian facilities to road miles due to some *increase* in number of road miles with development.
- Pedestrian injury and fatality would *not change significantly*, but there may be a slight increase due to a population increase. More people, no matter where they are, imply more cars, more driving, and more accidents.
- More people living in non-urban areas means more automobile travel overall and increased traffic in urban areas.

Plan Alternative C:

Potential health hazards could increase due to changes in the following indicators:

- VMT would *increase* by 32% - approximately 400 million extra miles per year traveled in the County - with potential increase in obesity, cardiovascular disease, and stress and decrease in physical activity and social cohesion. Greenhouse gas emissions and climate change contributions by the County would increase the most under this Plan Alternative.
- Travel time to work would *increase*, leaving slightly less time for exercise, family, friends, relaxation, and better nutrition. Across all working adults in the County, this Alternative would increase travel time by approximately 110,000 hours a year from current levels.
- Public transit use is likely to *decrease* as the proportion of the population within ¼ mile of a bus stop will decrease from 51% to 46%.
- Average expenses for transportation would likely *increase*, since there will be more dependence on cars. Families would thus have less money to spend on health insurance/health care, healthy food, education, and other healthful priorities.
- The proportion of bike/pedestrian facilities to road miles would *decrease* due to an *increase* in miles of road.
- There would be a *decrease* in the percentage of people who walk to work, thus less physical activity and increased risk of obesity, cancer, heart disease, and osteoporosis.
- Pedestrian injury would potentially *increase* due to the increased traffic from non-urban areas traveling in to cities for goods and services. There may also be an *increase* in pedestrian fatality as there will be more people driving in non-urban areas at higher speeds.
- The proportion of people living on roads with higher speeds would *increase*.
- The proportion of Humboldt's population that has access to pedestrian facilities would *decrease* due to population growth in non-urban areas where pedestrian facilities are uncommon.

Potential Health-Promoting Mitigations

1) Develop policies to increase public transit use:
    a. Encourage employer-based incentive programs for use of public transit and improve awareness of such programs;
    b. Increase bus and paratransit routes;
    c. Increase frequency and connections and hours of operation;
    d. Improve coordination between public transit agencies;
    e. Increase service to non-urban areas;
    f. Increase public education about public transit options;
    g. Increase proportion of funding for public transit and bike/ped relative to single occupant vehicle travel;
    h. Promote transit routes to employment locations;
    i. Consider a variety of transit vehicle types to serve different types of needs;
    j. Evaluate locations of bus stops;
    k. Develop standards for transit shelter amenities (seating, schedules, etc) tailored to local conditions/resources.
2) Develop policies to encourage walking and biking:
    a. Redirect money that goes to automobile travel to support alternative forms of transportation;
    b. Reduce speed limits on arterials, collectors, and local roads in non-urban areas;
    c. Establish a seat on HCAOG representing human-powered transport;

d. Raise priority of non-motorized modes of transport in land use planning. For example, develop building design standards and revise zoning codes to emphasize pedestrian/bike safety, especially on key pedestrian, bike and transit corridors. Zoning codes to consider include those that look at: mixed use zoning, human activity presence, the building/sidewalk interface, parking design, and lighting.
e. Develop streetscape standards that emphasize pedestrian and bike safety (lighting, trees, greenery, traffic calming measures, etc.);
f. Collect data about pedestrian facilities throughout Humboldt County, much like information is tracked about the amount and condition of road surfaces; make this data public and use this data to guide development of pedestrian facilities;
g. Promote and publish safe pedestrian and bike routes;
h. Fund a bicycle and pedestrian safety staff position for the County, in HCAOG for example;
i. Complete, build out and connect bike and pedestrian networks;
j. Institute traffic calming measures, including clearly marked bike and pedestrian routes, bike boulevards, bulb outs, median islands on two or more lane streets, in urban areas to decrease speeds and firmly separate pedestrians/bikers from motor vehicles;
k. Include paved shoulders on all roads in non-urban areas that can be used by bicyclists and pedestrians;
l. Improve signalization of crossing and routes;
m. Raise priority for funding for trails and active recreation infrastructure and facilities;
n. Teach bicycle and pedestrian safety in schools and workplaces and educate residents about the benefits of walking and biking.

3) Establish multimodal transit hubs with co-located businesses, childcare, senior services and housing with priority for transportation disadvantaged.
4) Encourage retail, business, and industry to grow within urban boundaries, perhaps establishing Central Business Districts with incentives for businesses to locate in them.
5) Encourage larger employers to adopt Transportation Demand Management programs such as encouraging flex time and incentives for carpooling.
6) Extend the usefulness of privately-funded shuttles (casinos, social service providers, etc.) to make additional loops/stops to supplement and coordinate fixed-route transit.
7) Create parking restrictions to support taking public transit:
    a. Establish workplace and retail fees for parking;
    b. Unbundle cost of parking from housing units;
    c. Reduce parking requirements for new developments;
    d. Limit availability of parking except proximal to transit hubs.
8) Create school-based incentives:
    a. Designate safe walking and biking routes to school;
    b. Require that schools establish and support walking groups to school ("walking school buses");
    c. Develop policies to reduce car trips to school;
    d. Establish a task force for school citing (including school closures) and safe routes decisions including public works, city, county, CALTRANS, law enforcement, school staff, public health, community groups and others;
    e. Promote student attendance at their local neighborhood school.
9) Develop transit-oriented streetscape and building design standards for key transit nodes and corridors, partially funded via development impact fees.

10) Improve locally-based programs and mechanisms to help people take transit and self-organize for ridesharing, walking school buses, bike buddies, paratransit etc.

Public Infrastructure

Public Infrastructure includes resources and amenities that residents can use – things like childcare, schools, parks, medical facilities, grocery stores, banks, sidewalks, roads, and sewer systems. The location of these resources and their proximity to where people live help determine whether people use them, how often, and how they access them (e.g., by walking or driving).

The General Plan will decide where future housing will be developed in the County. Depending on the Plan Alternative selected, housing may be available in areas that already have public infrastructure – that are already complete neighborhoods – or in areas where little or no infrastructure exists. This decision impacts health in several ways. When a neighborhood is 'complete', that is it contains most of the public infrastructure people need in their daily lives, people tend to:

- drive less and walk or bike more;
- exercise more;
- have fewer car accidents;
- have decreased social isolation;
- be less stressed.

These health benefits are described further in the introduction to the transportation section.

The Public Infrastructure section of this HIA evaluates the following housing indicators as they relate to Plan Alternatives A, B and C:

PI.1.d **Proportion of zipcodes without childcare facilities**
PI.2.a **Accessibility of full-service grocery store/supermarket or store carrying produce**
PI.2.b **Proportion of households within ½ mile of a public elementary school**
PI.2.d **Fast food establishments within ½ mile of high schools and middle schools**
PI.3.a **Proportion of population within ¼ mile of open public parks**
PI.4.d **Percentage of population within 2 miles of a medical center**
PI.5.a **Percentage of seniors within ½ mile of senior center**
PI.6.a **Residential density**

<u>Existing Conditions</u>

Proximity to elementary schools, public parks, senior centers and medical centers: The following table details existing conditions in Humboldt County.

Area	% of households within ½ mile of one of the 48 public elementary schools	% of population within ¼ mile of one of the 86 public parks	% of seniors within ½ mile of one of the 20 senior centers	% of population within 2 miles of one of the 20 medical facilities
Humboldt County	35.3%	21.0%	21.4%	72.2%
Areas with urban zip codes	41.4%	28.9%	24.7%	82.6%
Areas with non-urban zip codes	24.1%	6.6%	14.9%	53.5%

Eureka and Arcata	43.6%	33.8%	24.5%	83.2%
McKinleyville	21.4%	9.9%	21.5%	85.4%

Childcare facilities. One in five labor force participants in Humboldt County is a parent living in a household in which all parents work.[52] There are approximately 274 formal child care facilities in Humboldt County, including:
• 159 licensed family child care homes
• 26 licensed child care centers
• 21 Head Start and Early Head Start Programs
• 30 child development programs funded by the California Department of Education
• 38 license-exempt before- and after-school programs.[53]

Of the 40 Humboldt zip codes, 18 (45%) had no licensed childcare facilities listed and 24 (60%) had no licensed family child care homes listed. Rural areas of Humboldt County include fewer childcare facilities than urban areas. In the 2005 Child Care Needs Assessment, only 25% of licensed childcare providers are located in "outlying rural areas". This report stated that 21 of 29 zip codes (72%) had no licensed family child care homes.[54]

Fast food establishments near schools. The following table details the number of fast food establishments (defined as restaurants that prepare and serve food quickly) near middle and high schools in Humboldt County.

City	Number of fast food restaurants within ½ mile of high schools and middle schools
Arcata	6
Eureka	4
Fortuna	4
Hoopa	0
McKinleyville	6

Grocery Stores. Most grocery stores are concentrated in the western region of the County, near Highway 101. Cities that are more densely populated, such as Eureka, Arcata, McKinleyville, and Fortuna, have more grocery stores than non-urban towns such as Trinidad and Ferndale.

Residential Density. The average density of permitted new development in Humboldt County for the period 1985-2000 was 1 unit per 10 acres.[55]

Summary of Findings:
Given the necessity of future development in Humboldt County, the impact that development will have on health and the ability to plan for that development, **accommodating future population in areas that currently have the necessary infrastructure would be best from a health perspective. Plan Alternative A best exemplifies this and is the best option for reducing the ill health effects of residents living far from important goods and services.**

Within the scope outlined by Plan Alternatives A through C, this analysis concludes the following:

Plan Alternative A

Health benefits would accrue because of the following changes in infrastructure indicators:

- The proportion of households within 0.5 miles of a public elementary school would *increase* to 36.0%, allowing more children to engage in physical activity by walking to school and leading to less school-related driving.
- The proportion of the population within 0.25 miles of a park would *increase* to 21.8%, allowing more people to engage in physical activity at those parks and allowing more people to enjoy other health benefits from being near them (e.g., mental health).
- The proportion of seniors (62 or older) within 0.5 miles of a senior center would *increase* to 22.0%, allowing more seniors to engage in health beneficial activities at those centers and decreasing isolation of seniors.
- The proportion of the population within 2 miles of a medical center would *increase* to 73.4% allowing more people to get medical care, including preventative care, more easily.
- The proportion of residents within ½ a mile of a grocery store would increase, allowing for improved nutrition.
- The greatest proportion of County residents would live in dense, complete neighborhoods which are associated with the health benefit of access to goods and services, as well as other benefits such as increased physical activity, reduced levels of overweight and obesity, and better social cohesion.

Health would **remain the same due** to no change in the following indicators:

- By concentrating both families with children and childcare providers in the same areas, Plan Alternative A would best meet the demand for childcare by working parents. The potential cost of living decrease under this Alternative could also decrease the need for childcare if more parents choose to stay at home with their children rather than feel the necessity to work outside the house for financial reasons. However, Plan Alternative A is expected to result in the highest proportion of zip-codes without childcare facilities. The proportion of the County's population living within non-urban zip-codes may not have access to childcare under Plan Alternative A, which is detrimental to health because it may be difficult for parents to work and earn a sufficient income.
- The number of fast food establishments near high schools would likely *remain about the same* since this alternative includes the development of the least number of new units and would therefore attract the fewest new fast food establishments. The diet of students would likely remain the same.

<u>Plan Alternative B:</u>

Health benefits would accrue because of the following changes in infrastructure indicators:

- Families with children in urban areas would most likely be in close proximity to childcare providers, while families in non-urban communities could have less access to childcare. The overall demand for childcare may not be met as much as it would under Plan Alternative A. However, Plan Alternative B is expected to result in a lower proportion of zip-codes without childcare facilities than Plan Alternative A. Under this Plan Alternative, non-urban populations may have greater access to new childcare facilities in their areas, which is important for the health of working families.

Health would **remain the same due** to no change in the following indicators:

- The proportion of residents within ½ a mile of a grocery store would remain about the same and nutrition would not likely be affected.
- About the same proportion of County residents would live in dense, complete neighborhoods which are associated with the health benefit of access to goods and services, as well as increased physical activity.

And potential **health hazards would increase** due to changes in the following indicators:

- The proportion of households within 0.5 miles of a public elementary school would *decrease slightly* to 34.9%. Fewer children would engage in physical activity by walking to school and school-related driving would increase slightly.
- The proportion of the population within 0.25 miles of a park would *decrease* to 20.4%, allowing fewer people to engage in physical activity at those parks and allowing fewer people to enjoy other health benefits from being near them (e.g., mental health).
- The proportion of seniors within 0.5 miles of a senior center would *decrease slightly* to 21.0%, allowing slightly fewer seniors to engage in health beneficial activities at those centers and slightly increase isolation of seniors.
- The proportion of the population within 2 miles of a medical center would *decrease slightly* to 71.7% allowing slightly fewer people to get medical care, including preventative care, easily.
- The number of fast food establishments near high schools would likely *increase* since this alternative includes the development of the more new units and would therefore attract the more new fast food establishments. The diet of students could become worse.

<u>Plan Alternative C:</u>

Health benefits would accrue because of the following changes in infrastructure indicators:

A) Families who do live in urban areas would most likely be in close proximity to childcare providers and public transportation. The overall demand for childcare might not be met by Plan Alternative C as much as it would under Plan Alternatives B or A. On the other hand, Plan Alternative C is expected to result in the lowest proportion of zip-codes without childcare facilities. Non-urban populations would potentially experience the health benefit of having childcare facilities nearby. Access to childcare would enable these non-urban parents to maintain jobs, and it would enable children to gain from development opportunities such as socializing with other children.

Potential health hazards could increase due to changes in the following indicators:

- The proportion of households within 0.5 miles of a public elementary school would *decrease* to 34.0%, allowing fewer children to engage in physical activity by walking to school and leading to more school-related driving.
- The proportion of the population within 0.25 miles of a park would *decrease* to 19.2%, allowing fewer people to engage in physical activity at those parks and allowing fewer people to enjoy other health benefits from being near them (e.g., mental health).
- The proportion of seniors within 0.5 miles of a senior center would *decrease* to 20.6%, allowing fewer seniors to engage in health beneficial activities at those centers and increasing isolation of seniors.
- The proportion of the population within 2 miles of a medical center would *decrease* to 70.0%, making it more difficult for more people to get medical care, including preventative care.
- The number of fast food establishments near high schools would likely *increase most* since this alternative includes the development of the most new units and would therefore attract the most new fast food establishments, including some in non-urban areas. The diet of students could become worse.
- The proportion of residents within ½ a mile of a grocery store would decrease and nutrition would not likely be negatively affected.
- The greatest proportion of new housing built between now and 2025 would be within incomplete neighborhoods with limited access to good and services.

Potential Health-Promoting Mitigations

1) Ensure all new communities that are developed have a public elementary school; include developer fees for new schools.
2) Increase access to parks by:
    a. Ensuring schoolyards are available in off-hours for community use;
    b. Building new parks in new developments;
    c. Ensuring funding for parks is maintained;
    d. Ensuring that forests, parks and wetlands in the County are not being converted to other uses.
3) Increase access to senior centers by:
    a. increasing awareness about existing senior centers;
    b. building more senior centers;
    c. increasing funding for senior centers;
    d. creating other services for seniors;
    e. increasing transportation services for seniors.
4) Increase access to medical facilities by:
    a. increase transportation available to bring people to medical facilities;
    b. increase awareness of existing transportation options.
5) Increase access to childcare by:
    a. Continuing to make federal and state subsidies for after-school programs and childcare available;
    b. Providing incentives for new childcare facilities by easing the process of obtaining and maintaining a childcare license;
    c. Offering low-interest loans or grants to childcare operators for the establishment and operation of childcare facilities;
    d. Supporting increased investment in employer-sponsored childcare assistance programs;
    e. Improving public transportation so that families without vehicles can transport children to childcare;
    f. Ensuring that all future communities have licensed childcare facilities;
    g. Including childcare centers and family childcare homes in zoning plans in all communities;
    h. Allowing childcare centers in all zones besides Open Space and zones that are inappropriate for health and safety reasons;
    i. Encouraging placement of childcare facilities within office parks, industrial developments, and commercial areas;
    j. Supporting placement of childcare facilities near commute routes, public transit and multi-modal transportation hubs;
    k. Encouraging childcare facilities within multi-family housing projects.
6) Implement and enforce zoning restrictions against the placement of fast food establishments within ½ mile of a school.
7) Provide incentives for grocery stores selling produce to be located in all residential neighborhoods, regardless of resident income levels.
8) Implement policies that encourage development of complete neighborhood in non-urban areas.

Healthy Economy

The Humboldt County General Plan clearly recognizes the need for future policies to support economic development practices that "promote and sustain economic prosperity." This economic prosperity can be achieved by ensuring that the economy provide:

- A minimum standard of living - a living wage;[56]
- Job security;
- High employment rates;
- High numbers of jobs that provide health insurance.

Income is one of the strongest and most consistent predictors of health and disease in public health research literature. The strong relationship between income and health is not limited to a single illness or disease. The adoption of a living wage is associated with:

- A decrease in premature death from all causes for working adults;
- Improved educational outcomes and a reduced risk of early childbirth among the offspring of low-wage workers;[57]
- Better health, improved nutrition, and lower mortality;[58]

Unemployment, on the other hand, is associated with premature mortality[59], cardiovascular disease, hypertension, depression, and suicide.[60]

Jobs that do not include health insurance contribute to poor health outcomes. Families with at least one full-time, full-year worker are more than twice as likely to have health insurance coverage, compared to families whose wage earners work as part-time employees (less than 35 hours per week), as contingent labor (e.g., on a seasonal or temporary basis, as employees of contractors, self-employed), or in which there is no wage earner.[61] People without health insurance forego timely health care, suffer more severe illness, and are more likely to die a premature death than their insured counterparts[62]. Annually nationwide, 18,000 premature deaths are attributable to lack of health coverage.[63]

The Healthy Economy section of this HIA evaluates industries according to the following indicators for workers in a healthy economy:

HE.1.a **Proportion of jobs paying a livable wage**
HE.2.a **Proportion of jobs that provide health insurance**
HE.2.c **Number of jobs available with appropriate educational requirements**

This information is compared to baseline trends in the County for:

- **Living wage for family size of one adult and one child;**
- **Unemployment rate;**
- **Percent of population uninsured;**
- **Current education attainment of population 25 years and older;**
- **Current employment.**

The main source of employment information for this Health Impact Assessment came from the *California LaborMarketInfo*[64], an employment database provided by the State of California. Included in this analysis are occupations identified at the Humboldt County General Plan Update and Health focus groups and with the Humboldt County Public Health Branch, but only those where there was sufficient information for Humboldt County, i.e., this analysis does not represent all occupations in each industry, but serves as a sample. Occupations were categorized based on the description as provided by *California LaborMarketInfo*.

Goals, policies, and implementation measures defined in the Humboldt County General Plan Update Chapter 11: Economic Development Element, which can be accessed on the Humboldt County website[65], reinforce the goal of creating a "healthy economy", here defined as maintaining a healthy, employed workforce with living wages and health insurance in relation to the analysis of the current economic conditions based on industry. Positive impacts of current goals, policies, investments and partnerships as stated in the Humboldt County General Plan Update in conjunction with current findings of this assessment are:

- Maintaining a diverse, stable, and growing local economy (ED-G1, ED-P19);
- Expanding internet access (ED-G2);
- Supporting education and training of the workforce (ED-G4, ED-P11, ED-P17, ED-P18, ED-IM4);
- Protecting timber lands (ED-G8);
- Revitalizing Brownfields (ED-G9, ED-P6, ED-P7);
- Encouraging partnerships between educational and training institution, employment centers and job searchers (ED-G10);
- Economic Development Assistance Programs for current and future workforce (ED-G11).

Existing Conditions

Living Wage Occupations. A wide range of positions exists in each industry (including managerial, for example) and these positions come with different pay and benefits. The conclusions made below are only a sample provided by the *California LaborMarketInfo* database and are not meant to summarize all living wages by occupations in the entire industry.

Occupations in Humboldt County that can provide a living wage (i.e., an hourly mean wage that can support a family size of one adult and one child: $15.27 per hour) include:

- Timber;
- Construction;
- Road construction and maintenance;
- Restoration of lands;
- High technology industries.

Industries that often do not provide a living wage include:

- Agriculture, Ranching, Fishing;
- Tourism including restaurants, hotel, outdoor recreation;
- Retail;
- Government;
- Gaming.

Industries that sometimes provide a living wage include:

- Green industry;
- Healthcare.

Hourly mean wages for those employed in *education* could not be suitably estimated due to the seasonal work period.

Significant Employment Providers. The population employed in the industries mentioned above varies, but employment sectors providing the most jobs include:

- educational institutions, health and social services (26.6%)
- retail trade (12.5%).

Those in retail trade often earn wages below the living wage according to the *California LaborMarketInfo* database.

Educational Attainment/Training. Of the population in the County 25 years and older, approximately 74% have finished junior high but do not have more than an Associate's Degree. This level of education qualifies them for several industries with living wages:

- Timber;
- Construction (excluding managerial);
- Healthcare;
- Some education occupations.

Many of these industries do require additional on the job training ranging from 30 days to one year.

Occupations not often compensating employees with a living wage based on this level of educational attainment are (all excluding managerial and supervisor positions):

- Agriculture, Ranching, Fishing;
- Restaurants;
- Hotel;
- Outdoor tourism;
- Retail;
- Government;
- Gaming.

Projected Employment Growth (2004-2014). California LaborMarketInfo forecasts an increase in employment need in industries from 2004-2014. The growth industries often providing living wages include:

- High technology (20-40% growth);
- Registered nurses and some other health care professions (22.5%);
- Some construction occupations (19.1%).

These occupations educational/training perquisites range from an Associate's or Bachelor's Degree to on the job training.

Occupations with projected growth that infrequently supply living wages include:

- Gaming dealers and service workers (33% growth);
- Retail salespersons (21.9%);
- Recreation attendants in the outdoor tourism industry (18.8%);
- Preschool teachers (15.6%);
- Hotel clerks (13.6%).

Many of the occupations require a minimum of on the job training or vocational education.

Health Insurance Benefits. Information on health insurance benefits provided categorized by industry is limited and therefore not used in this analysis.

<u>Summary of Findings</u>

From a public health perspective, preserving and promoting growing industries that pay living wages, provide health insurance and meet existing levels of education would be best. Jobs that meet these needs include timber, construction of housing, roads and other structures, some jobs within healthcare and education. Industries that do not frequently meet these needs include retail, agriculture and tourism. Each Plan Alternative has strengths and weaknesses with regard to the jobs that would be created or preserved.

Below is a limited analysis of the Plan Alternatives based on descriptions in the Humboldt General Plan Update. There will be exceptions in these alternatives based on various industry and economic circumstances and trends.

<u>Plan Alternative A</u>

- With the protection of prime employment and industrial reuse, this land use alternative preserves and promotes some industries that provide employees with living wages and appropriate education requirements, such as timber.
- Housing construction jobs, which often can pay living wages, may increase least in this Alternative, since the fewest number of housing units would be built. However other constructions jobs, such as construction of walking trails, may increase.
- Some industries that infrequently provide jobs with living wages would also remain relatively stable (e.g., tourism and agriculture) or grow slightly given the population growth (e.g., retail). Other industries that also infrequently provide living wages, such as big box retail, would be less likely given the limited development opportunities.
- There is also a possibility that the cost of living may decrease in this Alternative since, for example, people may be less dependent on owning a car, average electricity consumption could decrease and housing prices may be reduced.

<u>Plan Alternative B</u>

- This land use scenario could be slightly detrimental to some industries that can provide employees with living wages and have appropriate education requirements, such as timber.
- Construction jobs, which also can pay living wages, may increase more than in Plan Alternative A.
- Some industries that infrequently provide jobs with living wages would also remain relatively stable (e.g., tourism) or grow given the higher population growth in this Plan Alternative (e.g., retail). Others industries that do not frequently provide jobs with living wages would decrease (e.g., agriculture). Plan Alternative B is slightly more hospitable to other industries that also do not always provide living wages, such as big box retail.

<u>Plan Alternative C</u>

- This land use alternative would be detrimental to some industries that can often provide employees with living wages and have appropriate education requirements, such as timber.
- Construction jobs, which also can pay living wages, would increase most in this Plan Alternative.
- Some industries that infrequently provide jobs with living wages would also remain relatively stable (e.g., tourism) or grow given the higher population growth in this Plan Alternative (e.g., retail). Other industries that infrequently provide for living wages would decrease (e.g.,

agriculture). This Plan Alternative is most likely to promote other industries that also do not always provide living wages, such as big box retail.

- There is also a possibility that the cost of living may increase in this Alternative since, for example, people may be more dependent on owning a car, average electricity consumption could increase and housing prices may increase.

Potential Health-Promoting Mitigations

1) Develop policies to attract and retain industries which:
   a. Can provide a living wage;
   b. Provide health insurance benefits;
   c. Meet existing levels of workforce education.
2) Develop policies to solidify collaborations that can provide employees the opportunity for advancement, possibly resulting in earning a living wage, including those with:
   a. Educational institutions;
   b. Labor training centers;
   c. Other labor organizations.
3) Ensure that a trained and qualified workforce is available to meet the needs of projected growing industries that can often provide living wages.
4) Assure availability of substance abuse treatment services to decrease the number of people disqualified for continued employment based on positive drug tests, absenteeism or poor performance.

Public Safety, Social Cohesion and Health

Humboldt County decisions on public safety and social cohesion will have an impact on health. For example:

- First responder (fire, paramedics, EMTs) response times can have an impact on mortality and morbidity both due to fire hazard and medical emergency;[66 67 68]
- The state of California expects its residents to be able to self-sufficient for the first 72 hours after an emergency, and those trained in emergency preparedness are more likely to be, thus to avoid injury and care for injuries. Those trained in first aid are 2.4 times more likely to use their first aid skills in an emergency;[69 70]
- Humboldt County residents have much higher arrest rates for driving under the influence (DUI) and for alcohol violations than in California as a whole.[71] Fatal crashes and traffic fatalities in rural areas are 3.5 times more prevalent than expected on the basis of the percentage of total population, and the risk that the driver behavior of DUI is attributed to a fatal crash is 10% higher in rural areas than urban.[72]
- Isolation, or lack of social connection, is associated with depression, anxiety, suicide, slower recovery from illness, as well as other health outcomes.[73]

The General Plan Update has many opportunities to impact these indicators. The policies that municipalities adopt with regard to safety and location of new population can make a grave difference in regard to proximity to hospitals and first responders such as fire stations, how often people will have to drive on winding or potentially dangerous roads, emergency preparedness training and drunk driving, and very simply, how close people live to each other. The Public Safety, Social Cohesion and Health section of this HIA evaluates the following indicators as they relate to Plan Alternatives A, B and C:

SC.1.c	**Rates of driving under the influence (DUI)**
SC.2.a	**First responder response times - Fire response times**
SC.2.b	**Emergency preparedness sites/ training for citizens**
SC.4.a	**Isolation index**

<u>Existing Conditions</u>

First Responder Response Times. Currently, rural fire response times are approximately 11 minutes, and urban response times are 7 minutes.[74]

Emergency Preparedness of the Citizenry. In 2006-2007, Humboldt County's chapter of the American Red Cross trained approximately 9,000 people in Health & Safety trainings and 13,000 people attended disaster preparedness trainings or workshops.[75] 2,000 county employees have received training, including 200 Public Health Branch employees. All incorporated municipal employees are required to be trained, and schools must have an emergency operations plan.[76]

Rates of DUI. Humboldt County has one of the highest rates of deaths due to alcohol and drug use in the State of California.[77] Adult arrest rates for DUI in 2001 were 15.2 per 1,000 compared to 8.3 per 1,000 in the state of California. In 2000, the rate of fatalities and injuries from motor vehicle accidents in Humboldt County was 153.5 per 100,000 licensed drivers compared to 98.1 per 100,000 in California.[78]

Isolation. There is no one measure for isolation that has been used in Humboldt County, so this HIA used an "index", or a conglomeration of multiple measures: psychological distress, suicide, mental health treatment, substance abuse treatment, crime and civic engagement. In 2005, 10.2% of Humboldt County residents, or 1 out of every 10, stated they had spent between 10 – 20 days in the last month in poor mental health and 20.3% felt that they needed help for an emotional/mental problem[79] From 2001-2004, Humboldt County's rough suicide rate was 22.3 per 100,000, over three times Los Angeles's rate of 7.1 per 100,000. The most recent statistic for California is 9.4 per 100,000.[80] 11.2% had seen a mental health professional.[81] Humboldt County has higher rates of admission for drug and alcohol treatment than California, and also has over double the rate of death due to alcohol and drugs.[82] Crime rates are higher in Humboldt (46.3 per 1000 people in 2001) than in California overall (39.4 per 1000 people in 2001).

Some measures of civic engagement find Humboldt County faring better than the California as a whole. The County has between 5-11 percent higher voter registration rates than California since 1996. In 2000, 73% of those registered cast a ballot, slightly higher than California's rate of 71%. Many people feel that residents of the County are active in their communities, know their neighbors and enjoy this aspect of living in the County.

Proximity to schools and community centers are important aspects of isolation and are addressed in the Public Infrastructure section.

<u>**Summary of Findings**</u>**:**
There are avoidable and unavoidable safety issues that any municipality faces. Humboldt County has the opportunity for prophylaxis in designing its General Plan. **Accommodate future population in areas where residents will have better access to emergency services, have less chance of fatality if in a motor vehicle accident, will have a higher rate of enforcement of DUI laws, and will have greater social connections would enhance health in the County. The land use maps of Plan Alternative A will best protect Humboldt County's residents in terms of public safety and social cohesion.**

Within the scope outlined by Plan Alternatives A through C, this analysis concludes the following:

<u>Plan Alternative A</u>
Health benefits would accrue because of the following changes in Public Safety and Social Cohesion indicators:

- Response times from first responders would, on average, be slightly lower. For certain emergency medical situations such as cardiovascular events, quicker response times would signify better health outcomes.
- Emergency preparedness currently has focused on the coastal areas, which is where infill is slated to take place. If current outreach and training remains the same, emergency preparedness would improve as more people would live in the targeted areas. Thus, mortality as well as the affects of injuries such as musculoskeletal injuries, broken bones, and abrasions (the most common injuries in natural disasters) would decrease due to an increase in residents knowing how to take care of themselves and others.
- Isolation would likely decrease. Health benefits due to greater social connection include decreased rates of depression and suicide, more social support leading to greater access to resources, better recovery from illness, and greater ability to advocate for positive change.

Health benefits are mixed due to changes in the following indicator:

- If all population growth is accommodated in urban areas, fatality rates from driving under the influence of alcohol would likely decrease while accident and injury from DUI accidents would likely increase. Urban and rural rates of drinking are similar in the existing literature about DUI, but prevalence statistics show higher rates of arrest for driving while intoxicated and fatality as well as use of substance abuse treatment in Humboldt County. While it is unclear if a causal relationship between alcohol intake and living in a rural area is implicated, injury and fatality from DUI would likely decrease due to lower speed limits and less dangerous conditions (such as curved roads, cliffs, poorly lit roads).

<u>Plan Alternative B:</u>

Health benefits would remain the same due to no change in the following indicators:

- First responder response times would likely remain similar.
- Fatalities and injuries from DUI would likely remain similar.
- The proportion of residents who are socially isolated would likely remain the same, given that Plan Alternative B allows for growth in both urban and non-urban areas that reflects the current proportion of residents in the county. Thus, suicide, depression, anxiety, and illness recovery times would be similar to current conditions.

And **potential health hazards would increase** due to changes in the following indicators:

- Unless the Red Cross and other agencies charged with training citizens in emergency preparedness increase programming, the proportion of citizens ready for a natural disaster would decrease.

<u>Plan Alternative C:</u>

Potential health hazards would increase due to changes in the following indicators:

- First responder response times would increase slightly, and more people would be served by the lower-capacity fire departments in rural areas..
- The proportion of residents trained in case of a natural disaster would decrease, leaving more people in Humboldt County unprepared and vulnerable to death, injury, and disease in the aftermath of a disaster.
- Injury and death due to traffic fatality from DUI would likely increase.
- Isolation would increase, given that more of the population growth would be accommodated in rural areas. Potentially that could lead to higher rates of depression and suicide; less social support; less access to health resources, networks, and information; and higher rates of substance abuse.

Potential Health-Promoting Mitigations

1) Incentivize employers to encourage volunteering and voting.
2) Require construction or renovation of community centers with funding for staff and programs with large rural or urban development projects.
3) As part of a community benefits package, require developers to fund programs to engage the community, such as community concerts, parades, festivals.
4) Support programming to build retiree/student partnerships or other mentoring relationships.
5) Expand outreach for Citizen Advisory Committees on various types of municipal projects.
6) Measure isolation and social cohesion in Humboldt County using a validated tool such as the Saguaro Index[83] or the Petris Scale[84] in order to have an indicator to measure.

7) Support community building activities such as parades and events that showcase local artisans.
8) Support clustered development in regions where water supply is adequate for fighting fires.
9) Establish a uniform measurement system county-wide to track response times.
10) Encourage currently trained EMTs to gain paramedic training.
11) The DRAFT Safety Element of the GPU has very little to say about improving emergency preparedness among Humboldt County's citizenry, beyond implementing the Emergency Operations Plan, which also does not go into detail. Increase the importance of emergency preparedness by highlighting it more in the General Plan.
12) Have schools communicate their Emergency Operations Plans to parents.
13) Expand funding for trainings and publicity about emergency preparedness.
14) Set benchmarks on how many citizens are trained in each area. Designate a public agency responsible.
15) Support the Humboldt Red Cross in outreach efforts to bring people into their CERT training (Community Emergency Response Team).
16) Set up a Rural Emergency Preparedness outreach team to specifically address the readiness and concerns of rural residents in case of emergency.
17) Implement evidence-based interventions and policies against alcohol-impaired driving:
    a) Implement 0.08% blood alcohol concentration (BAC) laws. These are state laws that lower the illegal BAC for drivers from 0.10% to 0.08%. These have been shown to reduce alcohol-related fatalities by a median of 7 percent;
    b) Implement minimum legal drinking age laws and lower BAC laws specific to young or inexperienced drivers (zero tolerance laws);
    c) Increase the use of sobriety checkpoints;
    d) Fund mass media campaigns to educate the population about the dangers of drunk driving;
    e) Increase school-based education programs to educate students about the dangers of drunk driving and of riding with a drinking driver;
    f) Train alcohol servers on intervening with people who have been drinking and intend to drive;
    g) Decrease alcohol outlets and their hours of operation.

Environmental Stewardship & Health

According to an EPA report from 2000[85]:

> Direct environmental impacts of current development patterns include habitat loss and fragmentation, and degradation of water resources and water quality. Building on undeveloped land destroys and fragments habitat and thus displaces or eliminates wildlife communities. The construction of impervious surfaces such as roads and rooftops leads to degradation of water quality by increasing runoff volume, altering regular stream flow and watershed hydrology, reducing groundwater recharge, and increasing stream sedimentation and water acidity. A one-acre parking lot produces a runoff volume almost 16 times as large as the runoff volume produced by an undeveloped meadow. Development claimed more than half of the wetlands in the lower 48 states between the late 1700s and the mid-1980s.

In the Humboldt General Plan Update survey, 86.4% of respondents said that the surrounding natural environment was extremely important to the quality of life in Humboldt County and 85.1% said that quality of the natural environment was a major factor in why they decided to live in the county.[86] In this section of the Health Impact Assessment, development impacts on health through changes to the environment are considered. Development anywhere tends to degrade the environment, but the aim is to control the degree of degradation through better land use policy. Examples of how land use affects environment and health include:

- Further declines in agricultural lands, timber production, forestland fragmentation, and property improvements for development reduce the viability of the local farming and forest industry, diminish economic productivity and result in job losses. Income and unemployment impact health and well-being greatly (see the Healthy Economy section). Timber lands also contain culturally significant resources, wildlife habitats, sensitive watersheds (i.e, critical water supply areas), and protect the land from erosion, all of which also contribute to health.
- Consumption of locally produced foods can: reduce consumption of fossil fuels and reduce potential for pollution and for global warming[87]; increase consumption of fruits and vegetables; reduce consumption of processed foods; and have economic benefits including local farmers receiving more of the money spent on food[88] and keeping money in the community.[89]
- Parks and open space areas promote physical activity[90] and social interaction. Living in proximity to green space is associated with better self-rated health and higher scores on general health questionnaires.[91] Access to parks and open spaces also has a positive impact on stress, depression, and mental functioning.
- Watersheds (regions of land within which water flows down into rivers, lakes, or ocean; drainage basins) have been harmed by development. The increase in impervious areas (most notably, roads and parking lots) leads to reduction of water supplies and to increased flooding. Stormwater runoff, which is often polluted from household landscaping or agricultural pesticides, herbicides and fertilizers and from heavy metals from industry, has increased. Access to clean drinking water is vital for health.
- Electricity generation contributes to greenhouse gas emissions and indirectly to climate change which threatens health through more extreme weather events, increased air pollution, limitations on food production, increased water-borne and food-borne illnesses, and increased infectious disease vectors. The benefits of decreased energy consumption also include economic benefits through lower utility bills.

The environment offers resources and carries out valuable services for us. For example, it purifies water and air and gives us space for physical activity. When these resources and services are not available or the environmental systems go awry, technologies are developed, and financial and health costs are paid. For example, water purifiers must be purchased, asthma rates increase, and memberships at gyms must be bought. Protecting the environment takes advantage of this 'natural capital' and will improve health and lower the cost of living.

The Environmental Stewardship section of this HIA evaluates the following environmental indicators as they relate to Plan Alternatives A, B and C:

ES.1.b	**Residential electricity use (kWH) per capita**
ES.2.a	**Acres of public open space per 1,000 population in Urban areas**
ES.3.a	**Proportion of County land area retained for active farming uses**
ES.3.b	**Proportion of County land area retained for timber production**
ES.3.c	**Percent of food consumption from local sources**
ES.5.c	**Percent of households using municipal water system**
ES.5.a	**Total impervious area in County**

Existing Conditions

Agricultural and timber lands. In 2002, there were 633,931 acres of farm land, 28% of Humboldt acreage. According to the California Department of Forestry and Fire Protection, in 1996 the County had 1,487,000 acres of forest land (65% of total acreage), 20% less than the amount in 1967.[92]

Parks and open space. There are 7.5 square miles of public open space per 1000 persons in Humboldt County. Seventeen percent of land in Humboldt is publicly owned. Of the 2,287,000 acres of land in the county, 262,000 are national forests and 15,000 are other public lands.[93] Urban areas of the County also have a good number of parks. In Eureka, there are 4.5 acres of park per 1000 residents; Arcata has 6.2 acres per 1000 residents; and Fortuna has 6.5 acres of park per 1000 residents.

Public water supply. In Humboldt County there are 21 community Public Water Systems (PWS) with greater than 200 service connections and 25 PWS with fewer than 200 service connections. The lager PWSs tend to be used in more urban areas with denser populations. The numbers of coliform and turbidity failure are far lower in the larger PWS in the County.[94]

Impervious area. Data on current Total Impervious Area (TIA) in Humboldt County is only available around Arcata. All but one of the watersheds in Arcata is more developed than the amount recommended for stability (10%).[95] Some, like the Campbell Creek and Sunset Creek watersheds are significantly more developed (over 30%).

Electricity use per capita in the County, ~7300 kWh/year, is similar to use in California and about half the use in the US.[96] Electricity use in the County increased about 1.3% per year between 1990 and 2000, while population growth was about 0.6% per year. Due to decreased use in industry (mainly timber), energy use in the County decreased significantly (~24%) between 2000 and 2003. According to the Humboldt County Energy Element Appendices: Technical Report, currently, the County produces locally 73% of electricity and 11% of natural gas consumed.[97]

Local food. According to one source, around 85% of Humboldt's food is brought in by trucks.[98] In the US, on average, an item of food travels 1500 miles between the farm and the plate.[99] Opportunities for access to local produce include: 13 farmers markets, 6 local Community Supported Agricultural Farms programs, local grocery stores that highlight locally grown food, and a Farm-to-School program for education.

Summary of Findings:
In light of the predicted population growth in the County and the potential harm to the environment that could accompany that growth, **the best health outcomes would be achieved by accommodating future population in the urban areas that are currently developed and by protecting productive lands and other open space from development. Plan Alternative A best exemplifies this and is the best option for promoting health through environmental protection.**

Within the scope outlined by Plan Alternatives A through C, this analysis concludes the following:

Plan Alternative A
Health benefits would accrue because of the following changes in environmental indicators:
- The proportion of households that have access to large municipal water systems would increase and thereby more people would have access to safer drinking water.
- Per capita electricity consumption would decrease since urban housing tends to be smaller. This will help minimize pollution and global warming and their associated health effects and leave more money available for other necessities, such as food.

Health would **remain the same due** to no change in the following indicators:
- Productive agricultural and timber land would be preserved and thereby jobs, culturally significant resources, habitats of threatened species, sensitive watersheds, or critical water supply areas would be maintained. The amount of locally produced food would also not be impacted and therefore local consumption may be at least maintained.
- Total Impervious Area (TIA) would increase least since urban development will not require new road and parking construction and has the potential to build multi-family units with smaller roof areas. However, urban watersheds could be negatively affected and policies to account for this are needed. The health benefits of less TIA include less flooding, less water pollution, and preservation of water resources.

And potential **health hazards would increase** due to changes in the following indicators:
- The acres of park per 1000 residents in urban areas would decrease unless policies are adopted to increase the number or size of parks as more people move into these areas. Parks contribute to health by providing opportunities for physical activity and social interactions and because views of natural spaces improve mental health.

Plan Alternative B:
Health would **remain the same due** to no change in the following indicators:
- The proportion of households that have access to large municipal water systems would remain about the same as would the number of people who have access to safer drinking water.
- Per capita electricity consumption would remain about the same since new housing will be evenly distributed in urban and non-urban areas. This will not change the amount of pollution being generated and will contribute to global warming, both of which have negative health consequences. Additionally, people will spend about the same amount of

money on electricity and will not have more available for other necessities.

And potential **health hazards would increase** due to changes in the following indicators:

- Some productive agricultural and timber land could be lost and thereby jobs, culturally significant resources, habitats of threatened species, sensitive watersheds, or critical water supply areas may be lost. The amount of locally produced food could also decrease and therefore local consumption may be reduced.
- As above, the acres of park per 1000 residents in urban areas would decrease unless policies are adopted to increase the number or size of parks as more people move into these areas.
- Total Impervious Area would increase due to the non-urban development which will require new road and parking construction. Urban watersheds could be negatively affected, as in the other Plan Alternatives and policies to account for this are needed. Flooding and water pollution will increase, and water resources will be lost.

Plan Alternative C:

And potential **health hazards would increase** due to changes in the following indicators:

- The greatest amount of productive agricultural and timber land would be lost and thereby jobs, culturally significant resources, habitats of threatened species, sensitive watersheds, or critical water supply areas will be negatively affected. The amount of locally produced food would also decrease and therefore local consumption may be reduced.
- As above, the acres of park per 1000 residents in urban areas would decrease unless policies are adopted to increase the number or size of parks as more people move into these areas.
- The proportion of households that have access to large municipal water systems would likely decrease as would the number of people who have access to safer drinking water.
- Total Impervious Area would increase due to the non-urban development, which will require new road and parking construction. Urban watersheds will also be negatively affected, as in the other Plan Alternatives and policies to account for this are needed. Flooding and water pollution will increase, and water resources will be lost.
- Per capita electricity consumption would likely increase since more new housing will be built in non-urban areas. This will increase the amount of pollution being generated and will increase global warming, both of which have negative health consequences. Additionally, people will spend more money on electricity and will not have less available for other necessities.

Potential Health-Promoting Mitigations

1) Selectively preserve agricultural land and timber land if scenarios B or C are chosen.
2) Restrict housing placement to the periphery of agriculturally zoned land to maintain contiguous acreage for future farming use.
3) Maintain existing and build new urban parks by:
    a. Enacting a Humboldt County discount for national, state, and county parks;
    b. Ensuring funding for parks is maintained;
    c. Ensuring that forests, parks and wetlands in the County are not being converted to other uses;
    d. Building parks in urban areas to increase acreage of parks available;
    e. Increasing funding and protection for national, state, and county parks.
4) Reduce impact on TIA by:
    a. Building more densely and building fewer roads and parking lots;

   b. Implementing policies that decrease parking requirements for retail establishments in non-urban areas, decrease parking for office buildings, and encourage parking garages instead of large parking lots;
   c. Encourage development in areas near existing roads;
   d. Incentivizing the use of more porous materials for new roads and parking lots;
   e. Incorporating the Ahwahnee Water Principles into the General Plan: "City and County officials, the watershed council, LAFCO, special districts and other stakeholders sharing watersheds should collaborate to take advantage of the benefits and synergies of water resource planning at the watershed level;"
   f. Set limits on TIA for each watershed;
   g. Encouraging roofing partially or completely covered with vegetation and soil that can absorb water.
5) Decrease per capita electricity consumption by:
   a. Increasing energy efficiency of housing;
   b. Encouraging construction of multi-unit buildings and smaller houses;
   c. Encouraging construction of buildings that follow environmental standards such as those proposed by Leadership in Energy and Environmental Design (LEED);
   d. Regulating electricity use by industry and businesses (e.g., turning lights off in office buildings at night);
   e. Promoting solar and other locally produced energy production and consumption;
   f. Reducing the County's carbon footprint by following the recommendations of groups like the International Council for Local Environmental Initiatives (ICLEI);
   g. Implementing outdoor lighting efficiency standards to decrease public and private use of electricity.
6) Encourage consumption of locally produced food by:
   a. Increasing incentives to produce food locally and consume locally produced food;
   b. Increasing programs and incentives for locally grown food businesses (e.g., see: http://guide.buylocalca.org/ and http://www.caff.org/programs/eco_index.shtml)
   c. Encouraging County institutions (e.g., hospitals) to use locally grown foods;
   d. Supporting of food incubator businesses in the County.

Conclusions

In the process of updating its General Plan, Humboldt County is currently evaluating 3 Plan Alternatives. In this Health Impact Assessment, these alternatives were analyzed from a health perspective using 35 indicators prioritized by stakeholders in focus groups, by Humboldt Partnership for Active Living, and by the Humboldt County Public Health Branch. In looking at data on existing conditions for each indicator and analyzing how each Plan Alternative would likely change each indicator quantitatively and/or qualitatively, conclusions were reached about the likely health impacts of each Plan Alternative.

Briefly, Plan Alternative A provides for "focused growth." It encourages all new units to be built in existing areas that are already supported by public sewage and utilities, i.e., encouraging higher residential density and infill development. Alternative A provides for 6,000 additional units over the course of 25 years. Plan Alternative B is a compromise between an all-infill development plan and a plan that does not highly regulate the location of new development. It primarily provides for building in urban centers where there is a good network of utilities, sewage, and transit, but allows for some ex-urban development as well with modest expansion of existing water service areas, focusing on areas adjoining the city centers. Alternative B provides for 12,000 additional units over the course of 25 years. Plan Alternative C allows the most unrestricted growth, or an "expanded development pattern". Plan Alternative C allows the highest number of existing parcels to be developed for housing; it also expands water service areas beyond present boundaries to expand opportunities for housing in outlying parts of communities. Alternative C provides for 18,000 additional units over the course of the 25 years.

Many of the predicted changes in indicators, such as the proportion of the population living near parks, are only predicted to change by less than two percent. While this may seem like an insignificant amount, few other decisions about land use in the County could make changes of this magnitude. Given the current trends in health, everything possible must be done to change the built environment in ways to promote health.

One of the goals of HIA is to judge a plan for its potential health effects on a population, and the distribution of those effects within the population. In Humboldt, seniors, children, Native Americans, and those living close to the poverty line are vulnerable populations that currently often have more significant health issues. The decisions made in this general plan will affect those populations and those effects should be considered when choosing between the Plan Alternatives. In most cases, the policies associated with Plan Alternative A reduce this disparity most. For example, the poor, seniors and children have less access to private motor vehicle travel. By placing future development in urban areas, Plan Alternative A would make non-motorized forms of transit a more viable alternative for accessing parks, medical center, senior centers and grocery stores.

Many issues are and should be considered in the choice of Plan Alternatives for the General Plan Update; health is just one of them. If a Plan Alternative is chosen that has negative health impacts, additional health promoting mitigations can and should be implemented to offset these negative impacts. Many of these mitigations are suggested in both the summary documents and the full report.

Given the importance of health and current trends such as the increasing rates of type 2 diabetes and heart disease in the County, health should be a primary consideration in the choice of Plan Alternatives. As the table below shows:

- **Plan Alternative A will likely have the most positive overall health impacts and require the fewest health related mitigations**
- **Plan Alternative C will likely have the most negative overall health impacts and require the greatest number of health related mitigations; and**
- **Plan Alternative B would change health outcomes least.**

However, Plan Alternative A also may impact health negatively and other options not under consideration may be still better. For example, the need for affordable housing may not be met under Plan Alternative A. A plan involving the construction of more than 6000 units of housing in the currently urban areas would likely retain or increase most of the positive health impacts described for Plan Alternative A and would mitigate some of the potentially negative health impacts it has.

The table below summarizes conclusions for each indicator analyzed. In the table, a "+" sign indicates that the indicator would change in a positive way for that Plan Alternative, and, therefore, that health outcomes related to that indicator would improve as well. A "~" sign indicates that the indicator would not be affected significantly by the choice of alternatives. A "-" sign indicates that both the indicator and health would be negatively affected by that Plan Alternative. Lastly, a "TBD" (To Be Determined) indicates that not enough information is currently available to evaluate how the indicator and health would changed.

Indicator	Description	Plan Alternative A Impact	Plan Alternative B Impact	Plan Alternative C Impact
SUSTAINABLE AND SAFE TRANSPORTATION				
ST.1.b	Average vehicle miles traveled by Humboldt residents per day	+	-	-
ST.1.e	Average minutes traveled to work by zip code	+	~	-
ST.2.a	Proportion of commute trips made by public transit	+	~	-
ST.2.b	Proportion of households with 1/4-mile access to local bus	+	~	-
ST.2.c	Proportion of average income spent on transportation expense	+	~	-
ST.3.a	Ratio of miles of bike lanes/ pedestrian facilities to road miles	+	-	-
ST.3.b	Proportion of commute trips and trips to school made by walking or biking	+	~	-
ST.3.c	Number and rate of bicycle/pedestrian injury collisions	TBD	TBD	-
ST.3.e	Proportion of population living on residential streets with <35 mph speed	+	~	-

	limits			
ST.3.f	Percent of population who have access to pedestrian facilities	+	~	-
HEALTHY HOUSING				
HH.1.a	Proportion of housing production to housing need by income category	+	~	-
HH.1.b	Proportion of households paying greater than 30% & 50% of their income on their homes	+	~	-
HH.2.a	Homeless Population	+	~	-
PUBLIC INFRASTRUCTURE				
PI.1.d	Proportion of zipcodes without childcare facilities	-	~	+
PI.2.a	Proportion of residents within ½ mile of a grocery store	+	~	-
PI.2.b	Proportion of households within ½ mile of a public elementary school	+	~	-
PI.2.d	Fast food establishments within ½ mile of high schools and middle schools	~	-	-
PI.3.a	Proportion of population within ¼ mile of open public parks	+	~	-
PI.4.d	Percentage of population within 2 miles of a medical center	+	~	-
PI.5.a	Percentage of seniors within ½ mile of senior center	+	~	-
PI.6.a	Residential density	+	~	-
PUBLIC SAFETY AND SOCIAL COHESION

HE.2.c	Number of jobs available with appropriate educational requirements	TBD	TBD	TBD
ENVIRONMENTAL STEWARDSHIP				
ES.1.b	Residential electricity use (kWH) per capita	+	~	-
ES.2.a	Acres of public open space per 1,000 population in Urban areas	-	-	-
ES.3.a	Proportion of County land area retained for active farming uses	~	-	-
ES.3.b	Proportion of County land area retained for timber production	~	-	-

ES.3.c	Percent of food consumption from local sources	~	-	-
ES.5.a	Total impervious area in County	~	-	-
ES.5.c	Percent of households using municipal water system	+	~	-

Appendix A: Data Contributors and Focus Group Participants

The following people contributed data to this HIA:

- Tom Matson, Director of Public Works, Humboldt County
- Hugh Scanlon, California Department of Forestry
- Sheila Steinberg PhD, California Center for Rural Policy at Humboldt State University
- Susan Ornelas
- Melanie Williams, HumPAL (Humboldt Partnership for Active Living)
- Jen Rice, Natural Resources Services, Redwood Community Action Agency
- Deborah Giraud, UC Davis Agricultural Extension Service
- Kirk Girard, Alyson Hunter, Cybelle Immett, Martha Spencer, Michael Richardson, Humboldt Community Development Services
- Erica Terrance, Northcoast Environmental Center
- Cathy Bifeier, California Water Resources Board (North Coast Watershed Assessment Program)
- Mark Andre, City of Arcata
- Steve Steinberg, PhD, Department of Environmental and Natural Resource Sciences, Humboldt State University
- Steven Hackett, PhD, Humboldt State University
- Pat Higgens
- Jacqueline Debets, Humboldt County economic Development
- Rob Amerman and Jan Turner, Housing and Homeless Coalition
- Wendy Rowan, First Five Commission
- Julie Sessa, Area 1 Agency on Aging
- Judy Anderson, Local Childcare Planning Council
- Rick Martin, Air Quality Management District
- Luis Bruhnke, North Coast Emergency Medical Services
- Sue Aszman, USDA NRCS Arcata Soil Survey Office
- Kevin O'Neil, California Department of Forestry
- Staff, PG&E
- Connie Stewart, Assemblymember Patty Berg's office
- Spencer Clifton, Humboldt County Association of Governments
- Penny Figas, Director, Humboldt Del Norte County Medical Society
- Maureen Chase, Eureka City Schools
- Staff, Public Health Branch

The following people participated in focus groups:
Arcata Focus Group

- Ken Miller, Salmon Forever
- Mark Lovelace, Healthy Humboldt
- Peggy Martinez, Humboldt Council of the Blind
- Norma McAdams, Hoopa Valley
- Wendy Ring, Mobile Medical Office
- Timothy Daniels, Bigfoot Bicycle Club
- Rick Martin, North Coast Air Quality Management District
- Bill Spencer
- Deborah Giraud, U.C. Cooperative Extension
- Chris Rall, Greenwheels

- Susan Ornelas, Jacoby Creek Land Trust
- Joyce Houston, Public Health
- Andrea Armin
- Chris Jones, Tri County Independent Living
- Ann Lindsay, Public Health Officer
- Lona Bates, City of Arcata
- Carol McFarland, Foster Avenue Neighbors
- Ingrid Kosek, Friends of the Annie and Mary Rail Trail
- Linda Doerflinger, HumPAL, NAMI
- Robert Boher, Yurok Tribe
- David Mohrman
- Kim Hagans, United Way Switchboard
- Jason Davis, North Coast Air Quality Management District
- Marilyn Foote, Redwoods Rural Health Center
- Michael Atkins, Ridgewood Village
- Ann King Smith, Ex. Arcata Planning Commissioner, North Coast Regional Land Trust
- Michael Richardson, Community Development Services, County of Humboldt

Eureka Focus Group

- Victoria Onstine, Area 1 Agency on Aging
- Paula Yoon
- Susan Penn
- Jay Sooter, Small Business
- Larry Evans, Alliance for Sustainable Jobs and the Environment
- Wendy Rowan, First 5 Humboldt
- Lawrence Wieland, Redwood Family Practice
- Aaron Antrim, Green Wheels
- Ali O. Lee, Lighthouse of the North Coast
- Tressie Word, Winzler and Kelly

Fortuna Focus Group

- Nicole Gans, DHHS PHB Health Education
- Judi Anderson, Local Childcare Planning Council
- Kathleen Adkins, Lighthouse of the North Coast
- Patti Rose, Cedar St. Sr. Apts., So. Hum.Community Healthcare
- Sylvia Jutila, American Cancer Society
- Sharon Latour, Presbyterian Church, Garberville
- Dorina Espinoza, Public Health Branch
- Clif Clendenen, Clendenen's Cider Works
- Estelle Fennell

Appendix B: Map Creation and Data Analysis for Humboldt County

The system used for mapping and various analyses was ArcGIS 9.2 software by ESRI (2007). This software integrated the data for mapping and analysis. The color schemes for the maps were selected by consulting ColorBrewer (http://www.colorbrewer.org), an online tool for selecting color schemes.

The maps (population/household/age data) were classified using Jenks Natural Breaks. In this classification method, the data are assigned to classes based upon their position along the data distribution relative to all other data values. The classification is determined by the best arrangement of values into classes by comparing the sum of squared differences of values from the means of their classes.

The projection and coordinate system used for the maps
NAD_1927_StatePlane_California_I_FIPS_0401
Lambert_Conformal_Conic
False_Easting: 2000000.000000
False_Northing: 0.000000
Central_Meridian: -122.000000
Standard_Parallel_1: 40.000000
Standard_Parallel_2: 41.666667
Latitude_Of_Origin: 39.333333

The source of the population, household and age data was the 2000 Census. The data and map file boundaries were retrieved through Geolytics Research Package – using the Census Summary File 1 (SF1), also known as the long form, and Summary File 3 (SF3).

The method to determine the proximity measures (proportion of the population/households/seniors) is the 'centroid within' method. Each census block group was converted to a centroid or a point which represents the geographic center of each census block. The block groups which have their geographic center within the study area (in this case the appropriate sized buffer) are counted as being the distance the buffer represents. This method represents a good comprise of extraction techniques and polygons with a majority of its area within the study area will be included. Calculating centroids is not a precise measurement and there is a margin of error.

Healthy Housing Indicators

HH.1.a Proportion of housing production to housing need by income category

Health-Based Rationale

When housing production does not meet housing demand, people with the least financial resources are often deprived of adequate and/or affordable housing. One human health impact of inadequate housing stems from people spending high proportions of their incomes on rent or a mortgage; this corresponds to fewer resources for food, heating, transportation, health care, and child care.

Many low-income residents cannot afford housing that includes basic features necessary for health. For example, one out of every seven low-income families in the US lives in physically inadequate housing, defined as having severe physical deficiencies such as lacking hot water, electricity, a toilet, or both a bathtub and a shower.[1] Substandard housing with deficiencies such as these may be associated with exposure to waste and sewage, physical hazards, mold spores, poorly maintained paint, cockroach antigens, old carpeting, inadequate heating and ventilation, exposed heating sources and wiring, and broken windows. In turn, these exposures can lead to health conditions including respiratory diseases,[2] [3] lead poisoning,[4] and injuries.[5]

A third potential impact of inadequate housing supply is the need for people to leave their community in order to find affordable housing. Moving away can result in the loss of jobs, traveling long distances for work, difficult school transitions, and the loss of health-protective social networks. For children, moving can be particularly difficult. Research has shown that increased mobility in childhood is associated with academic delay, school suspensions,[6] and depression later in life.[7]

Existing conditions

Housing Demand: In order to house the population growth projected by the Department of Finance between now and 2025, approximately 5,021 housing units are needed in Humboldt

County.[8]

Area Median Income: The County's household AMI was $33,281 in 2004.[9]

Housing Production: Between 2001 and 2006, there were a total of 2,070 building permits issued for new residences in unincorporated areas.[10] As of October 31, 2007, the number of residential units permitted in 2007 was 248.[11]

Table HH.1. Housing Production Compared to Housing Need[12]

Humboldt County Unincorporated Areas, 2001-2006

Income Level	Projected Housing Need (Housing Units)	Housing Construction (Housing Units)	% of Need Met	Production Needed to Meet Goals
Very Low (50% AMI**)	498	216	43%	282
Low (80% AMI**)	324	239	74%	85
Moderate (120% AMI**)	420	538	128%	Surplus: 118
Above Moderate (Market rate)	552	1,077	195%	Surplus: 525
Total	1,794	2,070	115%	Surplus: 276

*Production is new units; rehabbed and conserved units are not counted.
** AMI = Area Median Income

People with the least financial resources are least likely to have their housing needs met. As shown in Table HH.1 above, only 43% of the projected new housing needs for the period between 2001 and 2006 were met by housing construction for people with very low incomes, and 74% of the new housing needs projected for this period were met by housing construction for people with low incomes.

According to Eureka's Abbreviated Consolidated Plan, written in 2004, Eureka contains the largest numbers of affordable housing units.[13] However, for the past decade, the number of new houses built in Eureka has been consistently and increasingly short of the number of housing units needed as identified in the community planning documents and the housing

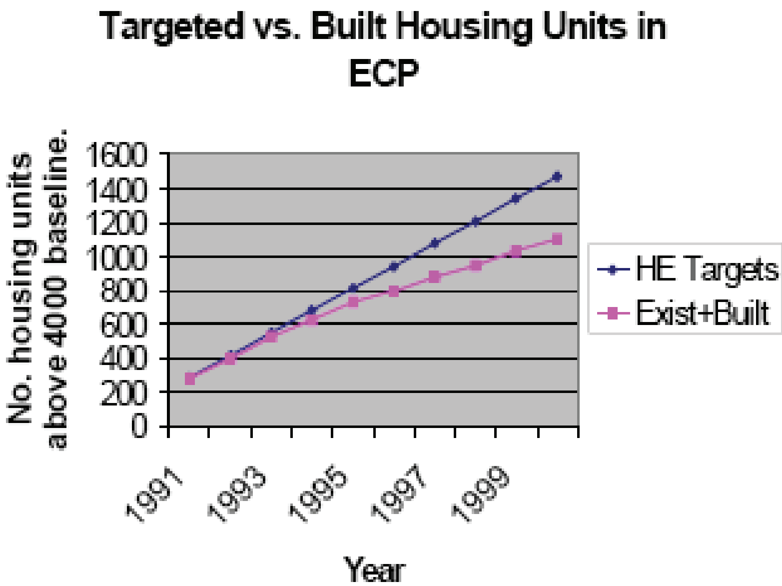
element. This trend is demonstrated in the following figure:

Figure HH.1. Targeted versus Built Housing Units in Eureka [14]



Analysis

<u>Assumptions</u>

- Housing demand of incoming populations within the next 25 years will generally adhere to the State's projected growth rate for the County, which calls for 5,021 new housing units.[15]
- Infill development will corresponds to denser development, thereby increasing the number of housing units per unit area of land.
- Housing within existing sewer and water infrastructure areas would more likely be within mixed-use neighborhoods (also known as "complete neighborhoods," which include commercial services, grocery stores, open space, and public transit within a five minute walking distance, a diversity of housing types [in terms of housing cost, size, and ownership/rental] to meet the needs of its residents, the presence of sidewalks, and connectivity of the street network) than housing outside of existing infrastructure boundaries.

<u>Logic</u>

- Low-income people disproportionately face a housing shortage in Humboldt County.

[14] Department of Community Development Services, Humboldt County General Plan update (Draft). February 2004. Housing Needs, Availability and Affordability in the Eureka and McKinleyville Community Planning Areas of the Unincorporated Areas of Humboldt County.
[15] Smith, Michael D., and Steinberg, Steven J., January 2005. Room to Grow? An assessment of the Potential for Unincorporated Humboldt County to Accommodate Future Projected Population Growth.

- The production of new dwelling units in Humboldt County will meet housing demands for incoming low-income people only if these new developments are affordable.
- Denser infill housing development may be more affordable than housing associated with sprawling development. Urban housing costs tend to be lower due to multi-family housing and higher residential density.[16] Provided the existing urban infrastructure can accommodate new housing, another cost that can be avoided with infill development is that of sewer and water infrastructure.[17] Studies show that water and sewer costs are about 40% higher in spread-out development than in compact development.[18]
- In addition to being more affordable, higher-density development within existing urbanized areas would preferentially meet housing needs of all income and mobility levels, due to the higher likelihood of these areas being "complete neighborhoods."

<u>Quantitative Analysis</u>

Table HH.2, presented below, shows median home prices and populations for four urban and five non-urban Humboldt County cities.

<table>
<tr><th colspan="6">Table HH.2. Median House Prices and Populations for Select Urban and Rural Cities in Humboldt County</th></tr>
<tr><th>Urban Cities[1]</th><th>2005 Median House Price (Dollars)[2]</th><th>2000 population[3]</th><th>Non-Urban Towns[1]</th><th>2005 Median House Price (Dollars)[2]</th><th>2000 population[3]</th></tr>
<tr><td></td><td></td><td></td><td></td><td></td><td></td></tr>
<tr><td>Arcata</td><td>317,783</td><td>16,651</td><td>Hydesville</td><td>377,689</td><td>1,209</td></tr>
<tr><td>Eureka (95501)</td><td>270,279</td><td rowspan="2">26,128</td><td>McKinleyville</td><td>317,783</td><td>13,599</td></tr>
<tr><td>Eureka (95503)</td><td>299,530</td><td>Redway</td><td>333,929</td><td>1,188</td></tr>
<tr><td>Ferndale</td><td>420,278</td><td>1,382</td><td>Willow Creek</td><td>227,924</td><td>1,743</td></tr>
<tr><td>Fortuna</td><td>296,596</td><td>10,497</td><td>Garberville</td><td>412,088</td><td>12,194</td></tr>
<tr><td colspan="6">1 = Cities with residential densities of 1,000 people per square mile and above are designated as urban, and cities with residential densities below 1,000 people per square mile are designated as rural.</td></tr>
<tr><td colspan="6">2 = Phone correspondence, Humboldt Association of Realtors.</td></tr>
<tr><td colspan="6">3= US Census 2000.</td></tr>
</table>

The following information is based on the data included in Table HH.2:

- Urban average house cost (average of median house costs by city, weighted by population[19 20]) = $300,589;

[16] Haughey, Richard M. The Case for Multifamily Housing, Second Edition. Washington, D.C.: ULI–the Urban Land Institute, 2003.

[17] Snyder, Ken and Bird, Lori, December 1998. Paying the Costs of Sprawl: Using Fair-Share Costing to Control Sprawl.

[18] Local Government Commission. Livable Communities and Water: Key facts about growth and California's water supplies.

[19] Phone Correspondence, Humboldt Association of Realtors.

- Non-urban average house cost (average of median house costs by city, weighted by population) = $354,029;
- Difference in housing cost between non-urban (higher cost) and urban (lower cost) = $53,440.

Based on this, the average cost of new housing would be:
- $300,589 for Plan Alternative A, since 100% of housing would be urban;
- $327,309 for Plan Alternative B since 50% of housing would be urban and 50% of housing would be non-urban;
- $332,854 for Plan Alternative C, since 33% of housing would be urban and 66% of housing would be non-urban.

Qualitative Analysis
In a community survey, 57.6% of respondents thought that the county should be putting "more effort" or "much more effort" into improving the availability of affordable housing in the county.[21]

Disparities
This will primarily affect populations such as the low-income population, single-parent families, and low-paid workers. Also, according to a focus group participant, county students experience a housing shortage.[22]

Conclusions
Each of the three Plan Alternatives would meet the total *future* demand of housing units. In order to estimate how much housing need met by each scenario, the following discussion examines the affordability of housing under each one:

A) Plan Alternative A provides 6,000 additional housing units over the course of 25 years, 100% of which are urban. This scenario proposes to meet the county's future housing demand solely through infill development in areas served by existing water and sewer lines. Based on estimations of housing costs under this Plan Alternative (see quantitative analysis above), which were calculated using median house prices for select cities in the county and definitions of urban vs. non-urban cities (described in the introduction to the summary), this Plan Alternative would result in the **most affordable housing** (proportionally) of the three scenarios. Essential resources such as public transportation, grocery stores, childcare, and senior services would be in close proximity to new housing developments, thereby decreasing transportation costs.

B) Plan Alternative B proposes 12,000 additional units over the course of 25 years, including 6,000 urban (50%) and 6,000 non-urban (50%). New housing would be distributed evenly between areas with and without existing water and sewer

[20] US Census 2000.
[21] Humboldt County General Plan Update Survey, 2003. Humboldt County Planning Department. [Available at http://co.humboldt.ca.us/planning/gp/survey/results.htm].
[22] Personal Communication, December 10, 2007.

infrastructure. Based on estimations of housing costs under this scenario, which were calculated using median house prices for select cities in the county and definitions of urban vs. non-urban cities (described in the introduction to the summary), this scenario would result in 50% of the new housing that would be built within existing water and sewer infrastructure being more affordable and practical for low-income people with currently unmet housing demand, whereas 50% of the new housing units built outside of this infrastructure would be less affordable. In summary, Plan Alternative B would likely produce **both affordable and unaffordable housing**.

C) Plan Alternative C proposes 18,000 additional units over the course of 25 years, including 6,000 urban (33%) and 12,000 non-urban (66%). This scenario meets the county's housing demand primarily through extending infrastructure into lands adjacent to existing urbanized areas, with some infill of existing water and sewer service areas. Based on estimations of housing costs under this scenario, this option is associated with the **least affordable housing** (proportionally). The 66% of new housing to be developed outside of urbanized areas would probably not be within complete neighborhoods, and may lack essential resources.

<u>Caveats</u>
Housing proposed by Plan Alternative A is intended to meet future housing needs based on incoming population within the next 25 years. However, housing proposed by Plan Alternative A would not supply housing to meet existing unmet housing needs.

Plan Alternatives B and C have the potential to reduce the cost of housing due to their proposed production of housing over and above the projected housing demand. In line with this theory, urban infill development of a greater quantity of housing units than what is proposed by Plan Alternative A would also have the potential to reduce the cost of housing.

Recommended Health-Promoting Mitigations:

- Inclusionary Zoning: In order to increase the stock of affordable housing units, inclusionary zoning offers developers incentives to build low and moderate cost housing that would otherwise be unavailable in the marketplace. Inclusionary housing programs in the State of California have created over 34,000 affordable homes and apartments over the past 30 years. According to the California Coalition for Rural Housing, inclusionary housing has the potential to create at least 15,000 units of affordable housing annually in California, nearly doubling the current rate of affordable housing production in the state.[23] Arcata has adopted a policy of Inclusionary Zoning, and as of October 2007, Humboldt County is considering doing the same.
- Reduction of construction costs: Reduction of construction costs through material selection and building and parking layout can reduce the price of the house for the homebuyer.
- Un-bundle automobile parking from housing unit in urban areas: The cost of parking for residential units is often passed on to the occupants indirectly through the rent or

---

[23] California Coalition for Rural Housing and Non-Profit Housing Association of Northern California, 2003. Inclusionary Housing in California: 30 Years of Innovation.

purchase price. A strategy for reducing the cost of housing is to sell parking spaces separately. This gives tenants and owners the opportunity to save money by using fewer parking spaces.

- Municipal support for first time and low-income homebuyers: Financial support for first time and low-income homebuyers can help to house people who otherwise could not afford the housing they need.
- Density bonuses: A density bonus is the entitlement to build additional residential units above the maximum number of units permitted pursuant to the existing General Plan, applicable specific plan and/or zoning designation.[24] In order to increase affordable housing opportunities, density bonuses can be offered to developers conditional on the provision of below market rate (BMR) housing.
- Allow Single Resident Occupancy Structures (SROs): This is multi-unit housing for very-low-income persons that typically consists of a single room and shared bath and also may include a shared common kitchen and common activity area.[25] Usually SRO's are developed by converting hotels, and they are often allowed under the same permits as hotels.[26]
- Require a percentage of BMR housing: Mandatory BMR housing reflecting the income distribution of the population can increase affordable housing opportunities.
- Establish a Community Land Trust (or participate in the already established Humboldt Bay Housing Development Corporation).
- Housing Trust Fund: Housing trust funds are funds established by cities, counties and states that dedicate sources of revenue to support affordable housing. They are usually created by legislation or ordinance.[27] By committing public sources of revenue to affordable housing, a bigger proportion of a given population receives the opportunity to own housing.

[26] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003, Amended November 30, 2004).

[27] PolicyLink, 2007. Housing Trust Funds – What is it?

HH.1.b Proportion of households paying greater than 30% & 50% of their income on their homes

Health-Based Rationale

Housing is considered affordable when a monthly mortgage or rent payment is no more than 30 percent of income.[28] Higher proportions than 30% are considered overpayment. Thus, defining affordable housing requires the consideration of both one's income and one's housing costs. California housing element law defines four income categories based on the percentage of an area's median income (AMI):

- Very low-income 0 - 50% of AMI
- Low-income 50 - 80% of AMI
- Moderate-income 80 - 120% of AMI
- Above moderate-income 120+% of AMI

Existing Conditions

Percent of households spending 25% or more of income on housing: The following table shows the percentage of various types of Humboldt County households spending 25% or more of their gross income on housing: [29]

Table HH.3. Percentage of Humboldt County households spending 25% or more of gross income on housing.

Type of Household	Percentage of households
All households	37%
Owner-occupied households	34%
Renter households	48%
Low-income renters ($10,000-$19,000 annual income)	85%
Low-income home owners	56%

Percent of renters spending 50% or more of income on housing: The following table shows the proportion of **renter** households in various regions of Humboldt County whose gross rent is greater than 50% of renter's last year income:[30]

[28] Department of Community Development Services, Humboldt County General Plan update (Draft). February 2004. Housing Needs, Availability and Affordability in the Eureka and McKinleyville Community Planning Areas of the Unincorporated Areas of Humboldt County.

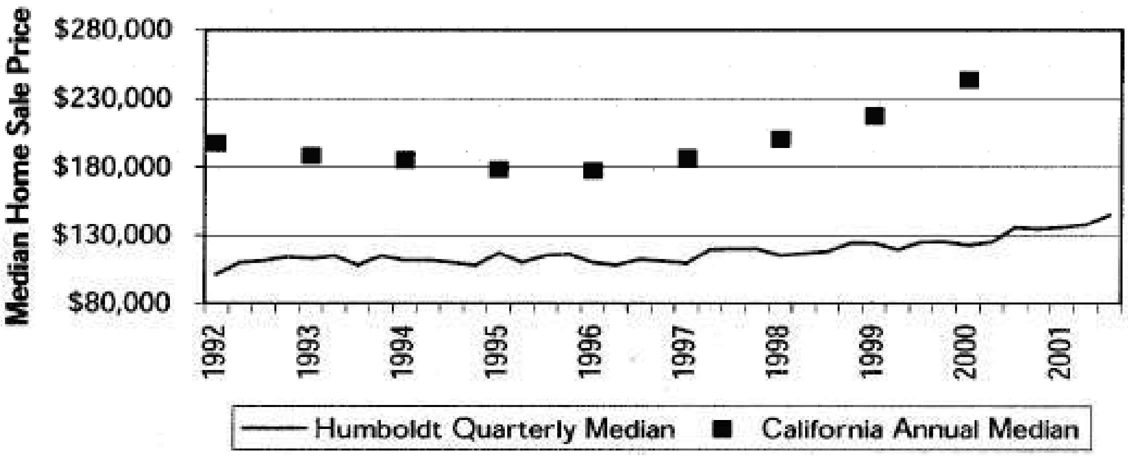
Briceland and Garberville	24%	Southern

Housing Costs: The median home price in Humboldt County in November 2007 was $299,000.[31] Home prices have significantly increased over the last decade, as shown below.

[31] Humboldt Association of Realtors, 2005, Humboldt County Housing Affordability Index. [Available at http://harealtors.com/properties.php].

Figure HH.2. Median Home Sales Prices in Humboldt County 1992-2001[32]



Analysis

Assumptions

- Land costs and the infrastruture costs of water and sewer access are borne by the homebuyer, while roads and police/fire protection are borne by the taxpayer.
- Inclusionary zoning and other policies and programs to create affordable housing of are assumed to be effective within existing water and sewer infrastructure areas only. Arcata has an inclusionary housing policy requiring at least 15% of publicly or privately developed housing to be affordable to low-and moderate-income persons and families, and of these units, at least 40% must be affordable to very low-income households. For agency-developed housing, at least 30% must be affordable to low- and moderate-income persons and families.[33] The County is considering inclusionary zoning and other methods for creating affordable housing as well.

Logic

- While the cost of land in urban areas tends to be higher, denser urban development is likely to include smaller housing units, smaller lots, and/or multi-family housing, which all contribute to greater affordability for a wide range of income levels.[34] [35]
- Water and sewer infrastructure costs are typically higher in rural areas than in urban areas.[36] Studies show that water and sewer costs are about 40% higher in spread-out development than in compact development.[37]

---

32 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003).

33 City of Arcata, Redevelopment Implementation Plan 2006-2010, Section 4, Affordable Housing Plan & Estimated Expenditures: 2006-2011. [Available at http://calruralhousing.org/housing-toolbox/inclusionary-housing-policy-search/policies/arcata].

34 Haughey, Richard M. The Case for Multifamily Housing, Second Edition. Washington, D.C.: ULI–the Urban Land Institute, 2003.

35 Transportation Research Board, National Research Council, 1998. TCRP Report 39: The Costs of Sprawl – Revisited.

36 Transportation Research Board, National Research Council, 1998. TCRP Report 39: The Costs of Sprawl – Revisited.

37 Local Government Commission. Livable Communities and Water: Key facts about growth and California's water supplies.

- Based on these factors, infill development is likely to correspond to more affordable housing than sprawling development. Accordingly, monthly costs of owning or renting a home within infill development would comprise a lesser percentage of monthly income than owning or renting a home within sprawling development.

Quantitative Analysis

In Humboldt County, the cost of land in urban areas is higher than the cost of non-urban land.[38] A comparison of urban Eureka with non-urban McKinleyville, for example, yields a difference of $20,000 per unit area of land:

Table HH.6. Average cost of land per acre in Eureka vs. McKinleyville[39]	
City	Average cost of land per acre
Eureka (urban)	$115,000
McKinleyville (non-urban)	$95,000

Table HH.7 depicts new home costs in Eureka versus McKinleyville as analyzed in the 2004 Housing Needs Assessment. These two communities provide a comparison of urban versus non-urban house prices in Humboldt County. Land is more expensive in Eureka, which is the more residentially dense community, whereas infrastructure costs are higher in McKinleyville, which is the less residentially dense community. Note that the costs of land depicted here assume different lot-sizes for each community, which are one-third acre for Eureka and one-fifth acre for McKinleyville. Housing costs were estimated based on the assumption that the size of houses would be the same in either community. These assumptions may not be correct. For example, homes constructed in denser areas may in actuality occupy smaller lots and be smaller than those located in less dense areas.

Table HH.7. Typical New Home Costs in Eureka and McKinleyville[40]		
	Eureka (Cutten)	**McKinleyville**
Raw land cost	$38,000 (corresponds to 0.33-acre)	$19,000 (corresponds to 0.2-acre)
Infrastructure costs	$50,000	$56,000
1,200 sq.ft. home construction costs @ $95/sq. ft.	$114,000	$114,000
Subtotal	$202,000	$189,000
Taxes, Insurance, Financing (estimated @ 10%)	$20,200	$18,900
New Home Cost (Developer)	$222,200	$207,900
New Home Cost (Buyer) @ 10%	$244,420	$228,690

profit margin		

Qualitative Analysis
In a community survey, 57.6% of respondents thought that the county should be putting "more effort" or "much more effort" into improving the availability of affordable housing in the county.[41]

Disparities
Low and very-low income people are most affected by the differences inherent in the three Plan Alternatives. These groups are more likely to pay high percentages of monthly income on housing.

Conclusions

A) Plan Alternative A provides 6,000 additional housing units over the course of 25 years, 100% of which are urban. This scenario proposes to meet the county's housing demand solely through infill development in areas served by existing water and sewer lines. Building in areas with pre-existing infrastructure could facilitate development of affordable housing. Because lot sizes would be smaller than in historical development patterns, one of the key components of housing cost, the price of land, would be significantly reduced.[42] Based on these factors, this scenario would produce the largest quantity of affordable housing, and consequently, lead to a **reduction in the proportion of households paying greater than 30% and 50% of their income on their homes**.

B) Plan Alternative B proposes 12,000 additional units over the course of 25 years, including 6,000 urban (50%) and 6,000 non-urban (50%). New housing would be distributed evenly between areas with and without existing water and sewer infrastructure. Development in areas outside of those currently serviced by sewer and water would likely increase the infrastructure costs, possibly contributing to increased housing costs for homebuyers.[43] For the developments outside of infrastructure areas, the lot sizes may be larger[44] leading to higher land costs.[45] Based on these factors, this scenario would increase affordable housing by a lesser amount than Scenario A would.

[44] Lindsay, Ann, Health Officer, Humboldt County Department of Health and Human Services. Personal Communication, December 10, 2007.
[45] Room to Grow?: An Assessment of the Potential for Unincorporated Humboldt County to Accommodate Future Projected Population Growth, Dr Michael Smith and Dr Steven Steinberg, Humboldt State University, January 2005.

On the other hand, new development projects in previously undeveloped land has the potential to present the County with new opportunities to utilize inclusionary zoning in these areas. A mixture of market-rate and low-income housing, as mandated by an inclusionary zoning policy, could increase the affordability of housing in the County.

In summary, **the proportion of households paying greater than 30% and 50% of their incomes on their homes may or may not be reduced by Plan Alternative B.**

C) Plan Alternative C proposes 18,000 additional units over the course of 25 years, including 6,000 urban (33%) and 12,000 non-urban (66%). This scenario meets the county's housing demand primarily through extending infrastructure into lands adjacent to existing urbanized areas, with some infill of existing water and sewer service areas. This option allows for the largest number of housing units, but as with the other scenarios, this does not necessarily correspond to affordable housing. Historically, housing development in previously undeveloped areas has been large-lot single-family homes, priced at the high end.[46] Contributors to high cost may include increased land costs associated with greater lot sizes[47] and infrastructure costs.[48] Based on this analysis, this scenario would produce the lowest quantity of affordable housing, this scenario may lead to an **increase in the proportion of households paying greater than 30% and 50% of their income on their homes**.

Caveats

Incomes reported may not reflect illegally obtained income, which may be a significant factor in underestimating affordability of housing in some areas.[49]

It is possible that some of the public might react negatively to multi-unit housing and increasing density. Further community education and early involvement of neighbors in the area to be developed in planning and mitigation of community concerns in a mutually acceptable manner could mitigate this.

Recommended Health-Promoting Mitigations:

- Developer incentives for residential densities between 2.5 and 10 units per acre
- Implementation of inclusionary zoning, requiring development to include a mix of housing types at a wide price range, as well as other programs and policies for increasing the amount of affordable housing (e.g., maximizing use of State and Federal funding resources and exploring non-traditional funding resources)

- Encourage the development of rental units.
- Public outreach campaign about the need for multi-unit housing to fulfill all housing including low-income housing needs. This could be coupled with the promotion of environmentally preferable Plan Alternative.
- As discussed in the 2004 Update to the 2003 Housing Element of the Humboldt County General Plan, in order to facilitate denser residential development, certain local government constraints could be reduced, such as:
  - Local zoning regulation constraints – For instance, according to the Housing Element Update, zoning regulations specify that each home with two or more bedrooms is required to have four parking spaces, unless the property is served by a 40-foot wide road. Another requirement restricts minimum parcel sizes to 5,000 square feet. While these regulations are generally necessary to protect public health, safety and welfare, they also make it more expensive to develop housing. Due to the critical need to provide more affordable housing, the County could reduce the regulatory burden on lower-cost housing by modifying a number of zoning constraints, such as these.[50]
  - Local budget constraints – Local agencies are the sole providers of all the public services and improvements that support new housing. Adequate local funding must be available to support new housing development.
  - Tax Constraints – Currently, reassessment laws tend to discourage major rehabilitation and upgrading of existing dwellings and conversion of single to multi-family units.[51]

[50] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003).

HH.2.a Homeless Population

Health-Based Rationale

Homelessness is a condition that describes people who lack a fixed, regular, and adequate nighttime residence. The term may also include people whose primary nighttime residence is in a homeless shelter, in an institution that provides a temporary residence for individuals intended to be institutionalized, or in a public or private place not designed for use as a regular sleeping accommodation for human beings.[52]

Homelessness is usually a consequence of a combination of structural and individual factors. On an individual level, homelessness is frequently the result of a crisis in one's life, such as leaving the parental home after arguments; marital or relationship breakdown; death of a spouse; leaving prison; a sharp deterioration of mental health; increased drug or alcohol misuse; unemployment or another financial crisis; or eviction. In addition, there are many factors that put individuals at a greater risk of homelessness when a crisis occurs. Some common background characteristics of people who become homeless include physical or sexual abuse in childhood or adolescence; a background of institutional care; lack of social support network; debts, especially due to rent and mortgage; anti-social behavior; substance abuse; and poor mental or physical health.[53]

Structural factors, relating to how we organize our society and distribute wealth and power, also play a role in homelessness. According to Ireland's Homeless Agency, "The failure of infrastructure to support those most vulnerable in our society has resulted in high levels of poverty, rising unemployment, social exclusion, the lack of affordable accommodation and increasingly negative effects of de-institutionalization ultimately creating pathways into homelessness."[54]

Homeless people have many of the same health problems as people with homes, but at rates three to six times greater than housed people.[55] Age-adjusted death rates were four times higher in the homeless than the general U.S. population in a study done in New York City.[56] In homeless shelters, high levels of contact, poor nutrition, poor access to health care, and substance abuse contributes to an increased risk for respiratory infections and outbreaks of tuberculosis and other aerosol transmitted infections infectious diseases.[57] [58] Among homeless children, 78% have suffered from depression, behavior problems, or severe academic delay.[59] Approximately one-third of homeless people have mental illnesses, and

approximately one-half have a current or past drug or alcohol addiction.[60] Many homeless people are in desperate need of health care services, but because they are often uninsured and lack access to preventative health care, they go without care until minor problems become urgent medical emergencies.[61]

Homelessness can also be emotionally damaging. In addition to representing poverty due to a lack of financial resources, homelessness can also cause people to lose privacy, security, and control over their lives. The longer the time period that a person is homeless, the more difficult it is for them to recover.[62]

Existing conditions

Total Number of Homeless: Estimates of total homeless persons in Humboldt County throughout the course of one year range from 4,000 to 6,000.[63] [64] It has been estimated that at any point in time, there are between 800 and 1,100 homeless persons in the County,[65] and the number is generally higher during summer months than during winter months.[66] According to the Housing and Homeless Coalition, the number of homeless in the County has gone down in the last three years, while the number of homeless children has stayed the same.[67]

The following tables present results of a point-in-time survey conducted on January 25, 2005.

60-69 years	3%
70 or more years	0%

Homelessness in Eureka and Arcata: Eureka hosts the majority of the homeless population, with an estimated 888 people.[72] [73] Eureka is also home to the largest numbers of affordable housing units, residents in poverty, and homeless services in the County. The City of Eureka provides approximately 423 beds in various shelters and transitional housing facilities, and an additional 86 during the winter. Many homeless people sleep in automobiles, outdoors, or in motels.[74]

There are between 50 and 75 homeless individuals in Arcata throughout the year, and the number rises to approximately 200 in the summer. In Arcata, an estimated 900 to 1,000 individuals experience some form of homelessness each year.[75]

Much smaller homeless populations are estimated to live in other incorporated cities in Humboldt County, which provide minimal or no homeless services. In unincorporated areas of Humboldt County, transients and homeless individuals often camp or stay with friends.[76]

Additional Location information: Almost three quarters of the County's homeless population camp in locations ranging from forests, wildlife sanctuaries, and city parks, to bushes along railroad tracks, under bridges, and on private property. Approximately 17% stay in shelters, 4% stay in motels, and 3% stay with friends.[77]

Nomadic population: In addition to the homeless population, there is also a nomadic population in Humboldt County with its own set of housing needs. According to the 2003 update of the county's Housing Element of the General Plan, "nomadic households belong

[77] City of Arcata, March 7, 2007. Homeless Services Plan: 2007-2016.

to a generally unnoticed demographic segment of our population that resides throughout the year in various campgrounds, parks, and other sites both public and private. The nomadic population distinguishes itself from other forms of housing styles by staying on the move. The nomadic population also has a spectrum of socio-economic income groups from high to moderate, to low and very low income groups". The 2003 Housing Element Update reports that in Humboldt County, "56 nomadic households might avail themselves of a special occupancy park specifically designed for lower income persons, and there are others who would use it on a more permanent basis who do not consider themselves nomadic." This evaluation estimates that there are presently 89 special occupancy spaces needed to accommodate the housing needs of nomadic persons.[78]

Analysis:

Assumptions

- At least 57% of the homeless population in the County does not choose to be homeless. These citizens would reside in permanent housing if it was accessible to them.

Logic

- One key strategy for reducing homelessness is the creation of affordable housing. While emergency shelters and transitional housing provide vital access to services for families in crisis, they often fail to address the long-term needs of homeless people. Getting people into housing and then providing the support and services they need to maintain housing leads to long-term stability and increased self-sufficiency.[79] [80] Because of its greater affordability,[81] [82] development of higher density housing is more likely to be accessible to the portion of the homeless population with significant incomes and a certain level of stability. Resources such as jobs, social service programs, food access, transportation, and social connection with others, are typically centered in denser areas. All three scenarios provide the same amount of housing in higher-density areas of the county, so they may all lead to more affordable housing than the housing currently available.
- Additional housing options for the homeless, such as those listed below (with the exception of the "special occupancy park"), are more likely to be concentrated within dense areas. Because all three Plan Alternatives propose the same amount of infill development, the following housing options could be incorporated by local governments into any of the three scenarios:
    - Homeless Shelters: Temporary residences for homeless people.
    - Transitional Housing: Programs that assist people who are ready to move

[78] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003, Amended November 30, 2004).
[79] City of Arcata, March 7, 2007. Homeless Services Plan: 2007-2016.
[80] Housing First. http://www.beyondshelter.org/aaa_initiatives/ending_homelessness.shtml.

[82] Transportation Research Board, National Research Council, 1998. TCRP Report 39: The Costs of Sprawl – Revisited.

beyond emergency shelter into a more independent living situation. Transitional programs allow individuals and families to further develop the stability, confidence, and coping skills they need to sustain permanent housing. Some transitional program participants live in apartment-style quarters, while others may live in group settings where several families or individuals share a household.[83]

- Homeless Support Centers: Resource centers with services to assist homeless people to cope with the problems they face in learning how to sustain their lives. They may also provide housing.[84]
- Multifamily Housing: Higher density housing, which is sometimes affordable to very low-income persons, may provide housing to members of the homeless population with significant incomes and who are stable enough to be on their own.[85]
- Single Resident Occupancy Structures (SROs): This is multi-unit housing for very-low-income persons that typically consists of a single room and shared bath and also may include a shared common kitchen and common activity area.[86] Usually SRO's are developed by converting hotels, and they are often allowed under the same permits as hotels.[87]
- Special Occupancy Park: A park specifically designed for the nomadic population, who otherwise sleep in various campgrounds, parks, and other sites both public and private.[88]

- However, a community that is concentrated in the area where social services are located may present better opportunities for the homeless population. In a sprawling community, social services may be less concentrated, and not as convenient in terms of access to other urban resources such as transportation, etc.

Disparities

People suffering from alcoholism and other substance abuse may be unable to access treatment programs.

Conclusions

Each of the three Plan Alternatives proposes the development of 6,000 housing units within urban centers. Multi-family housing units, homeless shelters, transitional housing, homeless support centers, SROs, and special occupancy parks would be possible within each scenario. **This analysis concludes that each of the three Plan Alternatives are equivalent in**

[83] Los Angeles Homeless Services Authority. http://www.lahsa.org/archive/programs/transitionalhousing.htm,

[84] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003, Amended November 30, 2004).

[85] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003, Amended November 30, 2004).

[86] New York State Office for the Aging. Your Guide to Senior Housing. http://seniorhousing.state.ny.us/definitions/index.htm.

[87] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003, Amended November 30, 2004).

[88] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003, Amended November 30, 2004).

terms of housing Humboldt County's homeless population, which depends on many factors including the availability of affordable housing, social services and programs, and other resources.

Nevertheless, the following factors may potentially make Plan Alternative A the most favorable choice:

- Expenses associated with building infrastructure outside of an existing urbanized area (i.e. related to Plan Alternatives B and C) will theoretically be paid for by county tax funds. Diverting tax funds towards water and sewer infrastructure development could potentially take them away from social services that are important resources for the homeless population. Whether the increase in the tax base that results from the increase in population in Plan Alternatives B and C offset this is an open question.
- There are more resources in urban areas for people with low incomes, such as transportation, access to jobs, treatment programs, health care, and other services. Under Plan Alternative A, these social services and programs would be concentrated into urban centers, while the sprawling development proposed by the other scenarios may result in these resources becoming more spread out and thus less accessible by the homeless population.

Caveats

- Only the portion of the homeless population that earns income and/or pursues opportunities for housing will attain housing. Percentage of homeless population who chooses to be homeless (between 8% and 43%) may not be affected by any of the Plan Alternatives. Park space for "nomadic" population and access to wilderness camping for homeless may not be affected by any of the scenarios.

Recommended Health-Promoting Mitigations

- Pre-release permanent housing planning for people discharged from public institutions such as the foster care system, jail, prison, mental health programs, hospital, or drug and alcohol programs.
- Increase emergency, interim, transitional, and permanent housing options and programs.
- Improve social services offered to the homeless population by the county, such as mental health, domestic abuse, and substance abuse resources.

Safe and Sustainable Transportation Indicators

ST.1.b Average vehicle miles traveled by Humboldt residents per day

Health-Based Rationale

Vehicle miles traveled are directly proportional to air pollution and greenhouse gas emissions.[1] Air pollutants, including ozone and particulate matter, are causal factors for cardiovascular mortality and respiratory disease and illness.[2] Greenhouse gases are contributing to climate change, which may increase heat-related illness and death, health effects related to extreme weather events, health effects related to air pollution, water-borne and food-borne diseases and vector-borne and rodent-borne disease.[3] [4]

Areas with high levels of vehicle miles traveled per capita tend to have higher accident and injury rates. More time in a car means higher exposure to the perils of driving, including accidents.[5]

Amount of vehicle miles traveled has a direct relation to amount of physical activity. A study done in Atlanta, Georgia looked at people living in walkable vs. car-dependent neighborhoods, and found that those living in car-dependent neighborhoods drove an average of 43 miles per day (vs. 26 in walkable neighborhoods), and walked much less (only 3% walked vs. 34% in the walkable areas).[6] Automobile use for all trips in different countries ranges from a low of 36% in Sweden to a high of 84% in the United States. Walking and bicycling levels are inversely correlated with automobile use: in lower auto-use countries such as Sweden, modal share of trips by walking or biking was above 40%, and in high auto-use countries, percentage of walking and biking was below 20%. In the US, walking or biking only accounted for about 10% of all trips.[7]

VMT correlates with obesity. In the Atlanta study, the car-friendly communities had almost double the rate of obesity as the pedestrian-friendly communities (22% vs. 12%). Also, commute time correlates with both obesity and physical inactivity. In a study of California counties assessing vehicle miles traveled and obesity, counties with the highest average amount of vehicle miles traveled were significantly associated with the highest average rank of obesity.[8]

How much one drives is also affected by proximity to public transportation, to work and to goods and services as well as to neighborhood walkability and bikability, to parking availability and to traffic congestion. For example, the San Francisco Metropolitan Transit Commission found that individuals living and working within ½ a mile of public transit use transit for 42% of their work commute trips, while only 4% of those that do not live within ½ a mile use public transit and that households living in dense areas and

near public transit produce about half the weekday daily vehicle miles traveled as compared to people in more suburban and rural areas.[9]

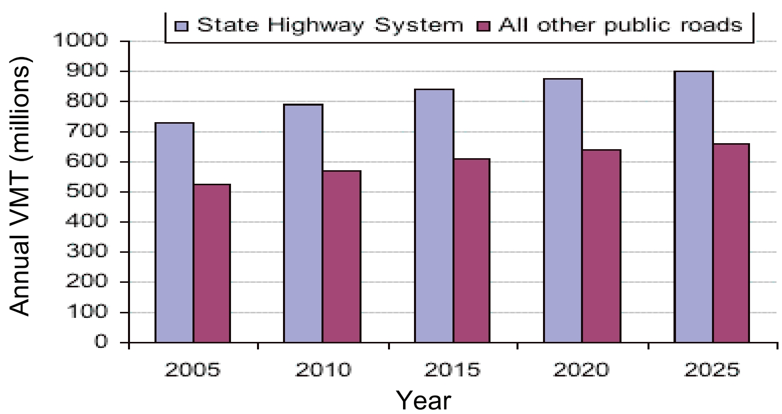
How much one drives has an impact on the amount of money a family has available for other health needs, such as nutritious food, health care costs.

Existing conditions

Average VMT and urban vs. non-urban differences in VMT: In 2006, Humboldt residents traveled 27 daily vehicle miles per capita compared to 24 daily miles for California as a whole.[10] According to the Federal Highway Administration, in 2001 in California, per capita VMT was 2.7 times higher in rural areas as compared with urban areas (58.8 daily vehicle miles traveled per capita versus 21.8).[11] In 2000, Humboldt County had about 9,600 annual *highway* vehicle miles traveled per capita.[12] This is 6% greater than the State average for that year. Humboldt County's level of vehicle miles traveled is due both to the number of personal vehicle miles traveled and the need to transport the majority of consumer goods into the county, and other materials (like municipal refuse) out of the county.[13]

Daily regional VMT on freeways, arterials and collectors is expected to increase 24.4 percent between 2005 and 2020. This represents an average annual increase of 1.9 percent on the County's state highway system.[14]

Figure ST.1: Projected Growth in Vehicle Miles Traveled in Humboldt County 2005-2025 without mitigations.[15] Alternative planning scenarios could affect this growth rate. Additionally, mitigations are suggested below.



Analysis

Logic

[15] Caltrans, California Motor Vehicle Stock, Travel and Fuel Forecast (MVSTAFF), November 2004.

- In areas with dense development, complete neighborhoods ('complete' means having nearby goods and services, parks, schools and jobs) and access to public transit, VMT is lower.

Quantitative Analysis
To compare vehicle miles traveled in the future for each Plan Alternative, a function that accounted for location of future population (urban vs. non-urban) and average VMT by location was used. The equations follow:

$$VMT_A = (U_C + U_I)x + NU_C 2.7x$$

$$VMT_B = (U_C + U_I)x + (NU_C + NU_I)2.7x$$

Where:

VMT = Vehicle Miles Traveled, with subscripts corresponding to their Plan Alternative
U_C = Urban population – current
U_I = Urban population – increase
NU_C = Non-urban population – current
NU_{IB} = Non-urban population – increase in SP B
NU_{IC} = Non-urban population – increase in SP C
x = current rate of vehicle miles traveled
2.7 = the multiplier to account for differences in VMT per capita by location.[16]

Percent increase in VMT if Plan Alternative B was approved over Plan Alternative A:

$$\frac{VMT_B}{VMT_A} = \frac{(U_C + U_I)x + (NU_C + NU_{IB})2.7x}{(U_C + U_I)x + NU_C 2.7x}$$

For Plan Alternative A:
$(U_C + U_I)$: 64,409 + (6,000 units in urban areas X 2.4 people per household = 14400) = 78,809
NU_C: 62,109

Given that non-urban residents drive 2.7 times more than urban residents, by increasing the percentage of urban residents, the VMT per capita will decrease. For purposes of comparison, Plan Alternative A is taken as the base case for the calculations below.

For Plan Alternative B:
$(U_C + U_I)$: 64,409 + (6,000 units in urban areas X 2.4 people per household = 14400) = 78,809
$(NU_C + NU_I)$: 62,109 + (6,000 units in non-urban areas X 2.4 people per household = 14,400) = 76,509

$$\frac{VMT_B}{VMT_A} = \frac{78{,}809x + (76{,}509)2.7x}{78{,}809x + (62{,}109)2.7x} = \frac{78{,}809 + 206{,}574}{78{,}809 + 167{,}694} = \frac{285{,}383}{246{,}503} = 1.16$$

Therefore, 16% more VMT would be expected under Plan Alternative B when compared to Plan

[16] FHA. Highway Statistics 2000. Updated March, 2003. Office of Highway Policy Information, Federal Highway Administration, US Dept of Transportation at http://www.fhwa.dot.gov/ohim/hs00/ps1r.htm. Accessed on December 28, 2007.

Alternative A. This would translate roughly into an additional 200 million miles traveled annually by Humboldt residents.

Percent increase in VMT if Plan Alternative C was approved over Plan Alternative A:

$$\frac{VMT_C}{VMT_A} = \frac{(U_C + U_I)x + (NU_C + NU_{IC})2.7x}{(U_C + U_{IC})x + NU_C 2.7x}$$

For Plan Alternative C:

$(U_C + U_I)$: 64,409 + (6,000 units in urban areas X 2.4 people per household = 14400) = 78,809

$(NU_C + NU_I)$: 62,109 + (12,000 units in non-urban areas X 2.4 people per household = 28,800) = 90,909

$$\frac{VMT_C}{VMT_A} = \frac{78{,}809x + (90{,}909)2.7x}{78{,}809x + (62{,}109)2.7x} = \frac{78{,}809 + 245{,}454}{78{,}809 + 167{,}694} = \frac{324{,}263}{246{,}503} = 1.32$$

Therefore, 32% more VMT would be expected under Plan Alternative C when compared to Plan Alternative A. This would translate roughly into an additional 400 million miles traveled annually by Humboldt residents.

Qualitative Analysis

Focus groups held specifically on the General Plan Update's impact on health revealed a general strong support for the County to focus more on walkable and bikeable communities, a better public transportation system to increase physical activity, decrease reliance on automobiles, and improve mobility for transportation disadvantaged. In these focus groups as well as an extensive Policy Charrette held by HumPAL, there was a call for better documentation of impact on VMT, i.e., that the County develop a monitoring system and continue to measure increases or decreases on this indicator.

A major policy recommendation that came out of the HumPAL Policy Charrette on Defining Healthy Design in Humboldt County was to measure and report per capita VMT, number of trips, per capita passenger miles, number of trips by bike/ped, and to count all of these modes for each traffic study. In addition, participants want these measures periodically evaluated and reported. Given this strong recommendation, it seems clear that the public supports decreasing VMT.[17] Additionally, public support is strong for reducing opportunity for sprawling communities, thus reducing the potential for more VMT.[18]

Disparities

- Low income populations tend to have fewer cars, thus less opportunity to accumulate VMT.
- Low income populations are less likely to afford housing in more non-urban areas with large lot sizes, thus they may drive less.
- If low income populations need to drive more, the percent of their income devoted to transportation will be higher given the cost of fuel.
- Many seniors may be unable or unwilling to drive, and so may use of paratransit more. Denser option would benefit them.

---

[17] HumPAL. 2007. Defining Healthy Design in Humboldt County: A 'Policy Charrette'. Humboldt Partnership for Active Living.

[18] Dyett & Bhatia. 2004. Humboldt 2025 General Plan Update. Sketch Plan Alternatives. Humboldt County Department of Community Development Services. Available at http://co.humboldt.ca.us/planning/gp/pdf/SKALT5.pdf.

Conclusions

A) Plan Alternative A will lead to a decrease in per capita VMT because a higher proportion of residents will live in urban areas and those residents on average drive less. Given that, Humboldt County residents on average will drive less, offering healthful opportunities to connect with family and friends, to be physically active, and the least risk for motor vehicle accidents and chronic disease due to obesity. Alternative Plan A also offers the least amount of risk for contributing to climate change and ill health effects due to global warming.

B) With Plan Alternative B, there would be 16% more VMT than with Plan Alternative A – approximately 200 million extra miles per year traveled in the County. While this is not the largest increase, it does raise the risk of obesity, motor vehicle accidents, a decrease in rates of physical activity, and less time for social cohesion.

C) Plan Alternative C would lead to the largest increase in VMT; residents in Humboldt County would experience an average increase of 32% in the amount of VMT compared to Plan Alternative A. This would translate into an extra 400 million miles traveled by Humboldt residents a year. Accompanying this are larger increases in obesity rates, traffic accidents, lack of physical activity, a decrease in connecting with family and friends, and Plan Alternative C offers the greatest increase in Humboldt County's contribution to global warming.

Caveats

When urban areas achieve a high level of density, VMT starts to decline due to use of public transit and the inconvenience of driving and owning a car.[19]

Recommended Health-Promoting Mitigations:

- Encourage larger employers to adopt Transportation Demand Management programs.
- Increase public education about public transit options.
- Design multimodal transit hubs with co-located businesses and housing with priority for transportation disadvantaged.
- Increase public transit options: bus and paratransit routes, frequency and connections, coordination.
- Increase funding for public transit and promote routes to employment locations.
- Encourage retail, business, and industry to grow within urban boundaries, perhaps establishing Central Business Districts with incentives for businesses to locate there.

ST.1.e Average minutes traveled to work by zip code

Health-Based Rationale

The amount of time one spends in the car has increased over the course of the last 25 years, when VMT per capita started increasing dramatically. An increasing amount of time commuting decreases the time an individual has to spend with family and effects engagement in civic or volunteer activities.[20] Thus, long commutes can distance an individual from his/her community and decrease social connectivity. Social connection has a variety of health impacts, ranging from reducing stress, having a longer lifespan, supplying access to emotional and physical resources.[21] [22]

Also, the more time in the car, the less time a person has to engage in leisure time physical activity and physical activity is associated with many health outcomes.[23] One study in the US showed that each additional hour spent in a car per day was associated with a 6% increase in the likelihood of obesity. Each additional hour walked per day was associated with a 4.8% reduction in the likelihood of obesity.[24] Time spent in a car driving is also associated with 1.6 to 2.8 times higher odds of having shoulder pain when compared to those who spend less time in a car.[25]

On a very immediate level, an increase in the amount of driving can increase the odds of neck and back pain; people who drive 9,000 – 18,000 annual miles are 75% more likely to have neck and back pain than those who travel 3,000 miles annually.[26]

In general, people in developed countries spend an average of about one hour a day in motor vehicle travel. Valuing travel time at $8/hr (half of $16/hr average wage) indicates an overall average per capita travel time cost of about $3,000 per year.[27]

Traveling to and from work is the single biggest cause of stress for many people. According to a UK survey, 44% of people believed rush hour traffic was the single most stressful part of their life.[28] In a study of nine hundred working women in Texas, respondents rated commuting as the activity that gave them the least amount of happiness.[29]

Residents of automobile dependent suburban areas such as San Bernardino County tend to experience greater per capita congestion delay than dense cities such as New York and Chicago. U.S. automobile commute travel times are lowest for residents of communities with moderate to high densities (11-16

residents per acre), while transit commute times decrease with density. While the densities are different for Humboldt County, we found it to be generally true that the more dense areas had lower commute times. Empirical evidence indicates that higher-density development does not necessarily increase congestion, and Smart Growth strategies that improve accessibility and transportation mode diversity can further reduce per capita congestion delay.[30]

Existing conditions

Commute times: The majority of residents of both urban and non-urban areas in Humboldt County have travel times to work that are lower than the national and statewide average (17.8 minutes vs. 27 minutes[31]). Average commute time in the US is 26.4 minutes[32].

The table below details travel time to work by region in the County. The average travel time to work overall in the County is 17.8 minutes according to the 2000 Census. The weighted average travel time to work for non-urban areas is 19.1 minutes, while it is 15.4 minutes for urban areas. Areas that have low residential densities have a 26% higher average length of commute to work (measured in time) than those in higher residential densities.

Analysis

Assumptions

- More workplaces are located in urban centers.
- Goods and services are concentrated in urban centers.
- Plan Alternative A would not require additional roadway construction or bicycle lanes.
- There would be no specific increase in public transit funding, routes or frequency.

Quantitative Analysis

The current county-wide average travel time to work using the definitions of urban and non-urban described in the introduction are:

$$\frac{64{,}409\ (15.4) + 62{,}109\ (19.4)}{\text{Entire population}} = \frac{991{,}899 + 1{,}204{,}915}{(126{,}518)} = 17.3 \text{ minutes}$$

Under Plan Alternative A:

$$\frac{\text{New urban population } (78{,}809)\ (15.4) + \text{non-urban } (62{,}109)(19.4)}{\text{Entire population } (140{,}918)} = \frac{1{,}213{,}659 + 1{,}204{,}915}{140{,}918} = \frac{2{,}418{,}574}{140{,}918}$$

The new travel time to work under Plan Alternative A would be 17.2 minutes. Across all working adults in the County, this would reduce travel time by approximately 55,000 hours a year from current levels.

Under Plan Alternative B:

$$\frac{\text{New urban population } (78{,}809)\ (15.4) + \text{non-urban } (76{,}509)(19.4)}{\text{Entire population } (155{,}318)} = \frac{1{,}213{,}659 + 1{,}484{,}275}{155{,}318} = \frac{2{,}697{,}934}{155{,}318}$$

The new travel time to work under Plan Alternative B would be 17.4 minutes. Across all working adults in the County, this would increase travel time by approximately 55,000 hours a year from current levels.

Under Plan Alternative C:

$$\frac{\text{New urban population } (78{,}809)\ (15.4) + \text{non-urban } (90{,}909)(19.4)}{\text{Entire population } (169{,}718)} = \frac{1{,}213{,}659 + 1{,}763{,}635}{169{,}718} = \frac{2{,}977{,}294}{169{,}718}$$

The new travel time to work under Plan Alternative C would be 17.5 minutes. Across all working adults in the County, this would increase travel time by approximately 110,000 hours a year from current levels.

Health Disparities

- For Native American communities living on reservations further away from urban areas, time travel to and from work (off-reservation) may be disproportionately higher than other populations.
- Low income residents living in non-urban areas but working in urban areas (due to availability of jobs) can be disproportionately impacted by the distance to work.
- Farm workers living in-between urban and non-urban areas who must commute to work have fewer options for transportation. Time to work may be disproportionately longer for them.
- Seniors or those with disabilities may have less access to transportation (longer distance to travel to public transportation, no access to/inability to drive a car) and therefore may have to travel for longer periods of time to work.

Conclusions

A) Under Plan Alternative A, the average travel time to work would *decrease*. Across all residents of the County, commute travel would be reduced by approximately 110,000 hours in a year. Health effects of decreased travel time include more time with family and friends, higher rates of exercise, increased engagement in one's community, decreased stress and decreased risk for musculoskeletal pain associated with long trips in the car.

B) Plan Alternative B will *increase* the average travel time to work *slightly*. Across all residents of the County, commute travel would be increased by approximately 110,000 hours in a year. Longer travel times are associated with higher rates of obesity, stress, and musculoskeletal pain, and decreased community connection and rates of physical activity.

C) Plan Alternative C would offer the *largest increase* in travel time to work. Across all residents of the County, commute travel would be increased by approximately 220,000 hours in a year. Without mitigations from municipal and business leaders, residents would face longer distances to popular destinations that are accessible only by driving. Thus, health effects such as lack of physical activity, stress from driving, shoulder and back pain, and lack of connection to others are likely to result.

Recommended Health–Promoting Mitigations:

- Implement policies to encourage walking and biking, such as construction of pedestrian facilities (e.g., sidewalks).
- Increase incentives for carpooling.
- Increase frequency and accessibility of public transit.

Other mitigations to decrease time traveled to work would not likely to promote health. These include increasing development of roads and increasing industrial development aware from urban centers.

ST.2.a Proportion of commute trips made by public transit

Health-Based Rationale

In California, about 20 percent of those working in office buildings near rail stations regularly commute by transit, nearly three times transit's modal share among those working away from rail stations. Mode choice models reveal that office workers are most likely to rail-commute if frequent feeder bus services are available, employers help cover the cost of taking transit, and parking is in short supply.[33] While Humboldt County does not have a public rail system, if buses were more available and residents lived and worked close to bus stops, it follows that residents would potentially use a public transit system.

Americans who use public transit spend a median of 19 minutes daily walking to and from transit; 29% achieve more than or equal to 30 minutes of physical activity a day solely by walking to and from transit,[34] enabling them to reach the recommended amount of physical activity (30 minutes a day, five times a week) simply by taking public transit. Further, 16% of all recorded walking trips are part of transit trips, and these tend to be longer than average walking trips, according to an analysis of US travel survey data.[35] Thus, those taking public transit reap the health benefits of exercise and physical activity, i.e., reduced risk for cardiovascular disease and diabetes, increased strength for bone health, decreased risk of cancer, and decreased risk of depression.

Taking public transportation aids in decreasing isolation and encourages what city planning advocate Jane Jacobs referred to as casual contact from unplanned social interactions.[36] Socially isolated people die at two or three times the rate of people with a network of social relationships and sources of emotional and instrumental support.[37]

Additionally, public transit use (instead of driving) reduces noise and air emissions from cars. Environmental noise, mostly from transit, is associated with increased annoyance, stress, decreased sleep and concentration, poor school outcomes, and heart disease.[38] [39] [40] Reductions in driving can also improve air quality and thereby reduce respiratory disease.[41] Additionally, reduction of emissions, including greenhouse gasses, can help reduce global warming. The effects of global warming could have significant health impacts including issues related to heat, extreme weather events, and the spread of vectors that carry infectious disease.[42]

Last, taking public transit is cheaper than owning a car. A household with 2 adults that use public transit saves an average of $6,251 per year compared to an equivalent household that owns 2 cars.[43] The savings associated with taking public transit can be used for other necessities including healthcare, food, housing and clothing, and thereby lead to improved health through mechanisms associated with those, which are discussed elsewhere in this report.

Existing conditions

Public Transit Use: One percent of commute trips in Humboldt County are made by public transit. Many of the car-less households in Humboldt County do not have access to public transportation.[44] Approximately 24 percent of residents in the County do not or cannot drive (96,065 licensed drivers of 126,518 total population).[45] The table below details public transit use by location in the County.

Table ST.2. Use of Public Transit to Travel to Work (2000 Census)

Although not many people take public transit, more people in urban centers do so. Where public transit is more easily accessible, residents use it more often. Further evidence of higher use of public transit in more urban or higher residential density areas comes from some US Census 2000 data:

Arcata County Congressional District		In "Arcata City"
Take car, truck, van:	75.4%	70.1%
Public transit:	1.9%	2.4%

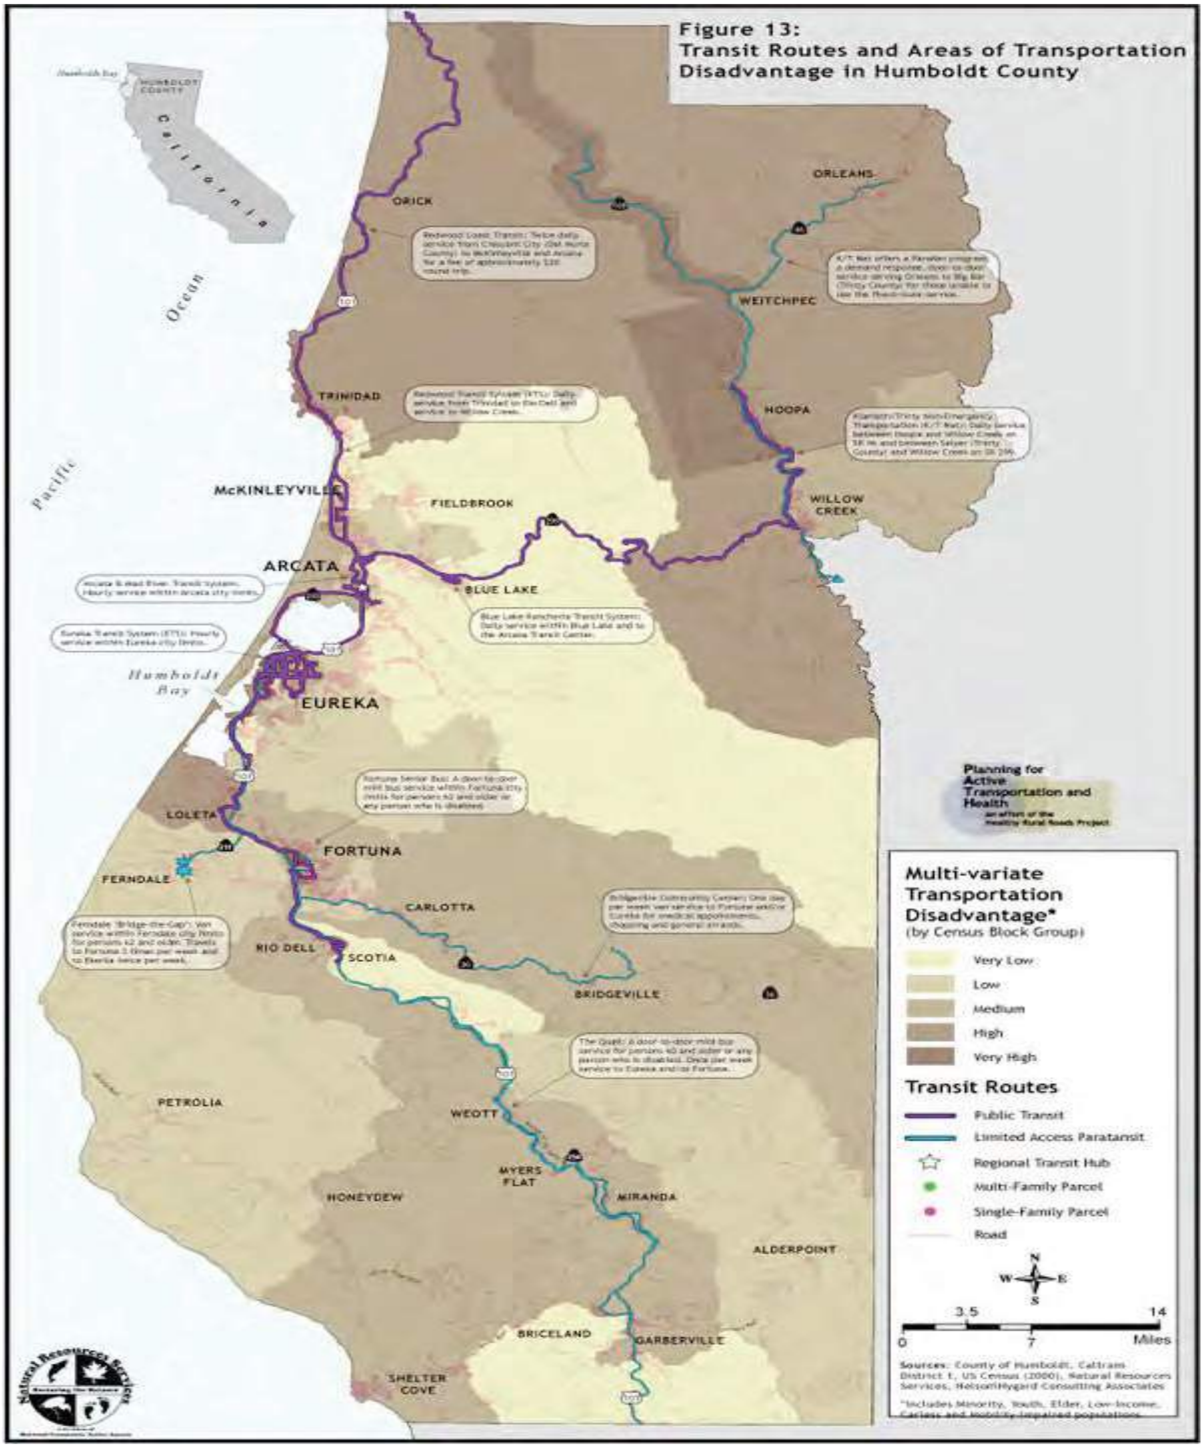
Eureka County Congressional District		In "Eureka City"
Take car, truck, van:	86.9%	83.1%
Public transit:	1.4%	1.9%

Garberville County Congressional District	
Take car, truck, van:	80.9%
Public transit:	<<.01%

Transit Routes: The Humboldt Bay region has the most transit service coverage in the County. Those living outside the Bay region, however, face significant gaps in transportation services. Paratransit and other community services provide limited help to seniors and the disabled, but youth and other members of the community are not eligible to take advantage of these services.[46] The map below shows existing transit routes.

[46] Natural Resources Services. 2006. Humboldt Country Transportation Disadvantaged Population Report. Redwood Community Action Agency. Available at http://www.nrsrcaa.org/path/pdfs/HumCoTDPReport5_06.pdf. Accessed on January 11, 2008.

Figure ST.2. Transit routes.



Analysis

Assumptions

- Use of public transit depends on many factors including:
    - proximity to transit stops;
    - frequency of transit;

  - commute distance and time;
  - parking availability and cost;
  - traffic congestion, cost of driving;
  - cost of transit;
  - employer incentives;
  - safety of transit and of driving;
  - weather; and
  - hours of operation.
- It is assumed that there will be no increase in public transit funding, routes, or frequency.

<u>Logic</u>

- Denser neighborhoods already have more proximity to transit and therefore urban dwellers are more likely to take public transit.

<u>Quantitative Analysis</u>

Since use of public transit depends on many factors, not only proximity to transit stops, a quantitative analysis is not currently possible.

<u>Qualitative Analysis</u>

Many participants in the Health and GPU focus groups were passionate about the problems the current public transportation system poses for those wanting to use it. The list of issues that make public transportation use uninviting include:

- the fragmented nature of service;
- different municipalities' systems do not coordinate with each other;
- low rate of scheduled services in non-urban areas in particular;
- uninviting and at times dangerous stations for waiting for buses;
- cost;
- distance;
- weather;
- traffic patterns and pedestrian safety;
- hours of operation;
- availability of parking;
- availability of travel stipends/incentives provided by work or to low income families; and
- public Transit commute takes longer than private vehicle commute, which is like a lack of access issue.

Written comments on the Draft Circulation Element of the GPU have noted that the County continues to focus primarily on automobile transportation. This is understandable given the low rate of public transit use; however, without municipal support both philosophically and financially, public transit will never be embraced.

The Moving Goods and People background report for the GPU states that congestion and safety along the major roadways between Eureka and Arcata is a concern. The section of SR 101 between the two cities is the most heavily traveled segment of roadway in the county, averaging 35,000 average daily trips (ADT).[47] Plan Alternative A holds the most promise for reducing congestion; both Eureka and Arcata are fairly well-served by public transportation as well as goods and services, so with proper incentive, residents could take

[47] Dyett & Bhatia. 2002. Humboldt County 2025 General Plan Update. Moving Goods and People: A Discussion Paper for Community Workshops. Available at http://co.humboldt.ca.us/planning/gp/meetings/moving_gp/moving.pdf. Accessed on December 13, 2007.

existing bus routes to avoid congestion and stress.

Disparities

1. Lower-income populations tend to reply more heavily on public transportation than higher income populations.
2. Disabled populations may be unable to drive, thus proximity to services and greater access to public transit would benefit their mobility and general health. If public transportation is handicapped accessible and sidewalks are ADA-compliant, Plan Alternative A could be better for them.
3. Seniors citizens who are no longer able to drive rely more heavily on public transportation.

Conclusions

A) Given that public transportation as well as jobs and schools are much more available in urban areas with residential density, by locating new growth in these areas Plan Alternative A would *increase* use of public transportation. People who use public transportation are more likely to get recommended amounts of physical activity and reap the health benefits of exercise and physical activity, i.e., reduced risk for cardiovascular disease and diabetes, increased strength for bone health, decreased risk of cancer, and decreased risk of depression. Using public transit also can decrease isolation, reduce noise and air emissions from cars with all the attendant benefits to respiratory health and ability to concentrate.

B) The proportion of the population in urban vs. non-urban areas would remain similar to the current situation under Alternative Plan B, so this Plan offers the *least amount of change* with regard to how many people take public transportation, and thus the least amount of change in health outcomes due to physical activity, noise and air quality, and obesity related chronic disease.

C) Plan Alternative C would encourage more of the new residents to Humboldt County to locate in non-urban areas and this is likely to *decrease use of public transit* to work and to school, resulting in increases in obesity and related chronic disease such as diabetes, increased isolation, increased noise and air pollution effecting most pertinently respiratory health, and increasing Humboldt County's contribution to climate change.

Recommended Health-Promoting Mitigations:

- Improve amount and awareness of employer-based incentives for taking transit, including programs to purchase transit from before-tax income, employer-subsidized public transportation.
- Increase public transportation services into non-urban areas (paratransit or buses).
- Improve coordination between public transit agencies.
- Pursue private-public partnerships and streamline opportunities for employers/institutions to fund transit service that benefits their populations.
- Consider a variety of vehicle types to serve different types of needs (not everything has to be an industrial feeling large bus with a few passengers).
- Develop transit-oriented streetscape and building design standards for key transit nodes and corridors, partially funded via development impact fees.
- Reduce parking requirements for new developments, thus reducing incentives to have more cars.
- Unbundle cost of parking from housing units.

ST.2.b Proportion of households with 1/4-mile access to local bus

Health-Based Rationale
Accessibility to public transport may influence Humboldt County residents to drive more. People who can easily access public transit, those who live near it for example, are more likely to use it. The Metropolitan Transportation Authority studied the transportation habits of people who live close to and farther away from public transit stations in the San Francisco Bay Area. They found that the following to be true:

- People who live within a ½ mile of a rail or ferry station are 4 times more likely to use transit than people living farther than a ½ mile.
- People who live within a ½ mile of a rail/ferry stop are twice as likely to walk and three times as likely to bike as residents living more than a ½ mile.
- People who live and work within ½ mile of rail/ferry stop use transit for 42% of their work commute trips. Those that live and work farther than ½ mile use public transit for 4% of their trips.
- Even those urban residents who were farther than one mile from rail/ferry stops are still twice as likely as suburban residents and four times as likely as rural residents to use transit.
- People living close to rail/ferry transit are twice as likely to walk for short trips.[48]

While this data comes from an urban study and examines proximity to rail or transit, the analyses are strong enough to assume that proximity to public transit of any sort would increase the likelihood of its use.

Research has found that proximity to public transit helps to determine travel choice.49 For any normal trips, only 10% of Americans will walk a distance of one-half mile. A recent study in King County, WA demonstrated that for every quarter mile increase in distance to transit, the likelihood of using transit fell 16%. Transit use promotes environmental health by reducing air pollution and greenhouse gas emissions from automobiles. People living in car-less households, or who are otherwise transportation disadvantaged, may rely on public transit or simply do without services, employment, education and social opportunities.

Existing conditions
Proximity to Bus Stops: Data from the US Census 2000 regarding several areas of Humboldt County illustrates that urban areas are far better equipped with bus access than non-urban arears.

Eureka: There are 11803 residential parcels and 37939 individuals. 10353 residential parcels are within ¼ mile of a public bus stop, thus 88% of the residents in Eureka are within ¼ mile of a bus stop.

Arcata: 4128 residential parcels are within ¼ mile of a public bus stop, representing 10873 individuals. 70% of the residents in Arcata are within ¼ mile of a bus stop (Mad River Transit Authority).
The Census does not count students in dormitories as being residents of Arcata.

Fortuna: There are 4058 residential parcels and 12471 individuals. 1152 parcels are within ¼ mile of a public bus stop, thus 28% of the residents of Fortuna are within ¼ mile of a bus stop (Humboldt Transit Authority).

South Bay: There are 2183 residential parcels accounting for 6575 individuals. 137 parcels are within ¼ mile of a public transit stop, thus 6% of the residents of the South Bay are within ¼ mile of a bus stop

---

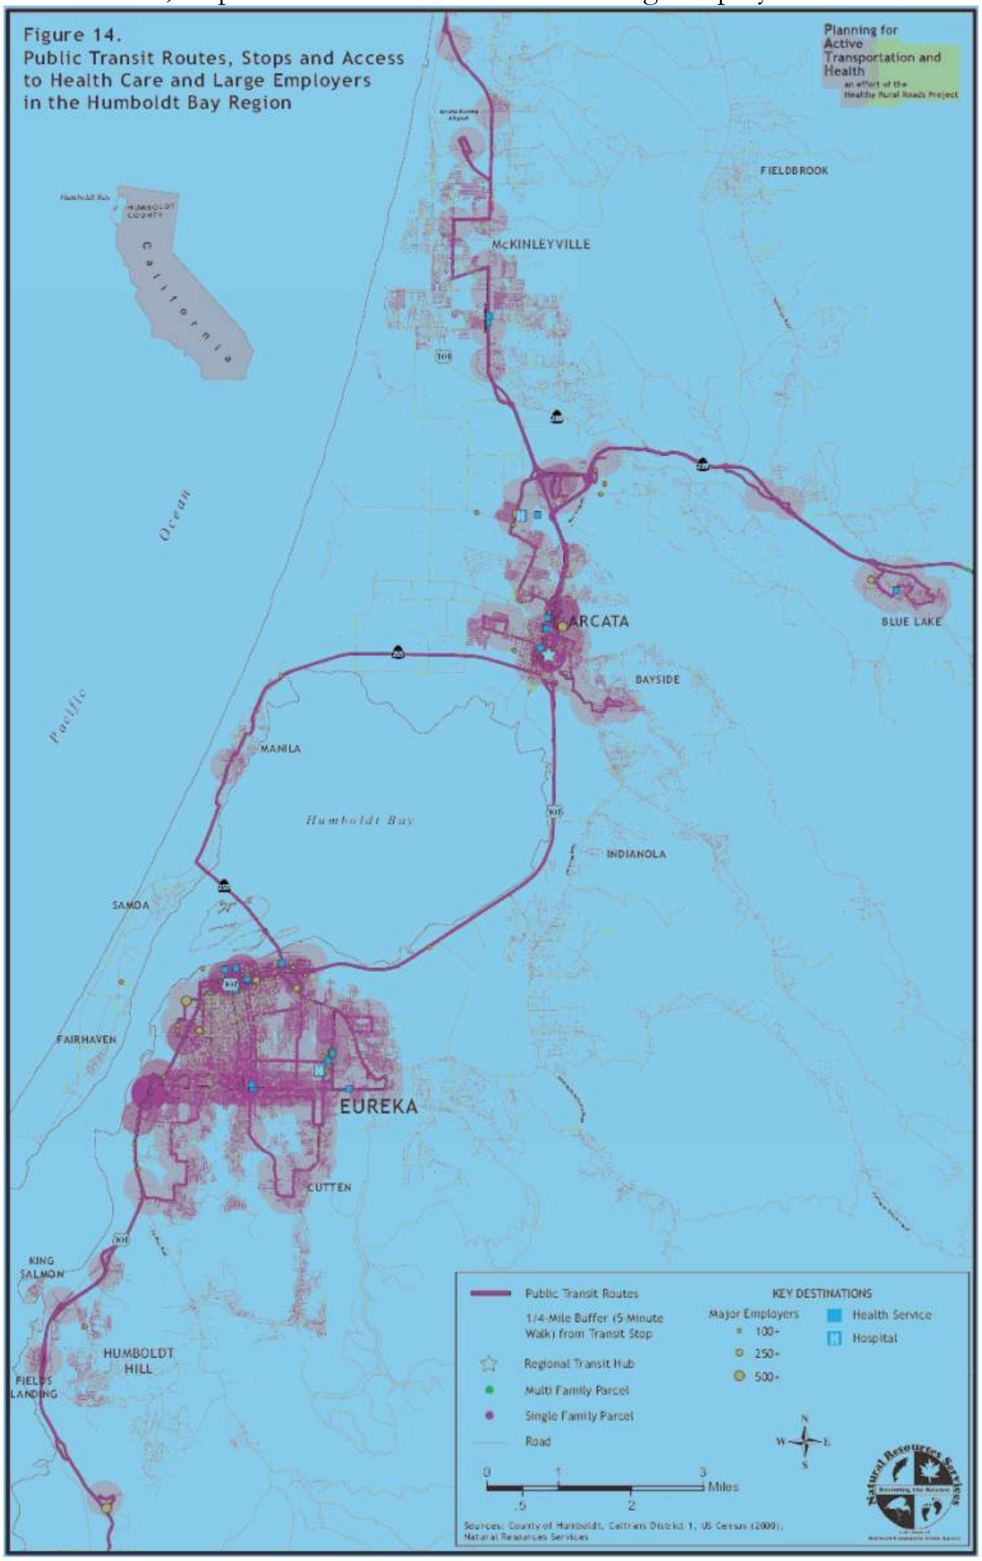
[48] MTC. 2006. Characteristics of Rail and Ferry Station Area Residents in the San Francisco Bay Area: Evidence from the 2000 Bay Area Travel Survey. Volume 1. Metropolitan Transportation Authority.
[49] Ewing R, Frank L, Kreutzer R. Understanding the Relationship between Public Health and the Built Environment: A Report to the LEED-ND Core Committee. 2006.

(Humboldt Transit Authority).

Hoopa: There are 259 residential parcels accounting for 2633 individuals. 28 parcels are within ¼ mile of a public bus stop. 11% of the residents of Hoopa are within ¼ mile of a bus stop (KT-Net). However, the KT-Net bus does not always strictly adhere to picking up and letting off passengers only at the listed bus stops. Pedestrians walking along Highway 96 are sometimes able to flag down the bus.
Note: The 1/4 mile access numbers refer to weekday schedules. There is reduced bus service on Saturday and virtually no service on Sunday.

The current population with ¼ miles access to public transit was mapped by in the Planning for Active Transportation and Health project in the Transportation-Disadvantaged Populations report of 2006. The figure below is taken from that report.

Figure ST.3. Transit routes, stops and access to healthcare and large employers.[50]



---

[50] RCAA. 2006. Humboldt County Transportation-Disadvantaged Populations Report. Redwood Community Action Agency, Natural Resources Services. Available at http://www.nrsrcaa.org/path/TDPReport.htm. Accessed on November 28, 2007.

Analysis

Assumptions

- Bus service will not be expanded.
- People in urban areas currently are within ¼ mile of a bus stop (see maps)

Logic

- Denser areas currently have more bus stops and nearby bus routes, therefore, denser areas will be served better in the future.

Quantitative Analysis

Currently, 51% of the population, or 64,409 of the 126,518 people, live in urban areas near bus stops.

Under Plan Alternative A, 14,400 people would come to the urban areas of Humboldt. Therefore 59% ((64,409+14,400)/(126,518+14,400)) of the future population would be near bus stops. Therefore Plan Alternative A *increases* the proportion of people who have ¼ mile access to public transportation.

Under Plan Alternative B, 14,400 people would come to the urban areas of Humboldt and another 14,400 would come to the non-urban areas. Therefore 51% ((64,409+14,400)/(126,518+28,800)) of the future population would be near bus stops. Therefore Plan Alternative B *does not change* the proportion of people who have ¼ mile access to public transportation.

Under Plan Alternative C, 14,400 people would come to the urban areas of Humboldt and another 28,800 would come to the non-urban areas. Therefore 46% ((64,409+14,400)/(126,518+43,200)) of the future population would be near bus stops. Therefore Plan Alternative C *decreases* the proportion of people who have ¼ mile access to public transportation.

Qualitative Analysis

Simple access to public transit is not the only determinant to its use. In qualitative discussions with focus group members, the importance of frequency of public transit, the public outreach about schedules and availability of public transit, coordination of scheduling between the various transit authorities, outreach and information about services entered the discussion as additional reasons as to why people do not use the bus system.

Participants in the Health and GPU focus groups felt:

- Better coordination between public transit agencies was needed, especially for access to medical services and for seniors.
- There are rural health clinics in both Redway and the hospital in Garberville. Transport should be coordinated between these sites.
- The size of vehicles should be appropriate to population being served.
- Noise levels decrease because there are less cars on the road with better public transportation.
- Casinos provide ready transportation and could be mobilized to be a resource for the general community.
- Lack of transportation options can lead to social isolation.
- Lack of access to transportation (either private vehicle or living on a transit route) leads to lack of access to employment, financial resources, health facilities, increased stress and reduced access to other needs
- There are no good options for taking public transit from Southern Humboldt to Eureka.

During HumPAL's Policy Charrette, an exercise about values in public transportation brought forth the following comments:

- Public transportation that is not scary is needed.
- A thorough and reliable public transportation would be valued.
- A "functional" public transportation is needed.
- Public transportation and facilities must be designed and programmed to encourage alternative transportation.
- Public transportation services must be coordinated.

Disparities

Those affected disproportionately by distance to bus stops (and thus use of public transit) are those who do not own cars: seniors, disabled, children, and low income residents of Humboldt County.

Conclusions

A) **Plan Alternative A *increases* the amount of people who would have ¼ mile access to bus routes from 51% to 59%.** People who live near public transportation tend to use it at an increased level, with health benefits accruing such as increased physical activity and increased social cohesion.

B) **Plan Alternative B will result in an almost equal proportion of people with access to public transit bus routes as currently have them**, although the increase in population implies that overall more people will have access. Accordingly, more people will also drive private vehicles.

C) **Plan Alternative C would result in a decrease in the amount of people who have ¼ mile access to bus routes in Humboldt County from the current 51% to only 46% of the population**. Health hazards from driving private vehicles, such as increased risk of injury from traffic accidents and lack of exercise, will thus accrue for the majority of the population.

Recommended Health-Promoting Mitigations:

- Increase investment in public transit to extend bus service to new areas.
- Improve frequency of service, especially in urban areas.
- Study bus stop spacing and locations in order to make sure bus stops are in the right places and within walking distance of population.
- Develop standards for transit shelter amenities (seating, schedules, etc) tailored to local conditions/resources.
- Extend the usefulness of privately-funded shuttles (casinos, social service providers, etc.) to make additional loops/stops to supplement and coordinate fixed-route transit.
- Better coordinate existing fixed-route transit services (schedules, hubs, marketing, fares).
- Limit availability of parking except by transit hubs.
- Encourage employee and public subsidies for public transit.
- Improve hours of operation of existing public transit to ensure that it is most useful for commute trips to work and school.

ST.2.c Proportion of average income spent on transportation expense

Health-Based Rationale

A high proportion of income put toward transportation can mean that a family has less money to spend on healthful choices. In low-income households particularly, high transportation expenditures reduce the amount households have to spend on housing, food, health care, insurance, education and other needs. Prohibitive transportation costs can interfere with employment prospects, economic self-sufficiency and access to health-promoting services. For example:

- 35% of Californians in 2002 did not have health insurance, and those without health insurance are much more likely to go without preventive care.[51] Transportation costs could be a factor in paying for health insurance.
- Those that have less money tend to be more obese, reflecting nutrition choices that are not as healthy. In National Center for Health Statistics data for 2001-2004, approximately 35% of those making less than 200% of poverty level are obese, while 30% of those making above 200% of the poverty level or more are obese.[52]

Taking public transit is cheaper than owning a car. In the United States, a household with 2 adults that uses public transit saves an average of $6,251 per year compared to an equivalent household that owns 2 cars.[53] Poor rural households are three times more likely to be without a car than non-poor rural households. However, public transportation serves only about 60% of counties nationwide, and 28% of those counties have limited service.[54]

Existing conditions

Transportation as a percent of income. Based on transportation costs for the Western Region and the average income in Humboldt County ($33,093), 27% of the average income before taxes is spent on transportation expenses. This compares to 15% in the Western Regions of the US.[55]

Transportation Costs in California. The table below shows transportation costs in California.

In urban areas low-income households allocated a smaller proportion of their household expense to transportation than in higher-income households, which were more likely to incur the expense of car ownership.[56]

Table ST.3. Median Annual Transportation Expenditures for California Households.[57]

	Low-Income Households		All Other Households	
	Dollar Amount	% of Household Budget	Dollar Amount	% of Household Budget
Transportation expenditures for all households	2,164	13	6,569	15
Public transit expenditures for transit users	360	2	434	1
Private vehicle expenditures for vehicle users	3,586	19	7,144	16

Analysis

Assumptions

- The average income in Humboldt County will remain relatively constant in relation to transportation expense in the region.
- People living in denser areas spend less on transportation, because employment and services such as schools and grocery stores are located near housing.
- Public transportation will continue to be relatively unavailable to those in outlying areas of the County.

Logic

- People living in non-urban areas need to own a car and need to drive more to access jobs, goods and services. It takes on the average $6000 - $9000 *nationally* a year to own and operate an automobile.[58] That alone accounts for almost 27% of the average income in Humboldt County.
- In urban areas, people can walk, bike or take public transit more – all these are cheaper.

Quantitative Analysis

The average Californian spends about $7,144 annually on private vehicle expenditure. There is no data on the location (urban vs. non-urban) of Humboldt residents that do not own a car. While the median household income for the different areas of Humboldt County is known, there is no data specifically on how much they spend on transportation, and current research into non-urban transportation has not looked into the average cost of transportation for the non-urban resident. A quantitative analysis is therefore not possible.

Conclusions

A) In Plan Alternative A, more population will live in proximity to schools, services, cultural offerings, jobs and retail outlets and are more likely to walk, bike or take public transportation. Thus, **expenses for transportation would decrease**, and Humboldt County residents would

[57] Public Policy Institute of California. July 2004. Research Brief: How much do California's Low-Income Households Spend on Transportation? Public Policy Institute of California. Available at www.ppic.org. Accessed on January 13, 2008.
[58] Planning for Active Transportation and Health. 2006. Humboldt County Transportation Disadvantaged Populations Report. Natural Resources, Redwood Community Action Agency. Availabe at http://www.nrsrcaa.org/path/pdfs/HumCoTDPReport5_06.pdf. Accessed on March 3, 2008.

have more income available for healthy choices, such as preventative health care, good nutrition, physical activity, and education expenses.

B) A moderate increase in people who live in settings encouraging automobile use takes place in Plan Alternative B, so **expenses for transportation would change little or increase slightly**.

C) Under Plan Alternative C, Humboldt residents would be most automobile dependent and therefore have **higher transportation costs**. People spending more on transportation have less money to spend on healthful choices such as nutritious food, relaxation, preventive health care, and education.

Caveats

Average transportation costs could be lowered by encouraging mixed-use development in currently developed areas and adopting policies that encourage less expensive transportation modes: walking, biking and use of public transportation.

Recommended Health-Promoting Mitigations:

- See other indicators for mitigations that would increase use of public transit, walking and biking as ways to decrease cost of transportation.

ST.3.a Ratio of miles of bike lanes/ pedestrian facilities to road miles

Health-Based Rationale

Sidewalks, roadway shoulders or other types of pedestrian facilities can enable people to walk and potentially decrease the number of pedestrian injuries. A high quality pedestrian environment can support walking both for utilitarian purposes and for pleasure. Recent studies in the U.S. show that people walk on average 70 minutes longer in pedestrian-oriented communities.[59] [60] Additionally, clearly delineated bike lanes can enable bicycle use and potentially decrease the number of bicyclist injuries.

Biking and walking can help people meet minimum requirements for physical activity. Health benefits of physical activity include a reduced risk of premature mortality and reduced risks of coronary heart disease, hypertension, colon cancer, and diabetes mellitus.[61] Regular physical activity also appears to reduce depression and anxiety, improve mood, and enhance ability to perform daily tasks throughout the life span.

Unsafe traffic mixes of motor vehicles, pedestrians, and cyclists lead to increased risk of injury and death (also, see Indicator ST.8 below).[62] Traffic volume increases the risk of pedestrian, cyclist and motorist injury and death, with pedestrians, cyclists, and motorized two-wheeled vehicle users bearing a disproportionate share of road injury burden.[63] [64]

Unlike driving, biking and walking do not contribute to noise or air pollution emissions. For the general population, long term exposure to moderate levels of environmental noise can adversely affect sleep, school and work performance, and cardiovascular disease.[65] Noise affects sleep both by waking people up and reducing the quality of sleep. According to the World Health Organization, reductions of noise by 6-14 dBA result in subjective and objective improvements in sleep. Chronic road noise can affect cognitive performance of children including difficulty keeping attention, concentrating and remembering, poorer reading ability, and poorer discrimination between sounds.[66] Noise is also associated with higher stress and stress hormone levels.[67] In addition, increased rates of biking and walking may reduce driving trips, which can have an impact on air quality and thus, respiratory disease. According to the California Air Resources Quality Board, about half the air pollution in California is caused by cars and trucks.[68]

Existing conditions

Definitions of Class I, II, and III bicycle facilities. Class I bicycle facilities, typically referred to as a multi-use path, provide for bicycle and pedestrian travel on a paved right-of-way completely separated from any street or highway. The Caltrans design criteria require a minimum width of 8 feet for a two-way path. Class II bicycle facilities are often referred to as bike lanes. They provide a striped and stenciled lane for one-way travel on a street or highway. The minimum width of a lane is 4 feet. Class III facilities are generally referred to as bike routes. They provide for shared roadway use with motor vehicles and pedestrian traffic (not recommended), and are identified only by signing.

According to the HCOAG Regional Transportation Plan Update from 2006, all state highways have a Class II or III bike lane or shoulder (but may be 4 feet or less in some cases).[69] However, residents report a different experience; residents state that not all state highways have a bike lane or shoulder. Given that a 4 foot or less shoulder on a state highway is not healthfully bikeable, in this report we quantified only Class I or II bicycle facilities.

Humboldt County Road miles. There are 378 miles of state highways and 1400 miles of local city streets and county roads in the County.[70]

Total Miles of Bicycle Facilities. There are 387.9 miles of bike facilities in northern Humboldt, 22.7 in Southern Humboldt. This includes all 3 classes of bike facilities. 36.5 miles of these are Class I (30.5 miles of those are in northern Humboldt), 18.2 are class II (all of which are in northern Humboldt), and 356.1 are Class III.[71]

County ratio of bike lanes to roads. Currently, the ratio of all bike lanes to roads is 0.23 (410.6/1778). The ratio of Class I facilities to roads is 0.02, Class II to roads is 0.01 and Class III to roads is 0.20.

Location of bicycle and pedestrian facilities. The "Moving Goods and People" background report to the General Plan Update acknowledges that bike and pedestrian facilities are most commonly provided in the urban areas. The report also points out that many of the bike lanes do not meet current state standards (although programs are underway to improve the bicycle network) and pedestrian facilities meet only the minimum standard for the Americans with Disabilities Act, but have obstructions which force pedestrians and wheelchair users into road shoulders or bike lanes.[72]

Analysis

Assumptions

- There will be no increase in pedestrian and bicycle facilities (sidewalks, shoulder, bike paths, lanes, and routes).
- Plan Alternative A would allow for the least amount of new road construction while Plan Alternative C would require the most.

Quantitative Analysis

---

[69] Telephone conversation with Lindsay Walker, CalTrans District 1 contact for bicycling.
[70] HCAOG 2006 Regional Transportation Plan Update.
[71] HCAOG. 2004 Regional Bicycle Transportation Plan Update. Humboldt County Association of Governments. Available at http://www.hcaog.net/docs/RBT.2004/TOC.htm. Accessed on January 22, 2008.
[72] Dyett & Bhatia. 2002. Humboldt County 2025 General Plan Update. Moving Goods and People: A Discussion Paper for Community Workshops. Available at http://co.humboldt.ca.us/planning/gp/meetings/moving_gp/moving.pdf. Accessed on December 13, 2007.

The Plan Alternatives do not currently specify how much new road construction would take place in the 3 Alternatives, making quantification impossible.

Qualitative Analysis

In 2003, a survey of Humboldt County residents was taken in relation to their opinions about many aspects of living in Humboldt County. 368 people responded and of those, 69 percent felt that the County should provide walking and biking paths closer to existing communities. The same survey asked residents why they chose to live in Humboldt County, and 62% stated that closer access to outdoor recreation including bicycling was a major reason why they live in Humboldt.[73]

People who participated in the Policy Charrette Values Exercise about biking/walking desire bike paths in the inner city, bicycling/walking opportunities and a culture that encourages these activities, exercise in everyday lifestyle, and a bike path from Arcata to Eureka.

People participating in the Health and GPU focus groups also understood the connection between land use planning that prioritized non-motorized forms of transportation and health. Participants understood that connected bike/pedestrian networks increase physical activity and reduce cardiovascular disease, diabetes and stress. They also felt that it is necessary to count the number of miles of non-motorized transportation routes and multi-use trails, and the number of bicycle-friendly roads to keep track of and encourage construction and maintenance of these.

When asked "How do land use decisions impact safe and quality environments for walking and biking?" participants noted: speed limits; safe, dry places to put bikes; lighting; traffic signals that are pedestrian and bike friendly; bike lanes that are marked, designated, mapped, identified in all communities and connecting communities; road corridors dedicated per mode (e.g. bike-only areas) or bike boulevards; continuous safe corridors; creating sidewalks; bike safety education; cross-walks that are well marked; and bike lanes in each village.

Disparities

The availability of safe places to walk and bike impacts those populations who do not rely on cars as much as other modes of transport. This includes children, seniors, the disabled, and low income residents.

Conclusions

A) **Plan Alternative A would result in the *smallest change* on ratio of bike lanes/pedestrian facilities to road miles.** By locating new residents in areas with existing road infrastructure, Plan Alternative A requires no increase in road construction, thus no change in the ratio of bike/pedestrian facilities to road miles.

B) **Plan Alternative B would result in a *slightly lower ratio* of bike/pedestrian facilities to road miles due to some *increase* in number of road miles with development.** Since most of the health benefits of having bicycle and pedestrian facilities are from increased physical activity, the decreased ratio of facilities for walking and biking would result in increased rates of chronic disease due to lack of physical activity, such as cardiovascular disease and diabetes.

C) **Plan Alternative C would result in the most significant *decrease* in the proportion of**

[73] 2003. Humboldt County General Plan Update Survey Results. Humboldt County Community Economic Development Services and Planning. Available at http://co.humboldt.ca.us/planning/gp/survey/results.htm. Accessed on November 18, 2007.

bike/pedestrian facilities to road miles due to the *largest increase* in road miles with development (residential, commercial and industrial). Thus, the health hazards related to decreased physical activity are likely to be the most significant with Alternative Plan C.

Recommended Health Promoting Mitigations:

- Redirect money that goes to cars to support alternative forms of transportation.
- Reduce speed limits on arterials, collectors, and local roads in non-urban areas.
- Establish a seat on HCOAG representing human-powered transport.
- Prioritize non-motorized modes of transportation in land use planning and construction (i.e., build more sidewalks and bike lanes).
- Raise the priority of non-motorized modes of transport in land use planning. For example, develop building design standards and revise zoning codes to emphasize pedestrian/bike safety, especially on key pedestrian, bike and transit corridors. Zoning codes to consider include those that look at: mixed use zoning, human activity presence, the building/sidewalk interface, parking design, and lighting.
- Develop streetscape standards that emphasize pedestrian and bike safety (e.g., lighting, trees, greenery, traffic calming measures).
- Collect data about pedestrian facilities throughout Humboldt County, much like information is tracked about the amount and condition of road surfaces; make this data public and use this data to guide development of pedestrian facilities;
- Promote and publish safe pedestrian and bike routes.
- Fund a bicycle and pedestrian safety staff position for the County, in HCOAG for example.
- Complete, build out and connect bike and pedestrian networks.
- Institute traffic calming measures, including clearly marked bike and pedestrian routes, bike boulevards, bulb outs, median islands on two or more lane streets, in urban areas to decrease speeds and firmly separate pedestrians/bikers from motor vehicles;
- Include paved shoulders on all roads in non-urban areas that can be used by bicyclists and pedestrians.
- Raise the priority of funding for trails and active recreation infrastructure and facilities.
- Increase the number of bicycle and pedestrian safety programs in schools and workplaces.

ST.3.b Proportion of commute trips and trips to school made by walking or biking

Health-Based Rationale
The health benefits of physical activity are well known: decreased risks for heart disease, diabetes, hypertension, and colon cancer, as well as an increased sense of well-being.[74] For children, benefits include also the importance of strengthening bones during a period of critical growth, increased confidence and self-esteem, and decreased risk of childhood obesity rates, which have skyrocketed over the past 30 years. Currently in the US, about 15% of children and adolescents can be labeled as having childhood obesity,[75] and up to 30% of adult obesity cases started in childhood.[76] In Humboldt County, 21.7% of adults are considered obese.[77] This is higher than California's rate of 19.1%, and also higher than the Healthy People 2010 objective of having only 15% of the population being obese.

Walking or biking to work or school helps people meet their daily requirements for physical activity. Health benefits of physical activity include the above–mentioned physical advantages, and physical activity also reduces depression and anxiety, improves mood, and enhances ability to perform daily tasks throughout the life span. A study in Gainesville, Florida, a region of the state with a fairly low population density and an average trip to school of just under 5 miles, looked at what would happen if you were able to change the features of the built environment to encourage walking to school. They found that with a 25 percent decrease walk time for the trip to school, the percent of those who walked increased from 4.5% to 5.5%. With a 25% decrease in biking time, the percentage who bike increased from 3.4% to 4.4%.[78] Through a simulation, the study also found that if the distance to school decreased to a 10-minute walk or 0.5 miles, the percentage of those who would walk increased by 129 percent, from 4.5% to 10.3%. For bicycling, by decreasing bike time to 2.5 minutes or 0.5 mile, the amount of children that biked to school increased from 3.4% to 11.1%, or a 226% increase.

Existing conditions
Percent of commute trips made by walking or biking, According to the 2000 Census, 8% of all commute trips in Humboldt are made by walking or biking,. The table below shows how many people choose walk or bike to work. In a comparison between urban and non-urban areas, more information would be necessary to understand differences between areas (e.g., Garberville and Redway). However, in looking at the increase in walking and biking when one lives in the central city vs. a Census County Division (CCD) of a city (a larger geographic area), it is instructive that those in the central city walk or bike more. According to the Census data and using the classification system described in the Summary Introduction, 9.0% of urban residents walk to work, while only 2.1% of non-urban residents do so.

Reasons for walking. In a survey of Humboldt County residents for the Pedestrian Needs Assessment of 2003, 53% of those surveyed stated that they walk daily, and the most commonly chosen response as to why they walk was for recreation (85% chose "recreation", 54% chose "shopping", 39% chose "work", 15% chose "school", and 9% chose simply "transit"). Given the survey results, it is likely that the US

Census information about people walking is low. The only question the Census asks is how people get to work.

Table ST.4. Percent of people who walk or bike to work[79]		
Area	**Walk**	**Bike**
California	2.9%	0.8%
Arcata CCD *	13.0%	4.2%
Arcata city	17.0%	5.2%
Eureka CCD *	5.4%	1.3%
Eureka city	7.7%	1.7%
Fortuna	3.6%	1.9%
McKinleyville	1.4%	1.6%
Garberville CCD *	8.5%	0.6%
Redway	16.5%	0
Hoopa	3.1%	1.6%

* Census County Division

Reasons for not walking. Of those surveyed in the Pedestrian Needs Assessment, 27% stated that they did not walk because of safety concerns, 24% spoke of a lack of sidewalks, 21% said time was an issue, and 14% said having too much to carry entered into their choice.[80]

Walking to school. National data shows that in 1969, 50% of children walked to school. Today, only 12% walk to school.[81] In California in 2000-2001, 15.2% of children aged 0 – 17 walked to school and 1% biked.[82] For students in Humboldt County, 3% walked to school in 2006-07, and 14% biked (see chart below). Parents reported that long distances to school were the primary barrier to walking to school in a 1999 Centers for Disease Control survey,[83] and one of the highest ranked indicators of willingness to walk for all ages was 'trip distance' in a national meta-analysis.[84]

The figure below details transportation mode for trips to school.

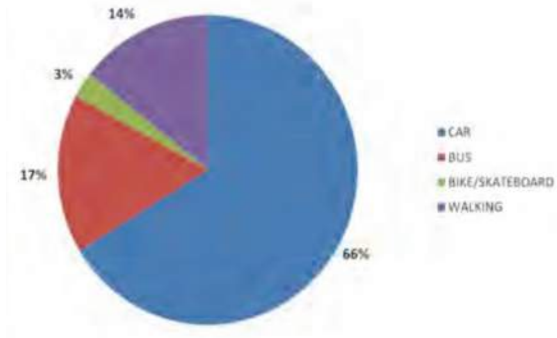
Figure ST.4. Transportation to school from the Humboldt County 2006-2007 Student BMI Study.[85]



Analysis

Assumptions
- Families with children will choose to live in cities at the same rate as others.

Logic
- A higher percentage of the population lives within walking/biking distance to schools in urban centers and a higher percentage of the population lives close to their workplace in urban centers.

Quantitative Analysis
Using the numbers above and classifying urban and non-urban as described in the Summary Introduction, 9.0% of the 64,409 people live in urban areas and 2.1% of the 62,109 people who live in non-urban areas walk to work. Therefore, the current county-wide percentage of those who walk to work is 5.6%.

With Plan Alternative A, 14,400 people would come to the urban areas. This would increase the percent of people who walked to work to 6% (9% of 78,809 + 2.1% of 62,109 divided by 140,918, the total population). Using similar analysis, with Plan Alternative B, 14,400 people would come to the urban areas and the same number would come to non-urban areas. Therefore the percent of people who would walk to work would remain the same, 5.6%. With Plan Alternative C, 14,400 people would come to the urban areas and the 28,800 would come to non-urban areas. Therefore the percent of people who would walk to work would decrease to 5.3%.

Conclusions

A) **Plan Alternative A, if adopted, would increase the number of people walking to work from 5.6% to 6%.** More Humboldt County residents would accrue the positive health benefits from walking to work of increased physical activity, decreased incidence of obesity and depression, better bone health, and enhanced ability to perform daily tasks throughout the lifespan.
B) **Plan Alternative B would mean that the percentage of those walking to work would remain virtually the same**, with no change on average in health status as a result of walking to work.
C) **Plan Alternative C would result in fewer people walking to work to only 5.3% of the population.** More people would not get a recommended amount of physical activity, thus incurring higher rates of chronic disease and depression.

[85] 2006-7 Humboldt Student BMI Study (DHHS).

Recommended Health-Promoting Mitigations:

- Ensure land use planning, including designs of residential neighborhoods, encourage walking and biking (i.e. with sidewalks and bike lanes and crosswalks);
- Implement educational program for residents regarding walking/safe routes to schools.
- Urban centers should offer companies incentives for locating in cities, increasing the chance that more of the population can access work by walking or biking.

ST.3.c Number and rate of bicycle/pedestrian injury collisions

Health-Based Rationale

Traffic injuries are a major cause of disability and death. Nationally, 12.6% of all traffic fatalities were pedestrians.[86] Vehicle volume predicts pedestrian injury rates. For example, in Boston's Chinatown, there were 3-5 more pedestrian injuries for each increase of 1,000 vehicles.[87] Speed also predicts pedestrian injury; the risk of child pedestrian injury was 3.6 times higher if the vehicles were traveling at high speeds in one study.[88] While pedestrian risk decreases with pedestrian flow, it is also true that greater population density is related to higher pedestrian injury.[89] [90]

Finally, while there are more pedestrian/auto accidents in urban areas simply because there are more people and more cars, the risk of fatality in a rural area is double or even triple the rate in urban areas (depending on what type of road the crash occurs). Very few of those fatalities occur on highways; more occur on collector and local roads, where there are more pedestrians.[91]

Existing conditions

Injury Collisions. According to the HCOAG Pedestrian Needs Assessment of June 2003, there were 163 injury collisions in Humboldt between 1999 and 2002, 10 of which were fatalities. Of those, 88 (54%) of the injury collisions were in Eureka and 24 (15%) were in Arcata.[92]

Location of Injury Collisions. The maps below shows the locations of injury collisions. Many pedestrian collisions in Eureka take place along Route 101, where traffic speed is slightly higher, although collisions are scattered throughout the city. In Eureka, 20 of the 88 collisions were on Route 101 (where it is called 4th and 5th Streets).[93]

Urban vs. Rural Statistics. The National Safety Council estimates that 85.7% of all *non-fatal* pedestrian crashes in the United States occur in urban areas and 14.3% occur in rural areas.[96] The number of traffic related *fatalities* (pedestrian, bicyclist, AND motor vehicle fatalities) in the US in 2005 was 24,837 in rural areas and 18,606 in urban areas (i.e., 56% of the *fatalities* were in rural areas and 44% were in urban areas), despite the fact that the rural population is only 21% of the US.[97] 72% of all *pedestrian fatalities* in 2003 occurred in urban areas.[98]

The figure below shows data from the Fatal Accident Reporting System, the National Highway and Traffic Safety Administration and the National Center for Statistics and Analysis. It demonstrates the higher amount of rural fatalities regarding motor vehicle collisions.

Analysis

Assumptions

- There will be few changes in traffic laws.
- There will be no mitigations implemented regarding pedestrian and bike safety.

Logic

- In areas with large numbers of people walking and more traffic, risk of pedestrian injury collisions increases.

Quantitative Analysis

The only numbers available are that there were 163 crashes involving pedestrians in Humboldt County; unfortunately, the Humboldt County Association of Governments report does not break down the location of injuries specifically except to say that 112 of them were in either Eureka or Arcata. Therefore it is impossible to quantitatively predict the future number of injury collisions and pedestrian injuries.

Qualitative Analysis

Many of the participants in the Health and GPU focus groups gave witness to the dangers of walking along non-urban roads that do not have proper pedestrian facilities (i.e., sidewalks or shoulders). Many participants said that they do not walk in those areas due to fear of injury.

People who participated in the Policy Charrette Values Exercise about biking/walking desire that it is safe to walk everywhere in the County, that neighborhoods are walkable and likeable, putting people before cars, and that they rarely need to drive their cars.

Humboldt County residents have already recognized that pedestrian safety is important by making it the first goal in the Pedestrian Needs Assessment Study Update 2003[100]:

GOAL 1: Make Humboldt County a pedestrian safe environment.

- Objective A: Safety. Maximize safety for pedestrians and all other roadway users alike.
- Objective B: Conflicts. Minimize potential conflicts between pedestrians, motor vehicles, and bicycles.

[99] NCSA, NHTSA, FARS 1994-2005.

[100] HCOAG. 2003. Humboldt County Regional Pedestrian Needs Assessment Study Update. Humboldt county Association of Governments.

Disparities

- Pedestrian collisions are more common in low income areas. This could reflect greater residential density, greater traffic volume, lower auto ownership, and/or greater number of alcohol outlets.[101]
- The only non-urban area mentioned in the Pedestrian Needs Assessment that had a slightly higher rate of pedestrian collisions was Hoopa.
- Children, particularly boys aged 5-9, are the most at risk for crashes as they tend to dart out into the street. The rates of crashes with older people tends to be lower, perhaps reflecting that older people walk with more caution. However, when an elderly person is struck by a vehicle, the odds of them dying are higher than other ages. There is a 20% risk of dying for those struck who are over age 75 versus 8% for those under age 14.[102]

Conclusions

A) Under Plan Alternative A, **pedestrian injury due to collisions with motor vehicles may decrease, given research that shows that when pedestrian/bike volume increase enough, it causes drivers to either slow down or take other routes.[103] Without reaching this critical point, however, there could be an increased risk of pedestrian injury due to the increase in vehicle volume in urban areas. Overall, there would be a lower risk of pedestrian *fatality*** as speeds in urban areas are lower; the literature tells us that motor vehicle collisions with pedestrians are more often fatal in non-urban areas and areas with higher speeds.

B) Plan Alternative B would result in the **smallest change in pedestrian injury and fatality**, however there may be some slight increase simply due to a population increase. More people, especially more people outside of urban centers, implies more cars, more driving, and more accidents.

C) Under Plan Alternative C, **pedestrian injury would potentially *increase* due to the increased population in non-urban areas traveling to cities for goods and services.** There may also be an *increase* in pedestrian fatality as there will be more people driving in non-urban areas at higher speeds.

Recommended Health-Promoting Mitigations:

- Institute traffic calming measures, including clearly marked bike boulevards, bulb outs, median islands on two or more lane streets, in urban areas to decrease speeds and firmly separate pedestrians/bikers from motor vehicles.
- Increase amount and quality of pedestrian facilities in urban areas.
- Reduce speed limits on arterials, collectors, and local roads in non-urban areas.
- Improve signage in both non-urban and urban areas.
- Improve and encourage use of public transportation to reduce driving.
- Develop streetscape standards that emphasize pedestrian and bike safety (lighting, trees, greenery, and traffic calming measures).
- Develop building design standards and revise zoning codes to emphasize pedestrian/bike safety, especially on key pedestrian, bike and transit corridors. Zoning codes to take into consideration are those that look at mixed use zoning, human activity presence, encouraging building lines to embrace the sidewalk, require better parking design, lighting).

[103] Jacobsen PL. 2003. Safety in numbers: More walkers and bicyclists, safer walking and bicycling. Inj Prev 9:205-9.

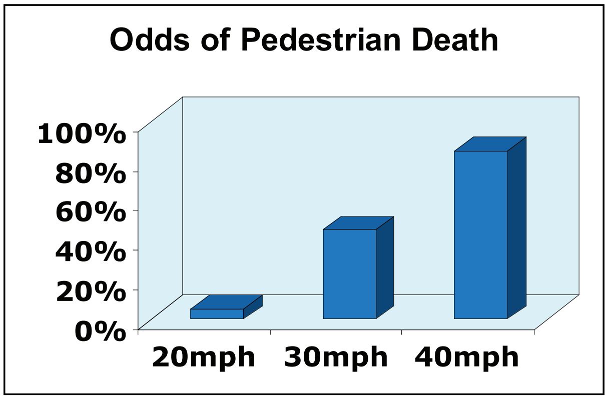
- Improve signalization of crossing and routes.
- Clearly mark and classify bike and pedestrian routes.

ST.3.e Proportion of population living on residential streets with less than 35 mph speed limits.

Health-Based Rationale

Vehicle speed predicts severity of pedestrian injuries. With vehicle speeds below 20 mph the probability of serious or fatal injury is less than 20%; with speeds above 35 mph, most injuries are fatal or incapacitating.[104] [105] Excess and inappropriate speed is widespread and may contribute to around 30% of road traffic crashes and deaths. An average increase in speed of 1 km (0.625 miles)/hour is associated with a 3% higher risk of a crash involving an injury. Pedestrians have a 90% chance of surviving car crashes at 30 km/hour (18 mph) or below, but less than a 50% chance of surviving impacts at 45 km/hour (28 mph) or above.[106] In a New Zealand study, the risk of child pedestrian injury was 3.6 times higher if the vehicles were traveling at high speeds. [107]

Figure ST.7. Odds of pedestrian death in a collision with a motor vehicle as a function of speed.



In 1999, 60% of all US motor vehicle fatalities and 64% of all speeding related fatalities occurred on rural roads.[108] In rural areas, traffic fatalities involve higher speeds than in urban areas, as the figure below shows.

[104] Leaf WA, Preusser DF. 1999. Literature review on vehicle travel speeds and pedestrian injuries. National Highway Traffic Safety Administration. Washington DC. US Department of Transportation. Available at http://www.nhtsa.dot.gov/people/injury/research/pub/HS809012.html.

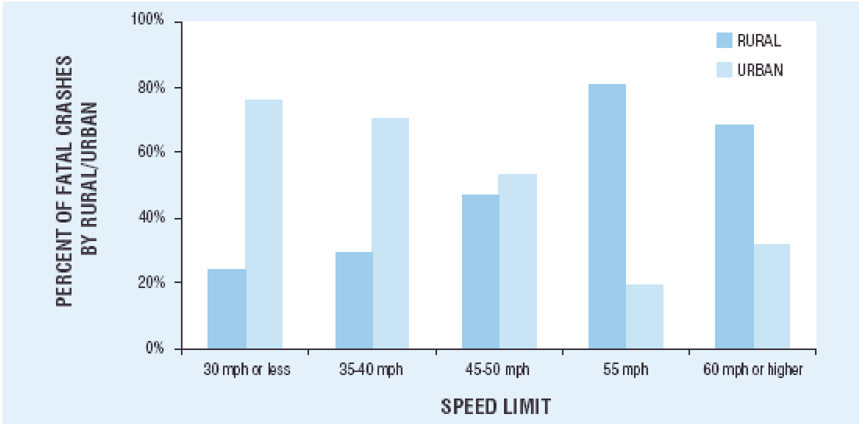
Figure ST.8. Fatal crashes by speed limit and location, 2005.[109]



Source: NCSA, NHTSA, FARS 2005

Existing Conditions

Existing data on this indicator is not available. Given rural nature of County, most roads are not low speed limits and most low speed roads are in urban areas.

Analysis

Logic

- Urban areas have lower speed limits; putting more people in urban areas would increase the proportion of people living on roads with lower speeds.
- Existing non-urban roads have higher speed limits. New roads constructed under C would be non-urban and have high speed limits. More people in non-urban areas would decrease the proportion of people living on roads with lower speeds.

Quantitive Analysis

Given the lack of data on existing conditions and the lack of information on new road construction under the various Plan Alternatives, a quantitative analysis was not possible.

Qualitative Analysis

People surveyed for the General Plan Update noted that on Route 101 in downtown Eureka there is a lot of traffic, congestion, pedestrian hazards and areas with high speed.

Conclusions

A) Because urban streets tend to have lower speed limits, **Plan Alternative A is likely to increase the proportion of people living on roads with lower speeds.** Thus there would be a decrease in pedestrian fatality due to motor vehicle collisions.

B) Given that growth in urban and non-urban areas would not change the proportion of the population urban vs. non-urban areas significantly, **Plan Alternative B would result in the least change in the proportion of residents living on roads with lower vs. higher speed limits**, and the least change in pedestrian fatality due to motor vehicle collisions on higher speed streets.

C) Since Plan Alternative C allows for the most growth in non-urban areas where speeds are higher, **it**

[109] NCSA, NHTSA, FARS 2005.

is likely to decrease the proportion of people living on roads with lower speeds, with the likely result of more pedestrian fatalities.

Recommended Health-Promoting Mitigations

See mitigations suggested for indicator ST.3.c.

ST.3.f Percent of population who have access to pedestrian facilities.

Health-Based Rationale

Pedestrian facilities include sidewalks, wide shoulders on non-urban roads and other areas designated for pedestrians.

According to the Centers for Disease Control, adults should engage in moderate intensity physical activities for at least 30 minutes on 5 or more days of the week.[110] In many places, walking is a primary source of physical activity and sidewalks and streets are the place people walk most commonly.[111] Having access to walkable streets would likely increase physical activity. For example, in one study, men and women who reported positive changes in the convenience of walking were more than twice as likely to increase their walking.[112] The rate of walking is nearly 13% lower among rural residents than among suburban residents,[113] and rural residents are more likely than urban/suburban individuals to report barriers to physical activity. These barriers include fewer sidewalks, limited access to exercise facilities, and lower social support for physical activity.[114] [115] Having access to places to walk increases the possibility that one walks recommended amounts. In a study in Atlanta, 34% of individuals who live in walkable neighborhoods walk; they drove 26 miles per day on average. Only 3% of individuals that live in car dependent neighborhoods walk, and they drove 43 miles per day.[116]

Walkable streets also increase social cohesion. Residents living in neighborhoods they categorized as walkable were 28% more likely to know their neighbors, 15% more likely to trust others, 14% more likely to be politically active, and 20% more likely to participate in social activities with others.[117] Social cohesion and participation are indicators of good health. For example, in one study for every one standard deviation increase in group membership in a community, mortality decreased by 83.2 individuals per 100,000.[118] And in Alameda County in 1979, researchers found that men and women who lacked ties to others were 1.9 to 3.1 times more likely to die during the follow-up period than those who had many contacts.[119]

[119] Berkman LF, Syme SL. 1979. Social networks, host resistance and mortality: a nine-year follow up study of Alameda County residents. American Journal of Epidemiology 109:186-204.

No data is available on number of people with access to pedestrian facilities currently. Many residents in focus groups said that lack of sidewalks and safe shoulders on non-urban roads was one of the primary reasons they did not walk.

Analysis

Assumptions

- There are more pedestrian facilities currently in urban areas.
- New pedestrian facilities will not be built in any scenario unless specific policies are put in place.

Logic

- Because there are more pedestrian facilities in urban areas, housing that would locate more people in urban areas would increase the number of people who have access to pedestrian facilities. Locating more housing in non-urban areas would decrease the number of who have access to pedestrian facilities.

Quantitative Analysis

A detailed quantitative analysis not possible without baseline data about the percentage of residents in urban areas vs. non-urban areas with access to pedestrian facilities.

Qualitative Analysis

Many participants in the Health and GPU focus groups held in December 2007 commented on pedestrian facilities and sidewalks. Themes included:

- A connected network of sidewalks can support health through encouraging social cohesion.
- Accessibility is needed for those of all means and abilities.
- Investment in roads should be reduced and investment for bike and pedestrian facilities and paths should be increased.
- Connected bike and pedestrian networks will increase physical activity and reduce cardiovascular disease, diabetes and stress.
- Affluent areas often have contiguous sidewalks, whereas lower-income areas often don't have that infrastructure completeness.
- Sidewalks are important for seniors – they can get around well on scooters but not without sidewalks. Sidewalks also have blockages, such as poles and other utilities, that need to be addressed.
- Lack of sidewalks on non-urban roads impacts physical activity.
- Because there are no sidewalks or proper shoulders on some roads people drive more often than they want to. Walking is not safe.

Participants felt that planning has impact on walking through creating walkable streets, car-less commercial centers, and continuous safe corridors, through improved lighting, through rezoning opportunities to encourage mixed use, through reducing sidewalk obstructions, and through pedestrian facility design appropriate to geographic area.

Goal 2 of the Humboldt County Pedestrian Needs Assessment Study Update in 2003 is to improve access to pedestrian facilities by improving connectivity from important destinations and improving function, such as access, convenience, and directness.

Disparities

Those who are unable to use motorized transport are disproportionately affected by the lack of pedestrian facilities. They rely on those facilities to do errands and get daily exercise. These populations include children, seniors, the disabled, and low-income residents who may not be able to afford a car.

Conclusions

A) **Plan Alternative A would offer more residents of the growing population of Humboldt County access to pedestrian facilities.** In Alternative Plan A, growth will occur in the urban areas where sidewalks and pedestrian facilities already exist.
B) **Plan Alternative B would offer the least change in access to pedestrian facilities** since it does not significantly alter the ratio of urban population to non-urban. Growth in each area would mean that the same proportion of people have access to sidewalks and pedestrian facilities.
C) **Plan Alternative C will decrease the proportion of Humboldt's population that has acces to pedestrian facilities.** Population growth will happen at a greater rate in non-urban areas where pedestrian facilities, by Humboldt resident participant report, are not widespread.

Recommended Health-Promoting Mitigations:

- Establish a seat on HCAOG representing human-powered transport.
- Increase amount and quality of pedestrian facilities in urban areas.
- Reduce speed limits on arterials, collectors, and local roads in non-urban areas.
- Improve signage in both non-urban and urban areas.
- Prioritize funding for trails and active recreation infrastructure and facilities.
- Pursue policies, programs, and investments to make walking the first, best, and safest choice for more local-serving trips.
- Increase the priority of funding to pave shoulders on all roads in non-urban areas that can be used by bicyclists and pedestrians.

Public Infrastructure Indicators

PI.2.b Proportion of households within ½ mile of a public elementary school

Health-Based Rationale

Nationally, only 13% of children aged 5 to 15 walk to school. According to the Centers for Disease Control and Prevention, long distances to school are a primary barrier to walking to school. Danger from traffic was the second most important barrier.[1] Research on travel mode choice also shows that when schools are located closer to home, more children walk and/or bicycle to school and vehicle pollution emissions fall.[2] 31% of children that live within one mile of school walk, compared to only 2% of children living within two miles of school.[3]

Having schools closer to the places children live is important. Walking to and from school can be an important source of exercise for children, many of whom are not getting enough exercise currently. School yards are also places children and others can play and socialize when schools are not in session. In 2003-2004 Public Health Staff weighed school aged children and determined that the percentage overweight was 21% compared to NHANES 1999-2000 national prevalence of 15.5%.

Walking to school is safer when schools are close. The more children are exposed to traffic on their way to school, as measured by the number of intersections they have to cross, the higher their risk of being hit by a car.[4]

Existing conditions

Elementary Schools: There are 48 public elementary schools (that are not charter schools) in the Humboldt County. Of those, 19 are in urban areas. The table below lists those schools and their locations.

Trinity Valley Elementary	730 Hwy. 96	Willow Creek
Weitchpec Elementary	Hwy. 169 and Weitchpec Road	Hoopa
Whitethorn Elementary	16851 Bricelano-Thorne Road	Whitethorn

The figures below show the locations of these schools.

Figure PI.1. The locations of the public elementary schools in the County. See Appendix B of the Summary for details about the mapping methods.

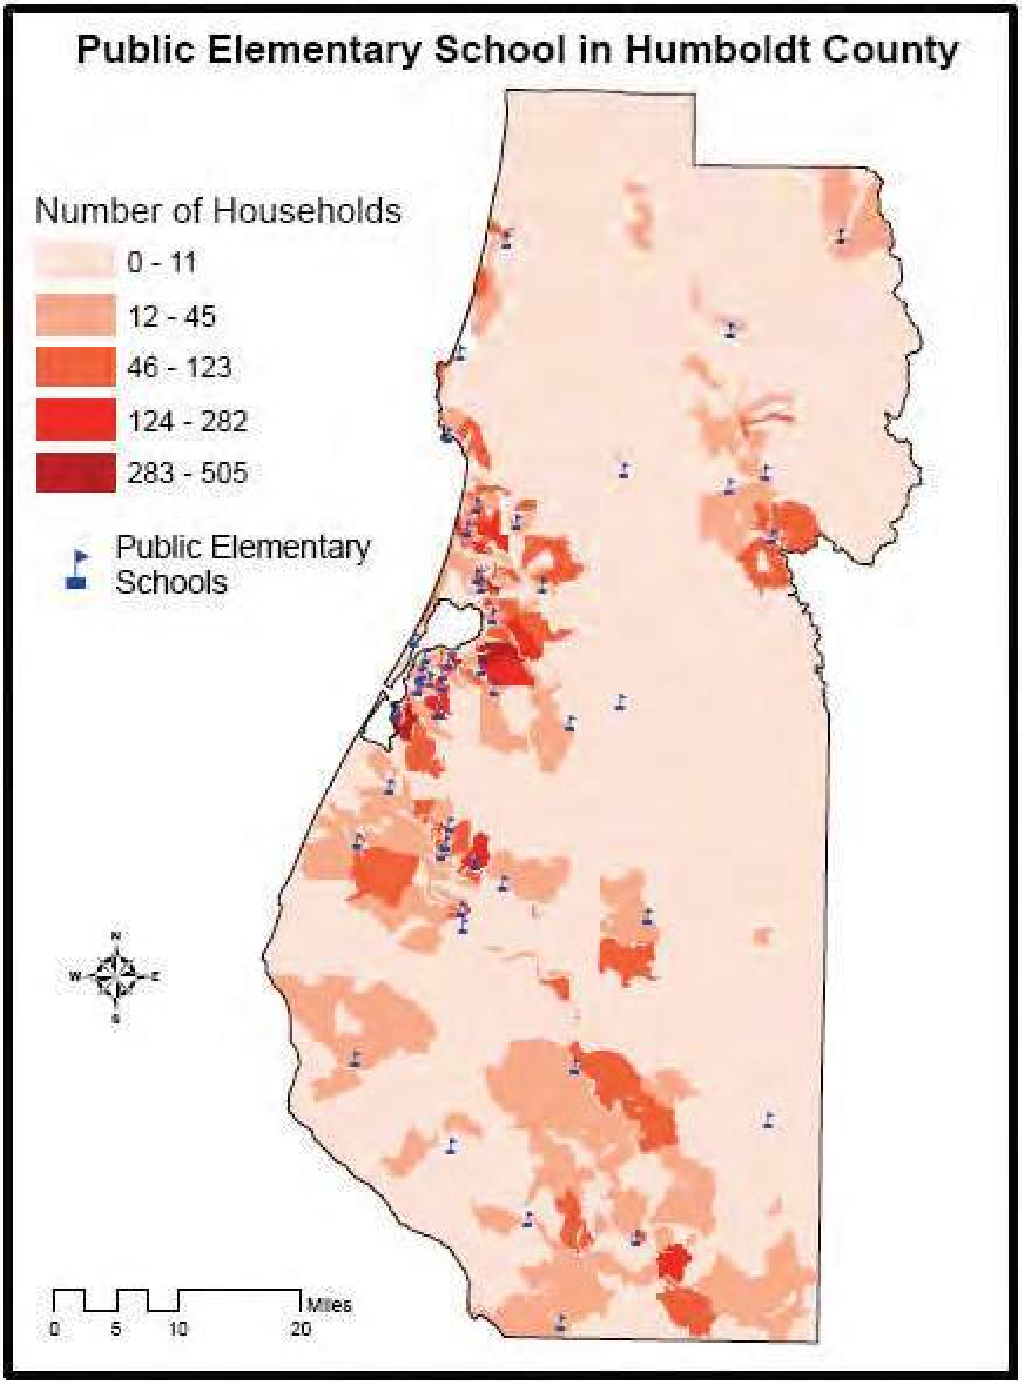

Figure PI.2. The locations of the public elementary schools in the area around Eureka and Arcata, showing a ¼ mile buffer around each school. Note that this buffer is smaller than the buffer used for this indicator. See Appendix B of the Summary for details about the mapping methods.

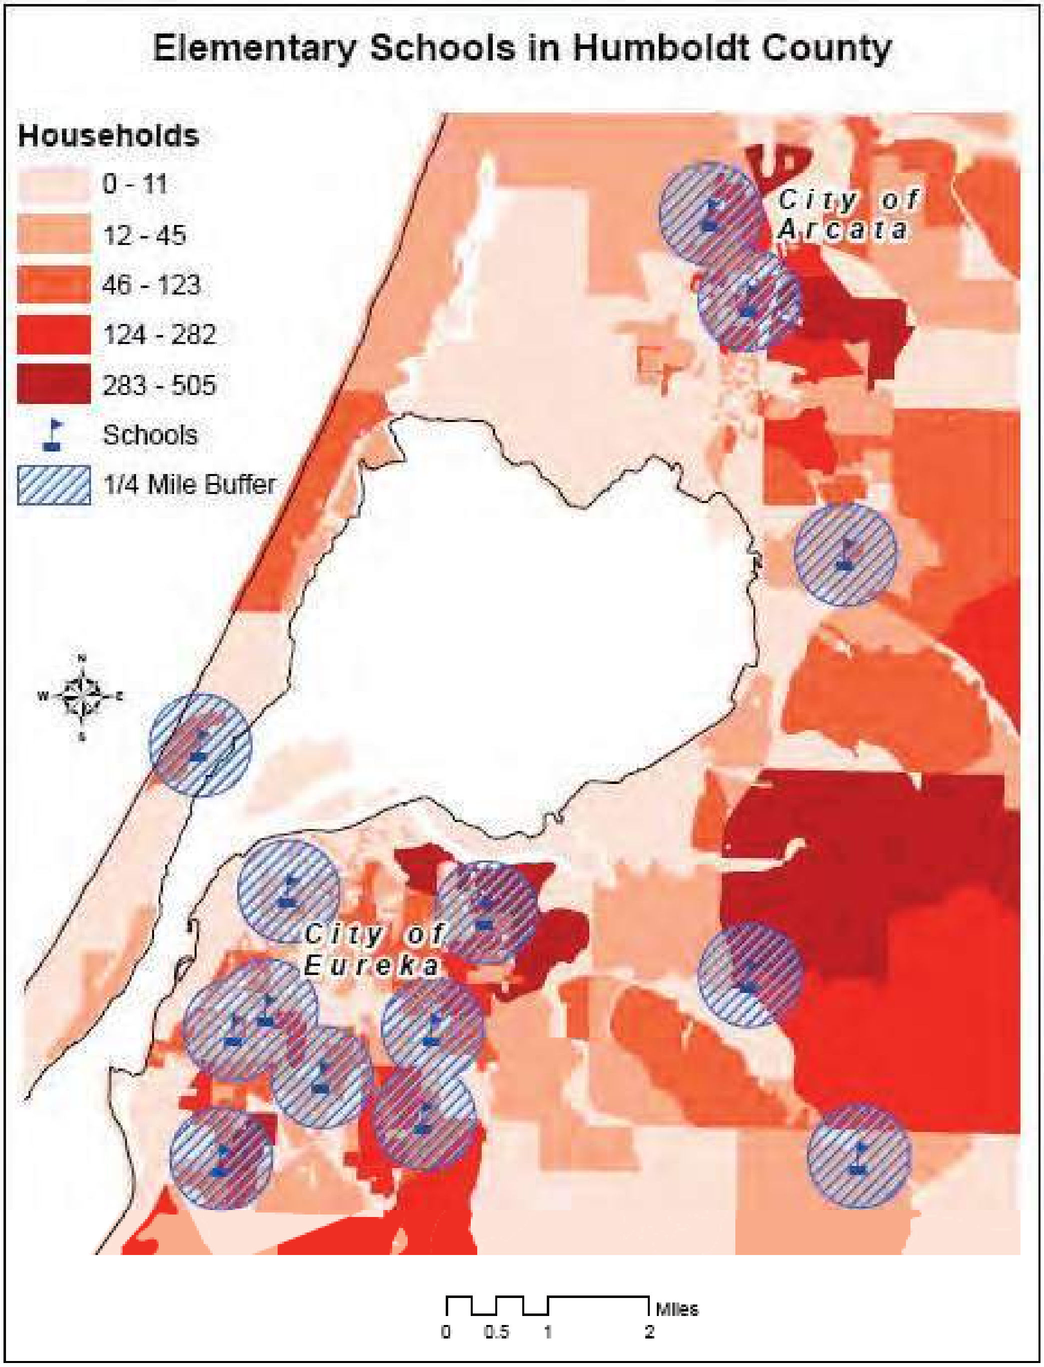

Proportion of Households within ½ mile of elementary schools: The table below summarizes current data for the proportion of households within 0.5 miles of a public elementary school. See Appendix B of the Summary for details about the calculations.

Table PI.2. Percent of Households within a ½ mile of a public elementary school	
Area	**% of households**
Humboldt County	35.3 %
Areas with urban zip codes	41.4%
Areas with non-urban zip codes	24.1%
Eureka and Arcata	43.6%
McKinleyville	21.4%

Analysis

Assumptions

- The analysis below assumes that most students go the school closest to their homes and that distance to school is a primary barrier to walking, as is true in other places. It is assumed that increasing proximity to schools would lead to more children walking to school.
- The proportion of households near elementary schools in urban and non-urban areas is not expected to change; only the overall proportion of households near elementary schools in the County is expected to change.

Logic

- A higher percent of households in urban areas are currently within ½ a mile of an elementary school than in non-urban areas currently. Therefore, building housing in urban areas will likely lead to more households being within ½ a mile of an elementary school in the future.

Quantitative Analysis

Of the 51238 households in County, 33443 are located in urban areas (based on the zipcode classification described in the summary introduction) and 17795 are in non-urban areas.

Under Plan Alternative A, 6000 new houses would be built in urban areas. Therefore, there would be 39443 urban households and the number of non-urban households would remain the same (17795). Since 41.4% of households in urban areas are currently within a ½ mile of a public elementary school and it was assumed that this would not change, 16329 (41.4% of 39443) households in urban areas would be near elementary schools. Similarly, since 24.1% of households in non-urban areas are within a ½ mile, 4289 households in non-urban areas would be so in the future. Therefore, 36.0% of total households in the County ((16329+4289)/(39443+17795)) would be expected to be located within a ½ mile of a public elementary school.

Using a similar analysis, the number of households within a ½ mile of a public elementary school under Plan Alternatives B and C can be calculated. With 6000 new urban and 6000 new non-urban households in Plan Alternative B, 34.9% of total households in the County ((16329+5735)/(39443+23795)) would be expected to be located within a ½ mile of a public elementary school. With 6000 new urban and 12000 new non-urban households in Plan Alternative C, 34.0% of total households in the County ((16329+7181)/(39443+29795)) would be expected to be located within a ½ mile of a public elementary school.

Qualitative Analysis

Accessible childcare and schools were repeatedly raised as issues of concern to Humboldt residents in the focus groups.

Disparities

Rural populations, such as the Native American tribes, would likely not see a change in their proximity to schools.

Conclusions

A) With 6000 new households in urban areas and no new households in non-urban areas, Plan Alternative A would bring the highest proportion of new households into areas that have higher numbers of schools and areas in which more of the existing households are within a ½ mile of a public elementary school. **Therefore under Plan Alternative A the proportion of households within a ½ mile of a public elementary school would increase to 36%.** This will allow more children to engage in physical activity by walking to school and lead to less school-related driving. It will also increase the number of households that have close access to school yards for off-hours activities.

B) With 6000 new households in urban areas and 6000 new households in non-urban areas, Plan Alternative B would bring similar numbers of households into areas that currently have both high and low proximity to elementary schools. **Under Plan Alternative B the proportion of households within a ½ mile of a public elementary school would decrease slightly to 34.9%.** Slightly fewer children will walk to school and there will be more school-related driving. It will also decrease the number of households that have close access to school yards for off-hours activities.

C) With 6000 new households in urban areas and 12000 new households in non-urban areas, Plan Alternative C would bring more new households into areas that currently have fewer households near elementary schools. **Under Plan Alternative C the proportion of households within a ½ mile of a public elementary school would decrease to 34.0%.** Fewer children will walk to school and there will be more school-related driving. It will also decrease the number of households that have close access to school yards for off-hours activities.

Caveats

An increase in the number of children walking to school could lead to an increase in collisions between cars and children if the routes to school are not safe. Precautions should be taken to ensure that there are safe routes to school in all scenarios.

Recommended Health-Promoting Mitigations:

- Ensure all new large communities that are developed have a public elementary school by having developers pay a fee for the construction of a local school.

PI.3.a Proportion of population within ¼ mile of public parks

Health-Based Rationale

Both the number of neighborhood parks in proximity to one's residence and the types of amenities at the park (i.e., lighting, sports fields) predict the duration of physical activity in children. For example, each additional park within a half mile increased physical activity by 2.8%.[5] One review of studies showed that access to places for physical activity combined with outreach and education can produce a 48 percent increase in the frequency of physical activity.[6] According to the CDC, enhanced access to spaces for physical activity resulted in 25% more people exercising 3+ days per week.[7]

Evidence also shows that contact or views of the natural environment can improve functioning in children with Attention Deficit and Hyperactivity Disorder (ADHD) and problem solving and cognitive function in people living in public housing.[8 9]

Access to parks and open spaces has an impact on stress, depression, and mental functioning. People dissatisfied with their available green spaces have 2.4 times higher risk for mental health issues.[10] Parks also contribute to neighborhood social cohesion and support. Parks increase neighborly interaction and socialization.[11] Social networks and interaction have been linked to improvements in physical and mental health.

More generally, living in proximity to green space is associated with reduced self-reported health symptoms, better self-rated health, and higher scores on general health questionnaires.[12]

Existing conditions

General information: Humboldt County has many federal, state, county, and local parks and these parks are one of the reasons many people choose to live in the County. There are 7.5 sq mi public open space/1000 persons in Humboldt County. Seventeen percent of land in Humboldt is publicly owned. Of the 2,287,000 acres of land in the county, 262,000 are national forests and 15,000 are other public lands.[13]

Existing Parks: The 55 local parks, 12 County parks, 14 State Parks and Areas, 1 National Park, and 4 other park-like areas (e.g., the Arcata Community Forest) are listed in the table below.

Veterans Park	Gower Lane and Chilton Road	Willow Creek
Candy Stick Park	Camp Kimtu Road and Chilton Road	Willow Creek

The figures below show the locations of these parks.

Figure PI.3. The locations of the parks in the County. See Appendix B of the Summary for details about the mapping methods.

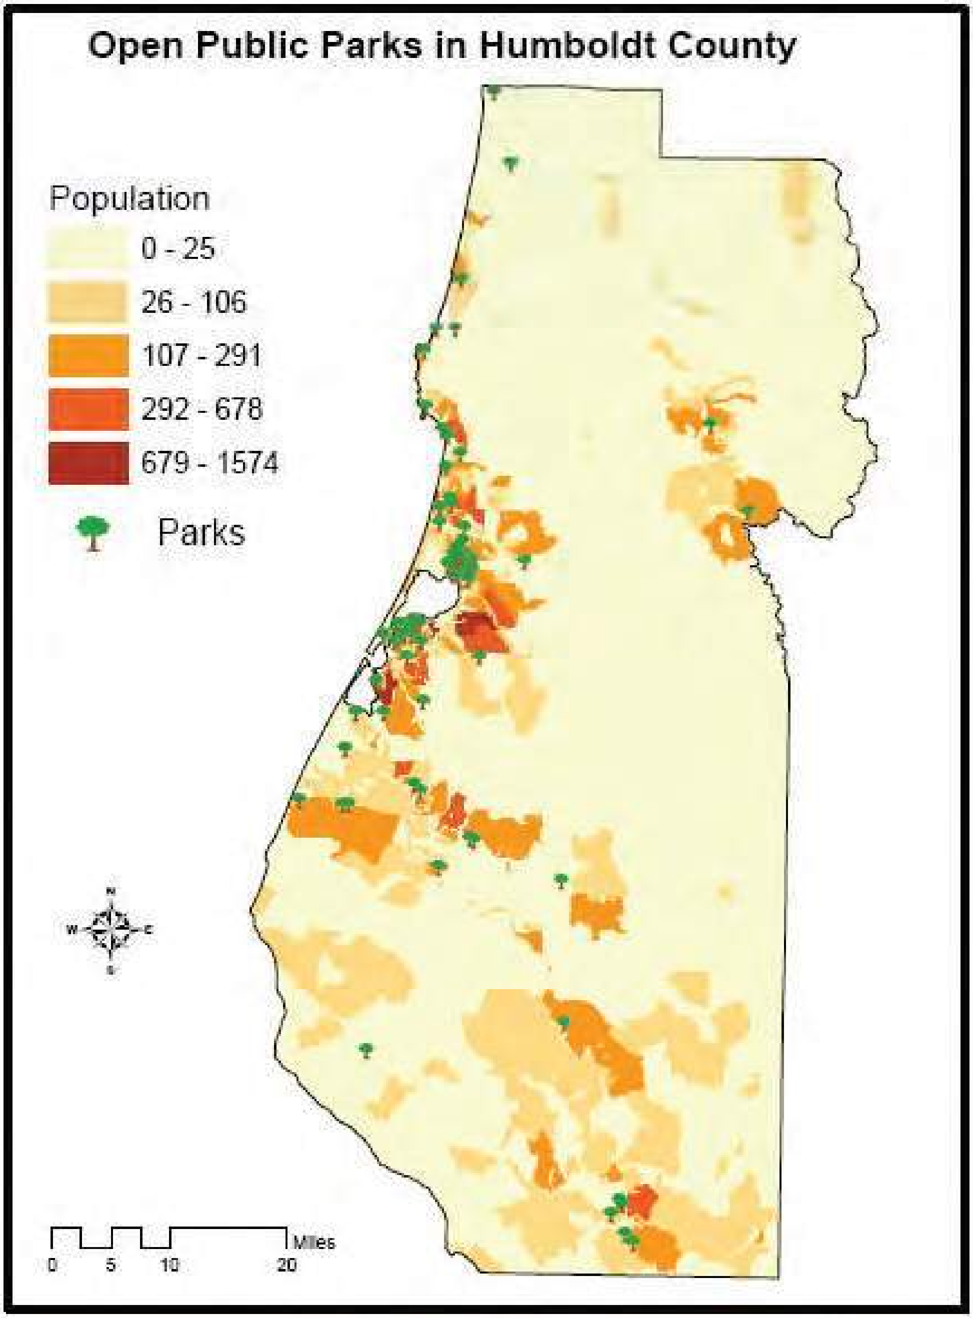

Figure PI.4. The locations of the parks in the area around Eureka and Arcata, showing a ¼ mile buffer around each school. See Appendix B of the Summary for details about the mapping methods.

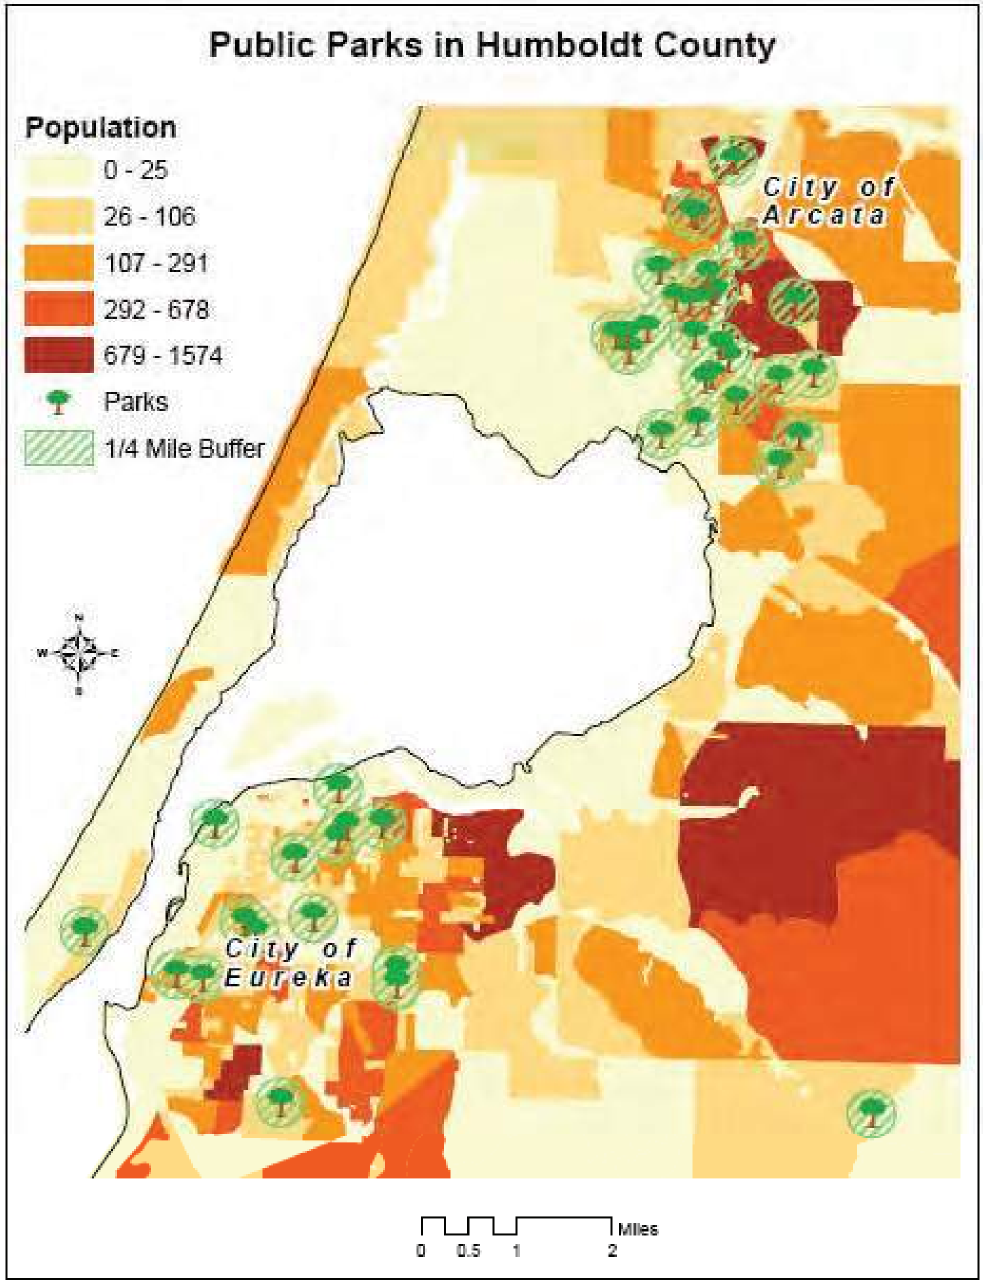

Proportion of population within ¼ mile of a park: The table below summarizes current data for the proportion of the population within ¼ mile of a public park. See Appendix B of the Summary for details about the calculations.

Table PI.4. The Percent of the Population within ¼ mile of a public park	
Area	**% of population**
Humboldt County	21.0 %
Areas with urban zip codes	28.9%
Areas with non-urban zip codes	6.6%
Eureka and Arcata	33.8%

McKinleyville	9.9%

Analysis

Assumptions
- It is assumed that increasing proximity to parks would lead to more people using those parks to get exercise.
- The proportion of the population near parks in urban and non-urban areas is not expected to change; only the overall proportion of the population near parks in the County is expected to change.

Logic
- A higher percent of people in urban areas are currently within a ¼ mile of a park than in non-urban areas currently. Therefore, building housing in urban areas will likely lead to more people being within a ¼ mile of a park in the future.

Quantitative Analysis
Of the 126,518 people in County, 81734 are located in urban areas (based on the zipcode classification described in the summary introduction) and 44784 are in non-urban areas.

Under Plan Alternative A, 14,400 new people would live in the new housing that would be built in urban areas. Therefore, there would be 96134 urban people and the number of non-urban people would remain the same (44784). Since 28.9% of people in urban areas are currently within a ¼ mile of a park and it was assumed that this would not change, 27783 (28.9% of 96134) people in urban areas would be near parks. Similarly, since 6.6% of people in non-urban areas are within a ¼ mile, 2956 people in non-urban areas would be so in the future. Therefore, 21.8% of the total population in the County ((27783+2956)/(96134+44784)) would be expected to be located within a ¼ mile of a public park.

Using a similar analysis, the number of people within a ¼ mile of a park under Plan Alternatives B and C can be calculated. With 14,400 new urban and 14,400 new non-urban people in Plan Alternative B, 20.4% of total population in the County ((27783+3906)/(96134+59184)) would be expected to be located within a ¼ mile of a park. With 14,400 new urban and 28,800 new non-urban people in Plan Alternative C, 19.2% of the total population in the County ((27783+4857)/(96134+73584)) would be expected to be located within a ¼ mile of a park.

Qualitative Analysis
In the Humboldt General Plan Update survey, 86.4% of respondents said that the surrounding natural environment was extremely important to the quality of life in Humboldt County and 85.1% said that quality of the natural environment was a major factoring why they decided to live in the county.[14] People want to retain outdoor space & feel, so ensuring parks are available is important. Preserving the rural nature of the County was important to residents. Publicly accessible parks (not just urban parks) were recognized for their importance to the economy (tourism and others), physical activity, and mental health.

[14] http://co.humboldt.ca.us/planning/gp/survey/results.htm.

Disparities

People without access to cars (the poor, seniors, children) need to be able to access parks by walking or biking. As shown in the map of the area around Eureka and Arcata below, areas with lower incomes often have less access to parks.[15]

Figure PI.5. A map that correlates youth in poverty with locations of parks in the Arcata and Eureka area.

Conclusions

A) With 14,400 new people in urban areas and no new people in non-urban areas, Plan Alternative A would bring the highest proportion of new people into areas that have higher numbers of parks and areas in which more of the existing population is within a ¼ mile of a park. **The proportion of the population within 0.25 miles of a park would *increase* to 21.8%, allowing more people to engage in physical activity at those parks and allowing more people to enjoy other health benefits from being near them (e.g., mental health).**

B) With 14,400 new people in urban areas and 14,400 new people in non-urban areas, Plan Alternative B would change the proportion of people living near parks least. **The proportion of the population within 0.25 miles of a park would *decrease* to 20.4%, allowing fewer people to engage in physical activity at those parks and allowing fewer people to enjoy other health benefits from being near them (e.g., mental health).**

C) With 14,400 new people in urban areas and 28,800 new people in non-urban areas, Plan Alternative C would bring more new people into areas of the County that are farther from parks. **The proportion of the population within 0.25 miles of a park would *decrease* to 19.2%, allowing fewer people to engage in physical activity at those parks and allowing fewer people to enjoy other health benefits from being near them (e.g., mental health).**

Recommended Health-Promoting Mitigations:

- Enact a Humboldt County discount for national, state, and county parks.
- Ensure schoolyards are available in off hours for community use.
- Build new parks in new developments.
- Ensure funding for parks is maintained.
- Ensure that forests, parks and wetlands in the County are not being converted to other uses.
- Increase funding and protection for national, state, and county parks to draw residents to them.

PI.5.a Percentage of seniors within a ½ mile of senior center

Health-Based Rationale
The National Council on Aging's definition of senior center is "a community focal point on aging where older persons as in individuals or in groups come together for services and activities that enhance their dignity, support their independence and encourage their involvement in and with the community."[16]

The types of programs that are available in senior centers include: health and wellness programs, transportation services, arts and humanities programs, volunteer opportunities, meal programs, educational opportunities, employment assistance, financial assistance, recreation assistance, intergenerational programs, information, referral, and counseling, social and community action opportunities.[17] Seniors participate to use all these programs, but recreational activities, socializing and healthy meals are cited as the most important activities.[18] [19] [20]

Senior centers can provide a social environment and help seniors develop a social support system. This can reduce loneliness and depression, and enhance life satisfaction. One study, showed that more than 90% of respondents participating in senior center activities felt that their health was the same or better compared to a year earlier. Over 75% of respondents felt that the center helped them remain independent. Statistically significant correlations were found between attending health promotion programs and practicing healthy behavior; hours spent at the center and possessing a healthy mental outlook; and hours spent at the center and practicing healthy behavior.[21] Another study found that 80% of respondents felt they benefited from opportunities to make friends and from opportunities to have a healthy meal. A majority of respondents also felt that the senior center was important in making them feel like a part of a group, having fun, improving their quality of life, maintaining new friendships, feeling more relaxed, providing a place to go each day, and improving their physical health.[22]

Specific health programs available at senior centers have also been shown to have benefits including increasing healthy behavior and subsequent health knowledge[23], decreasing depression, increased physical activity[24] and increasing physical functioning.[25]

Proximity of seniors to a senior center is believed to play an important role in the decision making regarding whether to participate and how frequently to participate.[26]

Existing conditions

Number of Seniors: According to the census, there were 18524 people over 62 in Humboldt County in 2000. This represents about 14.6% of the population.

Existing Senior Centers: Twenty facilities with a range of services for seniors, from a place to share a meal to more comprehensive services, operate within the County. Some of these services are open to the public and others are only open to those living in specific communities.[27] The table below lists these facilities and their locations.

Table PI.5 Senior Centers

Senior Center Name	Address	City
Arcata Lunch Site - HSRC	321 Community Parkway	Arcata
Blue Lake Rancheria	428 Chartin Road	Blue Lake

[26] Miltiades, HB, SA Grove, and C Drenovsky. Understanding The Impact Of Senior Community Center Participation On Elders' Health And Well-Being: An Analysis Of York And Clearfield Counties. Downloaded from www.aging.state.pa.us/aging/lib/aging/SeniorCenterstudy.pdf on 1/31/08.

[27] Personal communication from Area 1 Agency on Aging. http://www.a1aa.org/.

The figures below show the locations of these senior centers.

Figure PI.6. The locations of the senior centers in Humboldt. See Appendix B of the Summary for details about the mapping methods.

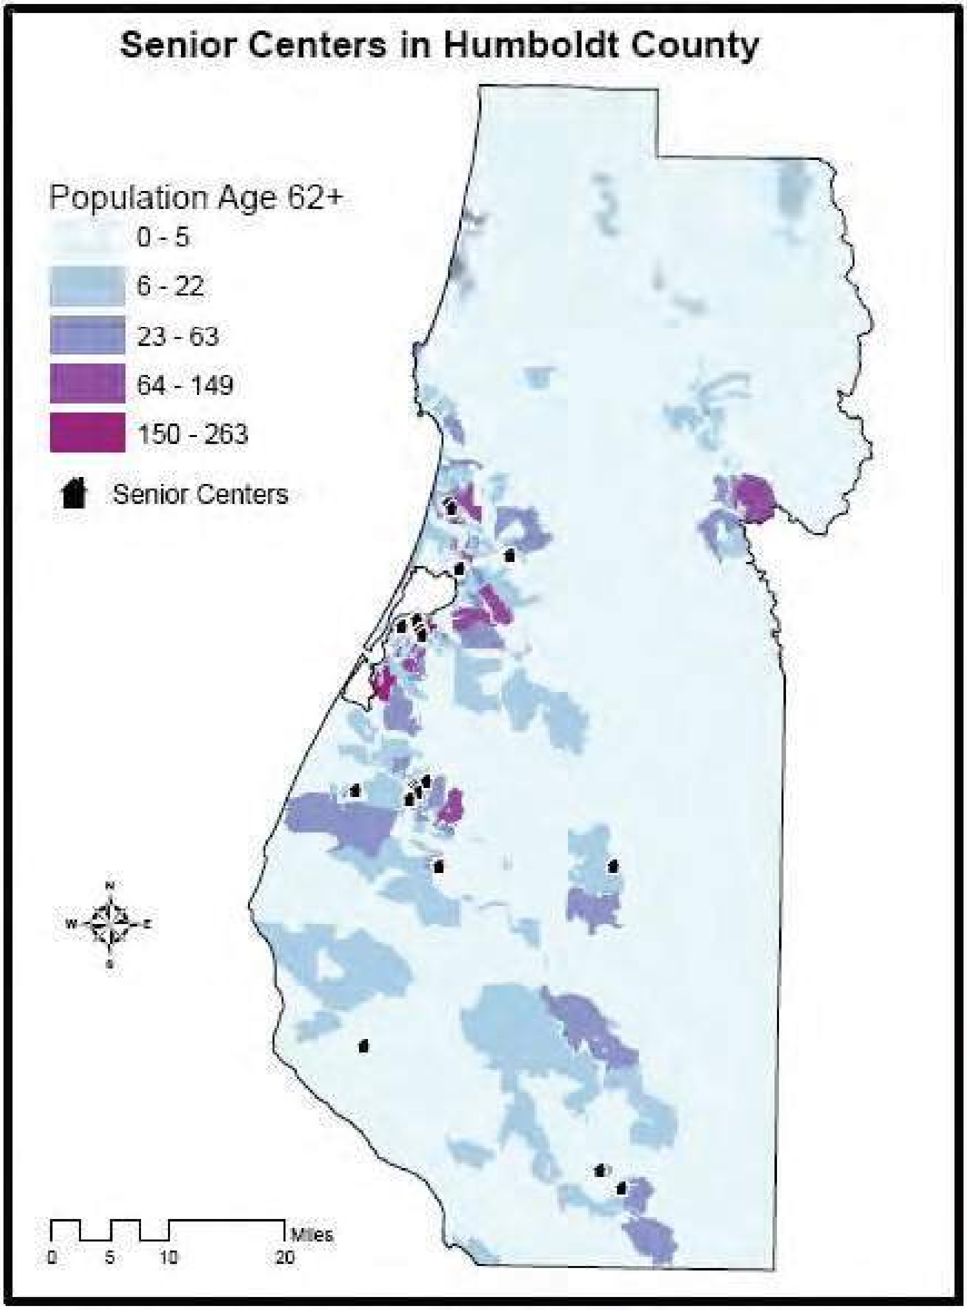

Figure PI.7. The locations of the senior centers in the area around Eureka and Arcata, showing a ½ mile buffer around each senior center. See Appendix B of the Summary for details about the mapping methods.

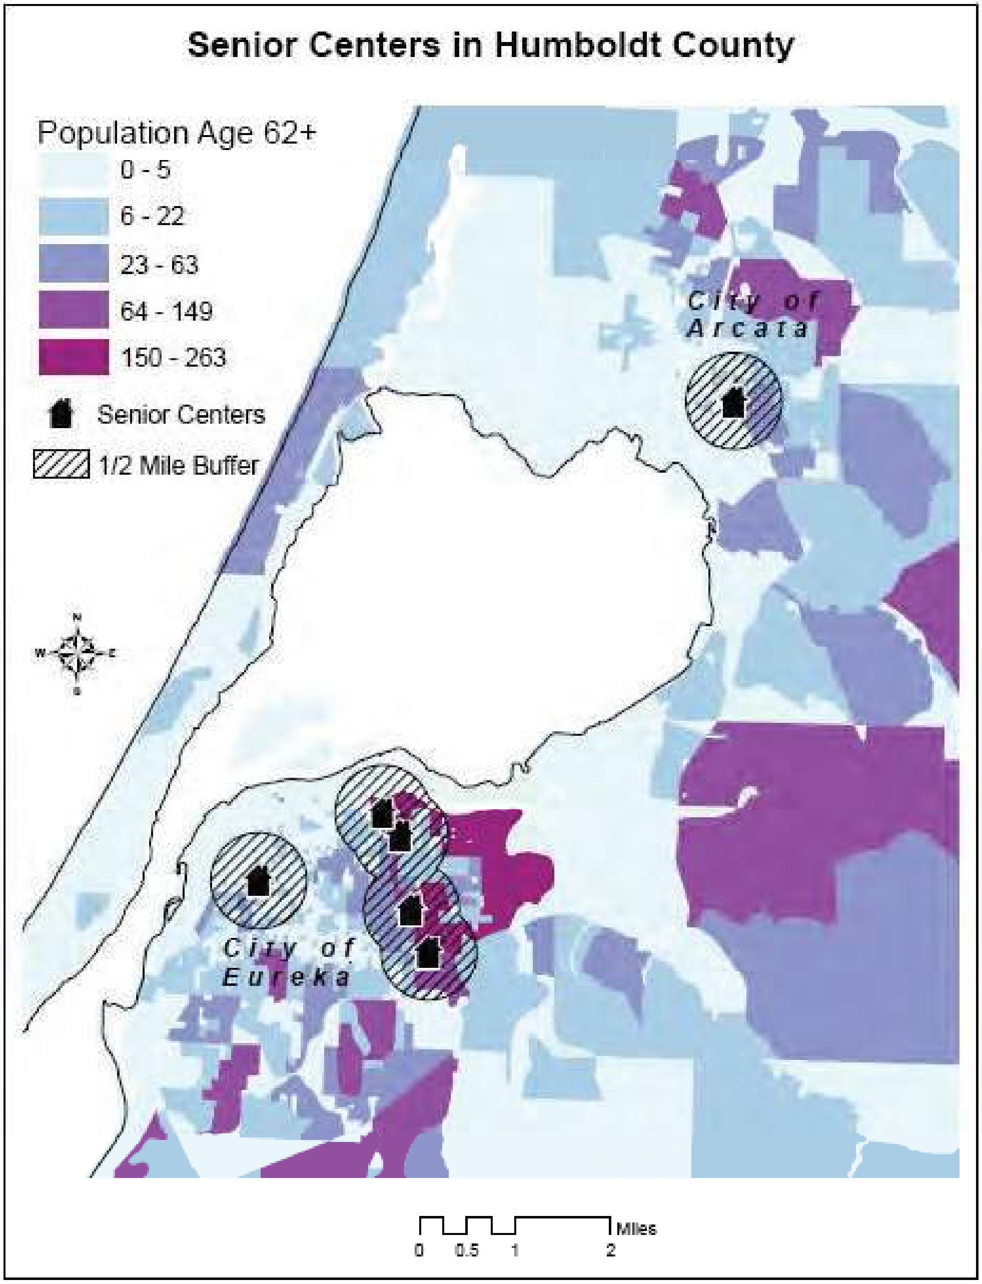

Proportion of seniors within a ½ mile of a senior center: The table below summarizes current data for the proportion of the seniors within ½ mile of a senior center:

Table PI.6. Percent of Seniors within 0.5 miles of a senior center

Area	% of seniors
Humboldt County	21.4 %
Areas with urban zip codes	24.7%
Areas with non-urban zip codes	14.9%
Eureka and Arcata	24.5%

McKinleyville	21.5%

Analysis

Assumptions

- According to the Humboldt Planning Department, the senior population is expected to more than double to over 35,000 by 2025 and this will represent 24.1% of the population. Population growth, and therefore the number of seniors in the county, varies between the scenarios. To reach 24.1% of the population from its current 14.6%, the existing population will age AND many of the new residents of the County will have to be seniors. For this analysis, it is assumed that 24.1% of the total population in each Plan Alternative is seniors and that half the increase will come from aging and half from new seniors moving to the County.
- This analysis also assumes that current aging population does not move as they get older and that as seniors move to the County they choose to live equally where development is occurring.

Logic

- A higher percent of seniors in urban areas are currently within a ½ mile of a senior center than in non-urban areas currently. Therefore, building housing in urban areas will likely lead to more seniors being within a ½ mile of a senior center in the future.

Quantitative Analysis

Of the 18,524 seniors in County, 12,393 (67%) are located in urban areas (based on the zipcode classification described in the summary introduction) and 6131 (33%) are in non-urban areas.

Under Plan Alternative A, the total population in the County would be the existing population (126,518) plus the new population (14,400), which is 140,918. The new senior population would be 24.1% of the total population, or 33,961 people. There are 18,524 seniors currently, so 15,438 of these seniors would be new. It was assumed that half of that increase (7719) would come from the current population aging in place, and the other half would be new seniors coming to the County. Therefore, the new senior population in urban areas would be the sum of the existing senior population in urban areas (123,393) plus 67% of half of the 7719 seniors aging in place plus the 7719 seniors coming to the County (all of these seniors would move to urban areas in this scenario, since that is where the new housing would be built). This means that 25,284 seniors would live in urban areas. In non-urban areas, there would be the 8678 seniors, which is the sum of the existing seniors (6131) and 33% of the 7719 seniors aging in place. Of the urban seniors, 24.7% or 6245 would be within a ½ mile of a senior center. Of the non-urban seniors, 14.9% (1293) would be within this distance. In total, 22.2% ((6245 + 1293)/(33,961)) would be within a ½ a mile of a senior center.

Using a similar analysis, the number of seniors within a ½ mile of a senior center under Plan Alternatives B and C can be calculated. With 14,400 new urban and 14,400 new non-urban people in Plan Alternative B, 21.0% of total seniors in the County ((0.247*(12,393+0.67*9454+0.5*9454)+ 0.149*(6131 + 0.33*9454 + 0.5*9454)) / 0.241*(126,518+28,800)) would be expected to be located within a ½ mile of a senior center. With 14,400 new urban and 28,800 new non-urban people in Plan Alternative C, 20.6% of total seniors in the County ((0.247*(12,393+0.67*11189+0.33*11189)+ 0.149*(6131 + 0.33*11189 + 0.67*11189)) / 0.241*(126,518+43,200)) would be expected to be located within a ½ mile of a senior center.

Qualitative Analysis

The growing senior population was raised numerous times in focus group discussions and is clearly an important issue for current Humboldt residents. The accessibility, affordability and quality of elder care came up several times, as did the impacts of elder care on the care-givers. The growing population of seniors was considered to be one of the most important issues that the General Plan update could address.

Disparities

Some populations of seniors may be less likely to participate in senior services and centers and may prefer to rely on family for support.

Conclusions

A) With 14,400 new people in urban areas and no new people in non-urban areas, Plan Alternative A would bring the highest proportion of new seniors into areas that have higher numbers of senior centers and areas in which more of the existing seniors are within a ½ mile of a senior center. **The proportion of seniors within 0.5 miles of a senior center would *increase* to 22.2%, allowing more seniors to engage in the services available and allowing more of them to enjoy the social networks facilitated by those centers.**

B) With 14,400 new people in urban areas and 14,400 new people in non-urban areas, Plan Alternative B would change the proportion of seniors living near senior centers least. **The proportion of seniors within 0.5 miles of a senior center would *decrease* to 21.0%, allowing fewer seniors to engage in the services available and allowing fewer of them to enjoy the social networks facilitated by those centers.**

C) With 14,400 new people in urban areas and 28,800 new people in non-urban areas, Plan Alternative C would bring more new seniors into areas of the County that are farther from senior centers. **The proportion of seniors within 0.5 miles of a senior center would *decrease* to 20.6%, allowing fewer seniors to engage in the services available and allowing fewer of them to enjoy the social networks facilitated by those centers.**

Recommended Health Promoting Mitigations:

- Increase awareness about existing senior centers.
- Increase funding for senior centers.
- Create additional services for seniors.
- Increase transportation services for seniors.

PI.4.d Percentage of population within 2 miles of a medical center

Health-Based Rationale

The use of primary care and preventative health care services is dependent on a number of factors including physical access to health facilities, transportation, and health insurance status. The timely use of primary care has a role in preventing morbidity and hospitalizations from a number of chronic diseases, including asthma and diabetes. Research has specifically found that Federally Qualified Health Centers in medically underserved areas can lower preventable hospitalization rates.[28]

Given that many patients miss appointments at health clinics due to transportation problems[29], better proximity to health care could improve access. A 10 mile travel distance or 30 minute travel time from home to health care services is specified in Medi-Cal regulations[30], but even this standard can make it nearly impossible for car-less households to get prompt access to healthcare.

Existing conditions

Medical Facilities: There are 152 medical facilities in Humboldt County, including private practices, hospitals, institutional medical facilities (e.g., at the Humboldt State University), community clinics, women's health clinics, an asthma clinic, and providers of health services for children, veterans, those with developmental disabilities. Of these, 47 are non-private practice facilities with distinct addresses. That list of 47 facilities was used for the calculations for this indicator.

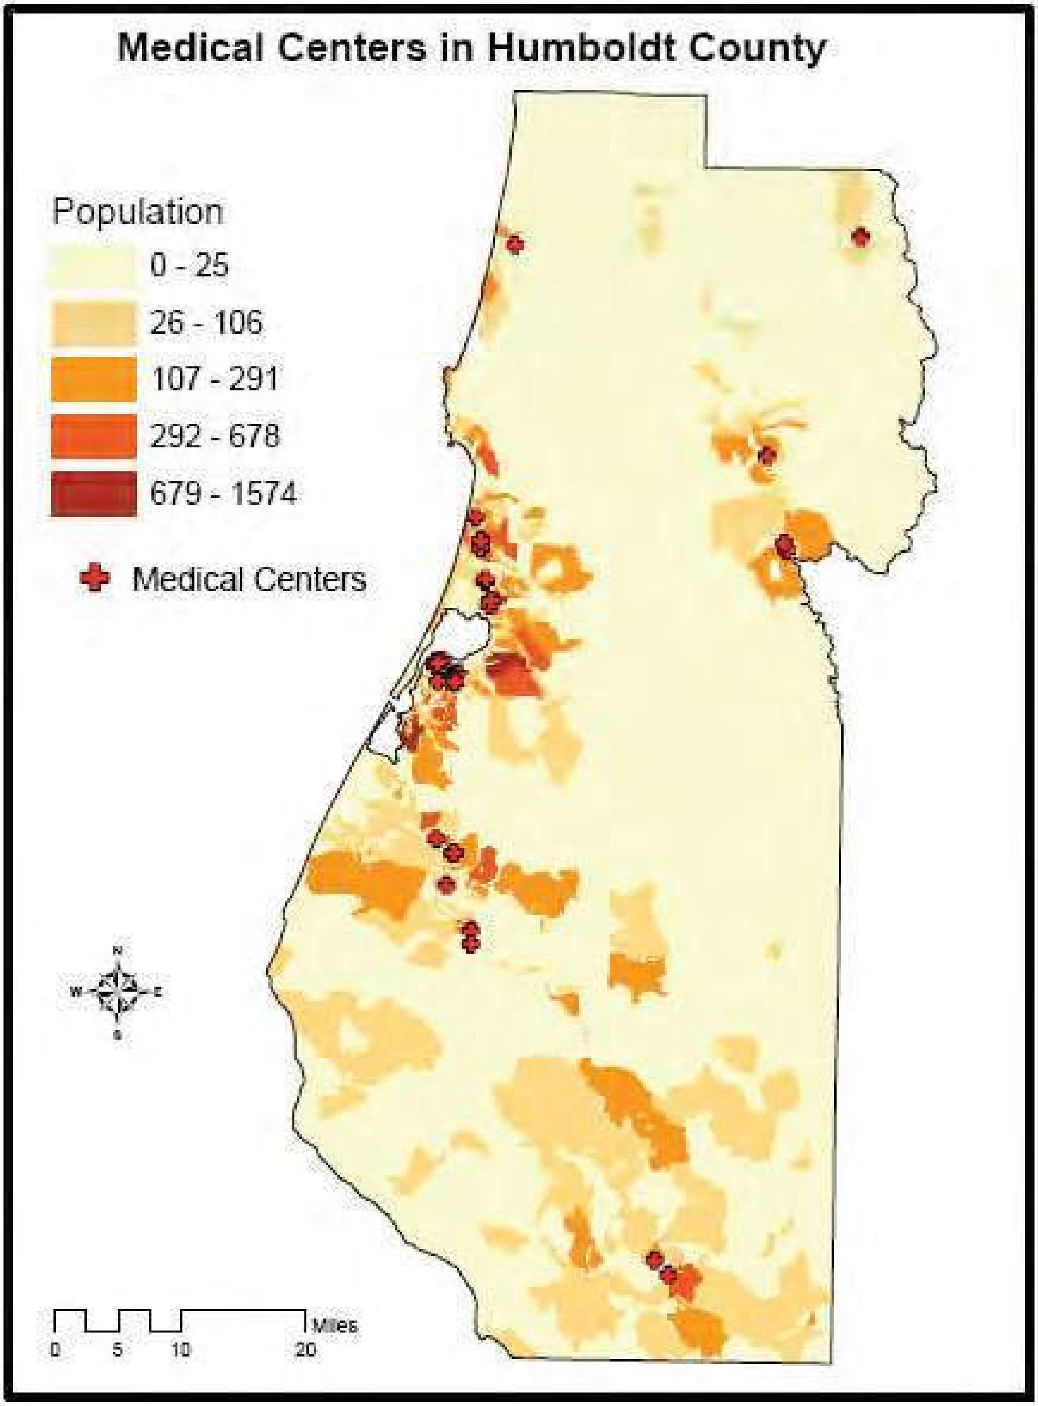

Figure PI.9. The locations of the medical facilities in the area around Eureka and Arcata, showing a 2 mile buffer around each facility. See Appendix B of the Summary for details about the mapping methods.

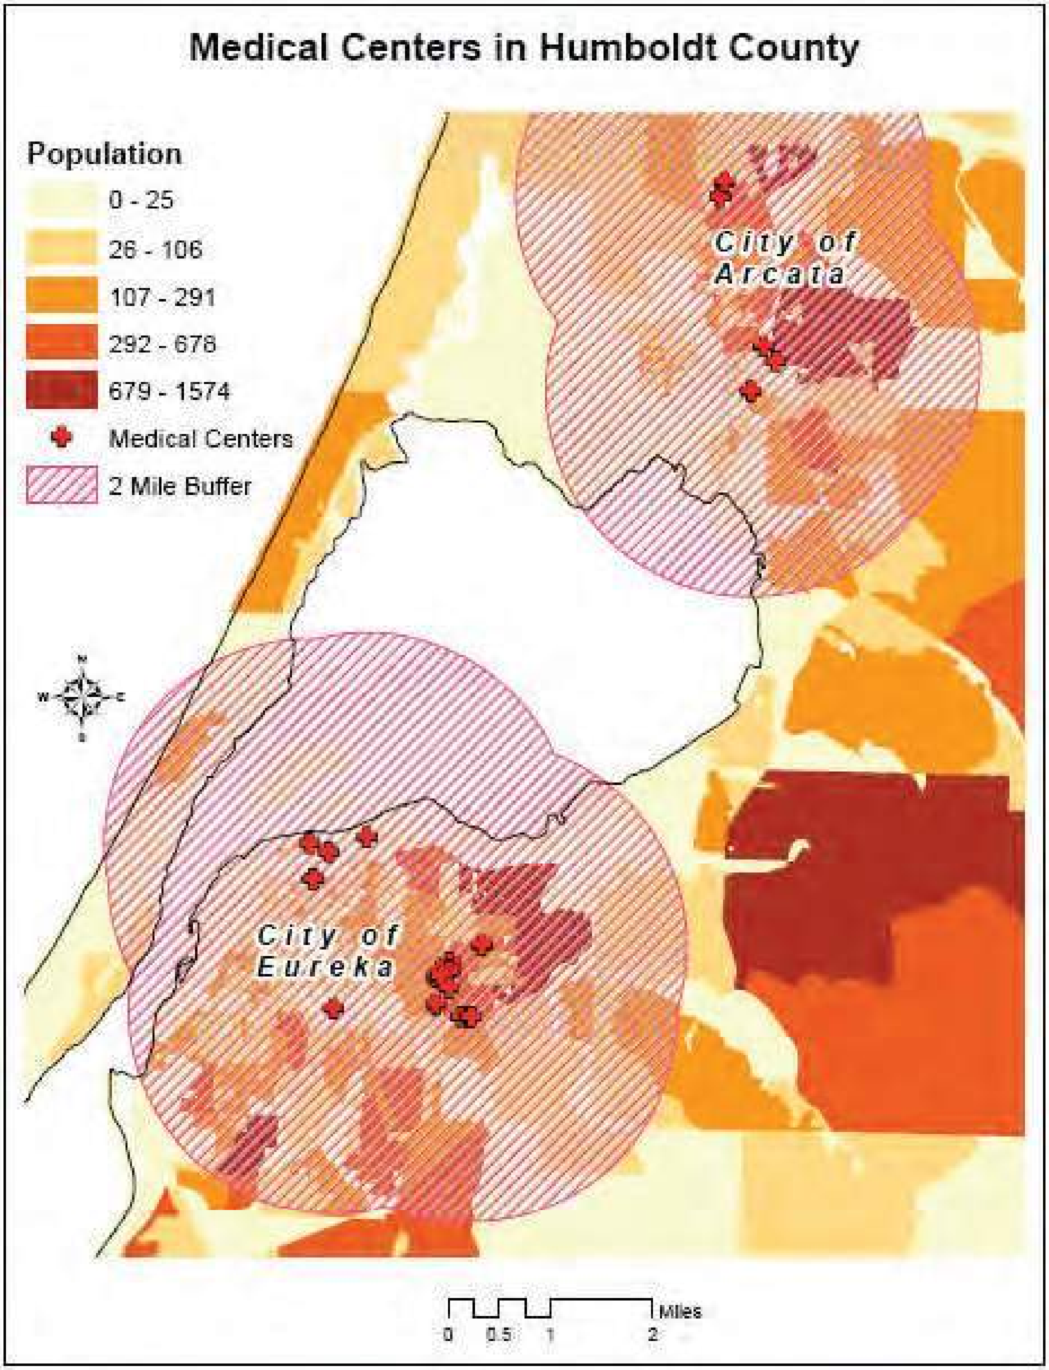

Proportion of seniors within 2 miles of a medical facility: The table below summarizes current data for the proportion of the population within 2 miles of a medical center:

PI.8. Percent of population within 2 miles of a non-private practice medical facility	
Area	**% of population**
Humboldt County	72.2 %
Areas with urban zip codes	82.6%
Areas with non-urban zip codes	53.5%
Eureka and Arcata	83.2%
McKinleyville	85.4%

Analysis

Assumptions

- The proportion of the population near medical facilities in urban and non-urban areas is not expected to change; only the overall proportion of the population near medical facilities in the County is expected to change.

Logic

- A higher percent of people in urban areas are currently within 2 miles of a medical facility than in non-urban areas currently. Therefore, building housing in urban areas will likely lead to more people being within 2 miles of a medical facility in the future.

Quantitative Analysis

Of the 126,518 people in County, 81734 are located in urban areas (based on the zipcode classification described in the summary introduction) and 44784 are in non-urban areas.

Under Plan Alternative A, 14,400 new people would live in the new housing that would be built in urban areas. Therefore, there would be 96134 urban people and the number of non-urban people would remain the same (44,784). Since 82.6% of people in urban areas are currently within 2 miles of a medical facility and it was assumed that this would not change, 79,407 (82.6% of 96134) people in urban areas would be near medical facilities. Similarly, since 53.5% of people in non-urban areas are within 2 miles, 23,959 people in non-urban areas would be so in the future. Therefore, 73.4% of the total population in the County ((79407+23959)/(96134+44784)) would be expected to be located within 2 miles of a non-private practice medical facility.

Using a similar analysis, the number of people within 2 miles of a medical facility under Plan Alternatives B and C can be calculated. With 14,400 new urban and 14,400 new non-urban people in Plan Alternative B, 71.7% of total population in the County ((79407+32000)/(96134+59184)) would be expected to be located within 2 miles of a non-private practice medical facility. With 14,400 new urban and 28,800 new non-urban people in Plan Alternative C, 70.0% of the total population in the County ((79407+39367)/(96134+73584)) would be expected to be located within 2 miles of a non-private practice medical facility.

Disparities

In some cities and counties in California, areas with minority populations have access to fewer hospitals and medical services. The analysis carried out here did not investigate whether this is true in Humboldt County. This question should be investigated further in the future.

Conclusions

D) With 14,400 new people in urban areas and no new people in non-urban areas, Plan Alternative A would bring the highest proportion of new people into areas that have higher numbers of medical facilities and areas in which more of the existing population is within 2 miles of a medical facility. **The proportion of the population within 2 miles of a non-private practice medical facility would *increase* to 73.4%, making it easier for more people to access medical services and to get timely medical care.**

E) With 14,400 new people in urban areas and 14,400 new people in non-urban areas, Plan Alternative B would change the proportion of people living near medical facilities least. **The proportion of the population within 2 miles of a non-private practice medical facility would *decrease* to 71.7%, increasing the difficulty some people will have accessing medical services to get treatment.**

F) With 14,400 new people in urban areas and 28,800 new people in non-urban areas, Plan Alternative C would bring more new people into areas of the County that are farther from medical services. **The proportion of the population within 2 miles of a non-private practice medical facility would *decrease* to 70.0%, making it more difficult for more people to access medical services and to get timely medical care.**

Caveats

The availability of health insurance could be another important factor regarding access to healthcare services by Humboldt County residents. This analysis did not research the impact of insurance on access.

Alternative Health-Promoting Mitigations:

- Increase awareness of transportation options available for people to access medical facilities.
- Increase transportation available to bring people to medical facilities.

PI.1.d Proportion of zip-codes without childcare facilities

Health-Based Rationale

Today, the majority of U.S. children live in families in which all parents work.[31] Access to childcare is essential for working parents to maintain employment and/or education. Accessible high-quality childcare provides children with valuable opportunities for cognitive, behavioral and educational development, and results in positive physical health outcomes.[32] [33] [34] [35]

While the availability of childcare facilities is dependent on market demand, parents are more likely to use childcare if it is available to them. The accessibility of childcare to working parents depends on many factors besides its supply and demand. In order to be practical for families, childcare facilities must be in close proximity to their homes and/or workplaces and have sufficient capacity to meet demand. For low-income families, the costs of childcare can consume a major portion of income, leaving less money for food, housing and other essentials. According to a survey of employees in Humboldt County, 58 percent reported that they experienced problems in arranging for childcare, some of which include:

- Friends or relatives unavailable
- Lack of flexible hours or drop in care
- Lack of substitute care when provider is sick
- Lack of care during the summer
- A shortage of available child care
- Lack of before-and after-school care and weekend care
- Lack of infant care
- Lack of transportation.[36]

Existing Conditions

Demand for Childcare: One in five labor force participants in Humboldt County is a parent living in a household in which all parents work.[37] In 2003, there were over 13,000 Humboldt County children between the ages of 0 and 12 with all parents in the labor force.[38]

"Rural" Humboldt County parents make up over half the total parents in the county, so there may be a greater demand for childcare in non-urban areas than in urban areas.[39]

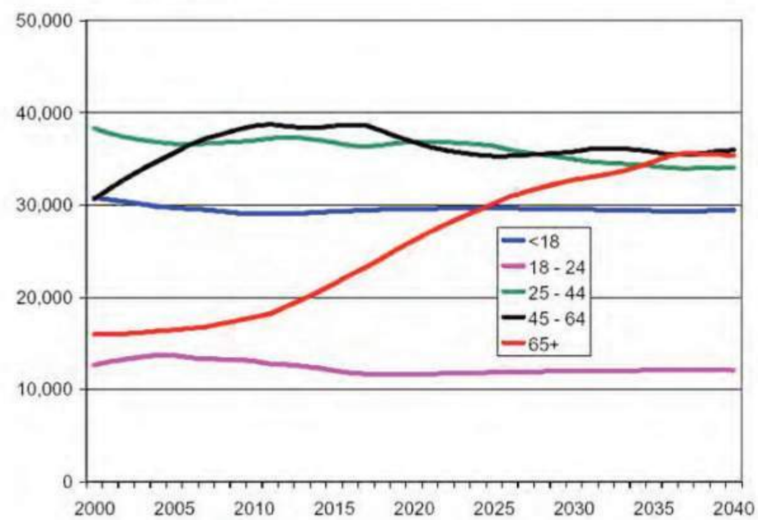
[39] Humboldt County Office of Education. Local Child Care Planning Council of Humboldt County, May 2005. Child Care Needs Assessment.

As shown on the Figure PI.10 below, between 2000 and 2040, there is a slight decline in projected population growth for youth under the age of 18. Thus, demand for childcare is not expected to increase in the county overall.

Figure PI.10. Projected Humboldt County Population by Age Group 2000-2004.[40]



Supply of Childcare: As of 2004, the childcare industry in Humboldt County, including licensed childcare centers, licensed family childcare homes, Head Start and Early Head Start programs, license-exempt before-and after-school programs, and programs funded by the California Department of Education had the capacity to serve just 5,000 children at any one time.[41] Comparing this capacity to the population of children under age 12 with both parents in the workforce, the formal childcare industry has the capacity to serve only 38 percent of these working families. While not all working families utilize formal childcare arrangements (for example, families may keep one parent home with children, or place children with family, friends or neighbors), this information indicates that there is a significant demand for childcare in Humboldt County.

There are approximately 274 formal child care facilities in Humboldt County, including:

- 159 licensed family child care homes
- 26 licensed child care centers
- 21 Head Start and Early Head Start Programs
- 30 child development programs funded by the California Department of Education
- 38 license-exempt before- and after-school programs.[42]

The table below details the numbers of children and childcare services available by area in the County.

Proportion of zip-codes without childcare facilities: Of the 40 Humboldt zip codes, 18 (45%) had no licensed childcare facilities listed. Of the 40 Humboldt zip codes, 24 (60%) had no licensed family child care homes listed.

Non-urban areas of Humboldt County include fewer childcare facilities than urban areas:

- In the 2005 Child Care Needs Assessment, only 25% of licensed childcare providers are located in "outlying rural areas".
- This report stated that 21 of 29 zip codes (72%) had no licensed family child care homes.[45]

The location of childcare facilities plays a large role in its accessibility: according to the Local Child Care Planning Council of Humboldt County, available transportation, commute patterns, and parental preferences differ between urban and non-urban areas. According to the Council, with its number of parents making up over half of the total county population, "Humboldt's rural population faces a number of unique barriers to child care including a shortage of suitable child care facilities stemming from houses that lack access to utilities or do not meet standards set by the Community Care Licensing Division. Furthermore, low population density, economic and transportation barriers often make child care businesses in rural areas financially unfeasible."[46]

Analysis

<u>Assumptions</u>

- Based on projections discussed above, the population of children between the ages of 0 and 14 in Humboldt County will remain approximately steady for the next 25 years.

<u>Logic</u>

- Because there is currently no projected increase in the population of people under age 18 between the years 2000 and 2040, this analysis considers potential shifts in the residential locations of families with young children needing daycare, as a result of Plan Alternatives A through C.
- Under Plan Alternative A, future children needing daycare in Humboldt County would be centrally located in urban areas, while in Plan Alternatives B and C, children would be increasingly spread into non-urban areas.
- Childcare facilities located in areas with higher population density and public transportation are more feasible for both providers and working parents. Plan Alternatives that house children in locations with higher population densities would provide the largest number of families with childcare opportunities.
- However, a shift of the county's population into non-urban areas (e.g., under Plan Alternatives B and C) is likely to eventually shift some childcare businesses away from urban centers and

45 Humboldt County Office of Education. Local Child Care Planning Council of Humboldt County, May 2005. Child Care Needs Assessment.
46 Humboldt County Office of Education. Local Child Care Planning Council of Humboldt County, May 2005. Child Care Needs Assessment.

into outlying regions. This may result in a higher proportion of Humboldt County zip-codes including childcare facilities, which is what is being measured by Indicator PI.5.

Qualitative Analysis

Accessible childcare was raised as an issue of concern to Humboldt residents in the focus groups.

Disparities

- The K-12 population is significantly larger in the Latino and Native American populations of Humboldt County.[47] Thus, there may be a greater demand for childcare among these groups. In addition, this suggests the need for bilingual childcare providers.
- The majority of the population and the services are currently concentrated along the Highway 101 corridor.[48] Communities living outside of this corridor, including Native American tribes, may continue to have disproportionately less proximity to childcare facilities under all three scenarios.
- In Humboldt County, there are an increasing number of jobs that require non-traditional hours and rotating shifts.[49] Parents of young children who have non-traditional working hours such as these are less likely to have the opportunity to use childcare.
- People without access to cars may have more difficulty transporting children to childcare than people who own cars.

Conclusions

A) By concentrating both families with children and childcare providers in the same areas, and by locating both in regions with access to public transportation, Plan Alternative A would best meet the demand for childcare by working parents. However, **Plan Alternative A is expected to result in the highest proportion of zip-codes without childcare facilities**. The proportion of the County's population living within non-urban zip-codes may not have access to childcare under Plan Alternative A, which is detrimental to health because it may be difficult for parents to work and earn a sufficient income.

B) Plan Alternative B would result in half of incoming families moving to urban areas, and the other half moving to non-urban areas. Families with children in urban areas would most likely be in close proximity to childcare providers and public transportation, while families in non-urban communities could have less access to childcare. The overall demand for childcare may not be met as much as it would under Plan Alternative A. However, **Plan Alternative B is expected to result in a lower proportion of zip-codes without childcare facilities than Plan Alternative A.** Under this Plan Alternative, non-urban populations may have greater access to new childcare facilities in their areas, which is important for the health of working families.

C) Plan Alternative C would result in one-third of incoming families moving to urban areas, with the majority moving to non-urban areas. Families who do live in urban areas would most likely be in close proximity to childcare providers and public transportation. The overall demand for childcare might not be met by Plan Alternative C as much as it would under Plan Alternatives B or A. On the other hand, **Plan Alternative C is expected to result in the lowest proportion**

---

[47] Humboldt County Office of Education. Local Child Care Planning Council of Humboldt County, May 2005. Child Care Needs Assessment.

[48] Humboldt County Office of Education. Local Child Care Planning Council of Humboldt County, May 2005. Child Care Needs Assessment.

[49] Humboldt County Office of Education. Local Child Care Planning Council of Humboldt County, May 2005. Child Care Needs Assessment.

of zip-codes without childcare facilities. Non-urban populations would potentially experience the health benefit of having childcare facilities nearby. Access to childcare would enable these non-urban parents to maintain jobs, and it would enable children to gain from development opportunities such as socializing with other children. However, having childcare facilities within one's zip-code does not guarantee that nearby facilities have enough room for all children living within the zip-code.

Caveats

- While sprawling residential patterns may shift childcare facilities into more non-urban zip-codes, this does not guarantee that nearby facilities have enough room for all children living within the zip-code.
- While non-urban families may have access to childcare facilities within their zip-codes under the Plan Alternatives that propose non-urban development, they would likely have to travel longer distances to reach them than would urban families, who may be able to reach childcare services on foot or by public transportation.
- An increased overall resident population (e.g. under Plan Alternative C) could lead to more childcare facilities opening up throughout the county (especially out of home).
- This analysis does not encompass informal childcare. Some families choose friends and relatives (license-exempt caregivers) to care for their children, and programs for school age children are often not licensed by the state. The demand for childcare changes with age -- i.e. demand for infant care is higher than demand for preschool-age care, because preschoolers have preschool and programs like Head Start. Also, demands for school-age childcare may vary considerably depending upon availability of after-school programs, older siblings/friends, and other alternative after-school care arrangements. Thus, separating childcare demand by age categories is important for the identification of greatest need. Additionally, it is important to note that certain types of care are more expensive than others.
- One drawback of looking at data within areas defined by zip codes is that individual communities that are not delineated by zip-codes may be lacking childcare services.

Recommended Health-Promoting Mitigations:

- Continue to make federal and state subsidies for after-school programs and childcare available.
- Provide incentives for new childcare facilities by easing the process of obtaining and maintaining a childcare license.
- Offer low-interest loans or grants to childcare operators for the establishment and operation of childcare facilities.
- Support increased investment in employer-sponsored childcare assistance programs.
- Improve public transportation so that families without vehicles can transport children to childcare.
- Ensure that all future communities have licensed childcare facilities.
- Include childcare centers and Family Child Care Homes in zoning plans in all communities.
- Allow childcare centers in all zones besides Open Space and zones that are inappropriate for health and safety reasons.
- Encourage placement of childcare facilities within office parks, industrial developments, multi-modal transportation hubs and commercial areas.
- Support placement of childcare facilities near commute routes and public transit
- Encourage childcare facilities within multi-family housing projects.

PI.2.d Fast food establishments within ½ mile of high schools and middle schools

Health-Based Rationale

High Schools in particular tend to have limited on-site kitchen and eating facilities and allow students to leave campus for lunch. Fast food restaurants tend to be clustered around schools, within short walking distance.[50] Fast food restaurants encourage poor nutrition,[51] and proximity to them is associated with diet-related disease rates.[52]

Humboldt County students have a higher rate of overweight and obesity than the national average. In 2003-2004, county public health staff weighed and measured students at local schools, determining the rate for overweight for 5th grade boys to be 30.1% compared to a 16.8% national rate.

Nearly 18 percent of Humboldt County youth between 0 and 18 years of age are overweight for their age, compared to 13.4% of youth in the state.[53]

Existing Conditions

Fast food restaurants near middle and high schools. The table and figures below show the number of fast food restaurants (defined as restaurants that prepare and serve food quickly) currently near middle and high schools in the County.

Table PI.10. Summary of fast food establishments within ½ mile of high schools and middle schools in six Humboldt County cities

Analysis

Assumptions

- Urban areas attract a greater number of fast food establishments than non-urban areas since population density is a factor considered in fast food location choice.

Logic

- An increase in Humboldt County's population is expected to increase demand for food establishments in general. The more housing that is developed, the more people are expected to move into the county, thereby increasing the demand for fast food establishments.
- Additional schools in the County are not anticipated because the youth population is expected to remain generally constant between 2000 and 2040.
- Each Plan Alternative proposes the same quantity of housing units (i.e. 6,000) within urban areas. Plan Alternative C proposes the most total housing units in the county, and is therefore associated with the highest demand for food establishments including fast food restaurants. Plan Alternative B proposes the next highest number of total housing units in the county, followed by Plan Alternative A. Due to drawing the lowest quantity of new residents to the county of the three Plan Alternatives, Plan Alternative A is likely to result in the fewest new fast food restaurants in the county.
- New fast food restaurants may be located in any area that is relatively dense with potential customers, but evidence suggests that they are often located near schools.[55]

Qualitative Analysis

Focus group participants expressed their desire for access to healthy foods in Humboldt County. For example, access to farmers markets was raised as a main priority.

Disparities

- Because fast food establishments are preferentially located in urban regions, urban students will be affected more than non-urban students.

Conclusions

A) Because Plan Alternative A proposes the least amount of total housing developments (i.e. 6,000 housing units), this scenario is associated with the lowest demand for additional food establishments in the county. This Plan Alternative is likely to lead to the **least additional fast food establishments within ½ mile of high schools and middle schools.** From a health perspective, this is the best Plan Alternative in terms of limiting unhealthy food choices for students.

B) Plan Alternative B proposes twice the overall housing developments proposed by Plan Alternative A. Based on a higher population growth than is expected under Plan Alternative A, Plan Alternative B is associated with a higher demand for additional food establishments in the county. This Plan Alternative has the potential to lead to **more fast food establishments within ½ mile of high schools and middle schools than Plan Alternative A.** From a health perspective, this is the next best Plan Alternative in terms of limiting unhealthy food choices for students.

[55] Austin SB, Melly SJ, Sanchez BN, Patel A, Buka S, Gortmaker SL. Clustering of fast-food restaurants around schools: a novel application of spatial statistics to the study of food environments. Am J Public Health. 2005 Sep;95(9):1575-81.

C) Plan Alternative C proposes three times the overall housing units proposed by Plan Alternative A. Based on the highest expected population growth of the three Plan Alternatives, Plan Alternative C is associated with the highest demand for additional food establishments in the county. Plan Alternative C has the potential to lead to the **most fast food establishments within ½ mile of high schools and middle schools of the three Plan Alternatives.** From a health perspective, this is the worst Plan Alternative. Fast food establishments offer few healthy food options, and their close proximity to schools makes it difficult for students to eat nutritiously.

Caveats

- Under scenarios proposing more housing developments (i.e., Plan Alternative C), fast food restaurants could be placed in non-urban areas in addition to urban areas.

Recommended Health-Promoting Mitigations:

- Institute zoning restrictions against the placement of fast food establishments within ½ mile of a school.
- Increase the number of schools serving meals on site and improve the nutritional quality of foods served on campuses.

PI.2.a Accessibility of full-service grocery store/supermarket or store carrying produce

Health-Based Rationale

Research suggests that people's dietary choices may be influenced by the availability of food stores in their residential area.[56] Supermarkets may provide access to a greater variety of cheaper and healthier foods, including fresh fruits and vegetables. This access helps to facilitate healthier dietary choices. Research has found that the presence of a supermarket in a neighborhood predicts higher fruit and vegetable consumption and a reduced prevalence of overweight and obesity.[57] [58] The longer the distance necessary to travel to a full-service grocery store, the higher one's body mass index (BMI). For example, a 5'5" person who travels 1.75 miles or more to get to a grocery store is expected to weigh approximately five pounds more than someone who did not have to travel that far.[59]

For pedestrians in certain areas, it is necessary to walk long distances or take public transit to access a supermarket. Geographic proximity does not equal access, due to impediments such as freeways, major highways, or steep hills. In many communities characterized by sprawling development, supermarkets have followed land use and transportation growth, migrating into suburban areas. This often leaves urban corner stores, with limited selection and higher prices, as the main source of local groceries in densely populated areas of the state.[60] [61]

Existing Conditions

Locations of grocery stores. As shown on the map below, most grocery stores are concentrated in the western region of the county, in proximity to Highway 101. Urban areas that are more densely populated, such as Eureka, Arcata, McKinleyville, and Fortuna, include more grocery stores than non-urban towns such as Trinidad and Ferndale.

Nine percent of the population in Humboldt County does not own cars, and many individuals without cars live outside of towns.[62] These people are particularly vulnerable to inadequate nutrition as a result of not being close to grocery stores.

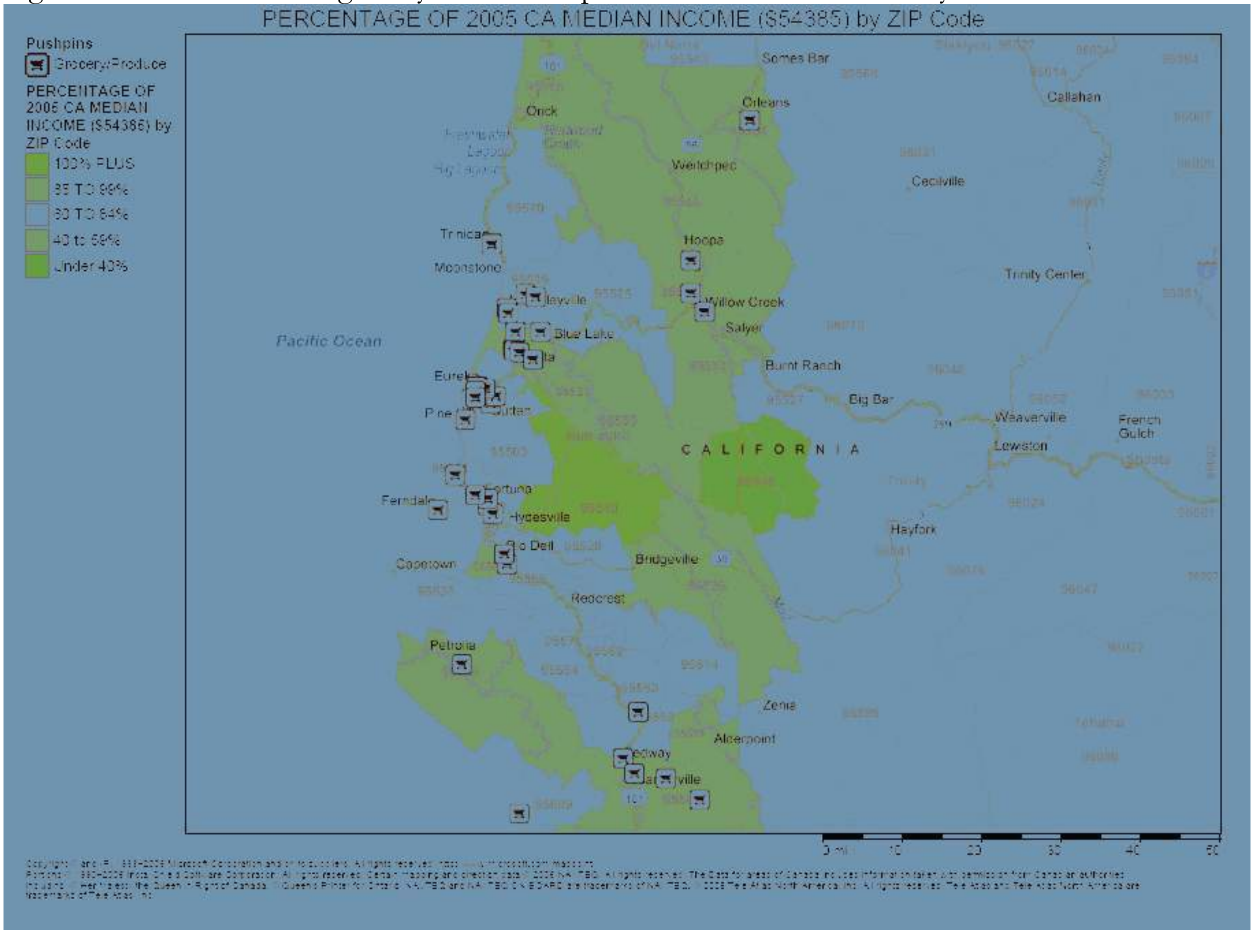
62 U.S. Census 2000.

Figure PI.12. Locations of grocery stores with produce in Humboldt County.[63]



Analysis

Assumptions

- Existing grocery stores and other markets selling fresh produce are assumed to remain in the same locations for the next 25 years.
- Corresponding to the demand associated with projected population growth in Humboldt County, additional grocery stores are expected to open up within the next 25 years.

Logic

- Large, corporate-owned chain stores, which are often sources of healthy food items at relatively low prices, are preferentially located in middle- or high-income neighborhoods.[64]
- Sprawling development leads to higher home prices, which leads to higher income communities. With sprawling housing development, new grocery stores may be built in non-urban areas rather than in urban centers.
- Exclusively urban infill development would encourage new grocery stores to locate within urban areas.

[63] Humboldt County Division of Environmental Health.
[64] Morland K, Wing S, Diez Roux A, Poole C. 2002. Neighborhood characteristics associated with the location of food stores and food service plans. Am J Prev Med. 22:23-29.

- Existing grocery stores that are located in residentially dense areas will continue to serve these more urban residents.

Qualitative Analysis

Focus group participants expressed their desire for access to healthy foods in Humboldt County. For example, access to farmers markets was raised as a main priority.

Disparities

- Humboldt County residents who do not own cars will be more affected by the placement of grocery stores within urban areas versus outside of them. In general, fewer households in poor neighborhoods have access to private transportation.[65]
- Because large, chain supermarkets, which carry the most healthy food at the lowest prices, are preferentially placed in wealthier neighborhoods,[66] low-income communities in Humboldt County will have less access to these stores.
- Low-income residents are more likely to consider small "corner stores" as inaccessible due to their cost. Thus, if existing or future grocery stores follow housing development into non-urban areas (i.e., under Plan Alternative C), these residents will not have easy access to groceries including fresh produce.
- Large, corporate-owned chain stores, at which the most healthy food can be found at the lowest prices, are four times more common in predominantly white neighborhoods compared to predominantly black neighborhoods.[67] Communities of color in Humboldt County may experience a disproportionate shortage of grocery stores and supermarkets carrying produce.

Conclusions

A) Plan Alternative A would likely encourage prospective grocery store owners to place stores within urban areas where the majority of the population resides. Thus, Plan Alternative A would likely give the **highest number of residents access within ½ mile of new full-service grocery stores/supermarkets or stores carrying produce.** From a health perspective, this is advantageous because access to produce and other healthy food choices encourages better nutrition.

B) Plan Alternative B may encourage prospective grocery store owners to place stores outside of urban areas, where land costs are cheaper and higher-income residents reside. **About the same number of residents would live within ½ mile of full-service grocery stores/supermarkets or stores carrying produce.** From a health perspective, a lower proportion of residents living in proximity to grocery stores carrying produce and other healthy foods would be detrimental because residents may be less likely to obtain nutritional food.

C) Because grocery stores are preferentially placed within non-urban areas when the community is characterized by sprawl, new grocery stores in the County may be located outside of densely populated urban areas. Under this scenario, the **lowest number of residents would have access within ½ mile of full-service grocery stores/supermarkets or stores carrying produce.** From a health standpoint, this is the least healthy of the three options. Residents

[65] Morland K, Wing S, Diez Roux A, Poole C. 2002. Neighborhood characteristics associated with the location of food stores and food service plans. Am J Prev Med. 22:23-29.

[66] Morland K, Wing S, Diez Roux A, Poole C. 2002. Neighborhood characteristics associated with the location of food stores and food service plans. Am J Prev Med. 22:23-29.

who do not live in close proximity to grocery stores selling healthy food would not be encouraged to make healthy nutritional choices.

Caveats

- This analysis does not include farmers markets, which offer some communities a great source of fresh produce.
- This analysis does not examine proximity of future housing to current grocery stores.

Recommended Health-Promoting Mitigations:

- Provide incentives for grocery stores selling produce to be located in all residential neighborhoods, regardless of resident income levels.

PI.6.a Residential density

Health-Based Rationale

Residential density can be defined as the number of residents or housing units per area unit of land. Along with residential density, access to goods and services in the neighborhood (neighborhood "completeness") affects health. Denser neighborhoods often combine residential and commercial uses, and provide greater access to resources including public transportation, libraries, and social services, grocery stores, and other retail shops and businesses.

Residential density is one measure of sprawl, or planned low-density. Sprawl is a term used to denote the continued growth of suburban neighborhoods that have sprawled from cities into more rural or "natural" areas. Residents of these areas typically live farther away from restaurants, grocery stores, jobs, and businesses. Research has found that people living in the most sprawling counties are likely to weigh six pounds more than people in the most compact counties.[68] In addition, increasing rates of diabetes, heart disease, and high blood pressure are linked with increasing degrees of sprawl.[69] [70] For example, a study examining the health effects of sprawl found that the 25 most sprawling counties in the U.S. had average hypertension rates of 25 per 100, while the 25 least sprawling counties had hypertension rates of 23 per 100.[71]

People living in sprawling communities drive more, because they typically need to travel longer distances between their homes and various destinations, and are too spread out to make public transportation, walking, or biking convenient or effective. The often long distances between suburban homes and workplaces means that people spend a significant amount of time each day in the car. The more hours that people spend driving or riding in cars increases the likelihood that they will be injured or killed in a car accident.[72] Vehicle miles traveled are directly proportional to air pollution and greenhouse gas emissions. Air pollutants, including ozone and particulate matter are causal factors for cardiovascular disease, respiratory disease and illness, and birth defects.[73] Greenhouse gases contribute to climate change and may increase heat-related illness and death, health effects related to extreme weather events, health effects related to air pollution, and water-borne, food-borne, vector-borne, and rodent-borne diseases.[74] [75] [76]

Mixed residential and commercial neighborhoods, such as those offering a variety of retail options, quality destinations, and modes of transport, are typically associated with better health. One reason for this is that neighborhoods with a mix of shops and businesses within easy walking distance are more "walkable." Another word for a neighborhood like this, with the majority of one's necessary resources included within walking distance, is a "complete" neighborhood.[77] Complete neighborhoods, which are mixed-use neighborhoods in which people can walk to school, work, stores, parks, and restaurants, can lead to more exercise and less obesity by significantly reducing the need to drive.[78] [79] According to an evaluation of urban planning and public health in Atlanta, people who live in mixed-use neighborhoods are seven percent less likely to be obese than those living in a mix level equal to the lower regional average. In other words, this study reports, one who lives in a mixed-use community is expected to weigh ten pounds less than someone living in a low density, residential-only cul-de-sac subdivision.[80] An additional important health benefit associated with complete neighborhoods is a higher consumption of fruits and vegetables.[81] [82]

Social capital is a measure of connections within and between social networks, and includes objectives such as strong social relationships with one's community, promotion of healthy behaviors, and collective action and political engagement by social groups to secure material resources and policies that promote good health. Social capital is expected to be greater for residents of denser, walkable, mixed-use neighborhoods. This type of neighborhood design encourages spontaneous and intentional social engagement, because residents spend less time in cars and more in local schools, small stores, and other places were people interact.[83] Spontaneous interactions, such as accidentally encountering neighbors, brief conversations, or waving hello, can increase respect, trust, and a sense of connection.[84] [85]

Existing conditions

Residential Density of recent new construction: The average density of permitted development in Humboldt County for the period 1985-2000 was 1 unit per 10 acres.[86]

The following table shows residential density for various Humboldt County zip-codes, and is adapted from the 2000 U.S. Census.[87]

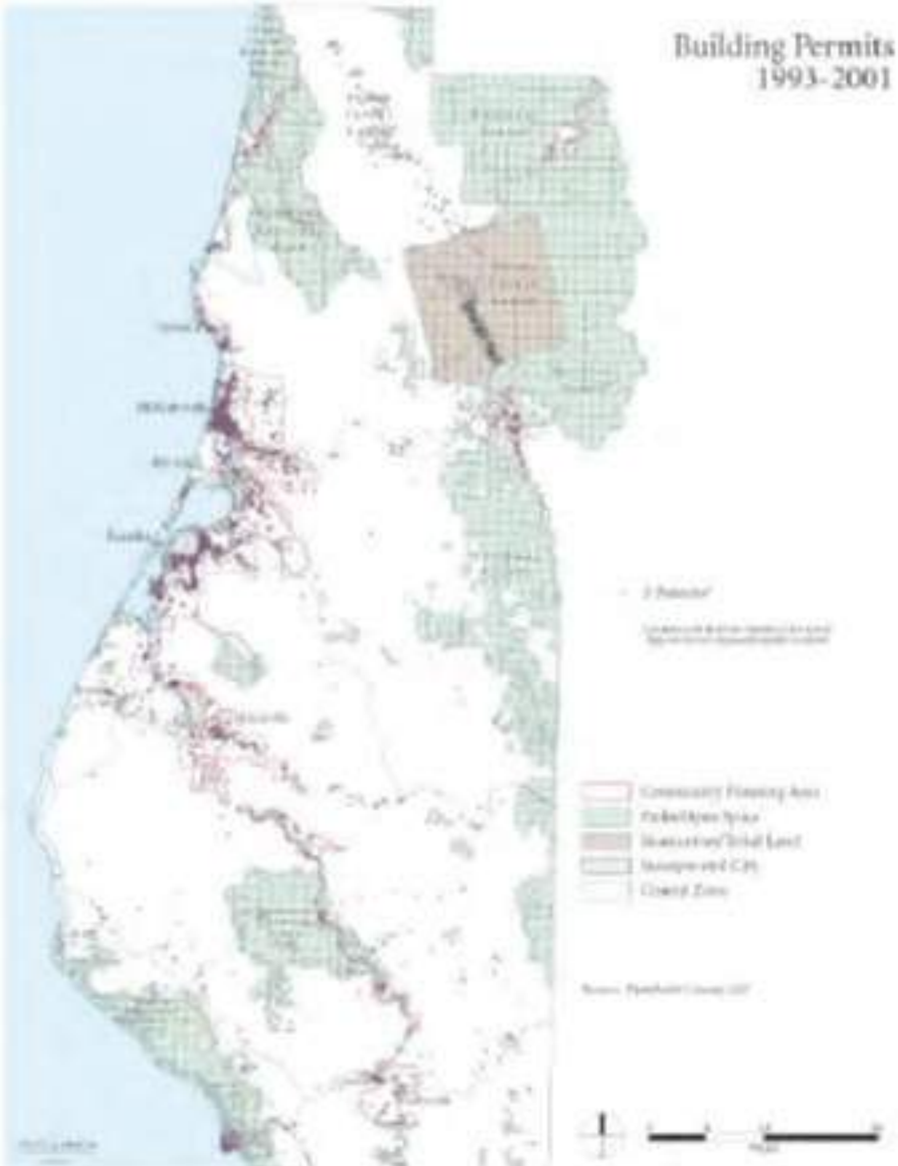
* Average housing units per acre			

The following figure shows density of new developments in Humboldt County between 1993 and 2001.[88]

Figure PI.13. Density of new developments in Humboldt County between 1993 and 2001.



[88] 2003 Housing Element Update to Humboldt County General Plan. (Approved December 16, 2003 Amended November 30, 2004).

Analysis

Assumptions

- Urban neighborhoods are generally "complete," offering resources in close proximity such as public transportation, grocery and retail stores, senior services, and childcare. The assumption is made here that new housing developments in urban communities will be part of complete neighborhoods, while new housing developments outside of urban communities will be residential only.

Logic

- If Humboldt County continues to develop at current densities, it will fall short of housing needs. As discussed in the housing section of this Health Impact Assessment, approximately 5,021 housing units are needed to house the projected population of Humboldt County in 2025. According to an assessment conducted by Dr. Michael D. Smith and Dr. Steven J. Steinberg, development at current densities would generate only 166 units. "In order to meet the projected housing need through the year 2025, over 30,000 acres outside of existing residentially-zoned land in sewer and water district-serviced areas would need to be developed, much of which consists of working agricultural and forest lands." However, according to Smith and Steinberg, it is possible to accommodate projected population growth by developing residentially-zoned lands within existing sewer and water serviced-areas by increasing the density of future residential development. Ninety percent of the development could be accommodated with a mix of large-lot suburban homes and larger-lot development.[89]
- According to Smith and Steinberg, residential development at a density of 5 units per acre is compatible with the County's rural community character. For example, many of the recent subdivisions built in McKinleyville (designated as non-urban in this analysis) have average densities greater than five units per acre.[90]
- Denser, walkable, "complete" neighborhoods lead to increased exercise, decreased weight, and more social capital. Denser areas also lead to less dependence on cars, which results in improved regional air quality, and thus fewer respiratory and cardiovascular conditions. An increase in pedestrians and bicyclists within urban areas leads to a reduced risk of traffic accidents for each individual pedestrian.[91] Less dense areas are not associated with these positive outcomes.
- Less dense development increases road congestion in urban areas because residents of less dense areas drive to urban areas for jobs and goods and services.

Quantitative Analysis

Based on an analysis of accommodating projected population growth in Humboldt County by developing housing at various residential densities, Smith and Steinberg quantified the feasibility of housing the projected population in the county using eight different density scenarios. The projected annual growth rate in the county is 0.5%, and their analysis includes higher growth rates in order to take into account the possibility of greater population growth than current state projections. They assume that 3,354 housing units are required by 2025, but according to projections made in October 2007,

5,021 housing units are needed.[92] Therefore, their analysis does not accurately estimate whether housing needs would be met in each hypothetical scenario. Their results are presented in the following table, with the last column showing whether the updated housing demand of 5,021 would be met.

Table PI.12. Growth scenarios based on the analysis of Smith and Steinberg.

Scenario	Annual Growth Rate	Average Density (units per acre)	In/Out of Existing Infrastructure	2025 Dwelling Units Required	New Dwelling Unit Capacity	Meets Updated Housing Needs (5,021 units)?
1	0.5%	0.1	In	3,354	166	No
2	0.5%	5	In	3,354	8,273	Yes
3	0.5%	2.5	In	3,354	4,137	No
4	1%	5	In	7,058	8,273	Yes
5	1%	10	In	7,058	16,546	Yes
6	2%	5	In	15,661	8,273	No
7	2%	5	In and Out	15,661	17,132	Yes
8	2%	9.6	In	15,661	15,884	Yes

Qualitative Analysis

According to a recent master's thesis by Deborah T. Waxman at Humboldt State University, many county residents resist residential density, and instead favor homes on large, fenced-in, private lots. [93] However, this is not considered to represent the view of all county residents.

Though some people resist density, other top priorities among county residents are protecting the county's remaining working agricultural and timber lands from future conversion to other uses, preserving the county's unique rural character, and addressing the county's shortage of affordable housing.[94] [95] These values support higher residential density, or Plan Alternative A.

Disparities

- Elderly people who can no longer drive safely must have stores, medical offices, recreational and cultural facilities close to home or easily accessible by public transportation or must be dependent on others for access to these goods and services. Sprawling residential development makes independent access unlikely.
- Negative health effects of sprawl, such as overweight due to automobile travel rather than travel on foot, may disproportionately be faced by non-urban residents.

Conclusions

A) All housing development associated with Plan Alternative A is associated with an increase in residential density in central urban areas. **Plan Alternative A would lead to the greatest**

[92] General Plan Update & Updated Population and Housing Projections, October 2007 (powerpoint presentation).
[93] Waxman, Deborah T. Creating Affordable Housing in Humboldt County (Master's Thesis, Humboldt State University).
[94] Smith, Michael D., and Steinberg, Steven J., January 2005. Room to Grow? An assessment of the Potential for Unincorporated Humboldt County to Accommodate Future Projected Population Growth.
[95] Waxman, Deborah T. Creating Affordable Housing in Humboldt County (Master's Thesis, Humboldt State University).

proportion of County residents living in dense, complete neighborhoods. Complete neighborhoods are associated with the health benefit of access to goods and services, as well as other benefits such as increased physical activity, reduced levels of overweight and obesity, and better social cohesion.

B) Plan Alternative B corresponds to the same increase in residential density in central urban areas, plus an equal amount of housing being built outside of urban areas. Housing built outside of urban areas would likely lead to incomplete neighborhoods. Overall, **Plan Alternative B would lead to a lesser proportion of complete neighborhoods in the County than Plan Alternative A, but more than Plan Alternative C.** From a health standpoint, Plan Alternative is less beneficial than Plan Alternative A in terms of resident access to goods and services and the other health benefits listed above.

C) Most of the housing proposed by Plan Alternative C would be developed outside of urban areas, which would lead to sprawling development. Sprawl is associated with health risks posed by incomplete neighborhoods, less physical activity and social cohesion, and more overweight and obesity. **Plan Alternative C is the least healthy scenario, because the greatest proportion of new housing built between now and 2025 would be within incomplete neighborhoods with limited access to good and services.**

Caveats

- Residents preferring sprawl may not be concerned with the health benefits associated with density, such as driving less, less air pollution, and walking-distance access to shops and businesses.
- There may also be "NIMBY-ism": current residents may support residential density because it preserves the natural spaces around their own homes, but not want to move into dense areas themselves.
- Many residents are concerned about preserving the rural character of Humboldt County.

Recommended Health-Promoting Mitigations:

- Encourage policies that require or encourage complete neighborhood in non-urban areas.

Healthy Economy Indicators

Note: Unlike other indicator sections, an analysis of Healthy Economy Indicators for each Plan Alternative was not possible as part of this Health Impact Assessment. Data on how each Plan Alternative would impact jobs and wages was not available. After discussing the Health-Based Rationale and Existing Conditions for each indicator, a broad analysis including the conclusions are given for how each Plan Alternative could impact jobs generally. Detailed jobs data is given in the Appendix.

HE.1.a Proportion of jobs paying a livable wage

Health-Based Rationale

The Humboldt County General Plan clearly recognizes the need for future policies to support economic development practices that "promote and sustain economic prosperity." This economic prosperity can be achieved with a living wage, which is defined as a wage needed to meet a minimum standard of living.[1] Job security and employment rates, along with health insurance provided by employers all significantly contribute to a healthy workforce and result in a stable and efficient economy.

Income is one of the strongest and most consistent predictors of health and disease in public health research literature. The strong relationship between income and health is not limited to a single illness or disease. In one study, individuals with an income of less than $20,000 for 4-5 years had a higher mortality risk than those who earned this income for fewer years, and a separate study in the New England Journal of Medicine[2] concluded that people who earned $15,000 annually were three times likely to die prematurely that those earning $70,000 annually.

Unemployment is associated with premature mortality[3], cardiovascular disease, hypertension, depression, and suicide.[4] [5] Those who self-reported job insecurity versus those with secured employment faced minor mental illness.[6] An estimated 6,000 excess deaths were reported as a result of 1% increase in unemployment in the United States.[7]

The adoption of a living wage is associated with a decrease in premature death from all causes for working adults. Among the offspring of low-wage workers, a living wage was associated with

improved educational outcomes and a reduced risk of early childbirth.[8] Attainment of self-sufficiency income predicts better health, improved nutrition, and lower mortality.[9]

Existing Conditions

Data source. The main source of employment information for this Health Impact Assessment was the *California LaborMarketInfo*[10], an employment database provided by the State of California. Included in this analysis are occupations identified at the Humboldt County General Plan Update and Health focus groups and with the Humboldt County Public Health Department, but only those where there was sufficient information for Humboldt County, i.e., this analysis does not represent all occupations in each industry, but serves as a sample. Occupations were categorized based on the description as provided by *California LaborMarketInfo.*

General Plan Update Goals and Policies. Goals, policies, and implementation measures defined in the Humboldt County General Plan Update Chapter 11: Economic Development Element, which can be accessed on the Humboldt County website[11], reinforce the goal of creating a "healthy economy", here defined as maintaining a healthy, employed workforce with living wages and health insurance in relation to the analysis of the current economic conditions based on industry. Positive impacts of current goals, policies, investments and partnerships as stated in the Humboldt County General Plan Update in conjunction with current findings of this assessment are:

- Maintaining a diverse, stable, and growing local economy (ED-G1, ED-P19);
- Expanding internet access (ED-G2);
- Supporting education and training of the workforce (ED-G4, ED-P11, ED-P17, ED-P18, ED-IM4);
- Protecting timber lands (ED-G8);
- Revitalizing Brownfields (ED-G9, ED-P6, ED-P7);
- Encouraging partnerships between educational and training institution, employment centers and job searchers (ED-G10);
- Economic Development Assistance Programs for current and future workforce (ED-G11).

Living wage. Living wage calculations are based on a family scenario where one adult is the sole provider and working full-time (2080 hours per year or 40 hours per week). Poverty wage calculation is based on gross annual income and is converted to hourly wage for comparison. The table below compares living, minimum and poverty wages for different size families in Humboldt County. The living wage for a family of one adult and one child ($15.27 per hour) will be used for future comparison to hourly wage earned for each occupation.

Table HE.1. Living, minimum and poverty wages by family type for Humboldt County.[12]					
	One Adult	**One Adult, One Child**	**Two Adults**	**Two Adults, One Child**	**Two Adults, Two Children**
Living Wage (per hour)	7.42	**15.27**	10.81	17.22	22.07
Minimum Wage (per hour)	7.50	7.50	7.50	7.50	7.50
Poverty Wage (per hour)	4.73	6.38	6.03	7.43	9.39

Employment by industry. Based on the California Labor Market Info, the following table details how Humboldt residents, ages 16 years old and older, are currently employed based on industry.

Table HE.2. Employment in Humboldt County by industry.		
	Total	**%**
Agriculture, forestry, fishing and hunting, and mining	2,743	4.9
Also includes logging and crop production		
Construction	3,239	5.8
Manufacturing	4,802	8.7
Wholesale trade	1,727	3.1
Retail trade	6,930	12.5
Includes automobile dealers, furniture, appliances, grocery stores, clothing, etc.		
Transportation and warehousing, and utilities	2,082	3.8
Information	1,061	1.9
Includes software publishing, data processing services		
Finance, insurance, real estate, and rental and leasing	2,812	5.1
Professional, scientific, management, administrative, waste management services	3,822	6.9
Includes legal services, computer systems design, travel services		
Educational, health and social services	14,748	26.6
Includes elementary thru university, and trade schools, hospitals, other health care offices		
Arts, entertainment, recreation, accommodation and food services	5,408	9.8
Includes artists, art institutions, gambling, traveler services, parks/camps, restaurants, bars		
Other services (except public administration)	2,870	5.2
Includes political organizations		
Public administration	3,182	5.7
Includes legislative offices, general government, justice, armed forces		
Total	**55,426**	**100**

Living wage by occupation. Occupations in Humboldt County that can provide a living wage (i.e., the hourly mean wage can support a family size of one adult and one child - $15.27) include:

- Timber;
- Construction;
- Road construction and maintenance;
- Restoration of lands;

[12] Amy K. Glasmeier. Poverty of America Living Wage Calculator. Pennsylvania State University. Available at: http://www.livingwage.geog.psu.edu.

- High technology industries.

Industries that did not always provide a living wage include:

- Agriculture, Ranching, Fishing;
- Tourism including restaurants, hotel, outdoor recreation;
- Retail;
- Government;
- Gaming.

Industries that sometimes provide a living wages include:

- Green industry;
- Healthcare.

Hourly mean wages for those employed in *education* could not be suitably estimated due to seasonal work period.

Industry growth. *California LaborMarketInfo* forecasts an increase in employment need in industries from 2004-2014. The growth industries often providing living wages include:

- High technology (20-40%);
- Registered nurses and some other health care professions (22.5%);
- Some construction occupations (19.1%).

These occupations educational/training perquisites range from an Associate's or Bachelor's Degree to on the job training.

Occupations with projected growth that do not often supply living wages:

- Gaming dealers and service workers (33% growth);
- Retail salespersons (21.9%);
- Recreation attendants in the outdoor tourism industry (18.8%);
- Preschool teachers (15.6%);
- Hotel clerks (13.6%).

Many of the occupations require a minimum of on the job training or vocational education.

Significant Employment Providers. The population employed in the industries mentioned above varies, but employment sectors providing the most jobs include:

- Educational institutions, health and social services (26.6%);
- Retail trade (12.5%).

Unemployment rates. Unemployment Rate and Labor Force not seasonally adjusted. Humboldt County's unemployment rate (6.5%) is slightly higher than the State of California (5.9%) and San Francisco County (4.5%).

4

HE.2.c Number of jobs available with appropriate educational requirements

Health-Based Rationale

One's education level plays an important role in determining the types of jobs and therefore the income one can expect. Level of educational attainment is a variable linked with economic advancement with the opportunities and accessibility to higher paying jobs. As income increases, funds can be used to amenities that contribute to good health including medical care.[13] As detailed above, income is one of the strongest and most consistent predictors of health and disease in public health research literature.

Existing Conditions

Education levels. As the table below shows, of the population in the County 25 years and older, approximately 74% have finished junior high but do not have more than an Associate's Degree.

HE.3 Education levels in Humboldt.[14]		
	Population	**Percent**
Population 25 years and over	**84,677**	**100**
Less than 9th grade	3,648	4.3
9 to 12th, no diploma	5,978	7.0
High School Graduate (Equivalency)	20,958	24.8
Some college, no degree	24,495	29.0
Associate's degree	7,468	8.8
Bachelor's degree	15,353	18.1
Graduate or professional degree	6,777	8.0
High School Graduate or higher	75,024	88.60
Bachelor's Degree or higher	22,101	26.10

Occupations by education level. This level of education qualifies Humboldt residents for several industries with living wages:

- Timber;
- Construction (excluding managerial);
- Healthcare;
- Some education occupations.

Many of these industries do require additional on the job training ranging from 30 day to one year training.

Occupations not often compensating employees with a living wage based on this educational attainment are (all excluding managerial or supervisor positions):

- Agriculture, Ranching, Fishing;

[13] Isaacs, Stephen and Steven A. Schroader. The Ignored Determinant of the Nation's Health. The New England Journal of Medicine. 2004: 351:11.

5

- Restaurants;
- Hotel;
- Outdoor tourism;
- Retail;
- Government;
- Gaming.

6

HE.2.a Proportion of jobs that provide health insurance benefits

Health-Based Rationale

Jobs that do not include health insurance contribute to poor health outcomes. Annually nationwide, 18,000 premature deaths are attributable to lack of health coverage.[15] Families with at least one full-time, full-year worker are more than twice as likely to have health insurance coverage, compared to families whose wage earners work as part-time employees (less than 35 hours per week), as contingent labor (e.g., on a seasonal or temporary basis, as employees of contractors, self-employed), or in which there is no wage earner.[16] Individuals without health insurance frequently forego timely health care, suffer more severe illness, and are more likely to die a premature death than their insured counterparts.[17] [18]

Existing Conditions

Information on health insurance benefits for industries is limited and not sufficiently categorized and unable to make conclusions based on this evidence.

Humboldt County's uninsured percentages for all ages and person under age of 18 are below that of the entire State of California (18.8, 15.5), but above that of San Francisco County (13.3, 10.6).[19]

Table HE.4. Number of Uninsured in Humboldt County.[20]

All Ages			Under Age 18		
Number insured	Number uninsured	Percent uninsured	Number insured	Number uninsured	Percent uninsured
102,605	21,154	17.1	25,539	3,975	13.5

7

Impacts of the Humboldt General Plan Update

Below is a limited analysis of the Plan Alternatives based on descriptions in the Humboldt General Plan Update. There will be exceptions in these alternatives based on various industry and economic circumstances and trends.

Description of Plan Alternatives

The Humboldt General Plan Update describes the Plan Alternatives as follows:

Plan Alternative A: Industrial reuse and protection of prime employment lands are key policies. Includes less robust economic development such as the expansion of road, rail, and airport, does not accommodate "big box" in unincorporated areas, and is more environmentally superior alternative.

Plan Alternative B: Consists of fairly robust economic development initiatives including expansion of road, rail, and airport and includes discretionary review of "big box" commercial uses. Industrial reuse and protection of prime employment lands are key policies.

Plan Alternative C: Higher capacity, less regulatory plan, some government programs left out and accommodates "big box" in unincorporated area.

Conclusions

Plan Alternative A

- With the protection of prime employment and industrial reuse, this land use alternative preserves and promotes some industries that provide employees with living wages and appropriate education requirements, such as timber.
- Construction jobs, which often can pay living wages, may also increase with infill housing development and with the development of walking trails and other green living construction.
- Some industries that often do not provide jobs with living wages would also remain relatively stable (e.g., tourism and agriculture) or grow slightly given the population growth (e.g., retail).
- Other industries that also infrequently provide living wages, such as big box retail, would be less likely given the limited development opportunities.
- There is also a possibility that the cost of living may decrease because general costs, such as those for housing, utilities and transportation may be reduced. See other indicator sections for more details.

Plan Alternative B

- This land use scenario would be slightly detrimental to some industries that can provide employees with living wages and appropriate education requirements, such as timber.
- Construction jobs, which also can pay living wages, may increase more in this Plan Alternative than in Plan Alternative A.
- Some industries that do not often provide jobs with living wages would also remain relatively stable (e.g., tourism) or grow given the higher population growth in this Plan Alternative (e.g., retail).
- Others industries that infrequently provide jobs with living wages would decrease (e.g., agriculture).
- Plan Alternative B is slightly more hospitable to other industries that also infrequently provide living wages, such as big box retail.

8

<u>Plan Alternative C</u>

- This land use alternative would be detrimental to some industries that can often provide employees with living wages and appropriate education requirements, such as timber.
- Construction jobs, which also can pay living wages, would increase most in this Plan Alternative.
- Some industries that do not often provide jobs with living wages would also remain relatively stable (e.g., tourism) or grow given the higher population growth in this Plan Alternative (e.g., retail).
- Other industries that infrequently provide for living wages would decrease (e.g., agriculture).
- This Plan Alternative is most likely to promote other industries that also infrequently provide living wages, such as big box retail.
- There is also a possibility that the cost of living may increase in this Alternative since, for example, people may be more dependent on owning a car, average electricity consumption could increase and housing prices may increase.

Recommended Health-Promoting Mitigations:

- Develop policies to attract and retain industries who:
    - Can provide a living wage;
    - Provide health insurance benefits;
    - Meet existing levels of workforce education.
- Develop policies to solidify collaborations that can provide employees the opportunity for advancement, possibly resulting in earning a living wage:
    - Educational institutions;
    - Labor training centers;
    - Other labor organizations.
- Ensure that a trained and qualified workforce is available to meet the needs of projected growing industries that can often provide living wages.

9

Public Safety and Social Cohesion Indicators

SC.2.a First responder response time, specifically Fire response times by zip code

Health-Based Rationale

The geographic distribution of fire stations throughout a county impacts the rate at which firefighters and emergency responders may respond to fires and medical emergencies at the neighborhood level. Rapid response by firefighters can influence severity of injury and number of deaths from a fire or emergency.

The National Fire Protection Association (NFPA) establishes codes and standards to minimize the possibility and effects of fire and other hazards. NFPA 1710 is a *voluntary* standard for fire station and emergency responders that states that the first arriving unit should respond within 5 minutes for 90% of all fire suppression incidents. Emergency medical responders should also respond within 5 minutes for 90% of all emergency medical incidents.[1]

An adequate number of fire stations geographically distributed can aid in ensuring rapid response and rescue. However, it is unclear exactly how important response times actually are. Based on *one* study that showed that survival rates are better if CPR is administered within 4 minutes of the cardiac arrest, all EMS services have adopted a < 8 minute response time as the standard for the industry.[2] A different study showed, though, that whether the first responders arrived before or after 8 minutes did not make a difference for survival rates for traumatic injury.[3] And a study done in Helsinki determined that out of 72,000 "Category C" emergency responses by ambulances, 33% of the 73 pre-hospital deaths were potentially avoidable if there had been faster ambulance response.[4] This is 0.0003 of the responses, i.e., a negligible amount, that could have been saved by faster response.

It is possible that a more useful measure might be how many Humboldt County paramedics are available vs. Emergency Medical Technicians (EMTs). A study looking at EMT vs. paramedic services in King County, WA, determined that while the annual incidence of heart attacks was similar in the EMT and paramedic areas, more lives of persons with heart attacks were saved in the paramedic area than in the EMT area. During this 17 month period, the reduction in community cardiac mortality was 8.4% in the paramedic area and 1.3% in the EMT area. These findings suggest that paramedic services have a small but measurable effect on community cardiac mortality.[5]

Insurance companies rate the risk of devastating fires to be lower in cities compared to unincorporated and less densely populated areas of the County. Fire insurance can cost up to twice as much in a high risk area. Recently, industry standards were changed so that structures more than 10 miles from a fires station are given the highest risk rating for insurance purposes.

[5] Eisenberg M, Bergner L, Hallstrom A. 1979. Am J Public Health 69(1):39-42.

Response times are just one aspect of overall fire risk in neighborhoods. Increased risk of fire increases the risk of fire-related injury or death. Between 1983 and 1990, an average of 74% of all fire deaths in the United States occurred in residential fires.[6] Heating fires are more common in single family homes, particularly those with fire places, than in apartment buildings where heating systems are professionally maintained. However a higher proportion of smoke alarms did not operate in apartments than in one- and two-family homes.

Fire prevention methods such as use of smoke detectors, sprinkler systems, building code enforcement, and flame-retardant mattresses and materials have decreased the risk of fire. Only 60% of households where a fire death occurred were equipped with smoke alarms; of those, 39% did not operate. Smoke alarms contribute to saving lives.[7]

Existing conditions

Fire protection services. Humboldt County's fire protection services provide protection to the approximately 126,518 citizens residing in the County. Fire protection forces consist of 69 career and 689 volunteer firefighters, 120 engines, 55 fire stations, 18 ambulances, and 2 rescue squads.[8] These are detailed in the table below.

Wildfire risk. Approximately 11% of Humboldt County residents live in areas that have been assessed as "high wildfire risk". These areas are broken down by "fire planning compartments" and they are: East Klamath, Trinity, Mattole-Lost Coast, and South Eel. These areas comprise most of South County and a large portion of the northeast.[9]

Response times. Rural fire departments in Humboldt County have:[11]

- Longer turn-out times (3.5-5.5 minutes or greater) due to more distant proximity of volunteers to fire stations;
- Longer response times (6-13+ minutes);

[10] FSC. Chapter 3: Risk Assessment and Mitigation Strategies (RAMS) Modeling for Wildland Fires. Fire Safe Council Draft Master Fire Plan. Humboldt County Community Development Services Dept. Available at http://co.humboldt.ca.us/planning/fire_safe_council/fsc_default.asp. Accessed on February 18, 2008.
[11] Humboldt County Fire Safety Council. 2006. Humboldt County Master Fire Protection Plan. Available at http://co.humboldt.ca.us/planning/fire_safe_council/fsc_default.asp. Accessed on February 1, 2008.

- Insurance Service Office (ISO) Public Protection Classification (PPC) ratings that are usually in the 8,9,10 rating range, indicating high risk;
- Almost 100% volunteer fire personnel, many of whom do not live in close proximity to the fire station(s).

Urban/semi-rural fire stations in Humboldt County generally have:

- Multiple-station coverage with smaller jurisdictions;
- Shorter response travel times (3-7 minutes);
- Shorter turn-out times (1.5 – 2.5 minutes);
- ISO PPC ratings that are in the low single digit range;
- Considerable amount of water supply and pressure;
- Either full-time paid or a mix of full-time paid and volunteers;
- Volunteers that reside in close proximity to the fire stations.

The average rural Community Structure Fire Response is the sum of the average turnout time (5 minutes), and the average travel time (6 minutes). Thus, average response time is 11 minutes. The average urban/semi-rural Community Structure Fire Response is the sum of average turn-out time (1.5 minutes) and the average travel time (4.3 minutes). Thus average response time is 7 minutes.

Medical emergency calls. Over 50% of the calls for fire organization services are related to medical aid, and they are also the fastest growing type of call. From 2000 to 2003, Fortuna experienced a 33% increase in medical aid and traffic collision call volume (3,088 calls in 2000 vs. 4,106 calls in 2003). Generally, when an emergency medical dispatch is requested, the local fire department responds and provides Basic Life Support until an ambulance which has Advanced Life Support capability arrives. The table below details Fortuna's Interagency Command Center's activity.

Table PS.2. Fortuna Interagency Command Center Recorded Activity.[12]

	Year						
Incident Type	*1998**	*1999*	*2000*	*2001*	*2002*	*2003*	*2004*
Public Assist	Un-recorded	156	223	331	313	257	143

Average Increase per year							+11%
Percent Increase (1998 to 2004)							+62%

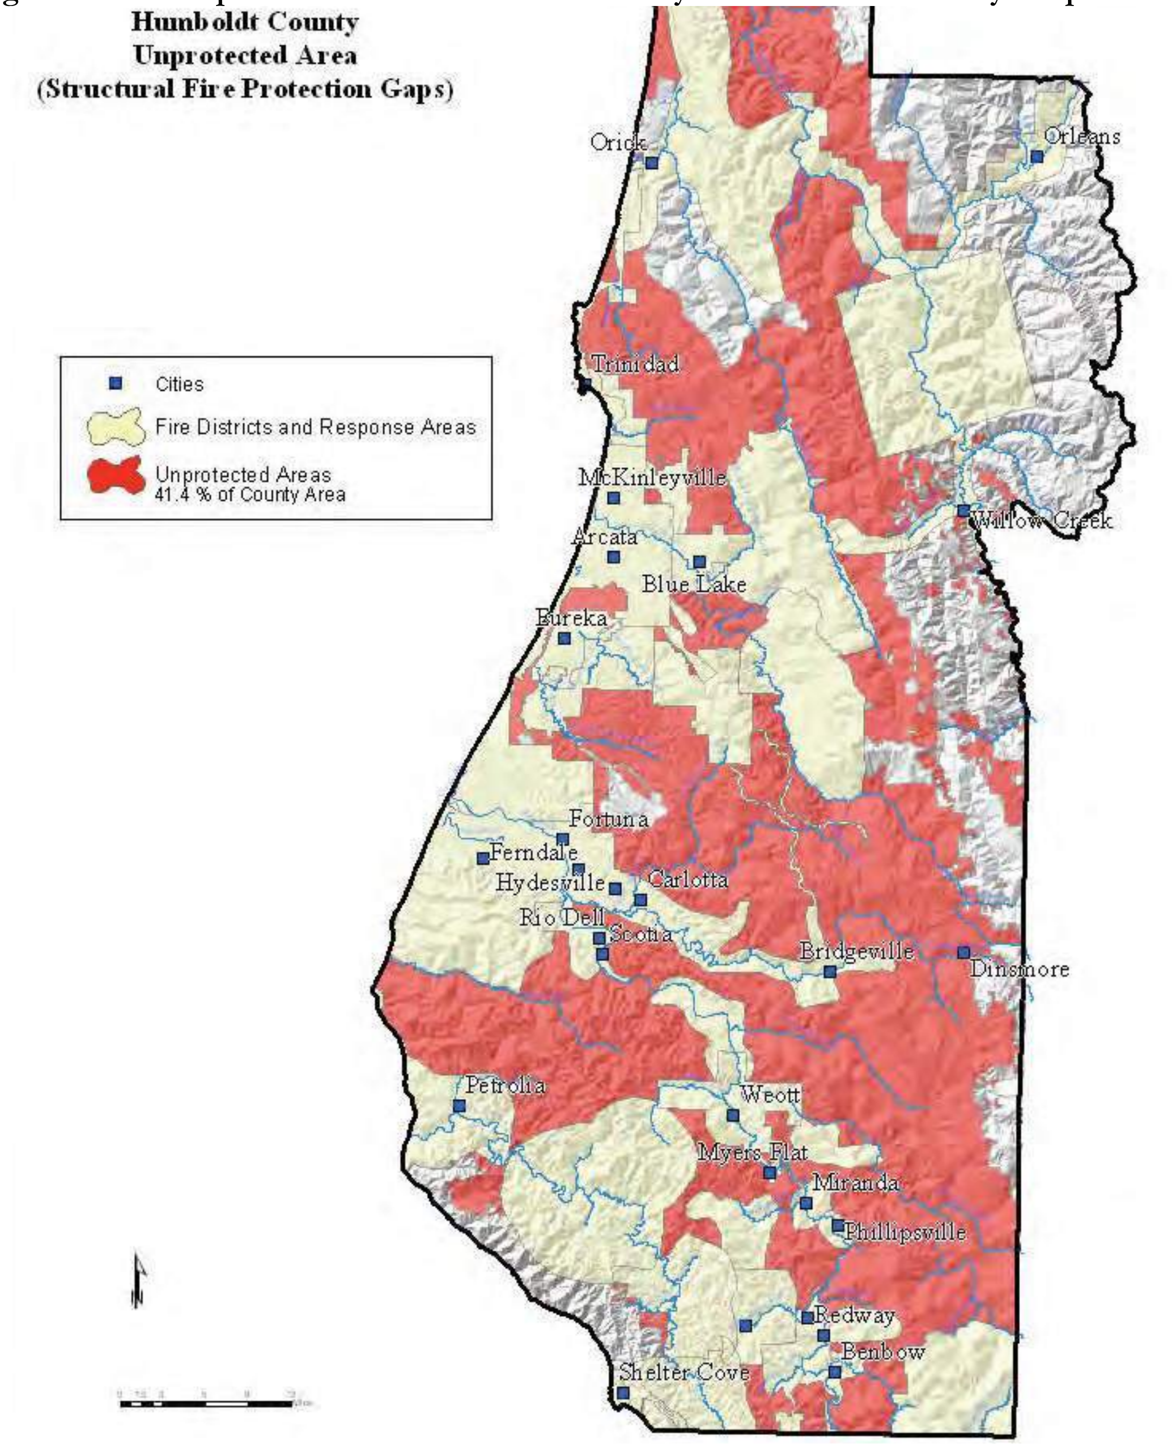
*Recorded activity for 1998 was not categorized by Public Assist incident type—these incidents are contained in other categories for that year.

[12] Humboldt County Fire Safety Council. 2006. Humboldt County Master Fire Protection Plan. Available at http://co.humboldt.ca.us/planning/fire_safe_council/fsc_default.asp. Accessed on February 1, 2008.

Areas Without Fire Protection. Similar to other Northern California counties with large rural areas, Humboldt has several areas that are without any dedicated, formal delivery of year-round structural fire protection and/or emergency response services. An analysis of the County fire protection coverage map, created using fire organization survey data, indicates that approximately 41.4% of Humboldt County falls into this category and is without year-round structural fire protection and other necessary emergency services (shown in the figure below). This represents approximately 2% of the housing units within Humboldt County.[13] These areas may receive a limited form of "good will" emergency response coverage from adjacent fire districts, CDF or other near-by agencies, but only on a seasonal or "as available" basis. These areas can have a response time of up to 45 minutes associated with them and the level of response greatly depends on the availability of resources. Additionally, a significant portion of the "unprotected" and "under protected" areas include State Highways and County Roads. Motorists involved in traffic collisions in these areas may experience long response times from first responders.

[13] This estimate is based on the 2000 Census, which indicates that the County contains 55,298 housing units of which 1,138 are located in the 41.4 % of the county area that is "unprotected".

Figure PS.1 A map of the areas of Humboldt County that are not covered by fire protection.



Analysis

Assumptions

- It is assumed that no new fire stations will be built and that staffing levels will remain the same.

Quantitative Analysis

Using information from the Fire Safe Council's Master Fire Protection Plan, the rural response time is 11 minutes, and the urban response time is 7 minutes. However, it is not yet clear whether new development in Plan Alternatives B and C would be in areas considered to be rural or just non-urban. Therefore, it is difficult to quantitatively assess the change in average response times for the County.

Qualitative Analysis

In focus groups with fire personnel held for the Master Fire Protection Plan, participants noted:

- On many occasions that a majority of their calls are medical. Incidence ranged from 56% - 95%, with most saying above 75%;
- Collaboration with forest service is vital to rural areas (however the fire service cannot enter structures by law);
- Insurance is difficult for volunteer firefighters due to it cost;
- Funding is a problem for most volunteer fire stations;
- Response times are long in rural areas;
- Semi-rural areas tend to have an ISO rating of 5 in hydrant areas and 8B in non-hydrant areas.

Disparities

In 1997, the Federal Emergency Management Agency (FEMA) conducted a review of socioeconomic factors and risk of fire. The review found that "virtually every study of socioeconomic characteristics has shown that lower levels of income are either directly or indirectly tied to an increased risk of fire."[14] One study in Dallas, Texas found that there was a 20-fold difference in risk of fire between persons with highest incomes and lowest incomes.[15] The review also found that African American and American Indian children are nearly twice as likely to die in a fire as white or Asian children. Children under age 5 are 40% more likely to die in a fire than the general population.[16]

Older adults are also particularly at risk in the event of a fire. Nationally in 2001, the elderly represented 12% of the US population but suffered more than 30% of all fire deaths. This is due to a combination of factors: mental and physical frailties, higher alcohol usage, greater use of medications, higher smoking incidence, and elevated likelihood of living in a poverty situation. The relative risk of an older adult dying in a fire is 2.5 times greater than the general population.[17]

---

[14] FEMA. Socioeconomic Factors and the Incidence of Fire. June 1997. Available at http://www.usfa.dhs.gov/statistics/reports/socio.shtm. Accessed online on February 2, 2008.

[16] USFA. A Profile of Fire in the U.S.: 1992-2001. October 2004. Available at http://www.usfa.dhs.gov/downloads/pdf/publications/fa-293-508.pdf. Accessed on February 2, 2008.

[17] US Fire Administration/National Fire Data Center. 2004. The Fire Risk to Older Adults. Topical Fire Research Series 4(9):1-8.

Conclusions

A) Plan Alternative A would encourage concentration of population in areas that are already better served by fire departments with a higher percentage of career firefighters. Thus, **response times will be faster in Plan A**. In addition, there are more paramedics and EMTs in the urban areas of Humboldt County (vs. First Responders with Basic Life Support skills and equipment), which have an impact on mortality and morbidity.

B) Plan Alternative B would encourage population in both urban and non-urban areas, and thus would not a have a large impact on response times.

C) Plan Alternative C would encourage a greater amount of population growth in rural areas that are served more often by volunteer firefighters with slower response times. As such, **Plan Alternative C would lead to lower average response times**. Negative health outcomes could include increased injuries and deaths from fires and potentially increased harm in medical emergencies.

Recommended Health-Promoting Mitigations:

- Support clustered development in regions where water supply is adequate.
- Establish a uniform measurement system county-wide to track response times.
- Encourage currently trained EMTs to gain paramedic training.

SC.2.b Emergency preparedness training for citizens

Health-Based Rationale

As population density and settlement in high-risk areas continue to rise, natural disasters are expected to increase in frequency and severity. Thus, mass casualties are a likely consequence of such events. In the last 25 years, the United States has been subject to 442 natural disasters. During the last century, more than 16,500 people died and almost 2.5 million people were affected as a result of the top ten natural disasters registered in the US alone.[18] And the occurrence of natural disasters is increasing; in the 1960's disaster totals numbered only 89 a year – in the 1990's it was 392.[19]

Studies of injuries after many types of natural disasters (floods, earthquakes, hurricanes, tornados) show that the most common type of injuries are soft tissue injuries, i.e., cuts, lacerations, and puncture wounds; or musculoskeletal injuries like fractures, sprains and closed head injures. Members of the lay public are often the actual 'first responders' in many disaster events.[20] In California, the state government expects residents to be self-sufficient for the first 72 hours after an earthquake.[21]

In a study done in Los Angeles after the Northridge earthquake, 54% of the residents surveyed said they had received first aid training; this is similar to other studies with regard to prevalence of first aid training. Of those, 45% had received it in the last five years. Respondents who had first aid training were 2.4 times more likely to help their family and 2.1 times more likely to help a stranger than those without first aid training. People who had first aid training (treating shock, controlling bleeding, putting on a splint, mouth to mouth resuscitation, CPR) were almost 2 ½ times more likely to use first aid skills.[22]

The Multihazard Mitigation Council studied the effectiveness of FEMA grants to mitigate the effects of floods, hurricanes, and earthquakes. They concluded that the mitigations (which include everything from emergency preparedness programs for citizens, hospitals, public health departments to infrastructure support and maintenance) set in place during 1993 – 2003 nationally will save 220 lives and prevent almost 4,700 injuries over the next 50 years. Additionally, they estimate that every $1 spent on hazard mitigation (actions to reduce disaster losses) provides the nation $3.65 in future benefits.[23]

Existing conditions

In 2006-2007, Humboldt County's chapter of the American Red Cross trained approximately 9,000 people in Health & Safety trainings and 13,000 people attended disaster preparedness trainings or

[23] Multihazard Mitigation Council. 2005. Natural Hazards Mitigation Save: An indpendent study to assess the future savings from mitigation activities. National Institutes of Building Sciences. Washington, DC.

workshops.[24] However, the trainings that people received could range from a ½ hour presentation to a 2-3 hour focused training. Currently, there is no exact count of the number of citizens who are prepared in case of an emergency.[25] [26] Barbara Caldwell, Executive Director of Humboldt Red Cross, indicated that the sites that the Red Cross concentrates on, and thus where most people are trained, are on the coast, given that the coastal region is at greatest risk of earthquake and tsunami.

All county employees (2000 people) are required to have disaster preparedness training. In the Public Health Department, all 200 employees received some training and emergency home kits.[27] The Emergency Operations Plan of the Office of Emergency Services designates public employees as Disaster Service Workers, and may be required by their employer to carry out disaster-related activities.[28] Also, all local government employees in incorporated areas are required to be trained.[29] All public schools are required to have a disaster emergency plan.

Each state has a Governor's Office of Emergency Services to manage state-level organization and response efforts. Within the states, each county is its own Operational Area (OA). Humboldt County Ordinance 2203 established the Humboldt OA and identified the Sheriff as Director of Emergency Services for the County. The Sheriff's Department has an Emergency Operations Plan, which identifies the chain of command, lays out the existing conditions with regard to threat from earthquake, tsunami, flooding, and civil disobedience. Additionally the Emergency Operations Plan details systems that could be affected during a natural disaster (transportation, communications, potable water, electrical power, medical facilities, sanitation systems, natural gas lines, hazardous materials storage, and dam failure). Evacuation areas are laid out.

The figure below shows which areas in Humboldt County will be most affected by earthquakes.

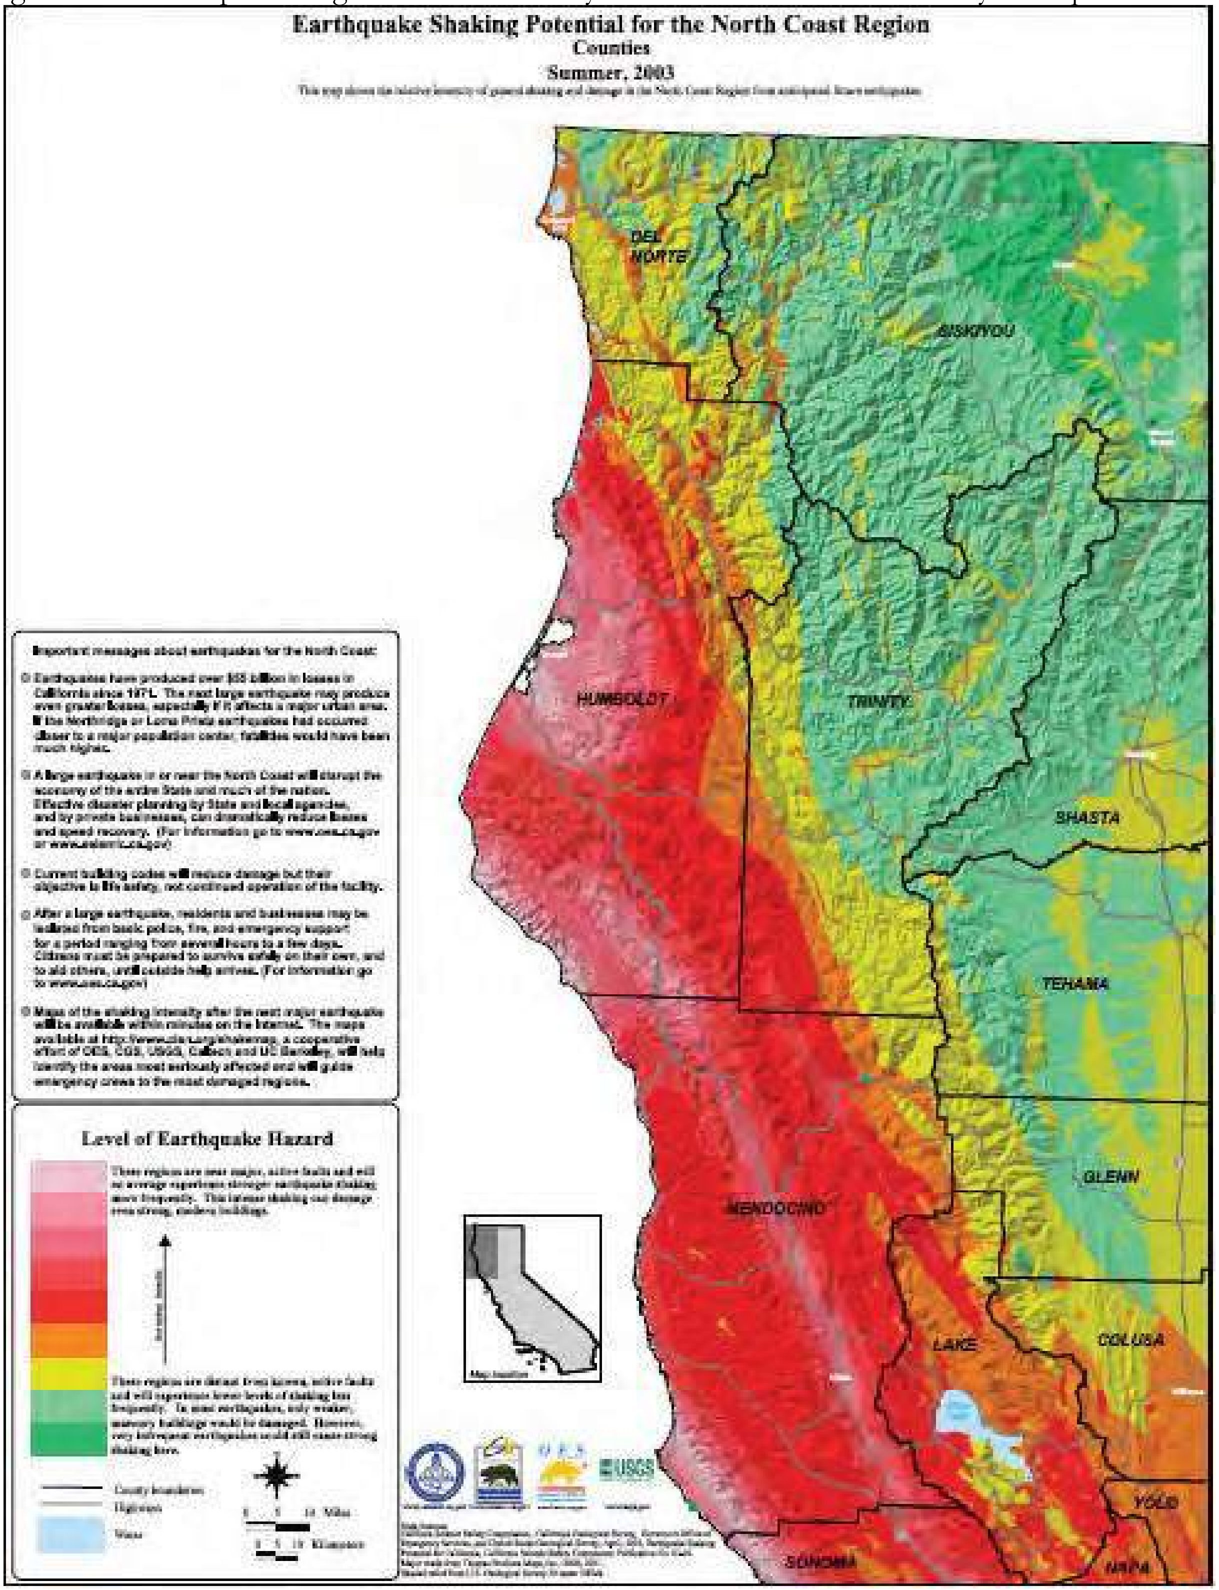
Figure PS.2. A map showing areas of the County that would be most affected by earthquakes.[30]



---

[30] California's Seismic Safety Commission. Available at: www.seismic.ca.gov/pub/intensitymaps/ncoast_county_print.pdf .

Analysis

Assumptions

- Earthquake, tsunami, flooding, wildland fire, and drought conditions will worsen with climate change over the next 25 years.

Quantitative Analysis

Data about current levels of emergency training does not exist. Sources stated that those kinds of numbers are not kept and it would be difficult to extract exactly how many people are trained. Given that, quantitative analysis is not possible.

Qualitative Analysis

Public comments on the Safety Element do not specifically address the County's level and capacity for training it's citizenry in emergency preparedness. However, there are comments that reflect a concern for the increase in threats due to an increase in natural disasters as a result of global warming. One comment raises the concern that Humboldt County's own future flood maps points out that the area north and south of Eureka/Arcata will be under water in the future, that Rt. 299 to Redway will also be cut off, and that this could happen sooner rather than later – and abruptly - if ice masses in Greenland and Antartica slip off. For a map of the 100 and 500 year flood risks, see http://co.humboldt.ca.us/planning/gp/PrelimHearingDraft/Group3/Maps/base2flood.pdf. There were also flooding concerns due to upstream timber production policies.[31]

Conclusions

A) **Plan Alternative A focuses growth in areas of the County where the Red Cross concentrates its trainings**. The Red Cross is the primary agency responsible for citizen emergency preparedness training on a county level.
B) **Plan Alternative B is likely to bring about an increase in the numbers of people trained in emergency preparedness but no change in the proportion of Humboldt County residents trained in urban vs. non-urban settings**.
C) **Plan Alternative is likely to bring about an increase in the numbers of people trained due to the increase in population in the urban areas, however, this is the least likely Alternative to bring about a proportional increase in rural residents trained**.

Recommended Health-Promoting Mitigations:

- Increase the importance of emergency preparedness in the General Plan. The Draft Safety Element of the GPU does not cover improving emergency preparedness among Humboldt County's citizenry beyond implementing the Emergency Operations Plan, which also does not cover this topic in detail. Have schools communicate their Emergency Operations Plans to parents.
- Set benchmarks on how many citizens are trained in each area. Designate a public agency responsible.

[31] Written Comments: Group 3 – Noise and Safety Element. Humboldt GPU Update. Available at http://co.humboldt.ca.us/planning/gp/PrelimHearingDraft/CommentList2.htm#group3. Accessed on February 3, 2008.

- Support the Humboldt Red Cross in outreach efforts to bring people into their CERT training (Community Emergency Response Team).
- Have schools communicate their Emergency Operations Plans to parents.
- Expand funding for trainings and awareness raising about emergency preparedness.
- Set up a Rural Emergency Preparedness outreach team to specifically address the readiness and concerns of rural residents in case of emergency.

SC.1.c Driving Under the Influence (DUI)

Health-Based Rationale

Drinking and driving is a common occurrence. The main health concerns are death and injury due to motor vehicle accidents (MVA). During 2005, 16,885 people in the U.S. died in alcohol-related motor vehicle crashes, representing 39% of all traffic-related deaths.[32] Also in 2005, nearly 1.4 million drivers were arrested for driving under the influence of alcohol or narcotics.[33] However, that's less than 1 percent of the 159 million self-reported episodes of alcohol–impaired driving among U.S. adults each year.[34] Drugs other than alcohol are involved in about 18% of motor vehicle driver deaths. These other drugs are generally used in combination with alcohol.[35]

More than half of the 414 child (ages 14 and younger) passengers who died in alcohol-related crashes during 2005 were riding with the drinking driver. Of the 1,946 traffic fatalities among children ages 0 to 14 years in 2005, 21% involved alcohol. In 2005, 16% of drivers ages 16 to 20 who died in motor vehicle crashes had been drinking alcohol.[36]

Among motorcycle drivers killed in fatal crashes, 30% have blood alcohol concentrations (BACs) of 0.08% or greater. Motorcyclists ages 40 to 44 years have the highest percentage of fatalities with BACs of 0.08% or greater.[37]

Among drivers involved in fatal crashes, those with BAC levels of 0.08% or higher were nine times more likely to have a prior conviction for driving while impaired (DWI) than were drivers who had not consumed alcohol.[38]

Urban counties have a higher *number* of alcohol-involved fatal crashes because they have more people, however, rural counties have higher crashes per capita *rates* for alcohol-related motor vehicle collisions.[39] While 17% of the US population is classified as rural, 58% of all fatal crashes and 60% of traffic fatalities were recorded in rural regions of the US between 1993-2004.[40] Fatal crashes and traffic fatalities in rural areas are 3.5 times more prevalent than expected on the basis of the

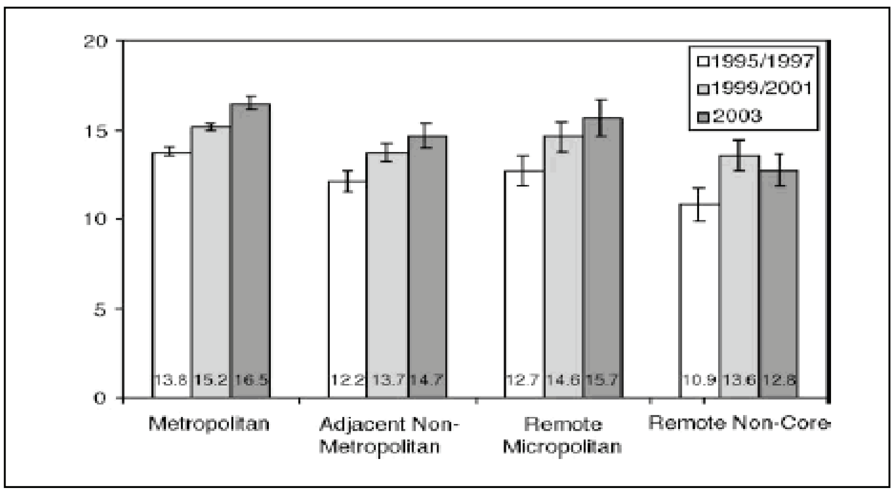
percentage of total population, and the risk that the driver behavior, such as DUI and not wearing seat belts, is attributed to a fatal crash is 10% higher in rural areas than urban.[41]

Higher mortality in rural crashes has been attributed in various research to delayed time to medical response, limited access to trauma resources, higher speed limits, an increased rate of alcohol use, and a lower rate of seat belt use in rural locations. However, much research shows the same rate of drinking while driving in urban and rural.[42]

In a report detailing US-wide rates of motor vehicle accident fatalities comparing rural and urban factors, the distribution of BAC levels was similar for urban and rural drivers at BAC levels of 0.10 or lower. However, for all levels of BAC above 0.10, the percentage of rural drivers with a given BAC exceeded the percentage of urban drivers with that same BAC, i.e., there was a higher percentage of rural drivers with a BAC of 0.11, 0.12, 0.13, etc.[43]

As the figure below shows, the proportion of adults in the US aged 18-49 who consumed 5 or more drinks in one day in the last year varied little with regard to urban vs. rural.

Figure PS.3. Adjusted percentage (95% confidence intervals) binge drinkers by type of county.[44]



Existing conditions

California. In 2004, 4,120 people in California were killed in traffic crashes. About 40% of all traffic fatalities in the state were the result of alcohol use. The average age of an arrested DUI offender in 2004 was 33.2 years, but the highest percentage of drivers with BAC levels of 0.08 or greater was for

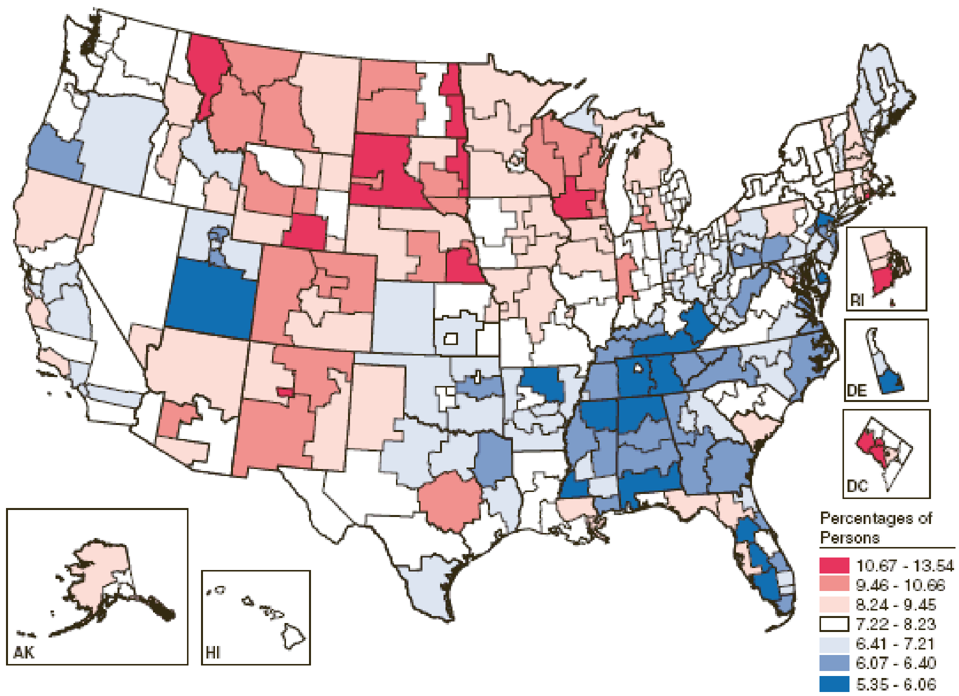
drivers ages 21-24 (32%). Drivers under the age of 21 who are drinking are twice as likely to be involved in fatal crashes as those who are older than 21. Even so, alcohol-related motor vehicle fatalities for ages 15-20 has declined 59% since 1982. Nearly ¾ of the drivers convicted of driving while impaired are either frequent heavy drinkers or alcoholics.[45]

Underage drinking among youth aged 12-17 was higher in rural than non-rural areas. Binge drinking (5 or more drinks on the same occasion at least one day in past month) is also higher among rural youth age 12-17 (4.1%) than non-rural (1.6%). Both of these measures were not higher in rural areas for the age group 18-20.[46] Three years of Substance Abuse and Mental Health Services Administration data from the National Survey on Drug Use and Health (2002-2004), found that of the 15 sub-state areas with the highest rates of past year alcohol dependence or abuse, most were in the northern West or Midwest of the country.

Figure PS.4. Alcohol dependence or abuse in the past year among persons aged 12 or older by sub-state region: percentages, annual averages based on 2002, 2003 and 2004 NSDUH data.[47]



Humboldt County. In Humboldt, the rate of alcohol dependence is higher than in the urban Bay area, with 8.2-9.5% of people reporting alcohol dependence or abuse in the last 12 months.

Humboldt County has one of the highest rates of deaths due to alcohol and drug use in California.[48] In some areas, DUI citations are increasing. For example, there were 336 DUIs in Arcata in 2001, 442 DUIs in 2005.[49] This increase is not unexpected; research from 2005 at the Traffic Safety Center at University of California at Berkeley forecast that alcohol-related motor vehicle accidents will increase by 10% by 2008. This research involved looking throughout California at transportation zones and corridors and found that rural counties have the highest rates of DUI crashes.[50]

Adult arrests for DUI. In 2001, there were 15.2 adults arrested for DUI in Humboldt per 1,000 (1316 total). This is much higher than state's rates, which were 8.4 per 1000. Humboldt is ranked near the bottom (47th out of 52) of counties in the state in terms of its DUI arrest rates. From 1996 – 2001, Humboldt County was consistently higher than California.[51]

Adult arrests for alcohol violations. 18.9 per 1,000 people in Humboldt were arrested for alcohol violotions in 2001. This is more than triple the state's rate of 5.5 per 1,000. Again, from 1996 – 2001, Humboldt County rate was consistently much higher than the state's.[52]

Alcohol-involved motor vehicle accidents. In 2000, there were 140 total alcohol involved motor vehicle accidents with a rate of 153.5 per 100,000 licensed drivers in Humboldt. This is much higher than state's rates, which were 98.1 per 100,000. Again, from 1996 – 2001, Humboldt County's rate was consistently much higher than California's.[53]

Binge drinking. Binge drinking is a significant public health problem in Humboldt County. The area comprised of Humboldt and Del Norte counties has the highest rate of binge drinking in California for persons aged 18-34, and the fourth highest rate of binge drinking among adults in the state.[54]

Binge drinking rates among youth in Humboldt County are also alarmingly high. 56 percent of 11th- grade students report being drunk or sick after drinking alcohol in their lifetime. Additionally, 6 percent of seventh-grade students reported drinking five or more drinks in a couple of hours during the past 30 days. By 11th grade, 33 percent of female students and 43 percent of male students reported drinking five or more drinks in a couple of hours during the past 30 days.[55]

- Enforcement, prevention, and deterrence interventions to decrease drunk driving will remain the same.

<u>Quantitative Analysis</u>
Quantitative analysis was not possible due to data limitations; the DUI rates were not separated by location (urban vs. non-urban).

<u>Qualitative Analysis</u>
The Humboldt County Health and GPU focus groups identified driving under the influence as a cause for great concern. In the GPU and Health focus groups, participants felt that alcohol dependency and DUI are a threat to public health and wanted to see an analysis included in the HIA. Additionally, comments on the Draft Safety Element included this by a Humboldt County resident:[56]

> The Safety Element is supposed to protect Humboldt County citizens from risk of death, injuries and property damage and economic and social dislocation resulting from fire, earthquake, flood and other hazards. The elephant in the room is that one of the other hazards is risk of death from auto accidents. That risk of death is more than twenty times higher than the risks from earthquake, fire and flood combined. And yet there is no mention of the best ways to go about reducing this huge threat to our physical safety.

Conclusions

A) **With Plan Alternative A, in which all population growth is accommodated in urban areas, fatality rates from driving under the influence of alcohol would likely decrease while accident and injury from DUI accidents would likely increase.** Urban and rural rates of drinking are similar in the existing literature about DUI, but prevalence statistics show higher rates of arrest for driving while intoxicated and fatality as well as use of substance abuse treatment in Humboldt County. While it is unclear if a causal relationship between alcohol intake and living in a rural area is implicated, fatality from DUI would likely decrease due to lower speed limits and less dangerous conditions (such as curved roads, cliffs, poorly lit roads).

B) **Plan Alternative B would likely result in the same rates of DUI** and thus a similar rate of incidence of injury and death due to DUI. An increase in population generally, though, would result in more DUI accidents.

C) **Plan Alternative C may** or may not affect the rates at which residents are driving impaired; however it **would likely increase the rate at which people are die due to driving under the influence**, given that road conditions and speed make all fatalities more likely in rural areas and thus more difficult to navigate while drunk.

Recommended Health-Promoting Mitigations:

- Implement evidence-based interventions and policies against alcohol-impaired driving:

[56] Humboldt General Plan Update. Public comments. Available at http://co.humboldt.ca.us/planning/gp/PrelimHearingDraft/CommentList2.htm#group3. Accessed on January 28, 2008.

- Implement 0.08% blood alcohol concentration (BAC) laws. These are state laws that lower the illegal BAC for drivers from 0.10% to 0.08%. These have been shown to reduce alcohol-related fatalities by a median of 7 percent;
- Implement minimum legal drinking age laws and lower BAC laws specific to young or inexperienced drivers (zero tolerance laws);
- Increase the use of sobriety checkpoints;
- Fund mass media campaigns to educate the population about the dangers of drunk driving;
- Increase school-based education programs to educate students about the dangers of drunk driving and of riding with a drinking driver;
- Train alcohol servers on intervening with people who have been drinking and intend to drive;
- Decrease alcohol outlets and their hours of operation.

.

SC.4.a Isolation index

Health-Based Rationale
GPU and Health focus group participants felt very strongly that a health challenge of rural life was being socially isolated. In fact, there is a broad literature base that demonstrate this. Those who feel socially isolated also feel higher levels of anxiety, negative mood, hostility, stress, as well as less optimism, happiness and life satisfaction.[57] Social isolation has been shown to weaken the body's ability to repair and maintain its systems.[58] Studies show that adults who report social isolation also report poorer sleep quality.[59]

Higher rates of social connectedness or support are associated with lower resting blood pressure, better immune system function, and lower amounts of stress hormones.[60] One study showed that in patients recovering from heart surgery, ratings of the statement "I feel lonely" predicted survival at 30 days and five years after surgery, even after controlling for preoperative conditions known to increase mortality.[61] A study in Australia showed that higher levels of social integration as measured by almost all indicators were associated with lower mortality rates.[62]

Social connectedness can be of great use during times of stress. Those who consider themselves socially connected are more likely to actively cope (e.g., problem solve) with stressful tasks and situations. Active coping has been associated with a biomarker signifying a healthier cardiac response.[63] Studies consistently find an inverse relationship between levels of social connection (defined as "social capital") and mental health issues: the higher the level of trust and connectivity in an area, the lower the levels of mental illness.[64]

Theory behind why social connection has such an impact on health commonly cites three pathways:[65]

1. Ease of diffusion of information;
2. Psychosocial support;
3. Political organizing which can bring resources into an area.

Isolation is difficult to measure, but there are proxy measures. There is a vast literature on social cohesion in public health as well as other fields, and making the assumption that social isolation was the opposite of social cohesion helped to define indicators. The Organization for Economic Cooperation and Development, in their Society at a Glance 2003 Social Indicators, chose the following as their "social cohesion" indicators:[66]

- CO1. Subjective well-being
- CO2. Social isolation
- CO3. Group membership
- CO4. Teenage births
- CO5. Drug use and related deaths
- CO6. Suicides

Here, the rates of the following will be examined:

- Psychological distress and mental well-being;
- Treatment for mental health and substance abuse;
- Depression and suicide;
- Crime;
- Volunteerism and civic engagement.

Existing conditions

Psychological distress and mental well-being. In Humboldt County:[67]

- 53% of residents said they spent 0 days in poor mental health in the last month;
- In 2005, 10.2%, or 1 out of every 10 people, stated they had spent between 10 – 20 days in the last month in poor mental health;
- 21% of the people polled did not do their usual work due to emotional problems in 2001;
- In 2001 less than 500 people in the county felt down most of the time, 16.5% felt down some of the time, 21% felt down a little of the time, and almost 60% felt down not at all
- 4.8% of respondents said they have psychological distress;
- In 2005, 11.2% saw a health professional for emotional problems;
- In 2005, 20.3% felt that they needed help for an emotional/mental problem.

Depression/suicide. Depression and suicidal intent is linked to social isolation. One study showed that in people who consider themselves to be socially isolated, some level of depression was 8 times more likely, and major depression was 21 times more likely.[68] Social isolation is also linked to suicidal intent.[69] [70] In adolescents, social isolation was associated with an increased risk for depressive symptoms, suicide attempts, and low self-esteem.[71]

Suicide rates are higher in rural areas. The Centers for Disease Control compared suicide rates in urban and rural counties and found that men in urban counties committed suicide at a rate of 21-22 per 100,000; in rural counties male suicide rate was 31 per 100,000. Men tend to have *rates* of suicide 4- 6 times higher than females because they use more reliably lethal methods. However, suicide *attempts* are higher for females.[72] Some posit that ease of accessing firearms may play a part in the higher rate in rural areas, as firearms suicides count for 62% of suicides, and in fact, rural counties had 54% more firearm suicides.[73] For both men and women, suicide rates in rural counties of the West were higher than those in any other region of the US. Lower treatment rates for depression in rural areas may also contribute to higher suicide rates.[74]

In Humboldt County, 34 people committed suicide in 2007, the highest total since 1990, and a 60 percent increase over 2006.[75] In the three year period from 2001-2004, Humboldt County's rough suicide rate was 22.3 per 100,000, over three times Los Angeles's rate of 7.1 per 100,000. The most recent statistic for California is 9.4 per 100,000.[76] The figure below shows these rates for the state.

[77] Avram S. 2002. North State Rural Mental Health Summit: Review of Relevant Data. Northern Sierra Rural Health Network.

Mental health treatment. Humboldt has served a fairly consistent amount of mental health clients per year. From 1990–1998, there were between 2,000–3,000 clients per year, going up and down but with no consistent trend.[78] There were 3,504 clients in 2000-2001, the most recent year for which there is data.[79] Unfortunately, the state Dept of Mental Health does not do a comparison analysis of mental health clients in rural vs. urban areas of the county. However, it is of note that Humboldt County only has 16 licensed mental health professionals per 10,000 residents. Marin County has 63 per 10,000. [80]

In Humboldt County, 11.2% of those polled had seen a mental health professional, and 11.8% said they had difficulty or delays in getting mental health care.[81]

In treating depression, travel time to the preferred provider was significantly associated with making fewer visits and having a lower likelihood of receiving care in accordance with guidelines.[82]

According to the Office of Statewide Health Planning and Development (OSHPD) hospital utilization data, there are only six hospitals in Humboldt County. None of them have chemical dependency beds, and only one of them takes psychiatrics admissions (Semper Virens PHF in Eureka). Thus, all hospital admissions for psychiatric illnesses were located in Eureka, and there were 5840 licensed bed days, 473 discharges, and 4014 patient days. There is no psych ER listed in the County. As such, data that is kept on emotional and mental health issues at the hospital level is limited and it is not possible to disaggregate between rural and urban admissions.[83]

Rates of substance abuse and substance abuse treatment. For the years from 1997 to 2002, Humboldt's rates of admission for alcohol and drug treatment programs was higher than the state's. In 2002, Humboldt's rate was 14.2 per 1000, while California's was 8.7 per 1000.[84]

With regard to deaths due to alcohol and drug use, for the years 1996 to 2000, Humboldt's rates were substantially higher than the state's. In 2001, the rate in Humboldt (39.5 per 100,000) were more than double the states' (18.0 per 100,000). [85]

As the figure below shows, trends in US substance abuse treatment statistics show that rates of alcohol admission rise precipitously with increasing rural-ness, peaking in rural areas with a city with

In a report from the California State District Attorney's office comparing urban and rural rates of crime, 97% of California's population is urban and 98% of crime takes place in urban counties. The table below shows rates of each type of crime per 100,000 people in urban and rural areas of California. In all categories except burglary, rates of crime are lower in rural areas of California; specifically rural violent crime comprises 1/3 of violent crime incidence even though approximately ½ of the population lives in rural areas.

Table PS.5. Rates of crime per 100,000 people in urban and rural areas.[89]

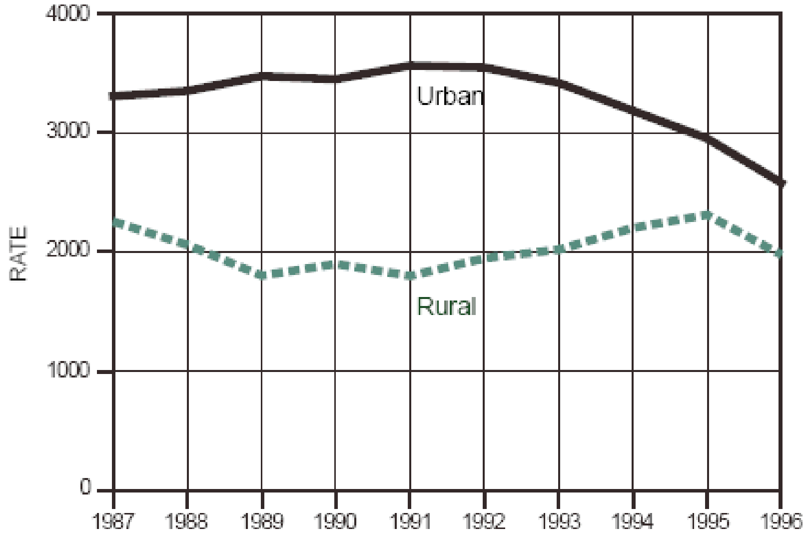
		Total	Violent crimes	Willful homi-icide	For-cible rape	Rob-bery	Aggra-vated assault	Property crimes	Burglary	Motor vehicle theft
1996	Urban	2,578.9	857.8	9.1	31.7	298.5	518.5	1,721.1	958.3	762.8
	Rural	1,974.4	567.8	4.5	30.4	63.7	469.2	1,406.6	1,093.0	313.6

Between 1987 and 1996 (the last year this comparison was done in the report), crime decreased 22% in urban areas and 12.5% in rural areas, but from 1991-96, crime in rural areas has increased (see chart below).

[88] California Department of Justice. Table 1: Crimes and Crime Rates by category and crime. Humboldt County. Available at http://stats.doj.ca.gov/cjsc_stats/prof05/12/1.htm. Accessed on February 17, 2008.

[89] Criminal Justice Statistics Center. 1997. Outlook: Crime in urban and rural California. Office of the Attorney General, California. Available at http://ag.ca.gov/cjsc/publications/misc/urbrurt.pdf. Accessed on February 17, 2008.

Figure PS.7. California crime rates (1987-1996) in urban and rural areas per 100,000 people.[90]



Crime rates per 1,000 people in Humboldt were slightly higher than the state's for the years 1996 to 2001. In 2001, Humboldt's rate was 46.3 crimes per 1,000 people, while the state's was 39.4.[91]

Group Membership/Civic Engagement. Humboldt County has higher participation and registration rates than California as a whole. The County has between 5-11 percent higher voter registration rates than California since 1996. In 2000, 73% of those registered cast a ballot, slightly higher than California's rate of 71%. Also, 59% of the electorate turned out to vote in 1996 and 2000, which is 7% higher than California.

53% of all adults volunteer in their communities every year. 62% of Humboldt County residents volunteered at least one hour per month in a survey generated by the Humboldt County Board of Supervisors during National Volunteer Week (4.11.00).[92]

<u>Analysis</u>

Quantitative Analysis
A quantitative analysis is not possible with existing data.

Qualitative Analysis
GPU and Health focus group participants felt very strongly that a health challenge of rural life was being socially isolated.

---

[90] Criminal Justice Statistics Center. 1997. Outlook: Crime in urban and rural California. Office of the Attorney General, California. Available at http://ag.ca.gov/cjsc/publications/misc/urbrurt.pdf. Accessed on February 17, 2008.
[91] CARS. 2004. Community Indicators of Alcohol and Drug Abuse. Humboldt County 2004. Center for Applied Research Solutions. CA Dept of Alcohol and Drug Programs.
[92] 2001. Humboldt County Social and Wealth Indicators Project 2001. Available at http://www.humboldt.edu/~envecon/Indicators/. Accessed on February 18, 2008.

Conclusions

A) Given that Alternative Plan A concentrates residents in a smaller area, people are more likely to have unintentional contact. Also, because more civic organizations are located in urban areas, rates of civic engagement will likely increase, resulting in more social cohesion, greater ability to advocate for resources which can aid in healthy living. The greater opportunities for social connection **may result in decrease in isolation** and thus decreased rates of suicide, depression, and substance abuse treatment.

B) **Plan Alternative B, due to an increase in residents, will probably bring a decrease in social isolation.** However, the gains brought about by simple population increase will be tempered by the fact that half of the increase will be located in non-urban areas with less opportunity for social cohesion. Thus, while some of the health benefits such as increased access to resources due to social networks and civic activism may result as well as a decrease in mental health issues, the effect would be less pronounced than with Plan Alternative A.

C) **Plan Alternative C is likely to bring about an increase in social isolation due to locating more people in the non-urban areas** of the County where there are fewer organizations and less opportunities for casual contact. Subsequently, Plan Alternative C is the least healthy option with regard to social connection.

Recommended Health-Promoting Mitigations:

- Incentivize employers to encourage volunteering and voting.
- Require construction or renovation of community centers with funding for staff and programs with large rural or urban development projects.
- As part of a community benefits package, require developers to fund programs to engage the community, such as community concerts, parades, festivals.
- Expand outreach for Citizen Advisory Committees on various types of municipal projects.
- Support programming to build retiree/ student partnerships or other mentoring relationships.
- Measure isolation and social cohesion in Humboldt County using a validated tool such as the Saguaro Index[93] or the Petris Scale[94] in order to have an indicator to measure.
- Support community building activities such as parades and events that showcase local artisans.

Environmental Stewardship Priority Indicators

ES.3.a Proportion of County land area retained for active farming uses

Health-Based Rationale

Agriculture is an important part of the economic base of Humboldt County, including many small producers and self-employed. Productive farming land is part of what many local residents value about the County.

Consumption of locally produced foods can reduce consumption of fossil fuels and reduce potential for pollution and for global warming.[1] It may also increase consumption of fruits and vegetables and reduce the consumption of processed foods by improving the freshness, and therefore the taste, of produce In addition, consumption of locally grown produce can have economic benefits. First, farmers who direct market their food receive a higher percentage of the sales price; when they do not, they only receive between 4 and 19 cents of every dollar spent on food while the remaining portion goes to marketers[2], processors, distributors, retailers, wholesalers, and goods movement. Second, money paid to local farmers is more likely to stay in the community. Every dollar spent on locally grown produce circulates 2.5 times in the local community, as compared to 1.4 times for dollars spent on conventionally grown food in a supermarket.[3]

Due to the rural nature and geographic location of the area, transportation of agricultural and industrial products to larger marketing areas within and outside of California is difficult and expensive, since most goods must be shipped over a mountainous or coastal highway to reach a major market area. Getting the crop from seed to harvest takes only one-fifth of the total oil used for our food. Most oil is consumed transporting food from the point of production to the point of consumption.[4] 16% of total US energy consumption goes into food production, processing, packaging, distribution and marketing.[5]

Importing food from other countries exposes the consumer to food produced under regulations concerning pesticides and production that may not be as vigorous as standards in this country.
Large commercial farming operations are the exception rather than the norm with smaller family farms making up the majority of agricultural operations in the area. Livestock related operations, including the dairy industry and beef cattle operations, are the most significant agricultural contributors to the local economies within the region. Other significant agricultural operations are nursery crops that include lily bulbs and woody ornamentals, pasture and hay land crops, and to a lesser extent, vegetable row crops, orchards and vineyards. Small family farm operators are finding it difficult to stay competitive[6] due to several limiting factors, not the least of which include higher operating and transportation costs to sell their products regionally or having to ship their products to larger market areas within or outside of California. Small farm operators are looking for ways to diversify their product lines and simplify marketing methods in order to offset their escalating operating costs, and health-conscious consumers are looking for ways to

access locally-grown, environmentally-friendly foods. Direct farmer-to-consumer marketing methods have potential for growth and success.

Existing conditions
Amount and conversion of farmlands: In 2002 there were 633,931 acres of farm land, accounting for 28% of Humboldt acreage. Cattle accounted for 17%, Milk Products for 36%, Nursery Products for 30% and miscellaneous crops for 17%. As of August 2007 there were 17,879 acres certified as organic (15,479 prime farm land and 2400 acres range land)[7].

Humboldt 2025 General Plan Update Agricultural Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/agrprt_2.pdf is a valuable resource for those interested in agricultural lands in the County. It contains a detailed breakdown of these lands by location and use as well as a detailed economic analysis. The report states that Humboldt ranked 36th in the state for gross value of agricultural production (excluding timber). The crops that produced the most value were: milk and diary products ($43 million), nursery stock (i.e., flowers and trees for sale to nurseries) ($34 million), livestock ($23 million), and field crops ($8 million). The report also includes information on farm size and agricultural land conversion. Based on the work of Smith and Giraud[8], it estimates that 60,500 acres of agricultural land was converted to other uses between 1985 and 2001. That land was used for subdivisions, was rezoned, or was used for other purposes. The figure below is a map from the report that shows the lands that were converted and for what purposes.[9]

---

10 Humboldt 2025 General Plan Update Agricultural Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/agrprt_2.pdf.

Analysis

Assumptions

- Lands not currently designated as agriculture lands will be converted to that use.
- There will be a continued market for agricultural products.
- With escalating transportation costs and consciousness about global warming local consumer interest in local products will grow.

Logic

- Agricultural acreage has been declining in recent history.
- There is a recent increase in interest in purchase of locally produced foods.
- Getting crops from seed to harvest takes only one-fifth of the total oil used for our food. Most in consumed transporting food from the point of production to the point of consumption.
- Only certain areas in the County have soils suitable for farming; zoning should be preserved when possible.

Quantitative Analysis

As part of the Environmental Impact Assessment process the County is currently preparing land use maps that will analyze how many acres of agricultural land would be converted to other uses for each Plan Alternative. No quantitative analysis is possible without that data.

Qualitative Analysis

Attendees from community meetings favored maintaining the rural character of the county and maintaining and supporting local agricultural production. Food miles traveled was discussed, as was supporting the local economy. Having local food was also considered a security issue.

During the public scoping meetings for the General Plan Update, protection of agricultural resources was raised as a key concern. Some of the recommendations were documented in the Critical Choices Report[11] and included:

- Developing County programs to provided incentives for preservation (e.g., conservation easements, TDR's, economic incentives);
- Developing programs that recognize and encourage smaller agriculture operations(intensive uses, organic and micro-agriculture) and allow smaller parcels in the Williamson Act;
- Implementing County-wide protection policies through Plan and zone map changes.

Conclusions

A) **Plan Alternative A will preserve the greatest amount of agricultural land** since it limits new development to urban areas. This would improve help by preserving jobs and maintaining the availability of locally produced foods, the transportation of which would not be as far and would therefore not contribute as much toward climate change and its associated health impacts.

B) **Plan Alternative B would reduce the acreage of land area retained for active farming uses** due to real estate pressures raising land prices and nuisance claims (despite the "right to farm ordinance" protecting farmers from unwarranted nuisance claims). Farming land close to urban centers has the particular value of reducing transportation costs and time for the farmer. Local jobs may suffer and more food would need to transported to Humboldt than in Plan Alternative A.

[11] Available at: http://co.humboldt.ca.us/planning/gp/meetings/critical/CCreport.asp.

C) Since it allows for the most development outside of the current urban areas, **Plan Alternative C would reduce the acreage of land area retained for active farming uses most**. This would lead to a decrease in jobs and an increase in the amount of food shipped into Humboldt. Food transportation is a source of vehicle emissions that leads to climate change, which will impact health.

Alternative Health Promoting Mitigations:

- Selectively preserve agricultural land under Scenario C.
- Restrict housing placement to the periphery of agriculturally zoned land to maintain contiguous acreage for future farming use.
- See the Humboldt 2025 General Plan Update Agricultural Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/agrprt_2.pdf for further mitigations.

ES.3.b Proportion of County land area retained for timber production

Health-Based Rationale

Timberland preservation is important for long-term economic utilization and to actively enhance and increase County timber production capabilities. Further declines in timber production reduce the viability of the local forest industry, diminish economic productivity and result in job losses. Forestland fragmented into small parcels cannot economically sustain timber production as the primary use. Property improvements for residential purposes can increase the market value of the land so that it is cost prohibitive for use as commercially viable forest land. Residential uses can reduce the long-term productivity of adjacent timberlands when increased regulatory restrictions are imposed on harvesting to moderate impacts to residential users.[12] Timberlands may contain wildlife habitats, sensitive watersheds or critical water supply areas.

From a health perspective, the loss of timberlands has several consequences. First, loss of timber-related jobs could result in increased unemployment in the County. Unemployment and underemployment lead to hypertension, depression, reduced life expectancy, and a tendency toward alcohol and drug abuse (see the Healthy Economy Indicators section for details). Good paying timber jobs may be replaced with poorly paying service jobs which often do not come with benefits such as health insurance.

Loss of timberlands can also negatively impact watersheds, which are needed for maintaining adequate supplies of clean water. See the Total Impervious Area indicator below for more details about the health impacts of loss of watersheds.

Other health related impacts of loss of timber land include a potential degradation of air quality as a result of losing trees that can filter particulate matter from air and potential loss of lands that are culturally significant.

Existing conditions

Amount and conversion of timberlands: Humboldt 2025 General Plan Forest Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/forest2.pdf[13] is a valuable resource for those interested in timberlands in the County. Some of its findings include:

- There are 1,900,000 acres of forestland in Humboldt, 1,700,000 of which are suitable for production.
- Timber harvest in the County is a substantial percent of the state's, consistently over 20%.
- About 1000 acres of timberland have been converted to other uses since 1985.

The report also includes a classification of timberland sites by tree height and value and by type of tree, an economic analysis, an analysis of land ownership and an analysis of potential land use conflicts.

According to the California Department of Forestry and Fire Protection, in 1996 Humboldt County had 1,487,000 acres of forest land, 65% of total acreage: 262,000 were National forests, 15,000 other public lands, 608,000 forest industry, 602 farmer and other private land. In 1967 there were 1,850,000 acres of forested land. Over almost 30 years there was close to a 20% reduction of forested land.[14]

[13] Humboldt 2025 General Plan Forest Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/forest2.pdf.
[14] Fire and Resource Assessment Program – California Dept of Forestry and Fire Protection.

Analysis

Assumptions

- Lands not currently designated as timberland will be converted to that use.

Logic

- Expansion of residential areas into existing timberland or land near existing timberland will affect the economic viability of those lands and impact associated jobs.

Quantitative Analysis

As part of the Environmental Impact Assessment process the County is currently preparing land use maps that will analyze how many acres of timberland would be converted to other uses for each Plan Alternative. No quantitative analysis is possible without that data.

Qualitative Analysis

At community focus groups, participants expressed interest in maintaining the rural character of the county by preserving open space. Timber production was recognized as an important economic force in the County, offering relatively well-paid jobs with benefits. Interest was expressed in preservation of habitats of threatened and endangered species which could be relatively preserved by responsible logging practices compared to residential development. There was discussion of the cultural importance of the forest lands among some populations.

When discussing timber the following issues were raised: forest fires, erosion (associated with water quality and fish), recreation, logging and forest roads, cultural/ceremonial places, sustainable harvests, globalization, preservation of biodiversity, and economic sustainability.

During the public scoping meetings for the General Plan Update, protection of timberlands was raised as a key concern. Some of the recommendations were documented in the Critical Choices Report[15] and included:

- Developing updated County-wide policies for timber resource protection and management and include consideration of economic, social and environmental affects of harvesting;
- Implementing these policies in specific areas through Plan and zone modifications, other areas of County jurisdiction (e.g., roads) and policy input to state and federal agencies.

Conclusions

A) **Plan Alternative A will preserve the greatest amount of timberland** since it limits new development to urban areas. This would improve help by preserving jobs and maintaining watersheds.

B) **Plan Alternative B would slightly reduce the acreage of land area retained for timber harvest** due to real estate pressures raising land prices. Local jobs may suffer as would watersheds.

C) Since it allows for the most development outside of the current urban areas, **Plan Alternative C would reduce the acreage of timberland most**. This would lead to a decrease in jobs associated with timber and could harm watersheds.

Caveats

[15] Available at: http://co.humboldt.ca.us/planning/gp/meetings/critical/CCreport.asp.

There is considerable variation in logging practices which influence the impact of the timber industry on long-term viability, rural character of the County, and sensitive habitats.

Alternative Health Promoting Mitigations

- Selectively preserve timberland tracts under scenario C.
- Humboldt 2025 General Plan Forest Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/forest2.pdf for further mitigations.

ES.2.a Acres of public open space per 1,000 population in Urban areas

Health-Based Rationale

Many residents of Humboldt County value the open space available. Parks and natural open space areas promote physical activity and social interaction. Areas with natural vegetation also have direct effects on physical and mental health. For example:

- One review of studies showed that access to places for physical activity combined with outreach and education can produce a 48% increase in the frequency of physical activity;[16]
- Living in proximity to green space is associated with reduced self-reported health symptoms, better self-rated health, and higher scores on general health questionnaires;[17]
- People dissatisfied with their available green spaces have 2.4 times higher risk for mental health issues;[18]
- Parks increase neighborly interaction and socialization.[19] Social networks and interaction have been linked to improvements in physical and mental health.

Existing conditions

National Standard: The National Recreation and Park Association's Standard of Excellence is 6 acres or more of park land per 1000 people. Most urban areas do not achieve this standard.

Eureka: There are a total of more than 113.67 acres of parks in Eureka including: Carson Park (3.22 acres), Clara Mae Berry Park (0.5 acres), Cooper Gluch (33 acres), Hammond Park (1.4 acres), Halvorsen Park (3 acres), Lundbar Hills Park (1.25 acres), Ross Park (1.5 acres), Sequoia Park (67 acres+), 20/30 Park (2.8 acres), and some other facilities and ball fields.[20] The population in Eureka was 25,435 in 2006. Using these numbers, one can calculate that there are more than 4.47 acres of park per 1000 people in Eureka.

Arcata: There are over 104 acres of Park in Arcata[21]. In 2006, there were 16,888 people in the city and therefore there were over 6.16 acres of park per 1000 people.

Fortuna: There are 2 main parks in Fortuna: Rohner Park (55 acres) and Newburg Park (18 acres). The city's population in 2006 was 11,208. Therefore, there were over 6.5 acres of parks per 1000 people in Fortuna.

Analysis

Assumptions

- Few parks, and no large parks, will be built in urban areas of Humboldt County in the coming years.

---

[16] Kahn EB. The effectiveness of interventions to increase physical activity. Am J Prev Med. 2002;22(4):73-107.

[17] Vries S, de Verheij RA, Groenewegen PP, Spreeuwenberg P. Natural environments - healthy environments? An exploratory analysis of the relationship between green space and health. Environment and Planning A. 2003;35(10):1717-1731.

[21] City of Arcata, Economic Development Strategic Plan, Technical Appendices, Appendix E Economic Development Assets. Available at: http://www.cityofarcata.com/images/stories/Economic_Development_Plan/AppendixE.pdf.

Logic

- Bringing more people into urban areas may reduce the acreage of parks available per 1000 people if more parks are not built.

Quantitative Analysis

In all three Plan Alternatives, approximately 14,400 people would come to urban areas over the next 25 years. Currently, using the information above, one can calculate that the average acres of park per 1000 residents for all three cities combined is approximately 5.5 (291 acres and 53531 people). With an additional 14,400 people, this will be reduced to 4.3 acres of parks per 1000 residents.

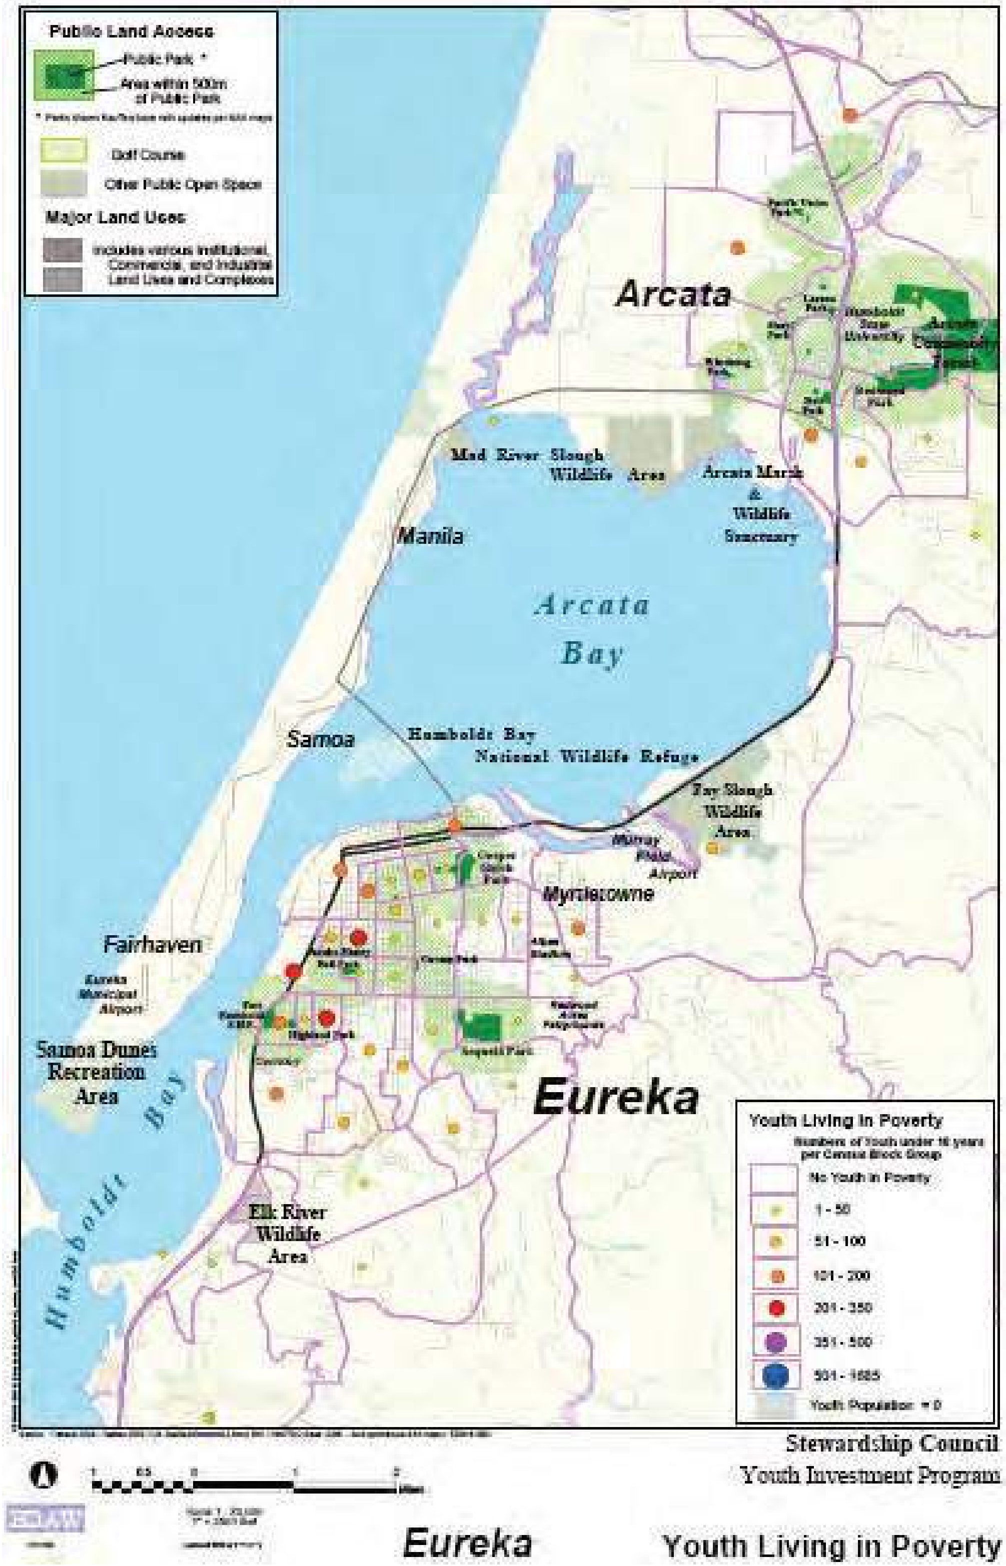
Qualitative Analysis

People want to retain Humboldt's outdoor space and rural character, so ensuring parks are available is important. Publicly accessible parks (not just urban parks) were recognized for their importance to the economy (tourism and others), physical activity, and mental health.

Disparities

People without access to cars (low income residents, seniors, children) need to be able to access parks by walking or biking. Often, areas in which low income residents live have fewer parks, as the figure below shows.

Figure ES.2. A map overlaying parks with areas of poverty in Eureka and Arcata.[22]



22 http://www.stewardshipcouncil.org/youth_investment/gis_maps/Loc-Eureka_youth-povdot_22x34.pdf.

Conclusions
In all Plan Alternatives, 14,400 new people will be moving to urban areas of Humboldt. **Without the construction of additional parks, the acreage of parks per 1000 residents will decrease.**

Caveats
In Plan Alternatives B and C, people in non-urban housing will probably not be close to parks and playgrounds.. This indicator evaluates urban centers and does not address people in those areas. Given that they will not be close to parks, there will be associated health issues – lack of exercise, lack of social interaction, etc. More research would need to be carried out to understand if the open space in the non-urban areas is used in the same way parks would be in urban areas.

Alternative Health-Promoting Mitigations:
- Ensure funding for parks is maintained.
- Ensure schoolyards are available in off hours for community use.
- Ensure that forests, parks and wetlands in the County are not being converted to other uses.
- Specifically, build parks in Eureka to increase acreage of parks available to the largest population in the county.

ES.5.c Percent of households using municipal water system

Health-Based Rationale

Water resources and water quality have been greatly affected by development. Watersheds (regions of land within which water flows down into rivers, lakes, or ocean; drainage basins) have been developed, stormwater runoff has increased, and pollution levels in water has increased. Among other environmental effects, the increase in impervious areas (most notably, roads and parking lots) leads to loss of groundwater recharge (the process by which ground water is replenished), which can reduce both residential and municipal water supplies and to increased flooding. Stormwater is often polluted by pesticides and fertilizers from homes and farms, and from oil, lead, heavy metals, and other pollutants from industry and transportation. In some parts of the California, pesticides in drinking water because of industrial agriculture is so great that by the age of 10, children have been exposed to the maximum allowable "life doses".[23] Water can also contain fecal coliform bacteria. This water can make its way into our drinking water supply, into the water used for recreation, and into the water in which we fish. Additionally, excess nutrients in water resources due to sewage and fertilizer runoff and other sources is harmful due to the resulting increase in plant growth (e.g., algae) and due to oxygen depletion, which can harm fish.

Water quality in many rivers, lakes and estuaries in the country is degraded and water can no longer be used for drinking, swimming or fishing. The EPA's 1996 National Water Quality Inventory estimates that about 40% of the bodies of water they surveyed were too polluted for such uses.[24] 59% of the North Coast Region is affected by sediment impairment.[25]

Access to clean drinking water is vital for health. Coliform bacterial contamination of water supplies can cause significant human illness, notably diarrheal illness. Infants, young children and the elderly are particularly prone to serious complications of such illnesses, which can include death. Other water contaminants can also cause disease.

As far as water quality is concerned, it is significantly safer to live in more densely populated areas served by larger PWS, as the data below shows.

Existing conditions

Public Water Systems: In Humboldt County there are 21 community Public Water System (PWS) with greater than 200 service connections. There are 25 PWS with fewer than 200 service connections. The lager PWSs tend to be used in more urban areas with denser populations.

Failures of the PWSs: The number of coliform failures (total coliform or e. coli) for PWS with greater than 200 service connections over last 3 years is approximately 1. The number of coliform failures (total coliform or e. coli) for PWS with fewer than 200 service connections over last 3 years is approximately 10. (In addition, there were approximately 13 failures to monitor for coliform in systems with fewer than 200 service connections over the last 3 years.) The number of community PWS with greater than 200 service connections using surface water is approximately 6. The number of community PWS with fewer than 200 service connections using surface water is approximately 12.

The number of turbidity failures (turbidity measures the amount of suspended matter/impurity in water) for PWS with greater than 200 service connections over last 3 years is approximately 3. The number of turbidity failures for PWS with fewer than 200 service connections over last 3 years is approximately 72.[26]

Data is not available for private water systems such as streams or wells, but water from wells in the County are often poor in quality and quantity.[27]

Water supply: There are currently shortages of water for domestic use in some areas of the County and these areas and the County as a whole require infrastructure development, including fixing leaks and improving storage capacity, to improve the situation and to avoid future health related issues. $180 million is needed currently to bring the sewer and water systems in the County into compliance with standards.[28]

Analysis

<u>Assumptions</u>

- Urban infill areas have access to Public Water Systems with greater than 200 service connections.
- Non-urban growth will occur in areas without access to a PWS with greater than 200 service connections. These include PWS with fewer connections and other water sources like streams and ponds.
- Existing municipal water supplies with infrastructure improvements can handle increased growth of urban areas.

<u>Logic</u>

- Homes built in existing urban areas would have access to municipal water supply; those built in non-urban areas would not.

<u>Quantitative Analysis</u>

Without data on the numbers of people served by different types of water systems and without data on the number of illnesses caused by water-borne contaminants over a given time period in the County, the changes in the number of people with access to public water systems or the changes in the number of people that become ill as a result of water-borne contaminants can not be quantified.

<u>Qualitative Analysis</u>

Water quality was a concern that was brought up in every focus group and appears to be a serious concern for residents of the County. Clean water was recognized for its contribution to food (fish), recreation, culture, and mental health (views of nature). Water diversion and conservation were raised as issues. Erosion was a concern as were stormwater runoff (impermeable surfaces) and runoff from agricultural lands. Having an emergency water supply was raised. Wastewater management was raised a number of times. Overall, water conservation was of high importance to participants.

---

[27] Winzler & Kelly Consulting Engineers. Nov 2007. Draft Water Resources Technical Report. http://co.humboldt.ca.us/planning/gp/PrelimHearingDraft/Group7b/Water_Resource_Tech_Rpt_11_21_07.pdf.

[28] Winzler & Kelly Consulting Engineers. Nov 2007. Draft Water Resources Technical Report. http://co.humboldt.ca.us/planning/gp/PrelimHearingDraft/Group7b/Water_Resource_Tech_Rpt_11_21_07.pdf.

Conclusions

A) **Plan Alternative A would increase the proportion of households using municipal water systems** since housing would only be built in urban areas that are assumed to have such systems. The number of illnesses caused by water contamination would decrease in the County.

B) **Plan Alternative B would not lead to a significant change in the proportion of households using municipal water systems** since new housing would be distributed between urban areas that are assumed to have such systems and non-urban areas that do not. The rate of illnesses caused by water contamination would remain the same.

C) **Plan Alternative C would not lead to a decrease in the proportion of households using municipal water systems** since more new housing would be built in non-urban areas that do not have access to such systems. The number of illnesses caused by water contamination would increase in the County.

Alternative Health Promoting Mitigations

- Extend the existing Public Water Systems to serve new developments or build new systems. Developers could be made responsible for paying fees for this.

ES.5.a Total impervious area in County

Health–Based Rationale

Total impervious area (TIA) is a measure of the area taken up by rooftops and transport system components such as parking lots, roads and driveways. Rooftop runoff is typically absorbed by yards and not connected to a drainage system. Transport system related runoff is directly connected to drainage systems and often results in greater impact. Studies from many geographical areas have similarly concluded that stream degradation occurs at approximately 10-20% TIA.[29] Generally, when 10 to 15 % of an area is covered by impervious surfaces, the increased sediment and chemical pollutants in runoff have a measurable effect on water quality. When 15 to 25 % of a watershed is paved or impervious to drainage, increased runoff leads to reduced oxygen levels and harms stream life.[30]

Urban and suburban development cause profound changes to natural watershed conditions by altering the terrain, modifying the vegetation and soil characteristics, and introducing pavement, building, drainage and flood control infrastructure. Roughly 65% of impervious surfaces in the U.S. are for transportation (e.g., roads), while only 35% are for structures (e.g., houses).[31]

As TIA increases, less precipitation percolates into soil, increasing the volume of surface runoff. Flooding risk increases and the soil retains less moisture. There is a reduction of natural groundwater storage. An 18% increase in imperviousness results in an estimated 80% increase in annual average rainwater runoff.[32]

Water from this increased runoff may contain high concentrations of heavy metals, organic pollutants, fecal coliform bacteria, nutrients and total suspended solids. These pollutants have health consequences for those who use the water, eat fish from the water, or drink the water. Some contaminants are carcinogens and others cause infections. Fish can also be affected by the contaminants and by sediment[33], which affects the supply of locally available food, and has added economic and cultural significance for Native Americans.

Stream research generally indicates that certain zones of stream quality exist, most notably at about 10% impervious cover, where sensitive stream elements are lost from the system. A second threshold appears to exist at around 25 to 30% impervious cover, where most indicators of stream quality consistently shift to a poor condition (e.g., diminished aquatic diversity, water quality, and habitat scores).

10% TIA is suggested for stability.[34] Urban infill development leads to a smaller increase in TIA than non-urban development overall,[35] but it may increase the TIA in some urban areas above the critical value.

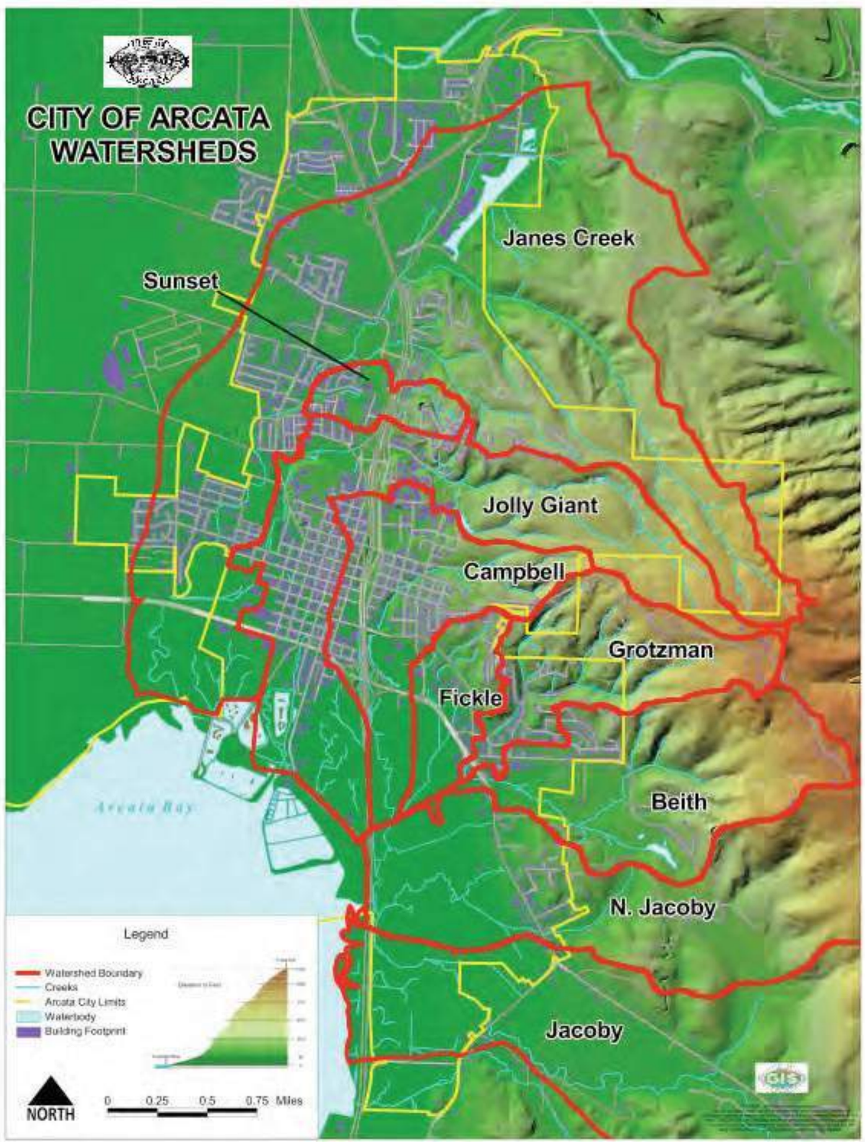
Existing conditions

Data on current TIA in Humboldt County is only available for the area around Arcata:[36]

Campbell Creek Watershed:	35%
Janes Creek Watershed:	12%
Jolly Giant Creek Watershed:	20%
Beith Creek Watershed:	6%
Grotzman Creek Watershed:	11%
Fickle Hill Creek Watershed:	20%
Sunset Creek Watershed:	32%

The figure below shows the location of these watersheds.

Figure ES.3. A map showing the watersheds near Aracata.[37]



[36] DATA SOURCE: Mark Andre, Environmental Services, City of Arcata

[37] DATA SOURCE: Mark Andre, Environmental Services, City of Arcata

Analysis

Assumptions

- Most non-urban development will include new roads and increase TIA.

Logic

- Urban development leads to a smaller increase in TIA due to less need to build new roads and parking lots and because multifamily housing in urban areas will reduce the square footage of new roofs.
- Non-urban development will require new roads and parking lots in non-urban areas, and will require new parking in urban areas to accommodate more drivers in the cities. New housing in non-urban areas also tends to be larger and may therefore have more roof square footage.

Quantitative Analysis

The difference in Total Impervious Area created by urban development versus non-urban development has not been quantified.

Qualitative Analysis

Water quality was a concern that was brought up in every focus group and appears to be a serious concern for residents of the County. Clean water was recognized for its contribution to food (fish), recreation, culture, and mental health (views of nature). Water diversion and conservation were raised as issues. Erosion was a concern as were stormwater runoff (impermeable surfaces) and runoff from agricultural lands. Having an emergency water supply was raised. Wastewater management was raised a number of times. Overall, water conservation was of high importance to participants.

Conclusions

Since all the Plan Alternative would bring the same number of housing units to urban areas, all could affect urban watersheds negatively.

A) **Plan Alternative A will lead to the least increase in TIA since all development would be urban**. Additional road construction would not be necessary and, if multi-family housing is built, the square footage of roofs could be reduced. Water quality would be least affected by this Alternative.

B) The mix of urban and non-urban housing in **Plan Alternative B will lead to a more significant increase in TIA than in Alternative A**. New roads would likely be built and cities would need to build more parking. Given the larger housing being built in non-urban areas, the square footage of roofing would be larger as well. Water quality would be degraded in this Alternative and this would impact health negatively.

C) **Plan Alternative C will lead to the most significant increase in TIA**. New roads would be built and cities would need to build more parking. Given the larger housing being built in non-urban areas, the square footage of roofing would be larger as well. Water quality would be significantly degraded in this Alternative and this would impact health negatively.

Alternative Health Promoting Mitigations:

- Minimize the impact on TIA by building more densely, building fewer roads and parking lots, and building smaller houses.

- Implement policies that decrease parking requirements for retail establishments in non-urban areas, decreased parking for office building and encourage parking garages instead of large parking lots.
- Limit development to areas near existing roads.
- Incentivize the use of porous materials for new roads and parking lots.
- Incorporate the Ahwahnee Water Principles into the General Plan: "City and County officials, the watershed council, LAFCO, special districts and other stakeholders sharing watersheds should collaborate to take advantage of the benefits and synergies of water resource planning at the watershed level."
- Set limits on TIA in each watershed.
- Encourage roofing partially or completely covered with vegetation and soil that can absorb water.

ES.1.b Residential electricity use (kWH) per capita

Health-Based Rationale

According to the Healthy Development Measurement Tool:[38]

> Electricity generated from fossil fuels produces air pollution in the form of particulate matter, nitrogen oxides, volatile organic compounds, and toxic air contaminants. Air pollution from these emissions in turn contributes to respiratory disease and deaths from cardio-vascular diseases. Electricity generation also contributes to greenhouse gas emissions and indirectly to climate change which threatens health through more extreme weather events, increased air pollution, limitations on food production, increased water-borne and food-borne illnesses, and increased infectious disease vectors.
>
> The benefits of energy efficiency go beyond environmental sustainability. Energy efficiency can have economic benefits for both residents and property managers by lowering utility bills. Furthermore, energy efficient design and construction techniques can contribute to household economic well-being through lowered energy costs.

Large homes on large lots that can be built in non-urban settings require more electricity (e.g., for lighting and heating) than smaller homes and multi-unit buildings that are typically built in urban areas. One study estimated that electricity consumption in a single family residence (3 units/acre) was almost twice that of a moderate high rise (~100 units per acre).[39]

Health impacts relate to individual family income spent on electric, general health impacts from global warming and climate change, and more generalized health effects laid out in Healthy Economy section from increasing locally produced electricity via alternative energy sources.

Existing conditions

In Humboldt, electricity use per capita is approximately 7300 kWh/year and is similar to that in California but about half the per capita electricity use in the US overall. In 2003, it is estimated that $134 million was spent on electricity in the County. Electricity consumption is divided as follows: 35% residential, 32% industrial, 31% commercial, and 2% agricultural.[40]

Electricity use in the County increased about 1.3% per year between 1990 and 2000, while population growth was about 0.6% per year. Due to decreased use in industry (mainly timber), energy use in the County decreased significantly (approximately 24%) between 2000 and 2003. It is expected that electricity consumption will grow over the next 20 years by between 0.5% and 1.5% per year, and that residential and commercial consumption will grow the fastest.[41]

There is a large potential for generation and use of renewable energy in Humboldt, both with mature technologies, such as wind power, and developing technologies, such as wave power.

---

[38] San Francisco Department of Public Health's Healthy Development Measurement Tool. Available at: http://www.thehdmt.org/indicator.php?indicator_id=2.

[39] "The Costs of Sprawl," Real Estate Research Corporation, 1974.

[40] Zoellick, J. Humboldt County's Energy Picture. Presented on Sept 29, 2005 at Humboldt State University. Author is from Schatz Energy Research Center.

[41] Humboldt County Energy Element Appendices: Technical Report. Prepared for Redwood Coast Energy Authority by Schatz Energy Research Center, Humboldt State University. October, 2005.

Currently, the County produces a large portion of electricity (~73%) and a small portion of natural gas (~11%) needed.

Since Humboldt is remote, issues include uncertainty of supply, reliability and affordability of energy, and a shift toward decentralized electricity generation. Land use development greatly affects energy consumption and land use policy can affect future energy generation and transportation. There is significant interest in the County to create and implement a sustainable energy plan.

Analysis

Assumptions

- Housing developed in urban areas will tend to be smaller than housing developed elsewhere.
- Some of the housing in urban areas will be developed as multi-unit housing, as opposed to non-urban areas which will not have multi-unit housing.

Logic

- Housing in urban areas will consume less electricity due to their smaller size.

Quantitative Analysis

Data on difference in consumption between urban and non-urban residential development is not reliable enough to be used to quantify difference in the Plan Alternatives.

Qualitative Analysis

Energy consumption and sustainability are of great concern for Humboldt residents and were raised numerous times in the focus groups. Items discussed included: modes of transport, home heating type, house siting, and alternative energy.

Disparities

Higher income people tend to use a greater share of resources, such as electricity, but the cost is often borne by the poor, who will be affected more by global warming, for example.

Conclusions

A) Plan Alternative A includes only urban development, which will encourage smaller housing and multi-unit housing that consume less electricity. **Whether this Plan actually reduces per capita electricity consumption or does not change it will depend on the characteristics of housing being built.**

B) **Per capita electricity consumption would likely increase in Plan Alternative B** since many new non-urban homes that could consume larger amounts of electricity will be built. This will have effects on air pollution and global warming, both of which have health consequences. This will also increase the amount residents spend on electricity and leave less income for other health-promoting resources such as healthy food.

C) **Plan Alternative C will increase per capita electricity consumption most** since the highest number new non-urban homes that could consume larger amounts of electricity will be built. This will have more significant effects on air pollution and global warming, both of which have health consequences. This will also increase the amount residents spend on electricity and leave less income for other health-promoting resources such as healthy food.

Alternative Health Promoting Mitigations:

- Increase energy efficiency of housing.
- Encourage construction of multi-unit buildings and smaller housing.
- Encourage construction of buildings that follow environmental standards such as those proposed by Leadership in Energy and Environmental Design (LEED).
- Regulate electricity use by industry and businesses (e.g., turning lights off in office buildings at night).
- Promote solar and other locally produced energy production and consumption.
- Reduce the County's carbon footprint by following the recommendations of groups like the International Council for Local Environmental Initiatives (ICLEI).
- Implement outdoor lighting efficiency standards to decrease public and private use of electricity.

ES.3.c Percent of food consumption of food produced within the County

Health-Based Rationale

Agriculture is an important part of the economic base of Humboldt County, including many small producers and self-employed. Productive farming land is part of what many local residents value about the County.

Consumption of locally produced foods can reduce consumption of fossil fuels and reduce potential for pollution and for global warming.[42] It may also increase consumption of fruits and vegetables and reduce the consumption of processed foods by improving the freshness, and therefore the taste, of produce In addition, consumption of locally grown produce can have economic benefits. First, farmers only receive between 4 and 19 cents of every dollar spent on food while the remaining portion goes to marketers[43], processors, distributors, retailers, wholesalers, and goods movement. Second, money paid to local farmers is more likely to stay in the community. Every dollar spent on locally grown produce circulates 2.5 times in the local community, as compared to 1.4 times for dollars spent on conventionally grown food in a supermarket.[44]

Due to the rural nature and geographic location of the area, transportation of agricultural and industrial products to larger marketing areas within and outside of California is difficult and expensive, since most goods must be shipped over a mountainous or coastal highway to reach a major market area. Getting the crop from seed to harvest takes only one-fifth of the total oil used for our food. Most oil is consumed transporting food from the point of production to the point of consumption.[45] 16% of total US energy consumption goes into food production, processing, packaging, distribution and marketing.[46]

Importing food from other countries exposes the consumer to food produced under regulations concerning pesticides and production that may not be as vigorous as standards in this country.
Large commercial farming operations are the exception rather than the norm with smaller family farms making up the majority of agricultural operations in the area. Livestock related operations, including the dairy industry and beef cattle operations, are the most significant agricultural contributors to the local economies within the region. Other significant agricultural operations are nursery crops that include lily bulbs and woody ornamentals, pasture and hay land crops, and to a lesser extent, vegetable row crops, orchards and vineyards. Small family farm operators are finding it difficult to stay competitive[47] due to several limiting factors, not the least of which include higher operating and transportation costs to sell their products regionally or having to ship their products to larger market areas within or outside of California. Small farm operators are looking for ways to diversify their product lines and simplify marketing methods in order to offset their escalating operating costs, and health-conscious consumers are looking for ways to access locally-grown, environmentally-friendly foods. Direct farmer-to-consumer marketing methods have potential for growth and success.

[45] Kingsolver, B. Animal, Vegetable, Miracle, Harper Collins Publishers, 2007, p. 5.
[46] Pirog R. Food, Fuel, and Freeways: An Iowa Perspective on How Far Food Travels, Fuel Usage, and Greenhouse Gas Emissions. Ames, Iowa. Leopold Center for Sustainable Agriculture. Iowa State University. 2001.
[47] Humboldt 2025 General Plan Update Agricultural Resources and Policies report available at http://co.humboldt.ca.us/planning/gp/pdf/agrprt_2.pdf.

Existing conditions
According to one source, around 85% of Humboldt's food, today, is brought in by trucks.[48] In the US, on average, an item of food travels 1500 miles between the farm and the plate.[49]

Opportunities for access to local produce include: 13 farmers markets, 6 local Community Supported Agricultural Farms programs, local grocery stores that highlight locally grown food, and a Farm-to-School program for education.

No data is available on home production of food.

Analysis

Assumptions
- Lands not currently designated as agriculture lands will be converted to that use.
- There will be a continued market for agricultural products.
- With escalating transportation costs and consciousness about global warming local consumer interest in local products will grow.
- Expansion of residential development could decrease agricultural lands.
- One limitation to consumption of locally produced food could be that there is not enough arable land to grow food.

Logic
- Preserving agricultural lands would ensure that local production continues.

Quantitative Analysis
It is impossible to estimate changes that would result from adoption of any of the three Plan Alternatives since information on what is limiting consumption of locally produced food is unavailable.

Qualitative Analysis
There is a strong desire to increase the self-sufficiency within the County and to support local farmers and businesses. Attendees from community meetings favored maintaining the rural character of the County and maintaining and supporting local agricultural production. Food miles traveled was discussed, as was supporting the local economy. Having local food was also considered a security issue.

Conclusions
A) Given that Plan Alternative A does not expand housing into agricultural lands, **there would not be a further limitation on local production of food and therefore consumption of locally produced food would not be hindered with Plan A.** Consumption of locally grown food would improve health because locally grown food could be more flavorful and therefore consumption of fruits and vegetable could increase. Additionally, transportation-related climate change would be limited.
B) **Plan Alternative B could result in some loss of farmland and could limit local production of food somewhat.** This could thereby limit consumption of locally grown food and lead to the need

[48] http://www.culturechange.org/HumboldtEcon.html.
[49] Pirog R. Food, Fuel, and Freeways: An Iowa Perspective on How Far Food Travels, Fuel Usage, and Greenhouse Gas Emissions. Ames, Iowa. Leopold Center for Sustainable Agriculture. Iowa State University. 2001.

to import more food from outside the County. Transportation-related climate change could increase as a result.

C) **Plan Alternative C would result in more significant loss of farmland and could limit local production of food.** This could thereby limit consumption of locally grown food and lead to the need to import more food from outside the County. Transportation-related climate change could increase as a result. The importing of fruits and vegetables could also affect flavor and may lead to a decrease in consumption of fruits and vegetables, which are necessary to maintain a healthy diet.

Caveats

Limitations on consumption could include: land for production, cost of locally produced food, types of food grown locally (including what food production is subsidized), outlets for locally produced food, successful business models, lack of interest in consuming locally produced food, etc.). It is unclear which of these is the biggest limitation currently.

Alternative Health Promoting Mitigations:

- Increase incentives to produce food locally and consume locally produced food.
- Increase programs and incentives for locally grown food businesses (e.g., see: http://guide.buylocalca.org/ and http://www.caff.org/programs/eco_index.shtml).
- Encourage County institutions (e.g., hospitals) to use locally grown foods.
- Support food incubator businesses in the County.

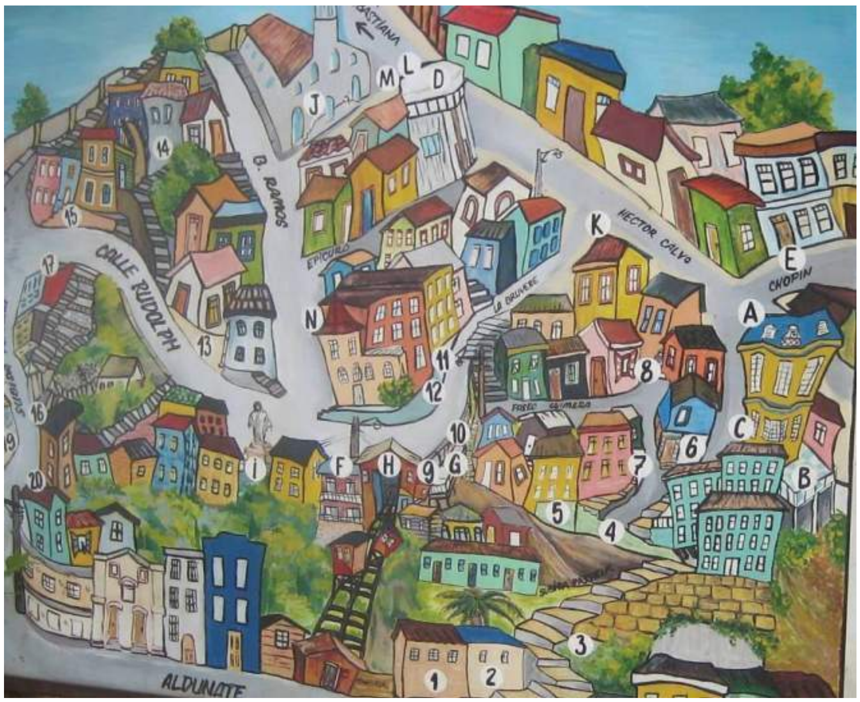
Land Use Impacts on Transport

How Land Use Factors Affect Travel Behavior

27 January 2015

Todd Litman
Victoria Transport Policy Institute
With Rowan Steele



Land use factors such as density, mix, connectivity and walkability affect how people travel in a community. This information can be used to help achieve transport planning objectives.

Abstract

This paper examines how various land use factors such as density, regional accessibility, mix and roadway connectivity affect travel behavior, including per capita vehicle travel, mode split and nonmotorized travel. This information is useful for evaluating the ability of smart growth, new urbanism and access management land use policies to achieve planning objectives such as consumer savings, energy conservation and emission reductions.

Contents

Executive Summary

This paper investigates how various land use factors affect transport impacts, and therefore the ability of *smart growth* (also called *new urbanism* or *compact development*) policies to achieve various planning objectives, as summarized below.

Land Use Factors	Transport Impacts	Planning Objectives
Regional accessibility	Vehicle ownership	Congestion reduction
Density	Vehicle trips and travel (mileage)	Road and parking cost savings
Land use mix	Walking	Consumer savings and affordability
Centeredness	Cycling	Improved mobility for non-drivers
Road and path connectivity	Public transit travel	Traffic safety
Roadway design	Ridesharing	Energy conservation
Active transport (walking and cycling conditions)	Telecommuting	Pollution emission reduction
Public transit service quality	Shorter trips	Improved public fitness and health
Parking supply and management		Habitat protection
Site design		Improved community livability
Mobility management		
Integrated smart growth programs		

This report considers various land use factors, transport impacts and planning objectives.

Although most land use factors have modest individual impacts, typically affecting just a few percent of total travel, they are cumulative and synergistic. Integrated smart growth programs that result in community design similar to what developed prior to 1950 can reduce vehicle ownership and travel 20-40%, and significantly increase walking, cycling and public transit, with even larger impacts if integrated with other policy changes such as increased investments in alternative modes and more efficient transport pricing.

Care is needed when evaluating the impacts of specific land use factors. Impacts vary depending on definitions, geographic and time scale of analysis, perspectives and specific conditions, such as area demographics. Most factors only apply to subset of total travel, such as local errands or commute travel. *Density* tends to receive the greatest attention, although alone its travel impacts are modest. Density is usually associated with other factors (regional accessibility, mix, transport system diversity, parking management) that together have large travel impacts. It is therefore important to make a distinction between the narrow definition of density as an isolated attribute, and the broader definition (often called *compact development*) that includes other associated attributes.

A key question is the degree of consumer demand for more accessible, multi-modal development. Demographic and economic trends (aging population, rising fuel prices, increasing health and environmental concerns, changing consumer location preferences, etc.) tend to increase demand for more accessible, multi-modal locations. This suggests that smart growth policies are likely to have greater impacts and benefits in the future.

Table ES-1 summarizes the effects of land use factors on travel behavior. Actual impacts will vary depending on specific conditions and the combination of factors applied.

Table ES-1 **Land Use Impacts on Travel Summary**

Factor	Definition	Travel Impacts
Regional accessibility	Location of development relative to regional urban center.	Reduces per capita vehicle mileage. More central area residents typically drive 10-40% less than at the urban fringe
Density	People or jobs per unit of land area (acre or hectare).	Reduces vehicle ownership and travel, and increases use of alternative modes. A 10% increase typically reduces VMT 0.5-1% as an isolated factor, and 1-4% including associated factors (regional accessibility, mix, etc.).
Mix	Proximity between different land uses (housing, commercial, institutional)	Tends to reduce vehicle travel and increase use of alternative modes, particularly walking. Mixed-use areas typically have 5-15% less vehicle travel.
Centeredness (centricity)	Portion of jobs and other activities in central activity centers (e.g., downtowns)	Increases use of alternative modes. Typically 30-60% of commuters to major commercial centers use alternative modes compared with 5-15% at dispersed locations
Network Connectivity	Degree that walkways and roads are connected	Increased roadway connectivity can reduce vehicle travel and improved walkway connectivity increases non-motorized travel
Roadway design	Scale, design and management of streets	Multi-modal streets increase use of alternative modes. Traffic calming reduces VMT and increases non-motorized travel
Active transport (walking and cycling) conditions	Quantity, quality and security of sidewalks, crosswalks, paths, and bike lanes.	Improved walking and cycling conditions tends to increase nonmotorized travel and reduce automobile travel. Residents of more walkable communities typically walk 2-4 times more and drive 5-15% less than in more automobile-dependent areas.
Transit quality and accessibility	Quality of transit service and access from transit to destinations	Increases ridership and reduces automobile trips. Residents of transit oriented neighborhoods tend to own 10-30% fewer vehicles, drive 10-30% fewer miles, and use alternative modes 2-10 times more than in automobile-oriented areas.
Parking supply and management	Number of parking spaces per building unit or acre, and how parking is managed and priced	Tends to reduce vehicle ownership and use, and increase use of alternative modes. Cost-recovery pricing (users finance parking facilities) typically reduces automobile trips 10-30%.
Site design	Whether oriented for auto or multi-modal accessibility	More multi-modal site design can reduce automobile trips, particularly if implemented with improvements to other modes.
Mobility management	Strategies that encourage more efficient travel activity	Tends to reduce vehicle ownership and use, and increase use of alternative modes. Impacts vary depending on specific factors.
Integrated smart growth programs	Travel impacts of integrated programs that include a variety of land use management strategies	Reduces vehicle ownership and use, and increases alternative mode use. Smart growth community residents typically own 10-30% fewer vehicles, drive 20-40% less, and use alternative mode 2-10 times more than in automobile-dependent locations, and even larger reductions are possible if integrated with regional transit improvements and pricing reforms.

This table describes various land use factors that can affect travel behavior and population health.

Introduction

Transportation and land use planning decisions interact. Transport planning decisions affect land use development, and land use conditions affect transport activity. These relationships are complex, with various interactive effects. It is therefore important to understand these in order to integrate planning, so individual decisions support strategic goals. A companion report, *Evaluating Transportation Land Use Impacts* (Litman 2009) describes methods for evaluating how transport planning decisions affect land use. This report describes ways that land use planning decisions affect transport.

Land use patterns (also called *community design*, *urban form*, *built environment*, *spatial planning* and *urban geography*) refers to various land use factors described in Table 1.

Table 1 **Land Use Factors**

Factor	Definition	Mechanisms
Regional Accessibility	Location relative to regional centers, jobs or services.	Reduces travel distances between regional destinations (homes, services and jobs).
Density	People, jobs or houses per unit of land area (acre, hectare, square mile or kilometer).	Reduces travel distances. Increases destinations within walking and cycling distances. Increases sidewalk, path and public transit efficiencies. Increases vehicle congestion and parking costs.
Mix	Proximity of different land uses (residential, commercial, institutional, etc.). Sometimes described as *jobs/housing balance*, the ratio of jobs and residents in an area.	Reduces travel distances between local destinations (homes, services and jobs). Increases the portion of destinations within walking and cycling distances.
Centeredness (centricity)	Portion of jobs, commercial and other activities in major activity centers.	Provides agglomeration efficiencies and increases public transit service efficiency.
Connectivity	Degree that roads and paths are connected and allow direct travel between destinations.	Reduces travel distances. Reduces congestion delays. Increases the portion of destinations within walking and cycling distances.
Roadway design and management	Scale and design of streets, to control traffic speeds, support different modes, and enhance the street environment.	Improves walking, cycling and public transit travel. May improve local environments so people stay in their neighborhoods more.
Parking supply and management	Number of parking spaces per building unit or hectare, and the degree to which they are priced and regulated for efficiency.	Increased parking supply disperses destinations, reduces walkability, and reduces the costs of driving.
Active transport conditions	Quantity and quality of sidewalks, crosswalks, paths, bike lanes, bike parking, pedestrian security and amenities.	Improves pedestrian and bicycle travel, and therefore public transit access. Encourages more local activities.
Transit accessibility	The degree to which destinations are accessible by high quality public transit.	Improves transit access and supports other accessibility improvements.
Site design	The layout and design of buildings and parking facilities.	Improves pedestrian access.
Mobility Management	Various strategies that encourage use of alternative modes.	Improves and encourages use of alternative modes.

This table describes various land use factors that can affect travel behavior and population health.

This paper investigates how these factors affect transport activity, including vehicle ownership, vehicle travel (vehicle trips and *vehicle miles of travel* or *VMT*), mode share (the portion of trips by different modes), active transport (walking and cycling), and therefore impacts on various planning issues such as traffic congestion, infrastructure costs, consumer costs, accident rates, physical fitness, and social equity objectives. Note that different types of travel have different impacts on these issues. For example, because commuting tends to occur during peak periods it contributes significantly to traffic congestion. The land use factors described in this report primarily affect the 60-70% of travel that is intraregional, they do not directly affect the 30-40% of travel that is interregional, such as business or recreational trips to other cities.

Land use patterns affect *accessibility*, people's ability to reach desired services and activities, which affects mobility, the amount and type of travel activity (Litman 2003). Different land use patterns have different accessibility features. Urban areas have more accessible land use and more diverse transport systems, but slower and more costly automobile travel. Suburban and rural areas have less accessible land use and fewer travel options but driving is faster and cheaper per mile. Table 2 summarizes these differences.

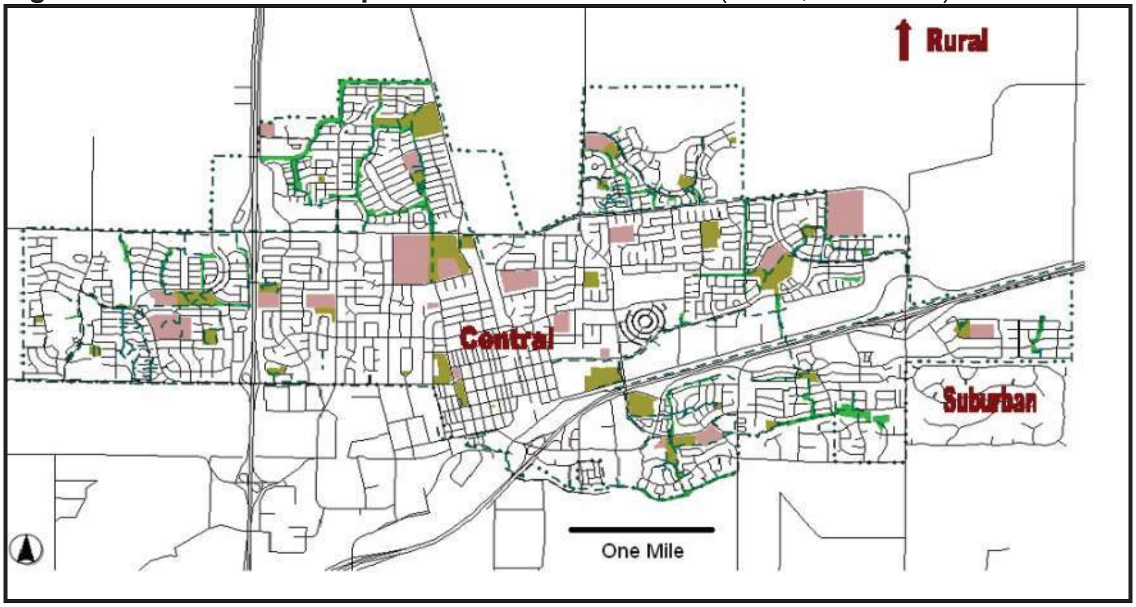
Table 2 **Land Use Features**

Feature	Urban	Suburb	Rural
Public services nearby	Many	Few	Very few
Jobs nearby	Many	Few	Very few
Distance to major activity centers (downtown or major mall)	Close	Medium	Far
Road type	Low-speed grid	Low-speed cul-de-sacs and higher-speed arterials	Higher-speed roads and highways
Road & path connectivity	Well connected	Poorly connected	Poorly connected
Parking	Sometimes limited	Abundant	Abundant
Sidewalks along streets	Usually	Sometime	Seldom
Local transit service quality	Very good	Moderate	Moderate to poor
Site/building orientation	Pedestrian-oriented	Automobile oriented	Automobile oriented
Mobility management	High to moderate	Moderate to low	Low

This table summarizes features of major land use categories.

These factors can significantly affect travel activity as illustrated in Figure 1. *Central* location residents typically drive 20-40% less and walk, cycle and use public transit two to four times more than they would at a *Suburban* location, and they drive 20-40% less than they would in a *rural* location. However, there are many variations among these categories. Suburban and rural villages can incorporate features such as sidewalks, bikelanes and land use mixing that increase accessibility and transport diversity. As a result, there are many degrees of accessibility and multi-modalism.

Figure 1 **Location Impacts on Travel Behavior** (Davis, California)



Residents of a **Central** *location drive less and walk, cycle and use public transit more than in* **Suburban** or **Rural** *location due to differences in accessibility and travel options.*

Table 3 illustrates typical differences in accessibility characteristics in various geographic areas of a typical U.S. city, indicating more nearby destinations (stores, schools, parks, etc.), and much higher rates of walking, cycling and public transit travel. These travel patterns are partly explained by demographic differences; urban households tend to be younger, smaller, have lower incomes, and lower employment rates.

Table 3 **Accessibility Differences** (Horning, El-Geneidy and Krizek 2008)

Characteristics	Urban	Inner Ring	Outer Ring	Overall
Mean age	43	51	54	50
Mean household size	1.85	2.25	2.77	2.35
Mean number of cars per household	1.26	1.79	2.17	1.80
Mean household income	$40 – 60k	$60 -$80k	$80 -$100k	$60 -$80k
Percent employed in the sample	38%	75%	72%	76%
Percent with college degrees in sample	44%	72%	72%	72%
Distance Perception				
Mean number of destinations within 1 km	44.29	26.17	12.90	41.50
Mean distance to all closest retail (km)	0.62	1.49	2.10	1.49
Non-auto modes use previous week				
Walked to work	33%	4%	2%	5%
Walked for exercise	49%	52%	54%	55%
Walked for to do errands	47%	20%	12%	29%
Biked	44%	24%	24%	24%
Used transit	45%	12%	5%	14%

This table summarizes differences in demographics, distance to common destinations, and travel activity between city, inner suburbs and outer suburbs.

Evaluating Land Use Impacts
Numerous studies measure the effects of various land use factors on travel activity (Barla, Miranda-Moreno and Lee-Gosselin 2010; CARB 2010 and 2011; Date, et al. 2014; Ewing, et al. 2007; Ewing and Cervero 2010; Guo and Gandavarapu 2010; Kuzmyak 2012; Outwater, et al. 2014; ULI 2010; USEPA 2013; Vernez Moudon and Stewart 2013). The report, *Effect of Smart Growth Policies on Travel Demand* (Outwater, et al. 2014) describes how smart growth policies affect travel. The *California Smart-Growth Trip Generation Rates Study* examined how smart growth policies affect trip generation rates and produced the *Smart Growth Trip-Generation Adjustment Tool* which can be used to model these impacts (Handy, Shafizadeh and Schneider 2013). The report, *Research on Practical Approach for Urban Transport Planning* by the Japan International Cooperation Agency includes detailed analysis of the geographic and demographic factors that affect urban travel in developing countries (JICA 2011).

Many land use factors overlap. For example, increased density tends to increase land use mix, transit accessibility and parking pricing, so analysis that only considers a single factor may exaggerate its effect (Stead and Marshall 2001). On the other hand, research is often based on aggregate (city, county or regional) data, impacts are often found to be greater when evaluated at a finer scale. For example, although studies typically indicate just 10-20% differences in average per capita vehicle mileage between Smart Growth and sprawled cities, much greater differences can be found at the neighborhood scale. As Ewing (1996) describes, "*Urban design characteristics may appear insignificant when tested individually, but quite significant when combined into an overall 'pedestrian-friendliness' measure. Conversely, urban design characteristics may appear significant when they are tested alone, but insignificant when tested in combination.*"

Impacts can be evaluated at four general levels:

1. Analysis of a single factor, such as density, mix or transit accessibility.
2. Regression analysis of various land use factors, such as density, mix and accessibility. This allows the relative magnitude of each factor to be determined.
3. Regression analysis of land use and demographic factors. This indicates the relative magnitude of individual land use factors and accounts for *self-selection* (also called *sorting*), that is, the tendency of people to choose locations based on their travel abilities, needs and preferences (Cao 2014).
4. Regression analysis of land use, demographic and preference factors. This analyzes takes into account sorting effects, including the tendency of people who, from preference or necessity, rely on alternative modes to choose more accessible locations.

Changes in vehicle mileage can involve various types of travel changes including trip frequency, destination, length and mode ("Transportation Elasticities," VTPI 2008). For example, urban residents tend to take more walking and public transit trips, and shorter automobile trips than sprawled location residents. Similarly, vehicle trip reduction incentives, such as congestion or parking pricing may cause people to consolidate trips, use closer destinations, and shift modes. These effects can affect benefit analysis. For example, destination shifts have very different cost impacts than mode shifts.

Travel impacts vary depending on the type of trip and traveler. For example, increasing land use mix and walkability tends to be particularly effective at reducing automobile shopping and recreational trips, while increasing regional accessibility and improved transit accessibility tend to reduce automobile commute trips. Shopping and recreation represent nearly half of all trips and about a third of travel mileage, but tend to be offpeak trips. As a result, improving mix and walkability tends to reduce energy consumption, pollution emissions and crashes but has less impact on traffic congestion. Commuting only represents 15-20% of total trips but often more than half of all trips on congested roadways and so have much larger congestion impacts.

Table 4 **U.S. Average Annual Person-Miles and Person-Trips** (ORNL 2004, Table 8.7)

	Commute	Shopping	Recreation	Other	Total
Annual Miles	2,540 (18.1%)	1,965 (14.0%)	4,273 (30.5%)	5,238 (37.4%)	14,016 (100%)
Annual Trips	214 (14.8%)	284 (19.6%)	387 (26.7%)	565 (39.0%)	1,450 (100%)

This table shows personal travel by trip purpose, based on the 2001 National Household Travel Survey.

Care is needed when evaluating this literature since studies vary in scale, scope and methodology, and the degree they account for confounding factors that affect both land use and travel (Fruits 2008). When evaluating impacts it may be important to account for *self selection*, the tendency of people to choose locations based on their abilities, needs and preferences (Cao, Mokhtarian and Handy 2008; Cervero 2007). For example, people who cannot or prefer not to drive tend to choose homes in more accessible neighborhoods. Some observed differences in travel activity reflect these effects, so it is inappropriate to assume that all households which move to smart growth locations necessarily reduce vehicle travel to neighborhood averages. As a result, policies which force people who prefer automobile-oriented lifestyles to live in smart growth communities may not achieve predicted vehicle travel reductions, energy savings and emission reductions. However, if there is latent demand for more multi-modal neighborhoods (some households want to locate in such areas but cannot due to a lack of appropriate and affordable housing), increasing the supply of such housing will tend to reduce total vehicle travel.

In many cities, more accessible older neighborhoods have high levels of poverty and related social and health problems, while more sprawled newer areas tend to be relatively wealthy, secure, and healthy. However, this does not necessarily mean that density and mix *cause* problems or that sprawl increases wealth and security overall. Rather, this reflects the effects of sorting. These effects can be viewed from three perspectives:

1. From individual households' perspective it is desirable to choose more isolated locations that exclude disadvantaged people with social and economic problems.
2. From a neighborhood's perspective it is desirable to exclude disadvantaged people and shift their costs (crime, stress on public services, etc.) to other jurisdictions.
3. From society's overall perspective it is harmful to isolate and concentrate disadvantaged people, which exacerbates their problems and reduces their economic opportunities.

Planning Objectives

Changes in travel behavior caused by land use management strategies can help solve various problems and help achieve various planning objectives. Table 5 identifies some of these objectives and discusses the ability of land use management strategies to help achieve them. These impacts vary in a number of ways. For example, some result from reductions in vehicle ownership, while others result from reductions in vehicle use. Some result from changes in total vehicle travel, others result primarily from reductions in peak-period vehicle travel. Some result from increased nonmotorized travel.

Table 5 **Land Use Management Strategies Effectiveness** (Litman 2004)

Planning Objective	Impacts of Land Use Management Strategies
Congestion Reduction	Strategies that increase density increase local congestion intensity, but by reducing per capita vehicle travel they reduce total regional congestion costs. Land use management can reduce the amount of congestion experienced for a given density.
Road & Parking Savings	Some strategies increase facility design and construction costs, but reduce the amount of road and parking facilities required and so reduces total costs.
Consumer Savings	May increase some development costs and reduce others, and can reduce total household transportation costs.
Transport Choice	Significantly improves walking, cycling and public transit service.
Road Safety	Traffic density increases crash frequency but reduces severity. Tends to reduce per capita traffic fatalities.
Environmental Protection	Reduces per capita energy consumption, pollution emissions, and land consumption.
Physical Fitness	Tends to significantly increase walking and cycling activity.
Community Livability	Tends to increase community aesthetics, social integration and community cohesion.

This table summarizes the typical benefits of land use management.

Land Use Management Strategies

Various land use management strategies are being promoted to help achieve various planning objectives, as summarized in Table 6. These represent somewhat different scales, perspectives and emphasis, but overlap to various degrees.

Table 6 **Land Use Management Strategies** (VTPI 2008; BA Consulting 2008)

Strategy	Scale	Description
Smart Growth	Regional and local	More compact, mixed, multi-modal development.
New Urbanism	Local, street and site	More compact, mixed, multi-modal, walkable development.
Transit-Oriented Development	Local, neighborhood and site	More compact, mixed, development designed around quality transit service, often designed around *transit villages*.
Location-Efficient Development	Local and site	Residential and commercial development located and designed for reduced automobile ownership and use.
Access management	Local, street and site	Coordination between roadway design and land use to improve transport.
Streetscaping	Street and site	Creating more attractive, walkable and transit-oriented streets.
Traffic calming	Street	Roadway redesign to reduce traffic volumes and speeds.
Parking management	Local and site	Various strategies for encouraging more efficient use of parking facilities and reducing parking requirements.

Various land use management strategies can increase accessibility and multi-modalism.

These land use management strategies can be implemented at various geographic scales. For example, clustering a few shops together into a mall tends to improve access for shoppers compared with the same shops sprawled along a highway (this is the typical scale of *access management*). Locating houses, shops and offices together in a neighborhood improves access for residents and employees (this is the typical scale of *New Urbanism*). Clustering numerous residential and commercial buildings near a transit center can reduce the need to own and use an automobile (this is the typical scale of *transit-oriented development*). Concentrating housing and employment within existing urban areas tends to increase transit system efficiency (this is the typical scale of *smart growth*). Although people sometimes assume that land use management requires that all communities become highly urbanized, these strategies are actually quite flexible and can be implemented in a wide range of conditions:

- In urban areas they involve infilling existing urban areas, encouraging fine-grained land use mix, and improving walking and public transit services.
- In suburban areas it involves creating compact downtowns, and transit-oriented, walkable development.
- For new developments it involves creating more connected roadways and paths, sidewalks, and mixed-use village centers.
- In rural areas it involves creating villages and providing basic walking facilities and transit services.

Individual Land Use Factors

This section describes how different land use factors affect travel patterns.

Regional Accessibility

Regional accessibility refers to a location relative to the regional urban center (either a central city or central business district), or the number of jobs and public services available within a given travel distance or time (Kuzmyak and Pratt 2003; Ewing 1995). Although regional accessibility has little effect on total trip generation (the total number of trips people make), it tends to have a major effect on trip length and mode choice, and therefore per capita vehicle travel (SACAG 2008). People who live and work distant from the urban center tend to drive significantly more annual miles than if located in similar neighborhood closer to the center.

Ewing and Cervero (2010) find that regional accessibility has the greatest single impact on per capita vehicle travel; the elasticity of VMT with respect to distance to downtown is -0.22 and with respect to jobs accessible by automobile is -0.20, indicating that a 10% reduction in distance to downtown reduces vehicle travel by 2.2% and a 10% increase in nearby jobs reduces vehicle travel by 2%. Kockelman (1997) also found that accessibility (measured as the number of jobs within 30-minute travel distance) was one of the strongest predictors of household vehicle travel.

Dispersing employment to suburban locations can reduce commute lengths, but tends to increases non-commute vehicle travel. Crane and Chatman (2003) find that a 5% increase in regional employment to outlying counties is associated with a 1.5% reduction in average commute distance but an increase in total per capita vehicle travel. Impacts vary by industry. Suburbanization of construction, wholesale, and service employment causes shorter commutes but for manufacturing and finance it lengthens commutes.

Based on detailed reviews of available research Handy, Tal and Boarnet (2010c) conclude the elasticity of vehicle travel with respect to regional accessibility (measured as distance from a central business district or travel time/distance to jobs and other destinations) is -0.13 to -0.25, so a 10% increase reduces VMT 1.3% to 2.5%. Miller and Ibrahim (1998) found that in Toronto, Canada average commute distances increase 0.25 kilometer for each additional kilometer from the city's central business district and 0.38 kilometer for every kilometer from a major suburban employment center. Prevedouros and Schofer (1991) found that Chicago region outer suburb residents make more local trips, longer trips and spend more time in traffic than residents of inner suburbs. Analysis by Boarnet, et al. (2011) indicates that Southern California urban fringe residents drive significantly more than residents of more central, accessible locations, suggesting that land use policy changes in such areas may be particularly effective at achieving VMT reduction and emission reduction targets.

Density

Density refers to the number of homes, people or jobs per unit of area (acres, hectares, square-miles or square kilometers) (Campoli and MacLean 2002; Kuzmyak and Pratt 2003; TRB 2009). It can be measured at various scales: site, block, census tract, neighborhood, municipality, county, urban region or country. Density can affect travel activity in several ways:

- *Increased proximity (geographic accessibility)*. Increased density tends to reduce travel distance to destinations and increases the portion of destinations within walking and cycling distances. This reduces average trip distances and reduces automobile travel.
- *Mobility options.* Increased density tends to increase the cost efficiency of sidewalks, paths, public transit services, delivery services, resulting in more and better transport options. For example, the cost per household of providing sidewalks is half for a neighborhood with 10 units per acre with 50-foot lot frontage than for 5 units per acre with 100-foot frontages. Similarly, the per capita costs of providing transit services declines with density.
- *Reduced automobile travel speeds and convenience.* Increased density tends to increase traffic friction (interactions among road users) which reduces traffic speeds, and higher land costs reduce parking supply and increase parking pricing. These increase the time and financial costs of automobile travel.
- *Complementary factors.* Density is often associated with other urban land use features such as regional accessibility (density is generally highest in central locations and declines to the periphery), centricity (more jobs are located in major urban centers), land use mix, roadway connectivity, reduced traffic speed, and better transport options (better walking, cycling, public transit and taxi services), reduced parking supply and increased parking prices, which reduce automobile travel speed and affordability.
- *Historical conditions*. Many denser neighborhoods developed prior to 1950 and so were designed for multi-modal access (with sidewalks, connected streets, local shops, transit services, limited parking, and regional accessibility), while newer, lower-density, urban fringe neighborhoods were designed primarily for automobile access (lacking sidewalks, dead-end streets, regional shopping, abundant parking and urban fringe locations).
- *Self-selection.* People who by need or preference rely on non-automobile modes tend to locate in denser urban areas.

Density data is widely available, so is one of the most commonly evaluated land use factors. As previously mentioned, density tends to be positively associated with other land use factors that affect travel including regional accessibility, mix, roadway network connectivity, improved transport options and reduced parking supply, plus self-selection as people who rely on non-automobile modes tend to locate in denser urban areas. A few studies have attempted to isolate density from these other factors (Ewing and Hamidi 2014; Liu 2007), which indicates that density itself is only a minor portion of the aggregated effects of these factors together. When evaluating the impacts of density on travel activity it is important to specify whether it considers *aggregated density* (density and its associated land use factors, sometimes called *compactness*) or *disaggregated density* (density by itself, with other land use factors such as mix, street connectivity and parking supply considered separately).

Measuring Density (Kolko 2011)
Density is usually measured as the number of people, workers or housing units per unit of area (acre, hectare, square kilometer or square mile), which often includes significant undeveloped or sparsely developed areas. For many applications it is better to use *weighted density*, which weights these densities by each tract's share of that factor for the metropolitan region. This reflect the weighted average densities in the areas where people actually live or work. An alternative approach is to use *net density* which excludes undeveloped land, such as farmland and large parks. This requires detailed land use data to identify and exclude undeveloped land, whereas weighted density requires only census tract population (or employment) and land area.

To understand how these measures work, consider two hypothetical cities, *Sparseville* and *Densetown*. Each has 1,000 residents and two one-square mile census tracts. In Sparseville, 500 people live in each tract, whereas in Densetown, all 1,000 residents live in one tract and the other is undeveloped. Both Sparseville and Densetown have 500 people per square mile overall density (1,000 residents divided by 2 square miles), but the weighted density is 500 people per square mile in Sparseville, since the average person lives in a tract with 500 people per square mile, but 1,000 people per square mile in Densetown, since the average person lives in a tract with 1,000 people per square mile.

Due to data limitations (comprehensive and comparable data on other land use factors such as mix and parking supply are often difficult to obtain) most density analysis is aggregated, so density represents a combination of compact land use factors, but disaggregated analysis can be important because it is possible to have dense sprawl (for example, large high-rise developments scattered over an automobile-dependent landscape) and rural smart growth (development concentrated in villages with common services within convenient walking distance of most households, connected to larger urban centers with convenient public transit services).

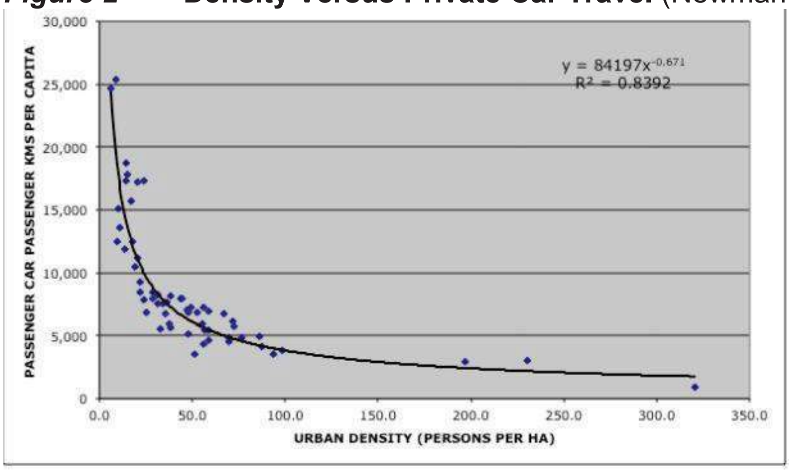
Also due to data limitations, density is often measured for relatively large geographic areas which may hide important differences in neighborhood density. For example, Los Angeles is a relatively dense city but lacks centricity (employment concentrated in major centers) and the type of neighborhood scale density needed to support frequent public transit service resulting in relatively high levels of per capita vehicle travel (Eidlin 2010).

Numerous studies indicate that as density increases per capita vehicle travel tends to decline, and use of alternative modes increases (Boarnet and Handy 2010; Ewing and Cervero 2010; JICA 2011). Overall, doubling urban densities typically reduces per capita vehicle travel 25-30% (Ewing and Cervero 2010). Manville and Shoup (2005) found the coefficient between urban population density and per capita annual vehicle mileage is -0.58, meaning that 1% population density increase is associated with a 0.58% reduction in VMT. Using detailed regression analysis of U.S. cities, McMullen and Eckstein (2011, Table 5.6) found the long-run elasticity of vehicle travel with respect to population density to be -0.0431. Turcotte (2008) found negative correlation between local density, automobile mode share and average daily minutes devoted to automobile travel in Canadian cities. Mindali, Raveh and Salomon (2004) reanalyzed this data and identified the specific density-related factors that affect vehicle use, including per capita vehicle ownership, road supply, CBD parking supply, mode share and inner-area employment.

Employment density affects commute mode share more than residential density (Barnes 2003). Frank and Pivo (1995) found that automobile commuting declines significantly when workplace densities reach 50-75 employees per gross acre. Employment and industrial density also seems reduce truck VMT per capita (Bronzini 2008). Levinson and Kumar (1997) found that as land use density increases, both travel speeds and trip distances tend to decline. As a result, automobile commute trip times are lowest for residents of medium-density locations.

Figure 2 shows the relationship between density and vehicle travel for 58 higher-income cities. The relationship between density and vehicle travel is statistically strong (R^2 0.8392) and the largest reductions occur as density increases from low (under 10 residents per hectare) to moderate (25-50 residents per hectare), which suggests that relatively modest land use changes (such as reductions in single-family lot size) can achieve large vehicle travel reductions.

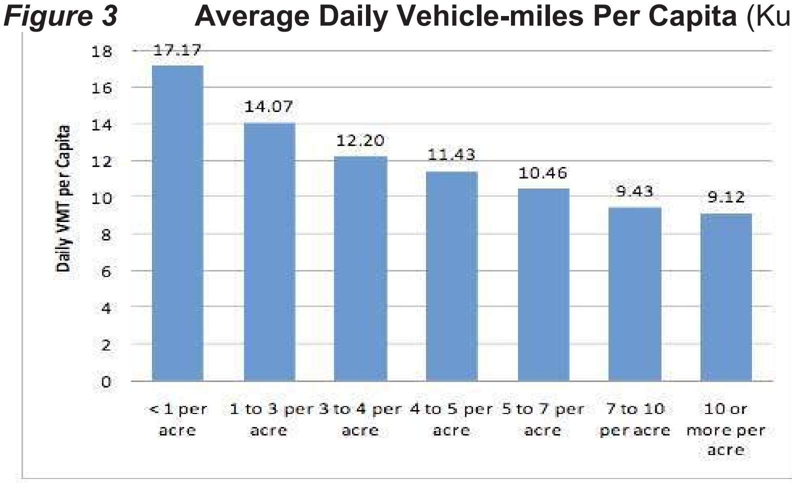
Figure 2 **Density Versus Private Car Travel** (Newman and Kenworthy 2011)



This figure illustrates the negative relationship between density and per capita vehicle travel in 58 high-income cities. The relationship is statistically strong. The largest reductions result from relatively modest density increases, indicating the relatively modest land use policy changes can significantly reduce vehicle travel.

Figure 3 shows how density affects average daily vehicle-miles per capita in Arizona.

Figure 3 **Average Daily Vehicle-miles Per Capita** (Kuzmyak 2012, Figure 76)



Increased density reduces vehicle mileage even in relatively new cities such as Phoenix, Arizona.

Beaton (2006) found that local density has a greater effect on transit ridership than household income. Boston neighborhoods that developed around commuter rail stations but lost rail service after 1970 retained relatively high rates of transit ridership, indicating that local land use factors such as density and mix have a significant impact on travel. Increased population density tends to increase walking and cycling activity (ABW 2010).

Various studies have examined how density affects fuel consumption (Karathodorou, Graham and Noland 2010). Brownstone and Golob (2009) found that, accounting for household demographics and income, 1,000 fewer housing units per square mile (1.56 units per acre) increases average vehicle travel 5%, and increases fuel consumption 6% due to increased vehicle travel and ownership of less fuel efficient vehicles (particularly trucks) in suburban areas, resulting in a -0.12 elasticity of VMT with respect to population density. Bhat and Guo (2007) also found that, accounting for demographic factors, vehicle ownership and use decline with residential and employment density, street density and transit service quality. Using California data, Niemeier, Bai and Handy (2011) found that increased density reduces vehicle travel, particularly in areas with more than 1,500 households per square mile. A major meta-analysis concluded that the elasticity of VMT with respect to population density is in the range of -0.05 to -0.12, and several land use variables together (density, mix, connectivity, etc.) can have a combined VMT elasticity of -0.25.

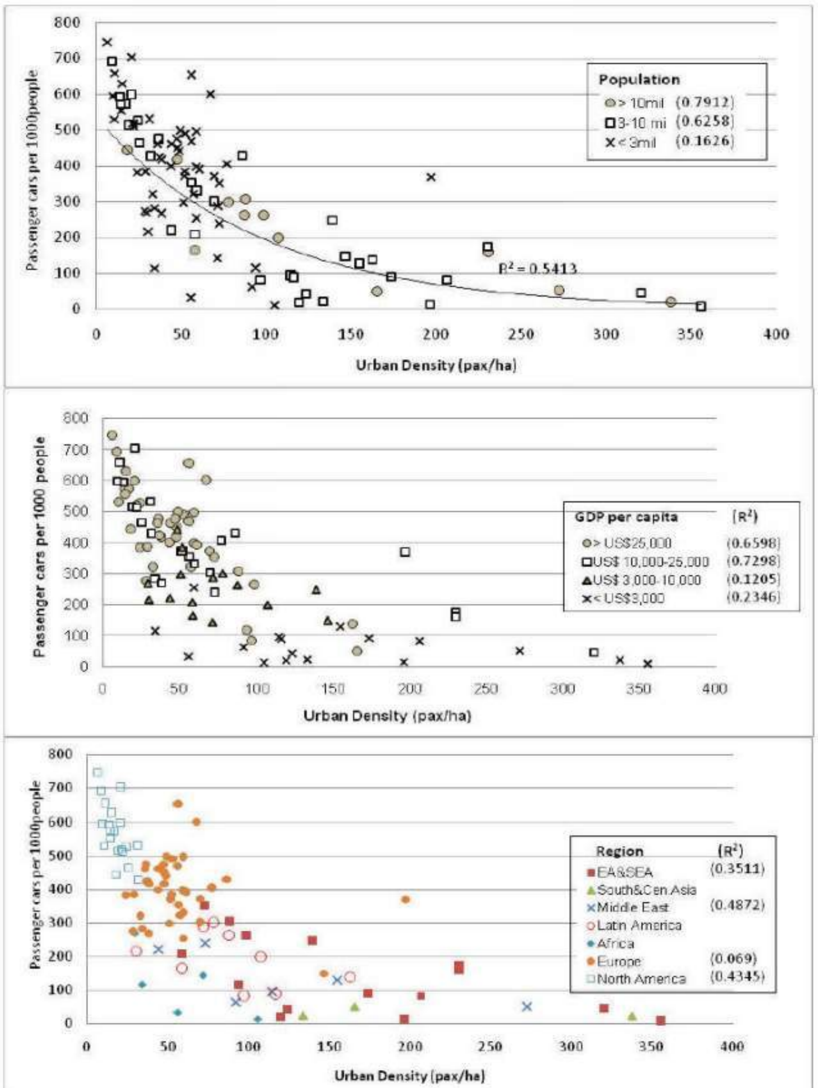
However, there is debate concerning why and how much (TRB 2009; Handy and Boarnet 2010). Analysis by Kockelman (1995), and Ewing and Cervero (2010) indicate that these travel changes result primarily from other factors associated with density, such as regional accessibility, land use mix and walkability, and from the self-selection of people who choose locations with these attributes.

These various factors, in turn, tend to reduce vehicle ownership, which in turn reduces vehicle travel. Described differently, in automobile-dependent areas, where private automobile travel is necessary for a significant portion of trips, households will tend to purchase one vehicle per driver, and because automobiles have high fixed costs and low variable costs, once a driver owns a vehicle they will use it for a major portion of trips, including many marginal value automobile travel (vehicle-kilometers that provide small net user benefits). In order to reduce vehicle ownership (and therefore leverage reductions in these marginal-value vehicle-kilometers) by higher-income households a neighborhood must include the combination mobility services that provide a high level of accessibility without requiring private automobile travel. This includes:

- Commonly-used services (shops, schools, parks, healthcare, etc.) located within convenient walking distances.
- Good walking and cycling conditions, and good public transit and taxi services (including safety and comfort). These need to be integrated, so for example, it is easy to walk and bike to transit stops and stations, which have secure bicycle parking.
- Convenient vehicle rental services (including carsharing).
- Social acceptability of non-automobile modes. As more community residents rely on walking, cycling and public transit the social acceptability of these modes increases.

Figure 4 illustrates the relationships between density and vehicle ownership from a study of approximately 400 large cities around the world. This study found much weaker relationships between density and transit mode share and between incomes and transit mode share, which probably reflect the large variations in transit service quality: if transit service quality is very poor, even residents of dense, congested, low-income cities will continue to rely on automobile travel, while residents of affluent, moderate density cities will commute by public transit if they have high quality service.

Figure 4 **Density Versus Private Vehicle Ownership** (JICA 2011)



These three figures illustrate the relationships between population density and vehicle ownership, taking into account city size, per capita gross domestic product (GDP), and world region. The high R^2 values indicate strong relationships. This indicates that even in affluent cities, increased density reduces per capita vehicle ownership, which in turn leverages reductions in per capita vehicle travel.

Table 7 summarizes the key findings of these studies. Overall this research indicates that increased density is associated with significantly reduced vehicle ownership and mileage, and increased use of alternative modes, but these impacts partly reflect various factors associated with density including regional accessibility, land use mix, centricity, roadway connectivity, transport system diversity, and parking supply. Most density analysis considers these factors in aggregate, which is sometimes called *compactness*. Disaggregated analysis is sometimes useful to isolate the effects of density itself. This research indicates that vehicle travel reductions do not require high urban densities, relatively modest increases, from low (under 10 residents per hectare or 4 residents per acre) to moderate (over 25 residents per hectare or 10 residents per acre) can significantly reduce vehicle travel if implemented with complementary smart growth policies that increase accessibility and transport system diversity. Such policies can be implemented in various geographic scales; they can be tailored to urban, suburban and rural conditions.

Table 7 **Density Impacts on Travel** (Kuzmyak & Pratt 2003; Boarnet and Handy 2010)

Study (Date)	Analysis Method	Key Findings
Prevedouros & Schofer (1991)	Analyzed weekday travel patterns in 4 Chicago area suburbs – 2 inner ring versus 2 outer ring	Outer suburb residents make more local trips, longer trips, use transit less, and spend 25% more time in traffic despite higher speeds
Schimek (1996)	Models using 1990 NPTS data quantify role of density, location and demographic factors on vehicle ownership, trips, and VMT	Estimated household vehicle trip/ density elasticity of -0.085 Household VMT/density elasticity of -0.069
Sun, Wilmot & Kasturi (1998)	Analyzed Portland, OR, travel data using means tests and regression	Population and employment density strongly correlated with vehicle ownership and VMT, but not trips
Ewing, Haliyur & Page (1994)	Analyzed effects of land use and location on household travel in 6 Palm Beach County, FL, communities	Households in least dense and accessible areas generated 63% more daily vehicle hours of travel per capita than in densest areas
Kockelman (1996)	Modeled density, accessibility, and land use balance using 1990 San Francisco Area travel survey and hectare-level land use	Estimated vehicle ownership/density elasticity of -0.068, but no significant direct effect of density on VMT
Bento, et al. (2005)	Analysis of city shape, jobs-housing balance, road density and rail supply and 1990 NHTS travel activity data for 114 U.S. Metropolitan Statistical Areas	Elasticity of VMT with respect to (wrt) individual land use factors, including density is -0.07, but a combination of land use factors can provide a total elasticity of -0.25
Brownstone and Golob (2009)	California land use statistics and subsample of the 2001 U.S. NHTS	Elasticity of VMT wrt individual land use factors, including density is 0.04 to -0.12
Fang (2008)	California land use statistics and subsample of the 2001 NHTS	Elasticity of VMT with respect to density -0.08 to -0.09
2010 Ewing and Cervero	Meta-analysis of various studies	Elasticity of VMT with respect to density -0.04 to -0.1
Heres-Del-Valle and Niemeier (2011)	Multivariate two-part model of vehicle travel which corrects for residential location self-selection bias. California data	Elasticity of VMT with respect to density -0.19

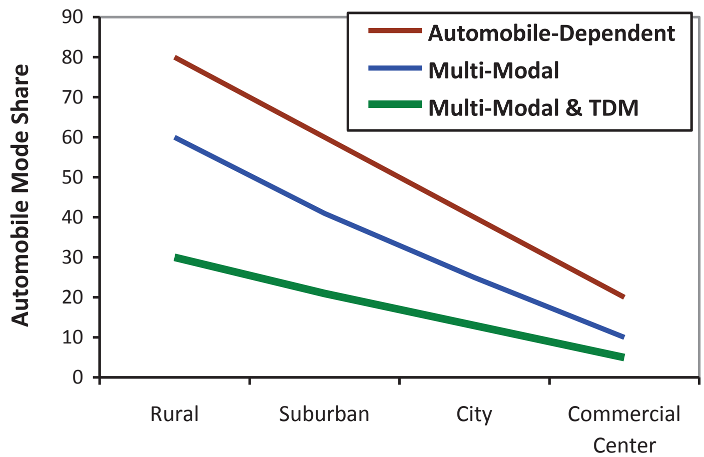
This table summarizes research on the relationships between land use density and travel behavior.

Centricity

Centricity (also called *centeredness*) refers to the portion of employment, commercial, entertainment, and other major activities concentrated in multi-modal centers, such as central business districts (CBDs), downtowns and large industrial parks. Such centers reduce the amount of travel required between destinations and are more amenable to alternative modes. People who live or work in major activity centers tend to rely more on alternative modes and drive less than in dispersed locations, as illustrated in Figure 6.

Comprehensive modeling by Kuzmyak, et al. (2012) indicates that employment density, job/population balance, street network grain and connectivity, transit service quality, and regional accessibility all have a significant effect on vehicle trip and vehicle travel. Franks and Pivo (1995) found that automobile commuting declines significantly when workplace densities reach 50-75 employees per gross acre. Barnes and Davis (2001) also found that employment center density encourages transit and ridesharing. Centeredness affects overall regional travel, not just the trips made to the center (Ewing, Pendall and Chen 2002). For example, Los Angeles is a dense city but lacks strong centers and so is relatively automobile dependent, with higher rates of vehicle ownership and use than cities with similar density but stronger centers (Eidlin 2010).

Figure 6 **Economically Automobile Optimal Mode Shares**



Automobile mode shares vary depending on location and transport options. Automobile mode shares decline as communities become more multi-modal and compact.

Analysis by Holian and Kahn (2012) found that all else being equal, residents of urban regions with more vibrant downtowns (indicated by its share of residents who are college graduates, center city crime rate, number of cultural and consumer-oriented establishments downtown, and the share of the metropolitan area’s jobs and population growth downtown), drive less, rely more on walking and public transport, consume less fuel and produce less vehicle emissions than in urban regions with less vibrant downtowns. Census data indicate that metropolitan areas with more vibrant downtowns experienced less sprawl between 2000 and 2010. This suggests that vibrancy influences land-use patterns, and land-use patterns in turn influence driving and public transit use.

Land Use Mix

Land use mix refers to locating different types of land uses (residential, commercial, institutional, recreational, etc.) close together. This can occur at various scales, including mixing within buildings (such as ground-floor retail, with offices and residential above), along streets, and within neighborhoods. It can also include mixing housing types and price ranges that accommodate different demographic and income classes. Such mixing is normal in cities and is a key feature of New Urbanism. Land use mix can be measured using *entropy indices* (the variety of different uses in a neighborhood) or *dissimilarity indices* (the number of adjacent parcels with different uses). Both methods result in scores from 0 (least mixed) to 1.0 (most mixed).

Another way to measure mix is using the *jobs/housing balance* ratio. A jobs/housing balance of about 1.0 tends to minimize average commute distance and per capita vehicle travel (Weitz 2003; Kuzmyak and Pratt 2003). Boarnet, Hsu and Handy (2011) conclude that the elasticity of vehicle travel (both commute travel and total per capita VMT) with respect to jobs/housing balance is 0.29 to 0.35, so a 10% increase reduces VMT 2.9 to 3.5%. Crane and Chatman (2003) find that a 5% increase in fringe county employment reduces average commute distance 1.5% but increases non-work vehicle mileage.

Increased mix reduces travel distances and allows more walking and cycling trips. It can reduce commute distances, particularly if affordable housing is located in job-rich areas, and mixed-use area residents are more likely to commute by alternative modes (Modarres 1993; Kuzmyak and Pratt 2003; Ewing, et al. 2010). Analyzed the trip generation rates in a mixed-use development, Sperry, Burris and Dumbaugh (2012) found that total trips increased, indicating induced travel, but many of these were walking trips, so total vehicle travel declined. Certain land use combinations create *complete communities* (also called *urban villages*); compact walkable neighborhood centers containing commonly used services and activities, such as stores, schools and parks. Wang, Khattak and Zhang (2013) found that vehicle travel and tailpipe emissions are about 9% lower for households that reside in mixed land use neighborhoods with good network connections.

Based on a detailed review of research, Spears, Boarnet and Handy (2010) conclude that the elasticity of vehicle travel with respect to land use mix is -0.02 to -0.11 (a 10% increase in an entropy or dissimilarity index reduces average VMT 0.2% to 01.1%). Ewing and Cervero (2010) found that land use mix reduces vehicle travel and significantly increases walking. Frank, et al. (2011) found that per capita vehicle travel and pollution emissions tend to decline with increased land use mix: shifting from the 25th percentile to the 75th percentile level of mix reduces total VMT 2.7%. Krizek (2003a) found that households located in highly accessible neighborhoods travel a median distance of 3.2 km (2.0 mi) one-way for errands versus 8.1 km (5.0 mi) for households in less accessible locations.

Table 8 summarizes the results of one study concerning how various land use features affected drive-alone commute rates. Important amenities include bank machines, cafes, on-site childcare, fitness facilities, and postal services. One study found that the presence of worksite amenities such as banking services (ATM, direct deposit), on-site childcare, a cafeteria, a gym, and postal services could reduce average weekday car travel by 14%, due to a combination of reduced errand trips and increased ridesharing (Davidson 1994).

Table 8 **Worksite Drive Alone Share** (Cambridge Systematics 1994, Table 3.12)

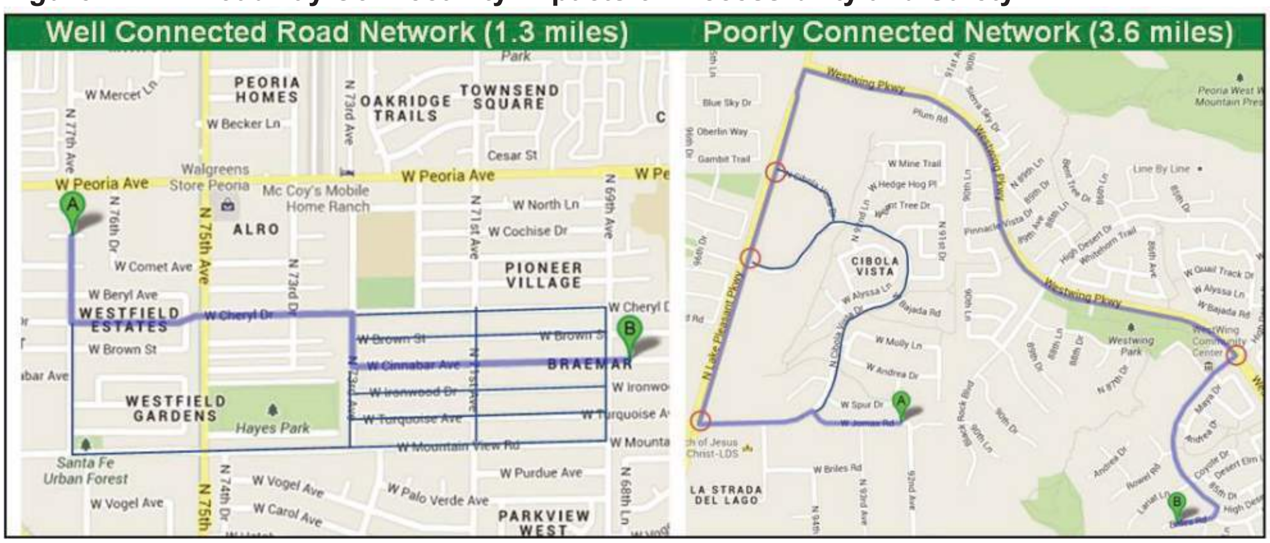
Land Use Characteristics	Without	With	Difference
Mix of Land Uses	71.7	70.8	*-0.9*
Accessibility to Services	72.1	70.5	*-1.6*
Preponderance of Convenient Services	72.4	69.6	*-2.8*
Perception of Safety	73.2	70.6	*-2.6*
Aesthetic Urban Setting	72.3	66.6	*-5.7*

This table summarizes how various land use factors affect automobile commuting rates.

Connectivity

Connectivity refers to the degree to which a road or path system is connected, and therefore the directness of travel between destinations ("Connectivity," VTPI 2008). A poorly connected road network with many dead-end streets that connect to a few major arterials provides less accessibility than a well-connected network, as illustrated in Figure 7. Increased connectivity reduces vehicle travel by reducing travel distances between destinations and by improving walking and cycling access, particularly where paths provide shortcuts so walking and cycling are more direct than driving.

Figure 7 **Roadway Connectivity Impacts on Accessibility and Safety**



Although points ***A*** *and* ***B*** *are approximately the same distance apart in both maps, the functional travel distance is nearly three times farther with the poorly-connected road network which forces most trips onto major arterials. This tends to increase total vehicle travel, traffic congestion and accident risk, particularly where vehicles turn on and off major arterials (red circles), and reduces the feasibility of walking and cycling to local destinations.*

Connectivity can be measured using various indices, including road or intersection density, portion of four-way intersections, and portion of dead-end streets (Handy, Paterson and Butler 2004; Dill 2005). It can be measured separately for different modes.

Ewing and Cervero (2010) find that intersection density and street connectivity has the second greatest impact on travel activity of all land use factors analyzed. They conclude that the elasticity of vehicle travel with respect to connectivity is -0.12, so increasing intersection or street density 10% reduces vehicle travel 1.2%. Based on detailed reviews of available research Handy, Tal and Boarnet (2010b) conclude that increased street intersection density reduces VMT, and increases walking and public transit travel. They find elasticity values from reliable studies ranging from -0.06 up to -0.59.

The Atlanta, Georgia SMARTRAQ Project found that doubling current regional average intersection density, from 8.3 to 16.6 intersections per square kilometer, would reduce average per capita weekday vehicle travel about 1.6%, from 32.6 to 32.1 daily miles, all else held constant. The LUTAQH (Land Use, Transportation, Air Quality and Health) research project sponsored by the Puget Sound Regional Council also found that per household VMT declines with increased street connectivity. It concluded that a 10% increase in intersection density reduces VMT by about 0.5%.

Emrath and Siniavskaia (2009) found that, accounting for other demographic and geographic factors, non-motorized commute mode share increases as block size declines, with approximately 10% of commuters using these modes in areas with the smallest block size (under five acres per block) about four times higher than the overall average. They find that commute time has a U-shape response to block size, meaning that average commute time first declines and then rises as block size increases. Tracts where workers average the quickest commutes, less than 25 minutes, have six to 20 acre block size.

Wang, Khattak and Zhang (2013) found that vehicle travel and tailpipe emissions are about 9% lower for households that reside in mixed land use neighborhoods with good network connections. Analysis by Larco (2010) indicates that increasing connectivity in suburban multi-family developments can significantly increase use of alternative modes. Residents of more-connected developments were more than twice as likely to walk or bike to local amenities (with 87% and 70% reporting that they did so) than in less connected locations. Respondents from the less-connected developments reported the ease and safety of nonmotorized travel as the largest barrier to walking and biking.

Frank and Hawkins (2007) estimate that in a typical urban neighborhood, a change from a pure small-block grid to a modified grid (a *Fused Grid*, in which pedestrian and cycling travel is allowed, but automobile traffic is blocked at a significant portion of intersections) that increases the relative connectivity for pedestrians by 10% would typically increase home-based walking trips by 11.3%, increase the odds a person will meet the recommended level of physical activity through walking in their local travel by 26%, and decrease vehicles miles of local travel by 23%. On the other hand, roadway supply is positively correlated with vehicle mileage, as indicated in Figure 8. This may partly reflect other factors that also affect road supply, such as population density.

Roadway Design

Roadway design refers to factors such as block size, road cross-section (lane number, widths and management, on-street parking, medians, and sidewalks), design speeds and speed control, sidewalk condition, street furniture (utility poles, benches, garbage cans, etc.), landscaping, and the number and size of driveways. Roadway designs that reduce motor vehicle traffic speeds, improve connectivity, and improve walking and cycling conditions tend to reduce automobile traffic and encourage use of alternative modes, depending on specific conditions.

Detailed analysis by Marshall and Garrick (2012) of travel patterns in 24 mid-size California cities found that roadway design factors significantly affect resident's vehicle travel. The found that per capita vehicle travel tends to:

- Decline with increased total street network density (intersections per square-kilometer).
- Decline with a grid street system (which provides many routes between destinations) compared with a hierarchical systems (which requires traveling on major arterials for a greater portion of trips).
- Decline with on-street parking, bike lanes, and curbs/sidewalks.
- Decline land use density and mix, and proximity to the city center.
- Decline with increased walking, bicycling and transit commute mode share.
- Increase with street connectivity (street link-to-node-ratio, which declines with more dead-end streets).
- Increase with increased major street network density (arterial intersections per square-kilometer).
- Increase with the number of lanes and outside shoulder widths on major roadways.
- Increase with curvilinear streets.

For example, their model indicates that, holding other factors constant, increasing intersection density from 31.3 to 125 intersections per square kilometer is associated with a 41% decrease in vehicle travel, from 44.7 to 26.5 daily vehicle-kilometers.

Traffic Calming tends to reduce total vehicle mileage in an area by reducing travel speeds and improving conditions for walking, cycling and transit use (Crane 1999; Morrison Thomson and Petticrew 2004). Traffic studies find that for every 1 meter increase in street width, the 85th percentile vehicle traffic speed increases 1.6 kph, and the number of vehicles traveling 8 to 16 kph [5 or 10 mph] or more above the speed limit increases geometrically ("Appendix," DKS Associates 2002). Various studies indicate an elasticity of vehicle travel with respect to travel time of –0.5 in the short run and –1.0 over the long run, meaning that a 20% reduction in average traffic speeds will reduce total vehicle travel by 10% during the first few years, and up to 20% over a longer time period.

Active Transport (Walking and Cycling) Conditions

The quality of active transport (walking and cycling, also called *nonmotorized* transport) conditions affect can affect travel activity in several ways. Improved walking and cycling conditions tend to increase nonmotorized travel, increase transit travel, and reduce automobile travel ("Nonmotorized Transport Planning," VTPI 2008; Mackett and Brown 2011; Buehler and Pucher 2012).

Non-motorized travel activity tends to be more common, and therefore more important, than travel statistics generally indicate because conventional travel surveys undercount shorter trips (those occurring within a *traffic analysis zone*), off-peak trips, non-work trips, travel by children, and recreational travel (ABW 2010). Many surveys ignore non-motorized links of motor vehicle trips. For example, a *bike-transit-walk* trip is usually classified simply as a transit trip, and a motorist who parks several blocks from their destination and walks for local errands is classified simply as automobile user. More comprehensive surveys indicate that non-motorized travel is three to six times more common than conventional surveys indicate (Rietveld 2000). As a result, if official data indicates that only 5% of trips are non-motorized, the actual amount is probably 10-30%.

Walking and biking conditions are affected by (TRB 2008):

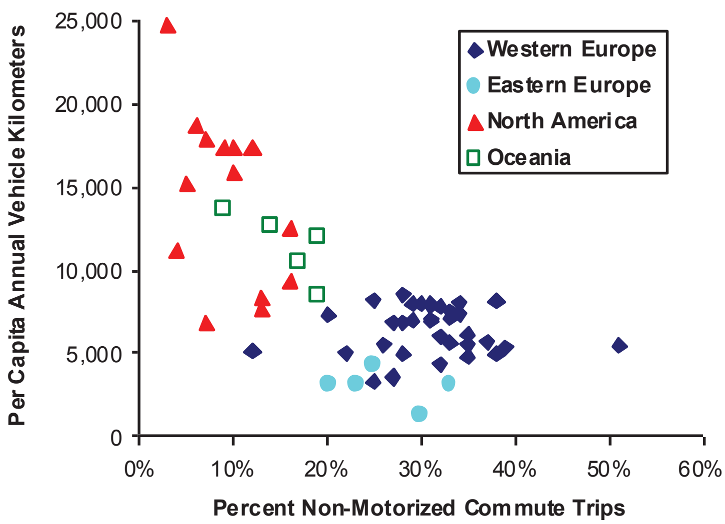
- The quality of sidewalks, crosswalks, paths, bike parking, and changing facilities.
- Ease of road crossing (road width, traffic speeds and volumes, presence and quality of crosswalks) and protection (separation between traffic and non-motorized travelers).
- Network connectivity (how well sidewalks and paths are connected and the overall extent of the pedestrian and cycling network).
- Security (how safe people feel while walking).
- Environmental quality (exposure to noise, air pollution, dust, sun and rain).
- Topography (inclines).
- Land use accessibility (distances to common destinations such as shops and schools).
- Attractiveness (quality of urban design).

Sidewalks and path improvements tends to increase non-motorized travel, with impacts that vary depending on conditions (ABW 2010; Barnes and Krizek 2005; Handy and Mokhtarian 2005; Handy, Tal and Boarnet 2010a; Sciara, Handy and Boarnet 2011). Each additional bikeway-mile per 100,000 residents increases bicycle commuting 0.075%, all else being equal (Dill and Carr 2003). Morris (2004) found that residents living within a half-mile of a cycling trail are three times as likely to bicycle commute as the country average. Ryan and Frank (2009) found that improved walkability around bus stops increases transit travel. Guo and Gandavarapu (2010) found that completing the sidewalk network in a typical U.S. town would increase average per capita non-motorized travel 16% (from 0.6 to 0.7 miles per day) and reduce automobile travel 5% (from 22.0 to 20.9 vehicle-miles). Cervero and Radisch (1995) found that pedestrian-friendly area residents walk, bicycle or ride transit for 49% of work trips and 15% of non-work trips, 18- and 11-percentage points more than in a comparable automobile-oriented community. Walking is three times more common in communities with pedestrian friendly streets than in otherwise comparable communities (Moudon, et al. 1996).

Research by Bassett, et al. (2011) using comparable travel surveys in Germany and the U.S. in 2001 and 2008 indicates that transport and land use policies can significantly affect walking and cycling activity. Between 2001 and 2008, the proportion of "any walking" was stable in the U.S. (18.5%) but increased in Germany from 36.5% to 42.3%. The proportion of "any cycling" in the U.S. remained at 1.8% but increased in Germany from 12.1% to 14.1%. In 2008, the proportion of "30 minutes of walking and cycling" in Germany was 21.2% and 7.8%, respectively, compared to 7.7% and 1.0% in the U.S. Virtually all demographic groups in Germany walk and cycle much more than their counterparts in the U.S.

However, not every public trail significantly increases non-motorized travel. Burbidge and Goulias (2009) surveyed residents of West Valley City, a suburb of Salt Lake City, Utah, before and after the construction of a neighborhood trail. They found that most trail users come from outside the areas, neighborhood residents seldom use the facility, new residents did not move to the neighborhood because of the trail. Similarly, not all additional nonmotorized travel substitutes for driving: a portion may consist of recreational travel (i.e., "strolling") or substitutes for public transit travel. Handy (1996b) and Handy and Clifton (2001) found that a more pedestrian-friendly residential and commercial environment in Austin, Texas neighborhoods increases walking and reduces automobile travel for errands such as local shopping. About two-thirds of walking trips to stores replaced automobile trips. A short walking or cycling trip often substitutes for a longer motorized trip. For example, people often choose between walking to a neighborhood store or driving across town to a larger supermarket, since once they decide to drive the additional distance is accessible.

Figure 8 **Non-motorized Vs. Motorized Transport** (Kenworthy and Laube 2000)



International data show that vehicle travel tends to decline as non-motorized travel increases.

Non-motorized transport improvements can leverage additional vehicle travel reductions by helping create more compact, multi-modal communities where residents own fewer vehicles and travel shorter distances (see discussion on the following page). For example, Guo and Gandavarapu (2010) found that sidewalk improvements in a typical town would increase average daily per capita non-motorized travel by 0.097 miles and reduce automobile travel by 1.142 vehicle-miles, about 12 miles of reduced driving for each mile of increased non-motorized travel. Similarly, international data indicates that percentage-point increase in non-motorized transport is associated with a reduction of 700 annual vehicle-miles, about seven vehicle-miles reduced for each additional active transport mile, as indicated in Figure 8.

The *Walkability Tools Research Website* (www.levelofservice.com) provides information on methods for evaluating walking conditions. The *Pedestrian and Bicycle Information Center* (www.bicyclinginfo.org) produced a community bikeability checklist (www.walkinginfo.org/library/details.cfm?id=12). It includes ratings for road and off-road facilities, driver behavior, cyclist behavior, barriers, and identifies ways to improve bicycling conditions. *WalkScore* (www.WalkScore.com) automatically calculates a neighborhood's walkability rating by identifying the distance to public services such as grocery stores and schools. Frank, et al. (2011) developed a model which can predict how sidewalk network expansion affects a community's vehicle travel and carbon emissions. Their analysis indicates that increasing sidewalk coverage from a ratio of 0.57 (sidewalks on both sides of 30% of all streets) to 1.4 (sidewalks on both sides of 70% of streets) could reduce vehicle travel 3.4% and carbon emissions 4.9%.

Non-motorized Indirect Travel Impacts

The previous analysis suggests that each mile of increased non-motorized travel resulting from walking and cycling improvements typically reduces five to fifteen motor vehicle-miles through leverage effects. Conventional planning analysis generally ignores these indirect impacts and so underestimates the potential of non-motorized transport improvements to achieve benefits such as reduced traffic congestion, accidents and pollution emissions. Considering these indirect impacts tends to increase estimated benefits by an order of magnitude, justifying much greater support for non-motorized transport. It is therefore important to understand these impacts.

Direct travel impacts consist of a mile of vehicle travel that shifts to a mile of walking or cycling. Indirect impacts result from the following factors:

- *Vehicle Ownership*. Motor vehicles are costly to own but relatively cheap to use, so once a household purchases an automobile they tend to use it, including discretionary travel that could easily be avoided. Households tend to own one vehicle per driver if located in an automobile-dependent community but fewer, and so drive significantly less, in a multi-modal community.
- *Travel Conditions.* Walking and cycling improvements often include roadway system changes, such as traffic calming and increased network connectivity, that reduce vehicle traffic speeds and so tend to reduce vehicle travel.
- *Public Transit Improvements.* Since most public transit trips include non-motorized links, to reach bus stops and for circulation at destinations, active transport improvements support use of this mode.
- *Land Use Patterns*. Walking and cycling improvements support more compact and mixed land use by reducing the amount of land required for roads and parking facilities and encouraging pedestrian-scale development. It may be difficult to determine cause and effect: increased walking and cycling both allow and require this type of land use.
- *Social Norms.* In automobile-dependent communities, use of alternative modes tends to be stigmatized. Walking and cycling improvements, and the increase in their use, can help change social attitudes allowing more shifts from driving to walking, cycling and public transit.

A portion of these impacts reflect self-selection, that is, more walkable areas attract people who, from necessity or preference, minimize vehicle travel. For example, if somebody cannot drive due to disability or low income they will often choose a more walkable home location if possible. Such neighborhoods will have lower average vehicle travel, providing local traffic reduction benefits, but do not necessarily reflect an overall reduction in regional vehicle travel. However, if there is latent demand for multi-modal neighborhoods, that is, some households want to live in less automobile dependent locations but there is insufficient supply, creating more walkable and bikeable communities will allow more households to reduce their vehicle travel, reducing regional vehicle travel. Several consumer preference surveys do indicate significant and growing latent demand for more multi-modal home locations, indicating that walking and cycling improvements can provide overall traffic reduction benefits.

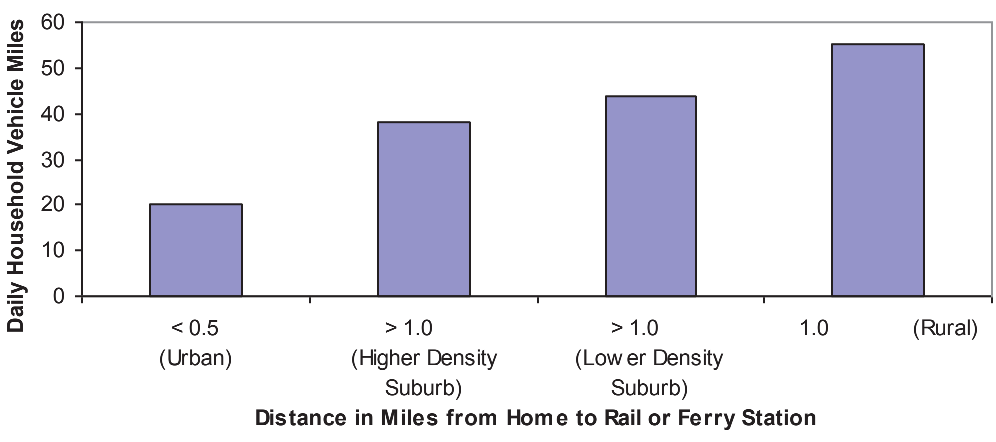
Not every non-motorized improvement has all these effects. By itself, a single policy or project usually has minimal impacts. However, if there is latent demand for walking and cycling, and improvements to non-motorized modes are integrated with other transport system and land use changes, vehicle travel reduction leverage effects can be large.

Transit Accessibility

Transit accessibility refers to the quality of transit serving a location and the ease of accessing that service by walking, cycling and automobile. *Transit-Oriented Development* (TOD) refers to residential and commercial areas designed to maximize transit access. Several studies indicate that people who live and work in TODs tend to own fewer vehicles, drive less and rely more on alternative modes than they would in more automobile dependent locations (Cervero, et al. 2004; Evans and Pratt 2007; CNT 2010; Gard 2007; Portland 2009; Pushkarev and Zupan 1977; Suzuki, Cervero and Iuchi 2013; Tal, Handy and Boarnet 2010; TransForm 2014). The *National TOD Database* (www.toddata.cnt.org) provides detailed demographic, geographic and economic data for 3,776 U.S. urban rail transit stations and 833 proposed stations in 47 metropolitan areas which can be used to evaluate the impacts of transit service quality and station area conditions on travel activity.

Ewing and Cervero (2010) found that increased proximity to transit stop, intersection density and land use mix increase transit travel. Cervero, et al. (2004) found that increased residential and commercial density, and improved walkability around a station increase transit ridership: for example, increasing station area residential density from 10 to 20 units per gross acre increases transit commute mode share from 20.4% to 24.1%, and up to 27.6% if implemented with pedestrian improvements. Lund, Cervero and Willson (2004) found that California transit station area residents are about five times more likely to commute by transit as the average worker in the same city. Gard (2007) proposes a methodology for adjusting predicted trip generation rates in TODs. He found that TOD typically increases per capita transit ridership 2-5 times and reduces vehicle trip generation 8% to 32% compared with conventional land use development.

Figure 9 **Transit Accessibility Impacts on Vehicle Travel** (MTC 2006)

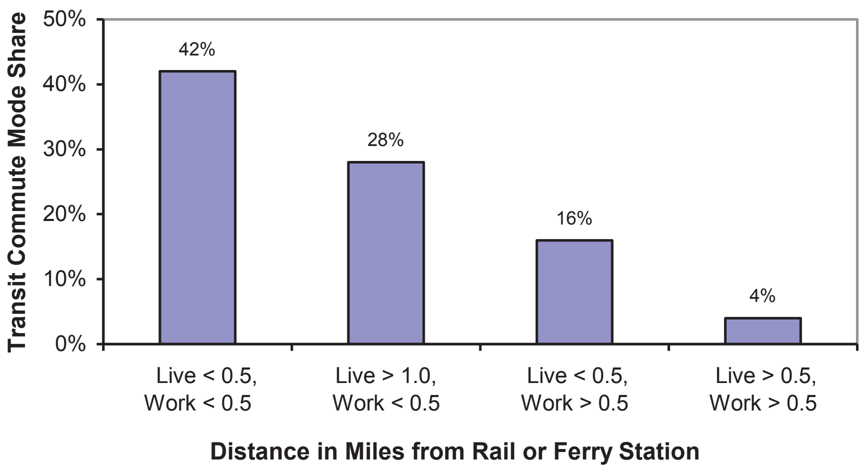


People who live closer to rail or ferry stations tend to drive fewer daily miles.

The report, *Why Creating And Preserving Affordable Homes Near Transit Is A Highly Effective Climate Protection Strategy* (TransForm 2014) used detailed data from the California Household Travel Survey to measure how demographic, geographic and economic factors affect household travel activity and fuel consumption. The results indicate that all types of households, and particularly lower-income households, tend to own fewer vehicles, drive less and consume less fuel if they live in transit-oriented neighborhoods. All else being equal, lower-income households drive 25-30% fewer miles when living within 1/2 mile of transit than those living in non-TOD, and 50% fewer miles when living within 1/4 mile of frequent transit service. The analysis also indicates that extremely-low-income households living within 1/4 mile of frequent transit own half as many vehicles and drive half as many annual miles as higher income households located the same distance from frequent transit service.

Automobile travel declines and public transit travel increases as households locate closer to San Francisco region rail and ferry terminals drive, as indicated in Figures 9 and 10. Arrington, et al. (2008), found that Transit-Oriented Developments generate much less (about half) the automobile trips as conventional, automobile-oriented development.

Figure 11 **Transit Accessibility Impacts on Transit Mode Share** (MTC 2006)



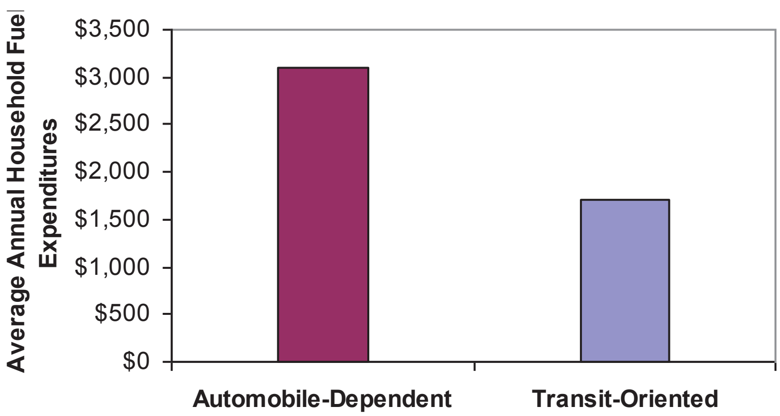
People who live or work closer to rail or ferry stations tend to commute more by public transit.

Various factors influence transit ridership rates. TOD residents are more likely to use transit if it is relatively time-competitive with driving, if there is good pedestrian connectivity, if commuters have flexible work hours, and if they have limited vehicle availability. TOD residents are less likely to use transit for trips involving multiple stops (chained trips), if highway accessibility is good, if parking is unpriced. Physical design factors such as neighborhood design and streetscape improvements show some influence in predicting project-level differences, but have relatively minor influences on transit choice among individual station area residents.

Detailed analysis of Washington DC and Baltimore TODs by Jeihani, et al. (2013) indicates that all else being equal (accounting for demographic and geographic factors), TOD residents drive about 20% fewer annual miles than non-TOD residents, and rely significantly more on walking, cycling and public transport for both commute and non-commute trips. Bento, et al (2003) found a 10% reduction in average distance between homes and rail transit stations reduces VMT about 1%, and “rail supply has the largest effect on driving of all our sprawl and transit variables.” They concluded that a 10% increase in rail supply reduces driving 4.2%, and a 10% increase in a city’s rail transit service reduces 40 annual vehicle-miles per capita (70 VMT including New York City), compared with just a one mile reduction from a 10% increase in bus service. They found a 3.0 elasticity of rail transit ridership with regard to transit service supply (7.0 including New York) indicating economies of scale in transit network scale.

Renne (2005) found that although transit commuting in major U.S. metropolitan regions declined during the last three decades (from 19.0% in 1970 to 7.1% in 2000), in the 103 TODs within those regions it increased from 15.1% in 1970 to 16.7% in 2000. TODs in Portland, OR and Washington D.C., which aggressively promoted transit, experienced even greater ridership growth (58% for both). Households in TODs also owned fewer vehicles; only 35.3% of TOD households own two or more vehicles compared with 55.3% in metropolitan regions overall, although TOD residents have higher average incomes. Transit-oriented development tends to "leverage" larger reductions in vehicle travel than what is directly shifted from automobile to transit (Litman, 2005b).

Figure 11 **Average Household Fuel Expenditures** (Bailey 2007)

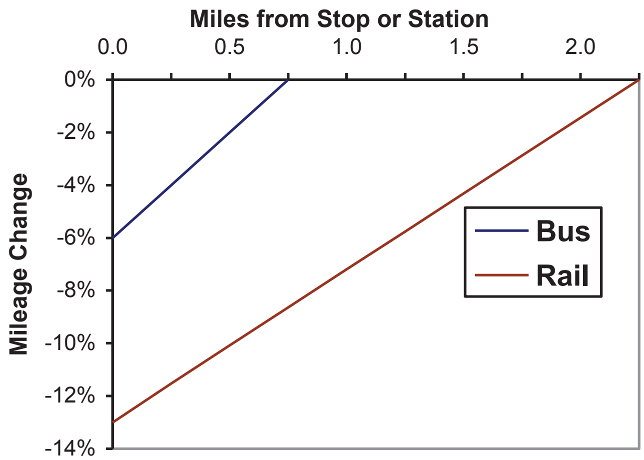


Households in transit-oriented neighborhoods tend to own fewer cars and drive less than otherwise comparable households in more automobile-oriented locations. This provides substantial energy and financial savings.

Reconnecting America (2004) studied demographic and transport patterns in *transit zones*, defined as areas within a half-mile of existing transit stations in U.S. cities. It found that households in transit zones own an average of 0.9 cars, compared to an average of 1.6 cars in the metro regions as a whole, and that automobile travel is also much lower in transit zones. Only 54% of residents living in transit zones commute by car, compared to 83% in the regions as a whole. Transit service quality seems to be a significant determinant of transit use, with more transit ridership in cities with larger rail transit systems. Similarly, Litman (2004) found that residents of cities with large, well-established rail transit systems drive 12% fewer annual miles than residents of cities with small rail transit systems, and 20% less than residents of cities that lack rail systems.

Goldstein (2007) found that household located within walking distance of a metro (rail transit) station drive 30% less on average than if they located in less transit-accessible locations. Bailey (2007) found that households located within ¾-mile of high-quality public transit service average of 11.3 fewer daily vehicle-miles, regardless of land use density and vehicle ownership rates. A typical household reduces annual mileage 45% by shifting from an automobile-dependent location with poor travel options that requires ownership of two cars, to a transit-oriented neighborhood, which offers quality transit service and requires of just one car (Figure 11). This saves 512 gallons of fuel annually, worth about $1,920 at $3.75 per gallon. Base on a detailed review of research Tal, Handy and Boarnet (2010) conclude that residents' average per capita vehicle travel declines 6% per mile closer to a rail station starting at 2.25 miles from the station, and 2% per 0.25 miles closer to a bus stop starting at 0.75 miles from the stop.

Figure 12 **Transit Proximity Vehicle Travel Impacts** (Tal, Handy and Boarnet 2010)



Average household vehicle travel declines with proximity to transit stops and stations.

Beaton (2006) found that in the Boston region, rail transit zones (areas within a 10-minute drive of commuter rail stations) had higher land use density, lower commercial property vacancy rates, and higher transit ridership than other areas. Although regional transit ridership declined during the 1970s and 80s (it rebounded after 1990), it declined significantly less in rail zones. In 2000, transit mode split averaged 11-21% for rail zone residents, compared with 8% for the region overall. Areas where commuter rail stations closed during the 1970s retained relatively high transit ridership rates, indicating that the compact, mixed land use patterns that developed near these stations has a lasting legacy. Land use density did not increase near stations built between 1970 and 1990, but did increase near stations build after 1990. This can be explained by the fact that the value of smart growth development (using land use policies to create more compact, mixed, multi-modal land use) only became widely recognized in the 1990s, and much of the research and literature on transit oriented development is even more recent (Cervero et al, 2004).

Residents of Orenco Station, a transit-oriented suburban community near Portland, Oregon, use public transit significantly more than residents of comparable communities (Podobnik 2002; Steuteville 2009). Orenco transit commute mode share is 22% compared with 5% average for the region, and 69% report using public transit more frequently than they did in their previous neighborhood.

A survey of 17 transit-oriented developments (TOD) in five U.S. metropolitan areas showed that vehicle trips per dwelling unit were substantially below what the Institute of

Transportation Engineer's *Trip Generation* manual estimates (Cervero and Arrington 2009). Over a typical weekday period, the surveyed TOD housing projects averaged 44% fewer vehicle trips than the manual predicts (3.8 versus 6.7), and were particularly low in more urban locations. Similarly, a parking and traffic generation study of Portland, Oregon transit oriented developments recorded 0.73 vehicles per housing unit, about half the 1.3 value in the ITE *Parking Generation Handbook*, and vehicle trip generation rates about half the values in the *Trip Generation Handbook* (PSU ITE Student Chapter 2007).

Chatman (2013) argues that many of the factors that reduce vehicle travel in transit-oriented areas, such as more compact and mixed development with reduced parking supply, can be implemented without rail.

Evans and Pratt (2007) summarize extensive research on TOD travel impacts:

- In Portland, Oregon the average central area TOD transit share for non-work travel was roughly four times that for outlying TODs, which in turn had over one-and-two-thirds times the corresponding transit share of mostly-suburban, non-TOD land development.
- In the Washington DC area, average transit commute mode share to office buildings declines from 75% in downtown to 10% at outer suburb rail stations. Transit mode share decreases by 7 percentage points for every 1,000 feet of distance from a station in the case of housing and by 12 percentage points in the case of office worker commute trips.
- California office workers who live located within 1/2 mile of rail stations to have transit commute shares averaging 19% compared to 5% regionwide. The statewide average transit commute mode share is 27% for workers living within 1/2 mile of a station compared to 7% for residents between 1/2 mile and 3 miles of the station.
- TOD residents tend to have lower motor vehicle ownership rates.

How Far Will Transit Users Walk? How Large Can A Transit-Oriented Development Be?
Experts generally conclude that typical transit riders will walk up to a quarter-mile to a bus stop and a half-mile to a train station, but acceptable walking distances can vary significantly due to:

- *Demographics.* Whether travelers are transit dependent or discretionary users (transit dependent users tend to be willing to walk farther).
- *Walkability.* The better the walking conditions (good sidewalks, minimum waits at crosswalks, attractive and secure streetscapes) the farther people will walk.
- *Transit service quality.* People tend to walk farther if transit service is frequent, and vehicles and stations are comfortable and attractive.

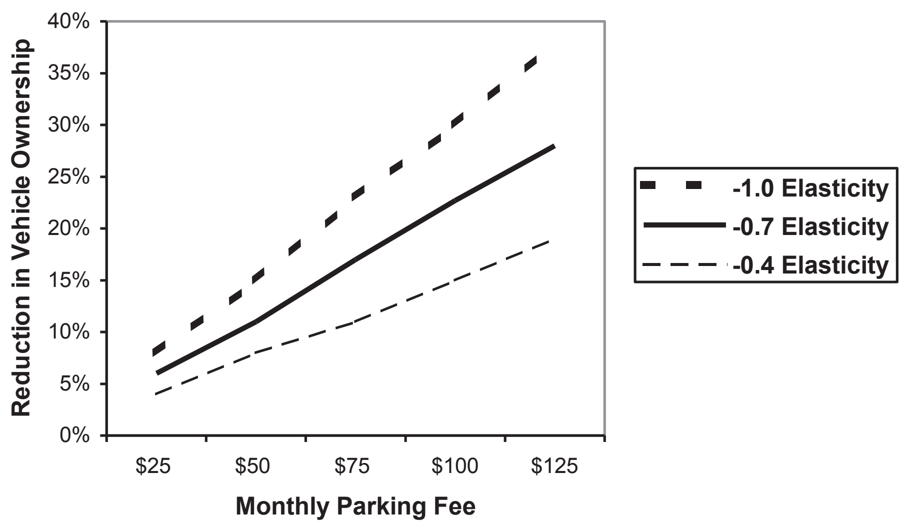
Parking Management

Parking Management refers to the supply, price and regulation of parking facilities. More efficient management can reduce the parking supply needed, allowing increased land use density and mix, wider sidewalks and bikepaths (bikelanes often conflict with on-street parking), and parking pricing, *unbundling* (renting parking spaces separate from building space, so for example, rather than paying $1,000 per month for an apartment with two parking spaces, renters pay $800 for the apartment and $100 for each parking space they choose to rent) and *cash out* (commuters can choose between a free parking space or its cash equivalent if they use an alternative mode) can significantly reduce automobile ownership and use (Morrall and Bolger 1996; Shoup 1997; Mildner, Strathman and Bianco 1997; Litman 2006; Weinberger, et al. 2008).

Figure 13 illustrates the likely reduction in vehicle ownership that typically results if residents pay directly for parking. As households reduce their vehicle ownership they tend to drive fewer annual miles. For example, Weinberger, et al. (2008) found that residents of urban neighborhoods with conventional parking requirements are 28% more likely to commute by automobile than in otherwise comparable neighborhood where parking supply is optional and therefore more constrained.

Figure 13 **Reduction in Vehicle Ownership From Residential Parking Prices**



This figure illustrates typical vehicle ownership reductions due to residential parking pricing, assuming that the fee is unavoidable (free parking is unavailable nearby).

Shifting from free to cost-recovery parking (prices that reflect the cost of providing parking facilities) typically reduces automobile commuting 10-30% (Shoup, 2005; "Parking Pricing," VTPI 2008). Nearly 35% of automobile commuters surveyed would consider shifting to another mode if required to pay daily parking fees of $1-3 in suburban locations and $3-8 in urban locations (Kuppam, Pendyala and Gollakoti 1998). The table below shows the typical reduction in automobile commute trips that result from various parking fees.

Table 9 **Vehicle Trips Reduced by Daily Parking Fees** ("Trip Reduction Tables," VTPI 2008, based on Comsis 1993; 1993 US Dollars)

Worksite Setting	$1	$2	$3	$4
Low density suburb	6.5%	15.1%	25.3%	36.1%
Activity center	12.3%	25.1%	37.0%	46.8%
Regional CBD/Corridor	17.5%	31.8%	42.6%	50.0%

This table indicates the reduction in vehicle trips that result from daily parking fees in various geographic locations. See VTPI (2008) for additional tables and information.

TRACE (1999) provides detailed estimates of parking pricing on various types of travel (car-trips, car-kilometres, transit travel, walking/cycling, commuting, business trips, etc.) under various conditions. The table below summarizes long-term elasticities for automobile-oriented urban regions.

Table 10 **Parking Price Elasticities** (TRACE, 1999, Tables 32 & 33)

Term/Purpose	Car Driver	Car Passenger	Public Transport	Slow Modes
Commuting	-0.08	+0.02	+0.02	+0.02
Business	-0.02	+0.01	+0.01	+0.01
Education	-0.10	+0.00	+0.00	+0.00
Other	-0.30	+0.04	+0.04	+0.05
Total	*-0.16*	*+0.03*	*+0.02*	*+0.03*

Slow Modes = Walking and Cycling

Frank, et al. (2011) used detailed data on various urban form factors to assess their impacts on vehicle travel and carbon emissions. They found that increasing parking fees from $0.28 to $1.19 per hour (50th to 75th percentile) reduces vehicle travel 11.5% and emissions 9.9%. The team developed a spreadsheet tool that can be used to evaluate the impacts of urban form, sidewalk coverage, and transit service quality and other policy and planning changes suitable for neighborhood and regional scenario analysis.

Local Activity Self-Sufficiency – Urban Villages

Local *self-sufficiency* (also called *self-containment*) refers to the portion of services and activities provided within a local area (Cervero 1995). *Urban villages* are areas with high local self-sufficiency, that is, the demands of area residents, employees and visitors can be met within a walkable neighborhood or district. For example, self-sufficiency will tend to increase in a community with many children if an area has suitable schools and parks, and will increase in a community with many seniors if the area has suitable medical services and stores that satisfy those populations. Stores in neighborhood shopping districts and downtowns tend to generate fewer vehicle trips than stores located in automobile-oriented shopping malls. Neighborhood shopping districts and downtowns have more *park once* trips (motorists park in one location and walk to several stores, rather than driving to each individually), which reduces parking demand (Abley 2007).

Site Design and Building Orientation
Some research indicates that people walk more and drive less in areas with traditional pedestrian-oriented commercial districts where building entrances connect directly to the sidewalk than in areas with automobile-oriented commercial strips where buildings are set back and separated by large parking lots, and where sites have poor pedestrian connections (Moudon 1996; Kuzmyak and Pratt 2003). Variations in site design and building orientation can account for changes of 10% or more in VMT per employee or household (PBQD 1994; Kuzmyak and Pratt 2003).

Mobility Management
Mobility management (also called *Transportation Demand Management*) includes various policies and programs that reduce motor vehicle travel and encourage use of alternative modes, as summarized in Table 11.

Table 11 **Mobility Management Strategies** (VTPI 2008)

Improved Transport Options	Incentives to Shift Mode	Land Use Management	Policies and Programs
Flextime	Bicycle and pedestrian encouragement	Car-free districts	Access management
Bicycle improvements	Congestion pricing	Compact land use	Data collection
Bike/transit integration	Distance-based pricing	Location efficient development	Commute trip reduction programs
Carsharing	Commuter financial incentives	New urbanism	Freight transport management
Guaranteed ride home	Fuel tax increases	Smart growth	Marketing programs
Park & ride	High occupant vehicle (HOV) priority	Transit oriented development (TOD)	School and campus trip management
Pedestrian improvements	Parking pricing	Street reclaiming	Special event management
Ridesharing	Road pricing		Tourist transport management
Improved taxi service	Vehicle use restrictions		Transport market reforms
Telework			
Traffic calming			
Transit improvements			

Mobility management includes numerous strategies that affect vehicle travel behavior.

Mobility management affects land use indirectly, by reducing the need to increase road and parking facility capacity, providing incentives to businesses and consumers to favor more accessible, clustered, development with improved transport choices. Conversely, most mobility management strategies become more effective if implemented in compact, mixed, walkable communities. For example, Guo, et al. (2011) found that congestion pricing is more effective in denser, mixed, transit-oriented communities. Similarly, a major road pricing study found that Smart Growth can be considered the land use component of mobility management, and mobility management can be considered the transportation component of Smart Growth.

Community Cohesion

Community cohesion refers to the quantity and quality of positive interactions among people who live and work in a community. This tends to increase perceptions of safety for residents and pedestrians. Some research indicates that walking activity tends to increase in more cohesive communities. For example, McDonald (2007) found higher rates of children walking to school in more cohesive neighborhoods, after controlling for other factors such as income and land use.

Cumulative Impacts

Land use effects on travel behavior tend to be cumulative and synergistic, so an integrated smart growth program can significantly change overall travel activity.

Most development between 1950 and 2000 was *automobile dependent*, designed primarily for automobile access with little consideration for other modes. *Multi-modal development* (also called *transit oriented development* or *TOD*) refers to areas designed for walking, cycling and public transit, as well as automobile access; driving in such areas is unrestricted, but traffic speeds tend to be lower, vehicle parking less convenient, and a few (London and Stockholm) apply road tolls in certain areas. *Carfree* areas have significant restrictions on private automobile ownership and use, ranging from mild (a few streets or times) to comprehensive (larger areas and permanent). The table below compares the travel impacts of these different development patterns. Although residents generate the same number of trips in each area, mode shares vary significantly, since automobile dependency requires driving for almost all travel.

Table 12 **Typical Mode Share By Trip Purpose For Various Transport Systems**

Trip Purpose	Automobile Dependent	Multi-Modal Development	Carfree
Work commuting	🚗 🚗 🚗 🚗 🚗	🚲 🚌 🚌 🚗 🚗	🚶 🚲 🚲 🚌 🚌
School commuting	🚲 🚌 🚗 🚗 🚗	🚶 🚲 🚲 🚌 🚗	🚶 🚶 🚲 🚲 🚌
Work-related business	🚗 🚗	🚌 🚗	🚲 🚗
Personal travel (errands)	🚶 🚗 🚗 🚗 🚗 🚗 🚗	🚶 🚶 🚲 🚲 🚗 🚗 🚗	🚶 🚶 🚲 🚲 🚌 🚌 🚗
Social and recreation	🚶 🚗 🚗 🚗 🚗 🚗	🚶 🚶 🚲 🚌 🚗 🚗	🚶 🚶 🚲 🚲 🚌 🚗
Total car trips	*21*	*9*	*3*
Total transit trips	*1*	*5*	*6*
Total non-motorized trips	*3*	*11*	*16*
Total trips	***25***	***25***	***25***

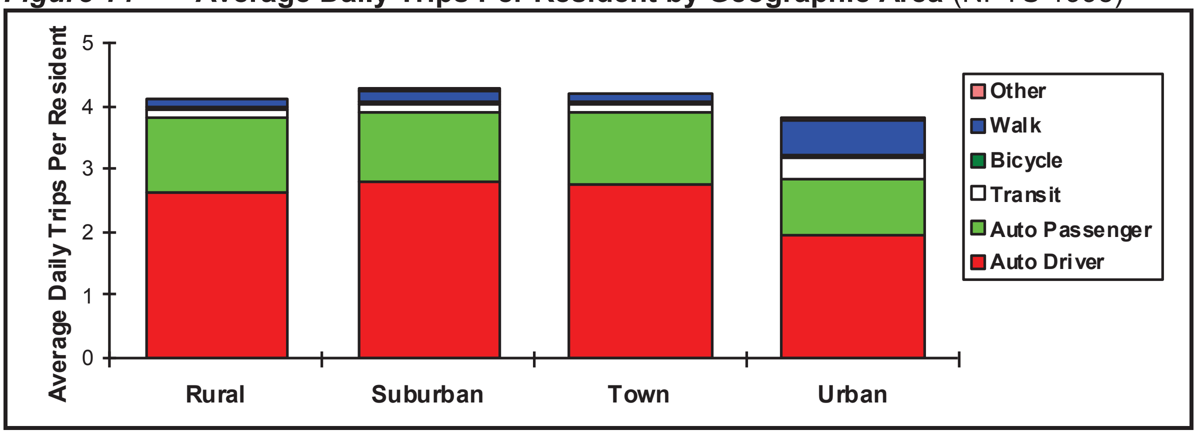
Residents of automobile-dependent communities use automobiles for most trips. Multi-modal development results in mixed mode use. Carfree development results in minimal driving.

Vehicle ownership influences vehicle travel (Ewing and Cervero 2010). Most households have a significant amount of marginal-value vehicle travel, trips they will make by automobile if one is available and driving is cheap (low fuel prices, free parking and uncongested roads), but will be made by another mode if driving is less convenient. For example, a parent may chauffeur children to school if a vehicle is available, but if not will walk or bicycle. Similarly, adding a household car encourages driving for shopping and commuting that would otherwise be by alternative modes.

Automobile dependency encourages each driver to own a personal vehicle. More multi-modal community design allows households to reduce their vehicle ownership by sharing vehicles among multiple drivers or relying on rentals. Residents of multi-modal communities tend to own 10-50% fewer vehicles per capita, which in turn reduces vehicle use. Hess and Ong (2001) find the probability of owning an auto decreases by 31 percentage points in traditional, mixed-use urban neighborhoods, all else being equal. Analysis by Kockelman (1995) indicates that the reduction in vehicle travel associated with increased density in the San Francisco Bay region results from lower vehicle ownership in denser areas, not density itself.

Data from the National Personal Transportation Survey shown in the figure below indicate that residents of higher density urban areas make about 25% fewer automobile trips and more than twice as many pedestrian and transit trips as the national average. Daisa and Parker (2010) also find that automobile trip generation rates and mode shares are much lower (typically 25-75%) in urban areas than ITE publication recommendations for both residential and commercial buildings.

Figure 14 **Average Daily Trips Per Resident by Geographic Area** (NPTS 1995)



Urban residents drive less and use transit, cycling and walking more than elsewhere.

Tomalty, Haider and Fisher (2012) found substantial differences in travel activity between new urbanist and conventional suburban neighborhoods: 51% of new urban households reported walking and cycling to local services several times a week compared with 19% in conventional neighborhoods, and new urban residents averaged 37.1 daily vehicle-kilometers compared with 46.0 in conventional neighborhoods. Nearly twice as many new urbanist residents report walking much more and driving less than in their previous neighborhood, indicating that these differences reflect behavioral change rather than self-selection. Burt and Hoover (2006) found that each 1% increase in the share of Canada's population living in urban areas reduced car travel 2.4% and light truck travel 5.0%. Ewing, Pendall and Chen (2002) developed a sprawl index based on 22 variables related to land use density, mix, street connectivity and commercial clustering. They found that a higher sprawl index is associated with higher per capita vehicle ownership and use, and lower use of alternative modes.

Ewing and Cervero (2002 and 2010) calculate the elasticity of vehicle trips and travel with respect to various land use factors, as summarized in Table 12. For example, this indicates that doubling neighborhood density reduces per capita vehicle travel 5%, and doubling land use mix or improving land use design to support alternative modes also reduces per capita automobile travel 5%.

Table 12 **Typical Travel Elasticities** (Ewing and Cervero 2002)

Factor	Description	Trips	VMT
Local Density	Residents and employees divided by land area	-0.05	-0.05
Local Diversity (Mix)	Jobs/residential population	-0.03	-0.05
Local Design	Sidewalk completeness, route directness, and street network density	-0.05	-0.03
Regional Accessibility	Distance to other activity centers in the region.	--	-0.20

This table shows Vehicle Trip and Vehicle Miles Traveled elasticities with respect to land use factors.

Comparing two automobile-oriented suburban areas in Nashville, Tennessee, Allen and Benfield (2003) found that a combination of improved roadway connectivity, better transit access, and modest increases in density reduces per capita VMT 25%. Comparing communities in Chapel Hill, North Carolina, Khattak and Rodriguez (2005) found that residents of a relatively new urbanist (or *neo-traditional*) neighborhood generate 22.1% fewer vehicle trips and take three times as many walking trips than residents of an otherwise similar (in terms of size, location and demographics) conventional design neighborhood, controlling for demographic factors and preferences. The two communities differ in average lot size (the conventional neighborhood's lots average 2.5 time larger), street design (modified grid vs. curvilinear), land use mix (the new urbanist neighborhood has some retail) and transit service (the new urbanist has a park-and-ride lot). In the new urbanist community, 17.2% of trips are by walking compared with 7.3% in the conventional community.

Boarnet, et al. (2011) use regression analysis of a detailed Los Angeles region travel survey to evaluate employment accessibility impacts on vehicle travel. They find non-linear effects; for households in the third and fourth employment accessibility quintiles, the elasticity of VMT with respect to employment accessibility is three to four times larger than average. This suggests a more important role for land use in transportation and climate change policy, and suggests that employment accessibility is a key variable.

Liu regressed National Household Travel Survey and Census data to estimate how various demographic and geographic factors affect household vehicle travel and gasoline consumption. Table 13 summarizes the results. It shows how income affects vehicle travel and fuel consumption, for a given household size, income and location. It indicates that vehicle travel and fuel consumption decline with neighborhood density, and households located in Metropolitan Statistical Areas (MSAs) with rail transit systems drive 6% less and consume 11% less fuel than otherwise equal households located in regions that lacks rail.

Table 13 **NAHB Statistical Models and Estimated Coefficients** (Liu 2007)

	Annual Miles		Gasoline (gals.)	
	Coefficient	Percent	Coefficient	Percent
Intercept	14,832	*100%*	694	*100%*
Single family home	1,645	11%	96	14%
Homeowner	1,297	9%	72	10%
Number of persons in household	1,789	12%	94	13%
Number of workers in household	6,384	43%	264	38%
Male householder	1,633	11%	101	15%
Black householder	-1201	-8%	-81	-12%
Hispanic householder	315	2%	26	4%
Other minority	-1,072	-7%	-72	-10%
Householder has a at least bachelor's degree	-1,294	-9%	-88	-13%
Age of householder	-61	0%	-2.84	0%
Annual household income $23.5k-$41.1k	720	5%	31	5%
Annual household income $41.1k-$58.8k	3,285	22%	168	24%
Annual household income $58.8k-$76.4k	5,241	35%	278	40%
Annual household income $76.4k-$94.0k	5,753	39%	315	45%
Annual household income $94.0k and up	8,597	58%	464	67%
Living in Northeast	-1,803	-12%	-84	-12%
Living in Midwest	65	0%	14	2%
Living in South	1,100	7%	70	10%
MSA has rail	-865	-6%	-74	-11%
0.08 to 0.39 units per acre	-1,600	-11%	-91	-13%
0.39 to 1.56 units per acre	-1,886	-13%	-93	-13%
1.56 to 4.69 units per acre	-4,248	-29%	-201	-29%
4.69 to 7.81 units per acre	-4,623	-31%	-218	-31%
7.81 units or more per acre	-6,574	-44%	-312	-45%
Rural areas in MSA, MSA population under 1 million	-2,589	-17%	-109	-16%
Urban areas in MSA, MSA population under 1 million	-5,445	-37%	-276	-40%
Rural areas in MSA, MSA population 1-3 million	-129	-1%	26	4%
Urban areas in MSA, MSA population 1-3 million	-5,114	-34%	-272	-39%
Rural areas in MSA, MSA population 3 million and up	384	3%	66	9%
Urban areas in MSA, MSA population 3 million and up	-3,816	-26%	-190	-27%
Urban areas, non-MSA	-3,425	-23%	-171	-25%
Urban areas, MSA pop. 3+mil., density<0.39 per acre	510	3%	87	12%
Urban areas, MSA pop. 1-3mil., density<0.39 per acre	1,733	12%	78	11%

This table summarizes Liu's results for vehicle travel and gasoline consumption.

Liu (2007) also found that residents of more compact communities tend to drive at less efficient speeds (below 45 mph) due to congestion, but not enough to offset vehicle travel reductions so households in more compact development tend to use less gasoline and generate fewer emissions overall. Table 14 summarizes these impacts. Although this data set does not allow direct quantification of individual land use factors such as land use mix, road connectivity and walkability (although they are generally associated with urban areas and the Northeast region), the results indicate that compact development tends to reduce vehicle travel and fuel use.

Table 14 **Factors That Increase Vehicle Travel and Fuel Consumption** (Liu 2007)

Geographic	Household	
• Located in the Midwest or South • Located in a lower-density neighborhood • Located in an rural area • Region lacks rail transit	• Are larger (more people) • Contain more workers • Have higher incomes • Own their homes • Live in single family homes	• Are younger • Are less educated • Have a male householder • Have a white householder • Have a Hispanic householder

All else being equal, residents of more compact regions tend to drive less and consume less fuel.

A major study, found substantially lower vehicle ownership and use in older, high-density, mixed-used urban areas than in more contemporary, sprawled, automobile-dependent areas in the Phoenix, Arizona region (Kuzmyak 2012). Higher-density neighborhood residents make substantially shorter trips: for example, work trips average about seven miles in higher-density neighborhoods compared with 11 miles in suburban neighborhoods, and shopping trip average less than three miles compared with over four miles in suburban areas. As a result, urban dwellers drive about a third fewer daily miles than their suburban counterparts. Smart growth area roads had considerably less traffic congestion despite much higher densities, apparently due to more land use mixing and more connected streets, which reduce vehicle travel and allow more walking and public transit trips and shifts to alternative routes.

Phoenix Household Vehicle Travel

	Smart Growth	Sprawled
Vehicle ownership per household	1.55	1.92
Daily VMT per capita	10.5	15.4
Average home-based work trip length (miles)	7.4	10.7
Home-based shopping trip length (miles)	2.7	4.3
Home-based other trip length (miles)	4.4	5.2
Non-home-based trip length	4.6	5.3

Dill (2004) found that residents of Fairview Village, a new urbanist neighborhood, own about 10% fewer cars and drive 20% fewer miles per adult, and make about four times as many walking trips than residents of more sprawled neighborhoods. The analysis indicates that residents of this community often substitute walking for driving due to increased land use mix, improved walkability and more attractive commercial center.

Table 15 **Travel In Conventional And New Urbanist Neighborhoods** (Dill 2004)

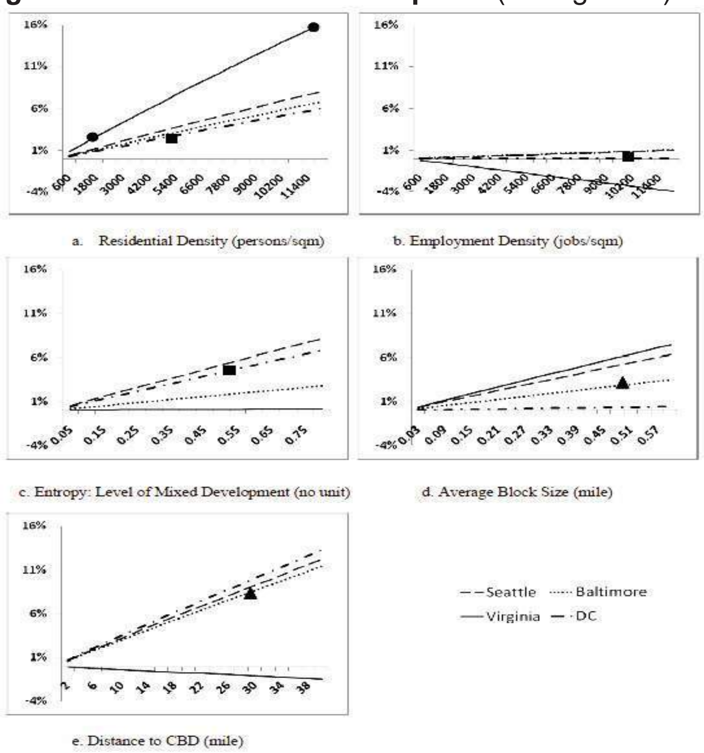
	Control Neighborhood	Fairview (New Urbanist)	Difference
Vehicles Per Adult	1.11	0.99	-0.12 (11%)
Weekly VMT Per Adult	151.2	121.8	-29.4 (19%)
Weekly Driving Trips	14.62	12.37	-2.25 (15%)
Weekly Cycling Trips	0.14	0.41	+0.27 (1.93%)
Weekly Walking Trips	1.66	6.55	+4.89 (295%)

Residents of a new urbanist neighborhood own few cars, drive fewer miles and make more walking and cycling trips than residents of more conventional neighborhoods.

More recent research by Dill (2006) found that 30% or more of Portland area Transit Oriented Development (TOD) residents commuted by MAX (the regional light rail system) at least once a week, and 23-33% used transit as their primary commute mode. This compares to less than 10% of workers in the automobile-oriented suburbs of Hillsboro and Beaverton, and 15% of Portland workers. Transit commuting increased significantly when people moved to TODs. Nearly 20% of the commuters switched from non-transit to transit modes while 4% did the opposite, for a net of about 16%.

Zhang (2011) used a Bayesian regression model to measure the travel impacts of various land use factors in Baltimore, Seattle, Virginia and Washington DC, summarized in Figure 15. The analysis indicates that residential and employment density, land use mix, block size and distance to city center all affect per capita vehicle mileage, although the effects vary depending on community type. For example, in lower-density areas like urban Virginia with 1,950 persons per sq. mile, a 20% density increase would reduce VMT 3%, but in an area that currently has 11,400 persons per sq. mile, VMT would decline 16%. Reducing city block length, an indicator of roadway connectivity, had the greatest impact on reducing VMT in smaller, less dense, automobile-oriented urban areas.

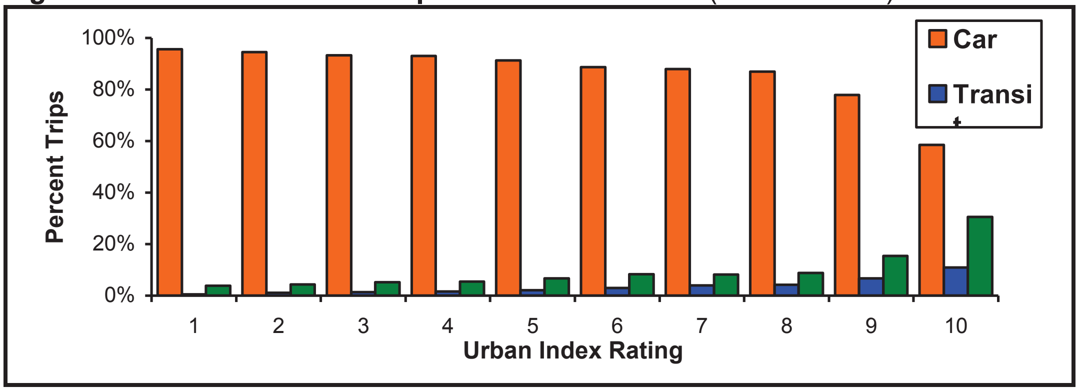
Figure 15 **Vehicle Travel Impacts** (Zhang 2011)



These graphs illustrate the vehicle travel reductions (vertical axis) caused by a 20% change in various land use factors (horizontal axis), including increased population and employment density, land use mix, block size and distance to the central business district (CBD), for four U.S. urban regions.

Lawton (2001) used Portland, Oregon data to model the effects of land use density, mix, and road network connectivity on personal travel. He found that these factors significantly affect residents' car ownership, mode split and per capita VMT. Adults in the least urbanized areas of the city averaged about 20 motor vehicle miles of travel each day, compared with about 6 miles per day for residents of the most urbanized areas, due to fewer and shorter motor vehicle trips, as indicated in Figure 16.

Figure 16 **Urbanization Impact On Mode Share** (Lawton 2001)



As an area becomes more urbanized the portion of trips made by transit and walking increases.

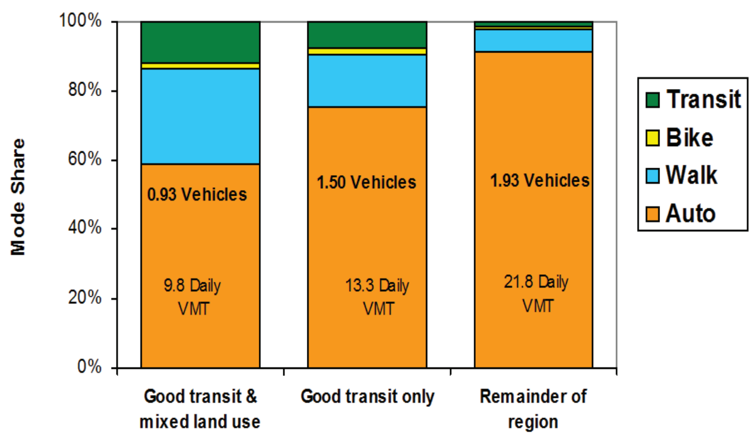
Table 16 and Figure 19 show how location factors affect vehicle ownership, daily mileage and mode split in the Portland, Oregon region. Transit-oriented neighborhoods, with good transit and mixed land use, have far lower vehicle ownership and use, and more walking, cycling and public transit use than other areas. Residents of areas with high quality transit drive 23% less, and residents of areas with high quality public transit *and* mixed land use drive 43% less than elsewhere in the region, indicating that land use and transportation factors have about the equal impacts on travel activity.

Table 16 **Impacts on Vehicle Ownership and Travel** (Portland 2009)

Land Use Type	Auto Ownership	Daily VMT	Mode Share				
	Per Household	Per Capita	Auto	Walk	Transit	Bike	Other
Good transit/Mixed use	0.93	9.80	58%	27%	12%	1.9%	1.5%
Good transit only	1.50	13.3	74%	15%	7.9%	1.4%	1.1%
Remainder of county	1.74	17.3	82%	9.7%	3.5%	1.6%	3.7%
Remainder of region	1.93	21.8	87%	6.1%	1.2%	0.8%	4.0%

Residents of transit-oriented neighborhoods tend to own significantly fewer motor vehicles, drive significantly less, and rely more on walking and public transit than residents of other neighborhoods.

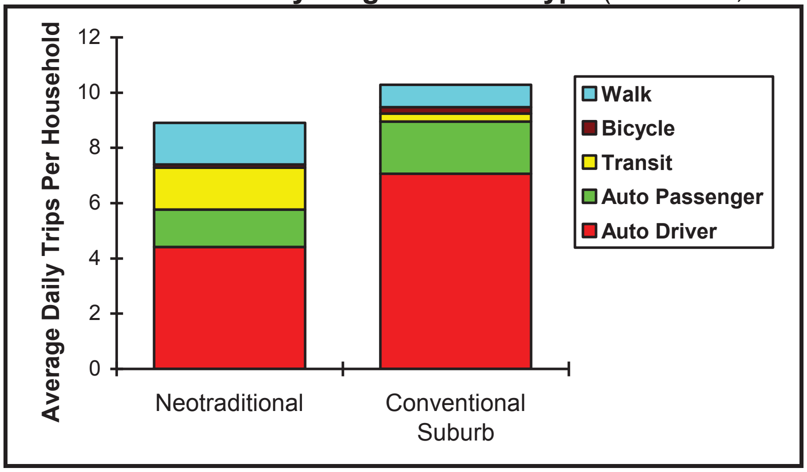
Figure 19 **TOD Impacts On Vehicle Ownership and Use** (Portland 2009)



Transit-oriented development residents tend to own fewer vehicles, drive less and use alternative modes more than in automobile-oriented communities. "Daily VMT" indicates average daily vehicle miles traveled per capita.

Other studies also find significantly lower per capita vehicle travel in higher-density, traditional urban neighborhoods than in modern, automobile-oriented suburbs, as illustrated in Figure 17.

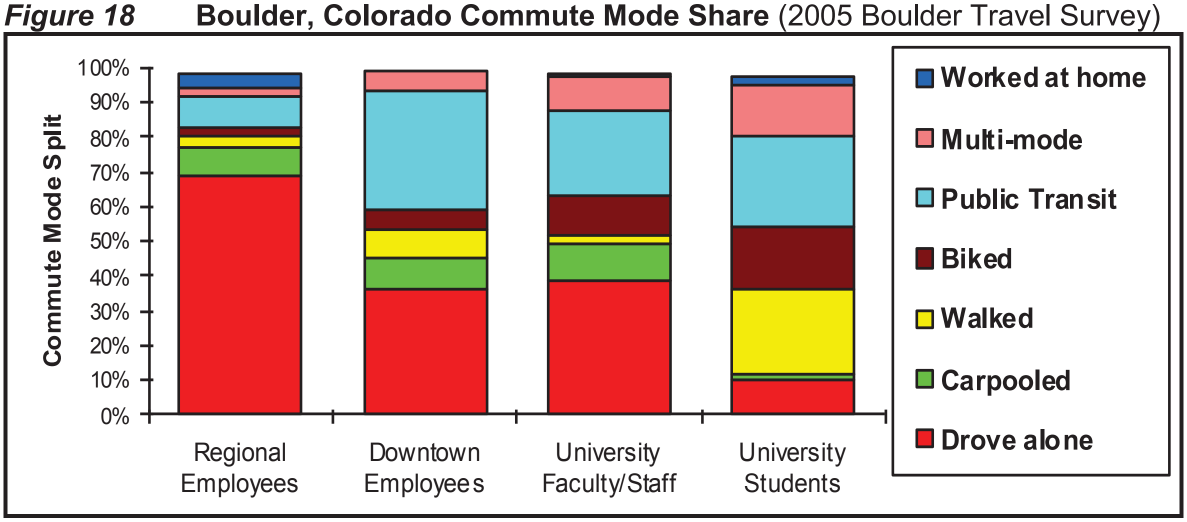
Figure 17 **Household Travel by Neighborhood Type** (Friedman, Gordon and Peers 1995)



Household vehicle trips are significantly lower in neotraditional (new urbanist) neighborhoods than conventional automobile-dependent suburbs due to higher densities and better travel options.

A Cambridge Systematics (1992) study predicts that households make 20-25% fewer vehicle trips if located in a higher density, transit-oriented suburb than in a conventional, low density, auto-oriented suburb. A 2005 Boulder, Colorado travel survey found much lower drive alone rates and much greater use of alternative modes in the downtown and university campus area than for the region overall, as illustrated in Figure 18.

Figure 18 **Boulder, Colorado Commute Mode Share** (2005 Boulder Travel Survey)



Vehicle trips per household are significantly lower in neotraditional neighborhoods than in conventional automobile dependent suburbs due to higher densities and better travel choices.

Frank, et al. (2010a) evaluated the effects of urban form on walking and driving energy consumption, assuming that increased walking energy consumption contributes to more physical fitness and more vehicle energy consumption contributes to climate change. They conclude that land use strategies to reduce driving and increase walking are largely convergent: increasing residential density, street connectivity, and transit accessibility (both through better transit service and more transit-oriented development) all help achieve both goals, as indicated by a higher energy index.

Bento, et al (2004) conclude that residents reduce vehicle travel about 25% if they shift from a dispersed, automobile-dependent city such as Atlanta to a more compact, multi-modal city such as Boston, holding other economic and demographic factors constant. Transit-oriented land use affects both commute and non-commute travel. Although less than ten percent of the respondents used transit to non-commute destinations on a weekly basis, TOD residents walk significantly more for non-commute travel.

A U.S. Environmental Protection Agency study identified substantial energy conservation and emission reductions if development shifts from the urban fringe to infill (USEPA 2007). The study found that individual households that shift from urban fringe to infill locations typically reduce VMT and emissions by 30-60%, and in typical U.S. cities, shifting 7-22% of residential and employment growth into existing urban areas could reduce total regional VMT, congestion and pollution emissions by 2-7%.

Tomalty and Haider (2009) evaluated how community design factors (land use density and mix, street connectivity, sidewalk supply, street widths, block lengths, etc.) and a subjective walkability index rating (based on residents' evaluation of various factors) affect walking and biking activity, and health outcomes (hypertension and diabetes) in 16 diverse British Columbia neighborhoods. The analysis reveals a statistically significant association between improved walkability and more walking and cycling activity, lower body mass index (BMI), and lower hypertension. Regression analysis indicates that people living in more walkable neighbourhoods are more likely to walk for at least 10 daily minutes and are less likely to be obese than those living in less walkable areas, regardless of age, income or gender. The study also includes case studies which identified policy changes likely to improve health in specific communities.

Higher rates of transit and walking travel may partly reflect *self selection* (also called *sorting*): people who by necessity or preference, drive less and rely more on alternative modes tend to choose more multi-modal locations. However, studies that account for self-selection statistically, and linear studies that track travel activity before and after people move to new locations, indicate that land use factors do affect travel behavior (Krizek 2003b; Cao 2014; Cervero 2007).

Even if self-selection explains a portion of differences in travel behavior between different land use types, this should not detract from the finding that such land use patterns and resulting travel behaviors provide consumer benefits, and reduce trip and parking generation (and therefore road and parking facility costs) at a particular location. A study sponsored by CalTrans (2008) found that trip generation and automobile mode split rates are significantly lower (often less than half) at urban infill developments than ITE standards. This apparently reflects the cumulative effects of various land use factors such as density, mix, walkability, transit accessibility and parking pricing.

Nelson/Nygaard (2005) developed a model that predicts how Smart Growth and TDM strategies affect capita vehicle trips and related emissions. This model indicates that significant reductions can be achieved relative to ITE trip generation estimates. Table 17 summarizes the projected VMT reduction impacts of typical smart growth developments.

Table 17 **Smart Growth VMT Reductions** (CCAP 2003)

Location	Description	VMT Reduction
Atlanta	138-acre brownfield, mixed-use project.	15-52%
Baltimore	400 housing units and 800 jobs on waterfront infill project.	55%
Dallas	400 housing units and 1,500 jobs located 0.1 miles from transit station.	38%
Montgomery County	Infill site near major transit center	42%
San Diego	Infill development project	52%
West Palm Beach	Auto-dependent infill project	39%

This table summarizes reductions in per capita vehicle travel from various Smart Growth developments

A major study by the University of Utah's Metropolitan Research Center developed a sprawl index that incorporates four factors: *density* (people and jobs per square mile), *mix* (whether neighborhoods had a mix of homes, jobs and services), *centricity* (the strength of activity centers and downtowns) and *roadway connectivity* (the density of connections in the roadway network); a higher rating indicates more compact, *smart growth* development (Ewing and Hamidi 2014). This index was used to evaluate how these land use factors affects various travel, economic and health outcomes. It indicates that:

- People in smart growth areas own fewer cars and spend less time driving. For every 10% increase in index score, vehicle ownership rates decline 0.6% and drive time declines 0.5%.
- For every 10% increase in an index score, the walk mode share increases by 3.9%.
- The portion of household income spent on housing is greater but the portion of income spent on transportation is lower, in smart growth communities. Each 10% increase in an index score was associated with a 1.1% increase in housing costs and a 3.5% decrease in transportation costs relative to income. Since transportation costs decline faster than housing costs rise, this results in a net decline in combined housing and transportation costs.
- For every 10% increase in an index score, there is a 4.1% increase in the probability that a child born to a family in the bottom quintile of the national income distribution reaches the top quintile of the national income distribution by age 30.
- Smart growth community residents tend to live longer. For every doubling in an index score, life expectancy increases by about 4%. For the average American with a life expectancy of 78 years, this translates into a three-year difference in life expectancy between people in a less compact versus a more compact county. This probably reflects significantly lower rates of traffic fatalities, obesity, high blood pressure and diabetes in

smart growth communities, although these are somewhat offset by slightly higher air pollution exposure and murder risk.

- Counties with less sprawl have more but less severe vehicle crashes. For every 10% increase in an index score, fatal crashes decrease by almost 15%. People in smarter growth communities also have significantly lower blood pressure and rates of diabetes.

Table 18 summarizes these results.

Table 18 **Summary of Sprawl Outcomes** (SGA 2014; Ewing and Hamidi 2014)

Outcome	Relationship to Compactness	Impact of 10% Score Increase
Average household vehicle ownership	Negative and significant	0.6% decline
Vehicle miles traveled	Negative	7.8% to 9.5% decline
Walking commute mode share	Positive and significant	3.9% increase
Public transit commute mode share	Positive and significant	11.5% increase
Average journey-to-work drive time	Negative and significant	0.5% decline
Traffic crashes per 100,000 population	Positive and significant	0.4% increase
Injury crash rate per 100,000 pop.	Positive and significant	0.6% increase
Fatal crash rate per 100,000 population	Negative and significant	13.8% decline
Body mass index	Negative and significant	0.4% decline
Obesity	Negative and significant	3.6% decline
Any physical activity	Not significant	0.2% increase
Diagnosed high blood pressure	Negative and significant	1.7% decline
Diagnosed heart disease	Negative and significant	3.2% decline
Diagnosed diabetes	Negative and significant	1.7% decline
Average life expectancy	Positive and significant	0.4% increase
Upward mobility (probability a child born in a bottom-income-quintile family reaches the top quintile by age 30)	Positive and significant	4.1% increase
Transportation affordability	Positive and significant	3.5% decrease in transport costs relative to income
Housing affordability	Negative and significant	1.1% increase in housing costs relative to income.

This table summarizes economic, health and environmental impacts from compact development.

These results validate previous research indicating that more compact development reduces motor vehicle travel and associated costs. This disaggregated analysis of sprawl factors is useful because it is possible to have dense sprawl (for example, dispersed high-rise development in an automobile-dependent area) and rural smart growth (development concentrated in villages with commonly used services within walking distance of most households, connected to larger urban centers with convenient public transit services). This expands the range of policy tools that can be used to increase transport system efficiency, for example, even if a city cannot increase development density it may be able to increase mix, road connectivity, and the quality of resource-efficient travel modes (walking, cycling and public transport).

Vernez Moudon and Stewart (2013) reviewed research on how various land use factors affect travel activity, and the tools available for modeling these imapcts and related outcomes such as vehicle emissions and health co-benefits. Table 19 summarizes their findings.

Table 19 **Typical Elasticities of Travel With Respect to the Built Environment** (Vernez Moudon and Stewart 2013)

Category	Variable	VMT	Walking	Transit
Density	Household/population density	–0.04	0.07	0.07
	Job density	0.00	0.04	0.01
	Commercial Floor Area Ratio (FAR)	n/a	0.07	n/a
Diversity	Land use mix	-0.09	0.15	0.12
	Jobs/housing balance	-0.02	0.19	n/a
	Distance to a store	n/a	0.25	n/a
Design	Intersection/street density	-0.12	0.39	0.23
	Percent 4-way intersections	-0.12	-0.06	0.29
Destination accessibility	Job accessibility by auto	-0.20	n/a	n/a
	Job accessibility by transit	-0.05	n/a	n/a
	Jobs within one mile	n/a	0.15	n/a
	Distance to downtown	– 0.22	n/a	n/a
Distance to Transit	Distance to nearest transit stop	-0.05	0.15	0.29

An extensive body of literature examines how various land use factors affect travel activity.

Kahn (2000) used household-level sets to study some environmental impacts of location. He found that suburban households drive 31% more than their urban counterparts and western households drive 35% more than northeastern households due to differences in travel options and land use patterns. International studies also find significant differences in travel patterns, as illustrated in Table 20.

Table 20 **Mode Split In Selected European Cities** (ADONIS 2001)

City	Foot and Cycle	Public Transport	Car	Inhabitants
Amsterdam (NL)	47 %	16 %	34 %	718,000
Groningen (NL)	58 %	6 %	36 %	170,000
Delf (NL)	49 %	7 %	40 %	93,000
Copenhague (DK)	47 %	20 %	33 %	562,000
Arhus (DK)	32 %	15 %	51 %	280,000
Odense (DK)	34 %	8 %	57 %	198,300
Barcelona (Spain)	32 %	39 %	29 %	1,643,000
L'Hospitalet (Spain)	35 %	36 %	28 %	273,000
Mataro (Spain)	48 %	8 %	43 %	102,000
Vitoria (Spain)	66 %	16 %	17 %	215,000
Brussels (BE)	10 %	26 %	54 %	952,000
Gent (BE)	17 %	17 %	56 %	226,000
Brujas (BE)	27 %	11 %	53 %	116,000

Many cities in wealthy countries have relatively high rates of alternative modes.

Using a detailed travel survey integrated with a sophisticated land use model, Frank, et al. (2008) found that automobile mode share declines and use of other modes (walking, cycling and public transit) increases with increased land use density, mix and intersection density at both home and worksite areas. Increasing destination retail floor area ratio by 10% was associated with a 4.3% increase in demand for transit. A 10% increase in home location intersection density was associated with a 4.3% increase in walking to work. A 10% increase in residential area mix was associated with a 2.2% increase in walking to work. A 10% increase in home location retail floor area ratio was associated with a 1.2% increase in walking to work. Increasing residential area intersection density by 10% was associated with an 8.4% increase in biking to work. A 10% increase in fuel or parking costs reduced automobile mode split 0.7% and increased carpooling 0.8%, transit 3.71%, biking 2.7% and walking 0.9%. Transit riders are found to be more sensitive to changes in travel time, particularly waiting time, than transit fares. Increasing transit in-vehicle times for non-work travel by 10% was associated with a 2.3% decrease in transit demand, compared to a 0.8% reduction for a 10% fare increase. Non-work walking trips increased in more walkable areas with increased density, mix and intersection density. Increasing auto travel time by 10% was associated with a 2.3% increase in transit ridership, a 2.8% increase in bicycling, and a 0.7% increase in walking for non-work travel.

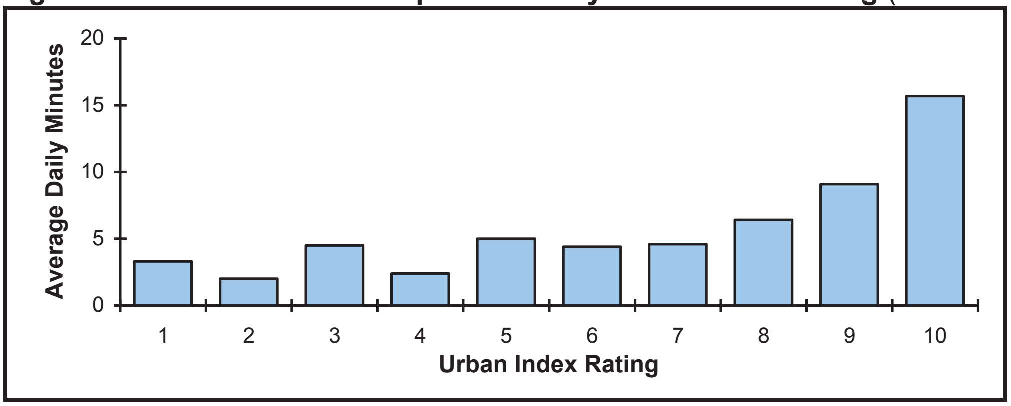
Chattopadhyay and Taylor (2012) developed an innovative way to predict people's behavior, particularly how people make decisions about where to live. The study focused on 18 urban areas across the United States and used census data and information from the 2001 National Household Travel Survey and the National Transit Database. They found that a 10% increase in a city’s smart growth features, such as residential density, jobs per capita and public transit infrastructure, would lead to a 20% decrease in vehicle miles traveled per household. According to study author Sudip Chattopadhyay, professor and chair of economics at SF State, “We found that changing the way cities are designed would significantly reduce travel demand. People’s travel habits would change, and they would drive less.”

Other factors also affect travel activity. In a detailed analysis of transport and land use factors, Buehler (2010) found that fuel prices and transport investments rather than land use conditions are the largest factor that explain the differences in travel activity (per capita walking, cycling, public transit and automobile travel) between the U.S. and Germany. He found that, although increased land use density and mix tend to reduce automobile travel in both countries, at any population density Americans drive between 60% to 80% more than Germans.

Nonmotorized Travel

Certain planning objectives, such as improving physical fitness and increasing neighborhood social interactions, depend on increasing nonmotorized travel (Litman 2003; Frumkin, Frank and Jackson 2004; Mackett and Brown 2011; Marcus 2008). Research by Ewing, et al (2003) and Frank (2004) indicate that physical activity and fitness tend to decline in sprawled areas and with the amount of time individuals spend traveling by automobile.

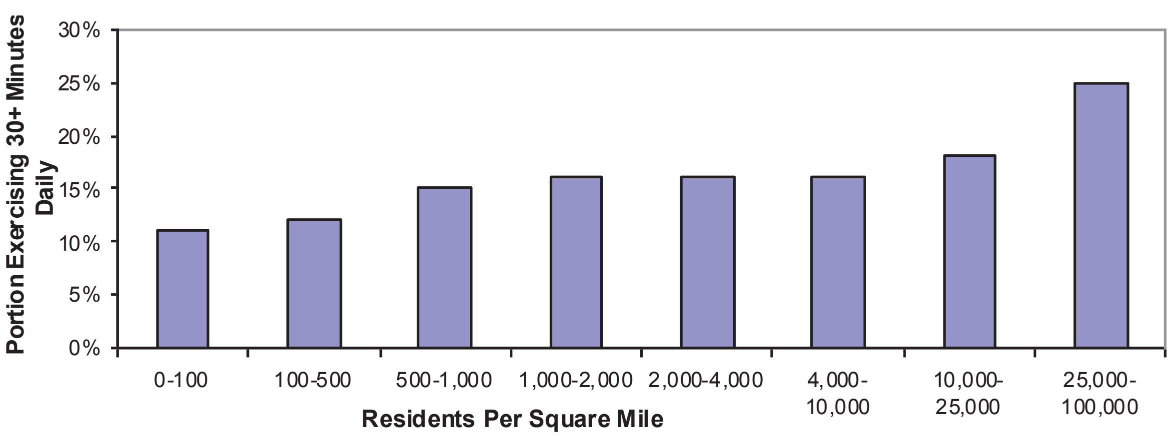
Figure 20 **Urbanization Impact On Daily Minutes of Walking** (Lawton 2001)



As an area becomes more urbanized the average amount of time spent walking tends to increase.

Lawton (2001), Khattak and Rodriguez (2003) and Marcus (2008) found that residents of more walkable neighborhoods tend to achieve most of the minimum amount of physical activity required for health (20 minutes daily), far more than residents of automobile-oriented suburbs. Unpublished analysis by transport modeler William Gehling found that the portion of residents who walk and bicycle at least 30 minutes a day increases with land use density, from 11% in low density areas (less than 1 resident per acre) up to 25% in high density (more than 40 residents per acre) areas, as illustrated below.

Figure 21 **Portion of Population Walking & Cycling 30+ Minutes Daily** (Unpublished Analysis of 2001 NHTS by William Gehling)



As land use density increases the portion of the population that achieves sufficient physical activity through walking and cycling increases. Based on 2001 NHTS data.

Cao, Handy and Mokhtarian (2005) evaluated the effects of land use patterns on strolling (walking for pleasure or exercise) and utilitarian walking trips in Austin, Texas. They found that residential pedestrian environments have the greatest impact on strolling trips, while the destination area pedestrian environment (such as commercial area) is at least as important for utilitarian trips. Pedestrian travel declines with increased vehicle traffic on local streets. They found that strolling accounts for the majority of walking trips, but tends to be undercounted in travel surveys.

Weinstein and Schimek (2005) discuss problems obtaining reliable nonmotorized information in conventional travel surveys, and summarize walking data in the U.S. 2001 National Household Travel Survey (NHTS). They find that about 10% of total measured trips involved nonmotorized travel. Respondents average 3.8 walking trips per week, but some people walk much more than others. About 15% of respondents report walking on a particular day, and about 65% of respondents reported walking during the previous week. The median walk trip took 10 minutes and was about 0.25 mile in length, much less than the mean walking trip (i.e., a small number of walking trips are much longer in time and distance). The table below summarizes walking trip data.

Table 21 **NHTS Walking Trip Attributes** (Weinstein and Schimek 2005)

Purpose	Frequency	Mean Distance	Median Distance	Mean Duration
	Percent	Mile	Mile	Minutes
Personal business/shopping/errands	48%	0.44	0.22	11.9
Recreation/exercise	20%	1.16	0.56	25.3
To transit	16%	N/A	N/A	19.6
To or from school	7%	0.62	0.33	13.3
To or from work	4%	0.78	0.25	14.1
Walk dog	3%	0.71	0.25	19.0
Other	2%	0.57	0.22	14.8
Totals	*100%*	*0.68*	*0.25*	*16.4*

This table summarizes the results of NPTS walking trip data. N/A = not available.

Besser and Dannenberg (2005) used the NHTS to analyze walking associated with public transit trips. They found that Americans who use public transit on a particular day spend a median of 19 daily minutes walking to and from transit, and that 29% achieve the recommended 30 minutes of physical activity a day solely by walking to and from transit. In multivariate analysis, rail transit, lower-income, age, minority status, being female, being a nondrivers or zero-vehicle household, and population density were all positively associated with the amount of time spent walking to transit.

Frank, et al. (2006) developed a *walkability index* that reflects the quality of walking conditions, taking into account residential density, street connectivity, land use mix and retail floor area ratio (the ratio of retail building floor area divided by retail land area). They found that in King County, Washington a 5% increase in their walkability index is associated with a 32.1% increase in time spent in active transport (walking and cycling), a 0.23 point reduction in body mass index, a 6.5% reduction in VMT, and similar reductions in air pollution emissions.

Study: Kids Take Walks If Parks, Stores Nearby
Stacy Shelton, *The Atlanta Journal-Constitution*, 12 December 2006

Young people in metro Atlanta are more likely to walk if they live in a city or within a half-mile of a park or store, according to a new study published in the *American Journal of Health Promotion*.

Of the 3,161 children and youth surveyed from 13 counties, the most important neighborhood feature for all age ranges was proximity to a park or playground. It was the only nearby walking attraction that mattered for children ages 5 to 8, who were 2.4 times more likely to walk at least half a mile a day than peers who don't live near a park, researchers said.

For older children and young adults up to age 20, a mix of nearby destinations including schools, stores and friends' houses also translated into more walking. Preteens and teenagers ages 12 to 15 who live in high-density or urban neighborhoods were nearly five times more likely to walk half a mile or more a day than those who live in low-density or suburban neighborhoods.

Lawrence Frank, the study's lead author and a former urban planning professor at Georgia Tech, said the research shows young people are particularly sensitive to their surroundings, most likely because they can't drive. "Being able to walk in one's neighborhood is important in a developmental sense," said Frank, now at the University of British Columbia. "It gives youth more independence. They start to learn about environments and where they live. There are also benefits for social networking for children."

The study used data collected from a larger study of land use and travel patterns, called SMARTRAQ, in the metro Atlanta area. It is funded by the Centers for Disease Control and Prevention, the Environmental Protection Agency, the Georgia Department of Transportation and the Georgia Regional Transportation Authority. Other SMARTRAQ findings showed a strong link between time spent driving and obesity.

Elke Davidson, executive director of the Atlanta Regional Health Forum, said getting kids to walk is "one of the most important health interventions that we need right now." Her group is a privately funded organization that works to make public health goals a part of local and regional planning.

Health officials say half of all children diagnosed with diabetes today have Type 2, formerly known as adult-onset, which is linked to obesity. Exercise is a key strategy for preventing and treating the disease.

"We need not just to tell kids to get off their computers and go outside. If there are no parks and no place to walk, they're stuck," Davidson said. "A lot of the natural opportunities for physical activity, like walking to school or walking to your friends' house or walking downtown to get a soda ... those opportunities are increasingly limited when we build communities that are so auto-dependent."

George Dusenbury, executive director of Park Pride, said he chose to live in Atlanta's Candler Park neighborhood because it's close to parks, restaurants, stores and MARTA. Both his sons, ages 5 and 8, are used to walking, he said. "We recognize that encouraging your kids to walk early is the best way to ensure they stay healthy," he said. "I hate driving with a passion. So for me it's an environmental thing and it's a health thing."

Modeling Land Use Impacts on Travel Behavior

Planners often use models to predict the impacts of specific policies and planning decisions. For more than fifty years transport planners have used traffic models to estimate demand (how many people would like to travel between different areas under specific conditions) and evaluate the impacts of transport system changes. These models use land use factors (the number and type of people, jobs and businesses in particular areas) as an input. However, these models are not very sensitive to many of the land use factors discussed in this report, they are either not considered at all or modelers lack the data needed to evaluate them (USEPA 2001; Hunt and Brownlee 2001; Lee, et al. 2012; Lewis Berger Group 2004; Sadek et al. 2011). For example, most models use analysis zones that are too large to capture small-scale design features, and none are very accurate in evaluating non-motorized travel. As a result, the models are unable to predict the full travel impacts of land use management strategies such as transit-oriented development or walking and cycling improvements.

The following improvements are recommended to help existing models better evaluate land use management strategies (Rosenbaum and Koenig 1997; Sadek, et al. 2011):

- Analyze land use at finer spatial resolutions, such as census tracts or block level (called *micro-level* analysis).
- Determine effects of special land use features, such as pedestrian-friendly environments, mixed-use development, and neighborhood attractiveness.
- Determine relationships between mixed-use development and travel mode selection.
- Improved methods for analyzing trip chaining.
- Improve the way temporal choice (when people take trips) is incorporated into travel models.

Integrated land use and transportation models, such as the gravity-based *Integrated Transportation Land Use Package* (ITLUP) and the economic equilibrium *CATLUS*, attempt to address traditional models' shortcomings by connecting submodels that represent various aspect of the urban system (land use development, traffic, etc.) (Bartholomew and Ewing 2009; Outwater, et al. 2014; TRB 2012). Such models must be calibrated to unique local data due to their sensitivity to small changes in parameters and assumptions. This makes them expensive and difficult to compute.

Another new approach, called *activity-based modeling*, predicts travel based on information about people's demand to participate in activities such as work, education, shopping, and recreation, and the spatial and temporal distribution of those activities (Dong, et al. 2006; UT 2004). They include a "behavioural core" of four interrelated components (land use, location choice, activity/travel, and auto ownership). Each behavioural component involves various sub-models that incorporate supply/demand interactions, and interact among each other. For example, land use evolves in response to location needs of households and firms, and people relocate their homes and/or jobs at least partially in response to accessibility factors.

Because of the complexity of creating comprehensive, integrated models that are sensitive to land use factors, some organizations have developed simplified and targeted models for evaluating smart growth strategies.

The *Smart Growth Area Planning* (SmartGAP) tool synthesizes households and firms in a region and determines the travel demand characteristics of these households and firms based on the characteristics of their built environment and transportation policies affecting their travel behavior (TRB 2012). The *Smart Growth Index (SGI) Model*, is a sketch model developed by the U.S. Environmental Protection Agency for simulating alternative land-use and transportation scenarios (USEPA 2002).

The *Rapid Fire Model* developed for Vision California (www.visioncalifornia.org) is a user-friendly spreadsheet tool that evaluates regional and statewide land use and transportation scenarios, including various combinations of land use density, mix, building types and transport policies, and predicts their impacts on vehicle travel, pollution emissions, water use, building energy use, transportation fuel use, land consumption, and public infrastructure costs. All assumptions are clearly identified and can be easily modified.

Frank, et al. (2011) developed a spreadsheet tool to estimate the potential reduction in vehicle travel and emissions from changes in urban form, including increased sidewalk coverage, improved and more affordable transit service, and increased road or parking fees, suitable for neighborhood and regional planning. This model was applied in two Seattle-area neighborhoods. It indicates that increasing sidewalk coverage from a ratio of 0.57 (the equivalent of sidewalk coverage on both sides of 30% of all streets) to 1.4 (coverage on both sides of 70% of all streets) could reduce vehicle travel 3.4% and carbon emissions 4.9%. Land use mix and parking pricing also had significant impacts. Increasing parking fees from approximately $0.28 to $1.19 per hour (50th to 75th percentile) reduced vehicle travel 11.5% and emissions 9.9%.

Table 22 summarizes various model that can be used to evaluate how land use factors affect travel behavior, energy consumption and pollution emissions.

Various tools can be used to predict how specific land use development factors affect travel activity and associated pollution emissions.

Feasibility, Costs and Criticism

This section discusses Smart Growth feasibility and costs, and evaluates various criticisms.

Feasibility

Land use patterns evolve slowly, reflecting historical trends, accidents, forces and the fashions in place when an area developed. Land use planning policies and practices tend to preserve the status quo rather than facilitate change. Current policies tend to stifle diversity, encourage automobile-dependency and discouraged walkability.

But positive change is occurring. In recent years planning organizations have developed Smart Growth strategies and tools (ITE 2003; "Smart Growth," VTPI 2008). We know that it is possible to build more accessible and multi-modal communities, and that many families will choose them if they have suitable design features and amenities. The number of people who prefer such locations is likely to increase due to various demographic and economic trends, including population aging, higher fuel prices, and growing appreciation of urban living (Reconnecting America 2004). Demand for Smart Growth communities may also increase if consumers are better educated concerning the economic, social and health benefits they can gain from living in such communities.

Although it is unrealistic to expect most households to shift from a large-lot single-family home to a small urban apartment, incremental shifts toward more compact, accessible land use is quite feasible. For example, many households may consider shifting from large- to medium-lot or from medium- to small-lot homes, provided that they have desirable amenities such as good design, safety and efficient public services. Such shifts can have large cumulative effects, reducing total land requirements by half and doubling the portion of households in walkable neighborhoods, as summarized in Table 23.

Table 23 **Housing Mix Impacts On Land Consumption** (Litman 2004b)

	Large Lot (1 acre)	Medium Lot (1/2 acre)	City Lot (100' x 100')	Small Lot (50' x 100')	Multi-Family	Totals	Single Family

Total Land Use (acres)	300,000	125,000	57,392	11,494	5,000	***451,497***	
Standard							
Percent	20%	20%	20%	20%	20%	*100%*	80%
Number	200,000	200,000	200,000	200,000	200,000	*1,000,000*	
Total Land Use (acres)	200,000	100,000	45,914	22,989	10,000	***378,902***	
Smart Growth							
Percent	10%	10%	20%	35%	25%	*100%*	75%
Number	100,000	100,000	200,000	350,000	250,000	*1,000,000*	
Total Land Use (acres)	100,000	50,000	45,914	40,230	12,500	***248,644***	

Even modest shifts can significantly reduce land consumption. The Smart Growth option only requires 15% of households to shift from single- to multi-family homes, yet land requirements are reduced by half compared with sprawl.

Costs

Smart growth and related land use management strategies tend to increase some development costs but reduce others. In particular they tend to increase planning costs, unit costs for land and utility lines, and project costs for infill construction and higher design standards. However, this is offset by less land required per unit, reduced road and parking requirements, shorter utility lines, reduced maintenance and operating costs, more opportunities for integrated infrastructure and transport cost savings. As a result, smart growth often costs the same or less than sprawl, particularly over the long-term.

The main real resource of smart growth is the reduction in housing lot size. To the degree that smart growth is implemented using negative incentives (restrictions on urban expansion and higher land costs) people who really want a large yard may be worse off. However, many people choose large lots for prestige rather than function, and so would accept smaller yards or multi-family housing if they were more socially acceptable. If implemented using positive incentives (such as improved services, security and affordability in urban neighborhoods) users (the people who choose those locations) must be better off overall or they would not make that choice.

Criticisms

Critics raise a number of other objections to smart growth management strategies. These include (Litman 2004b and 2011).

- *Land Use Management Is Ineffective At Achieving Transportation Objectives.* Some experts argued that in modern, automobile-oriented cities it is infeasible to significantly change travel behavior (Gordon and Richardson 1997). However, as our understanding of land use effects on travel improves, the potential effectiveness of land use management for achieving transport planning objectives has increased and is now widely accepted (ITE 2003)
- *Consumers Prefer Sprawl and Automobile Dependency.* Critics claim that consumers prefer sprawl and automobile dependency. But there is considerable evidence that many consumers prefer smarter growth communities and alternative transport modes (Litman 2010).
- *Smart Growth Increases Regulation and Reduces Freedom*. Critics claim that smart growth significantly increases regulation and reduces freedoms. But many smart growth strategies reduce existing regulations and increase various freedoms, for example, by reducing parking requirements, allowing more flexible design, and increasing travel options.
- *Smart Growth Reduces Affordability*. Critics claim that smart growth increases housing costs, but ignore various ways it saves money by reducing unit land requirements, increasing housing options, reducing parking and infrastructure costs, and reducing transport costs.
- *Smart Growth Increases Congestion.* Critics claim that smart growth increases traffic congestion and therefore reduces transport system quality, based on simple models of the relationship between density and trip generation. However, smart growth reduces per capita vehicle trips, which, in turn reduces congestion. Empirical data indicates that smart growth communities have lower per capita congestion costs than sprawled communities.

Impact Summary

Table 24 summarizes the effects of land use factors on travel behavior. Actual impacts will vary depending on specific conditions and the combination of factors applied.

Table 24 **Land Use Impacts on Travel Summary**

Factor	Definition	Travel Impacts
Regional accessibility	Location of development relative to regional urban center.	Reduces per capita vehicle mileage. Central area residents typically drive 10-30% less than at the urban fringe
Density	People or jobs per unit of land area (acre or hectare).	Reduces vehicle ownership and travel, and increases use of alternative modes. A 10% increase typically reduces VMT 0.5-1% as an isolated factor, and 1-4% including associated factors (regional accessibility, mix, etc.).
Mix	Proximity between different land uses (housing, commercial, institutional)	Tends to reduce vehicle travel and increase use of alternative modes, particularly walking. Mixed-use areas typically have 5-15% less vehicle travel.
Centeredness (centricity)	Portion of jobs in commercial centers (e.g., central business districts and town centers)	Increases use of alternative modes. Typically 30-60% of commuters to major commercial centers use alternative modes compared with 5-15% at dispersed locations
Network Connectivity	Degree that walkways and roads are connected	Increased roadway connectivity can reduce vehicle travel and improved walkway connectivity increases non-motorized travel
Roadway design	Scale, design and management of streets	Multi-modal streets increase use of alternative modes. Traffic calming reduces VMT and increases non-motorized travel
Active transport (walking and cycling)	Quantity, quality and security of sidewalks, crosswalks, paths, and bike lanes.	Improved walking and cycling conditions tends to increase nonmotorized travel and reduce automobile travel. Residents of more walkable communities typically walk 2-4 times more and drive 5-15% less than in automobile-dependent areas.
Transit quality and accessibility	Quality of transit service and whether neighborhoods are considered transit-oriented development (TOD)	Increases ridership and reduces automobile trips. Residents of transit oriented developments tend to own 20-60% fewer vehicles, drive 20-40% fewer miles, and use alternative modes 2-10 times more than in automobile-oriented areas.
Parking supply and management	Number of parking spaces per building unit or acre, and how parking is managed and priced	Tends to reduce vehicle ownership and use, and increase use of alternative modes. Cost-recovery pricing (users finance parking facilities) typically reduces automobile trips 10-30%.
Site design	Whether oriented for auto or multi-modal accessibility	More multi-modal site design can reduce automobile trips, particularly if implemented with improvements to other modes.
Mobility management	Strategies that encourage more efficient travel activity	Tends to reduce vehicle ownership and use, and increase use of alternative modes. Impacts vary depending on specific factors.
Integrated smart growth programs	Travel impacts of integrated programs that include a variety of land use management strategies	Reduces vehicle ownership and use, and increases alternative mode use. Smart growth community residents typically own 10-30% fewer vehicles, drive 20-40% less, and use alternative mode 2-10 times more than in automobile-dependent locations, and larger reductions are possible if integrated with improved regional transit and more efficient transport pricing.

This table summarizes typical impacts of various land use factors on travel activity.

Care is needed when predicting the impacts of these land use factors. The magnitude of these travel impacts vary depending on specific conditions, user demographics, their degree of integration, and analysis perspective. Impacts may be large for affected travel (such as the trips generated at a particular site or district, or area commute trips), but this may represent a small portion of total travel, and some of the reduction may represent self-selection (people who drive less than average choose more accessible locations) so net regional trip reductions may be small.

Total impacts are multiplicative not additive, because each additional factor applies to a smaller base. For example, if one factor reduces demand 20% and a second factor reduces demand an additional 15%, their combined effect is calculated 80% x 85% = 68%, a 32-point reduction, rather than adding 20% + 15% = a 35-point reduction. This occurs because the 15% reduction applies to a base that is already reduced 20%. If a third factor reduces demand by another 10%, the total reduction provided by the three factors together is 38.8% (calculated as (100% - [80% x 85% x 90%]) = (100% - 61.2%) = 38.8%), not 45% (20% + 15% + 10%).

On the other hand, impacts are often synergistic (total impacts are greater than the sum of their individual impacts). For example, improved walkability, improved transit service, and increased parking pricing might only reduce vehicle travel by 5% if implemented alone, but if implemented together might reduce vehicle travel by 20-30%, because they are complementary.

Conclusions

This paper investigates the transport impacts of various land use factors, and evaluates land use management strategies (generally called *smart growth*, *new urbanism* or *compact development*) at achieving planning objectives, as summarized below.

Transport Impacts	Land Use Factors	Planning Objectives
Vehicle ownership Vehicle trips and travel (mileage) Walking Cycling Public transit travel Ridesharing Telecommuting Shorter trips	Regional accessibility Density Land use mix Centeredness Road and path connectivity Roadway design Active transport (walking and cycling) conditions Public transit service quality Parking supply and management Site design Mobility management Integrated smart growth programs	Congestion reductions Road and parking facilities Consumer savings and affordability Improved mobility for non-drivers Traffic safety Energy conservation Pollution emission reductions Improved public fitness and health Community livability objectives

This report considers various transport impacts, land use factors and planning objectives.

Although most land use factors have modest individual impacts, typically affecting just a few percent of total travel, they are cumulative and synergistic. Integrated smart growth programs that result in community design similar to what developed prior to 1950 can reduce vehicle ownership and travel 20-40%, and significantly increase walking, cycling and public transit, with even larger impacts if integrated with other policy changes such as increased investments in alternative modes and more efficient transport pricing.

Care is needed when evaluating the impacts of specific land use factors. Impacts vary depending on definitions, geographic and time scale of analysis, perspectives and specific conditions, such as area demographics. Most factors only apply to subset of total travel, such as local travel or commute travel. *Density* tends to receive the greatest attention, although alone its travel impacts are modest. Density is usually associated with other factors (regional accessibility, mix, transport system diversity, parking management) that together have large travel impacts. It is therefore important to make a distinction between the narrow definition of density as an isolated attribute, and the broader definition (often called *compact development*) that includes other associated attributes.

A key question is whether there is latent demand for alternative modes. Demographic and economic trends (aging population, rising fuel prices, increased health and environmental concerns, changing consumer location preferences, etc.) tend to increase demand for more accessible, multi-modal locations (Litman 2010). Real estate market studies indicate a growing shortage of such development (ULI 2009). This suggests that smart growth land use policies are likely to have greater impacts and benefits in the future.

WESTERN RIVERSIDE COUNCIL OF GOVERNMENTS

SUBREGIONAL CLIMATE ACTION PLAN

FINAL DRAFT
MAY 2014

Western Riverside County CLIMATE ACTION PLAN

WRCOG WESTERN RIVERSIDE COUNCIL OF GOVERNMENTS

A Letter to the Subregion

It is a pleasure to present the Western Riverside Council of Governments (WRCOG) Subregional Climate Action Plan, the result of over three years of collaborative efforts among community leaders, industry experts, renowned scientists and consultants, and local governments. This plan describes the effects climate change could have on our subregion and suggests ways we can work together to address these challenges and reduce our collective carbon footprint while concurrently growing the economy and improving community livability and public health.

In 2012, WRCOG made a commitment to achieve a sustainable quality of life by adopting a Sustainability Framework, which is a blueprint that serves as a beginning point to establish, implement, and continuously refine a subregional sustainability plan for jurisdictions within WRCOG. This Framework presents a practical, integrated approach to sustainability which consists of six core components: Economic Development, Education, Health, Transportation, Water and Wastewater, and Energy and the Environment. WRCOG continues to demonstrate leadership in implementing programs that are environmentally, economically, and socially beneficial to the subregion including innovative award winning programs such as the HERO Program - an energy efficiency and water conservation financing program, the Transportation Uniform Mitigation Fee (TUMF), the Western Riverside Energy Leader Partnership (WRELP), and the Western Riverside County Clean Cities Coalition.

We believe our efforts demonstrate that implementing sustainable practices creates green jobs and a better economy, and makes our subregion a cleaner, safer, more enjoyable place to live. As you will notice in this report, some of the steps we need to take – such as investing in transportation infrastructure – require the involvement of the state and federal government. But many other important – and simple – steps can be achieved at the local level, such as driving less and walking more, using energy-efficient light bulbs, or turning down the thermostat a few degrees in the winter.

This Climate Action Plan provides a roadmap – a set of ideas – to help expand on our successes to slow the effects of climate change. It's no secret that this will require an enormous amount of hard work and cooperation. It will require the commitment of not only government, but of communities, individuals and businesses in our subregion. Our goal is to make WRCOG a vibrant example of how a subregion can collaborate to achieve climate protection goals and, as a result, enhance quality of life for all its residents and businesses. We are confident that if we can embrace this common challenge with creativity and commitment, WRCOG and its member jurisdictions will continue to lead the effort toward a sustainable future.

Sincerely,

Rick Bishop
Executive Director

Acknowledgements

The preparation of the Subregional Climate Action Plan was funded by a Sustainable Communities Planning Grant through California's Strategic Growth Council. The Strategic Growth Council, created in September 2008 by Senate Bill 732, is a cabinet level committee that is tasked with coordinating the activities of member state agencies to improve air and water quality, improve natural resource protection, meet the goals of the California Global Warming Solution Act of 2006, encourage sustainable land use planning, and revitalize urban and community centers in a sustainable manner. The Sustainable Communities Planning Grant Program is funded by The Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Proposition 84).

We would like to especially thank the WRCOG Planning Directors' Technical Advisory Committee for their leadership and passion for the project and the communities of Western Riverside County.

WRCOG – Western Riverside Council of Governments

WRELP – Western Riverside Energy Leader Partnership

Executive Summary

Climate change is occurring and needs to be addressed to successfully prepare for a sustainable future in which residents are healthy, businesses thrive, and communities prosper. The Western Riverside Council of Governments (WRCOG) tactic to mitigating climate change is to take a unified, collaborative approach and develop this Subregional Climate Action Plan (CAP). The objectives are to create more livable, equitable, and economically vibrant communities. By using energy more efficiently, harnessing renewable energy to power our buildings, enhancing access to sustainable transportation modes, recycling our waste, conserving water, and building local food systems, we can keep dollars in our local economy, create new green jobs, and improve public health and community quality of life. By integrating these elements, the WRCOG Subregional CAP will:

- **Create Local Jobs:** The technologies, products and services required for the shift to a low-carbon future can be provided by employers in our communities. Dollars currently spent on fossil fuels will no longer leave our economy. They will stay here to pay for home insulation; lighting retrofits; solar panels; bicycles; and engineering, design, and construction of more sustainable communities. WRCOG's adopted Sustainability Framework prioritizes sustainability as a key economic engine of the subregion, and our HERO financing program is a prime example of our success. HERO has created more than 1,000 jobs since its inception in 2011.

- **Promote Healthier Communities:** Walkable and bikeable neighborhoods, fresh foods, and clean air provide healthier, more active lifestyle options for our residents. Healthy communities are areas where public health and climate action policy priorities intersect, creating new active transportation and living options, enhancing access to nutritious foods, and improving our quality of life and environment.

- **Become More Energy Self-Sufficient:** Actions in this CAP will help reduce our reliance on fossil fuels. As energy prices continue to increase and supplies become more uncertain, reduced reliance on volatile oil supplies will diminish risks faced by everyone.

- **Enhance Social Equity:** Disparities among residents can be reduced by ensuring that communities most vulnerable to climate change effects are given priority for green jobs, healthy local food, energy-efficient homes and affordable, efficient transportation. We can also improve equity by ensuring that these communities are enabled to implement the CAP in a meaningful and engaging way.

- **Reduce Emissions, Improve Air Quality, and Protect Natural Systems:** Reducing GHG emissions from major sources helps protect and improve the air we breathe and the environment in which we live. Sustaining the values and functions of our habitat is an essential strategy that can simultaneously reduce emissions, sequester carbon and strengthen our ability to adapt to a changing climate. Healthy watersheds and ecosystems are an integral part of a sustainable Western Riverside County.

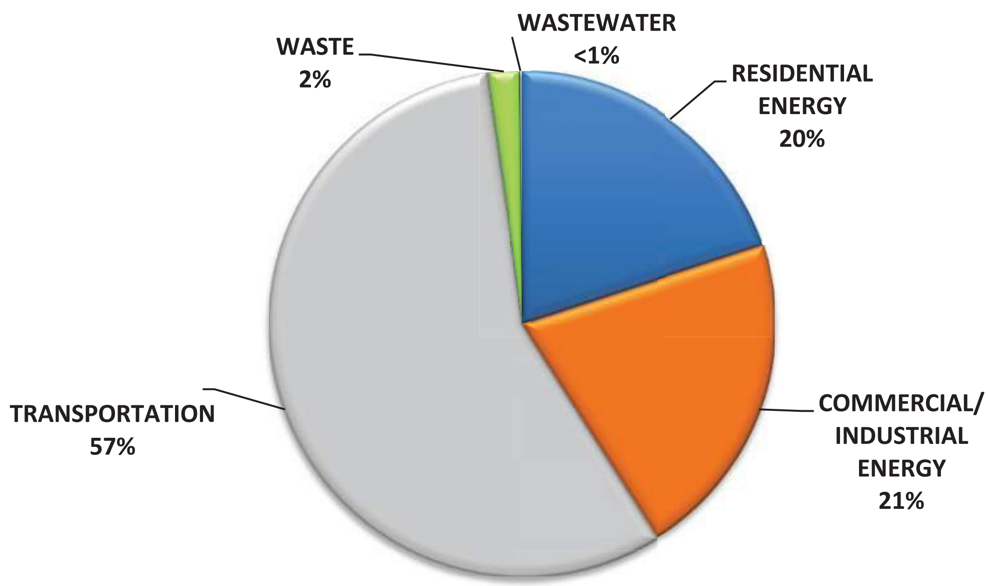
- **Save Money:** Using less energy in our homes, buildings and vehicles means lower energy and transportation bills for residents, business and government. Residents and local governments can also realize health-care cost savings inherent to a healthier, more active community.

Twelve cities in our subregion have joined efforts to develop this Subregional CAP, which sets forth a subregional emissions reduction target, emissions reduction measures, and action steps to assist each community to demonstrate consistency with California's Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32).

MEASURING OUR EMISSIONS

To ensure that the subregion stays on course to meet its greenhouse gas (GHG) reduction target, it is necessary to track our progress by conducting regular, community-wide GHG emissions inventories. It helps to think of an inventory as a "snapshot" of our subregion's GHG emissions for a given year. An inventory identifies the major sources and quantity of GHG emissions produced by residents, businesses, and public institutions. In 2010, Subregional CAP cities emitted approximately 5,834,400 metric tons of GHG emissions. Figure ES-1 below illustrates these emissions by source.

Figure ES-1: Baseline Greenhouse Gas Emissions by Source

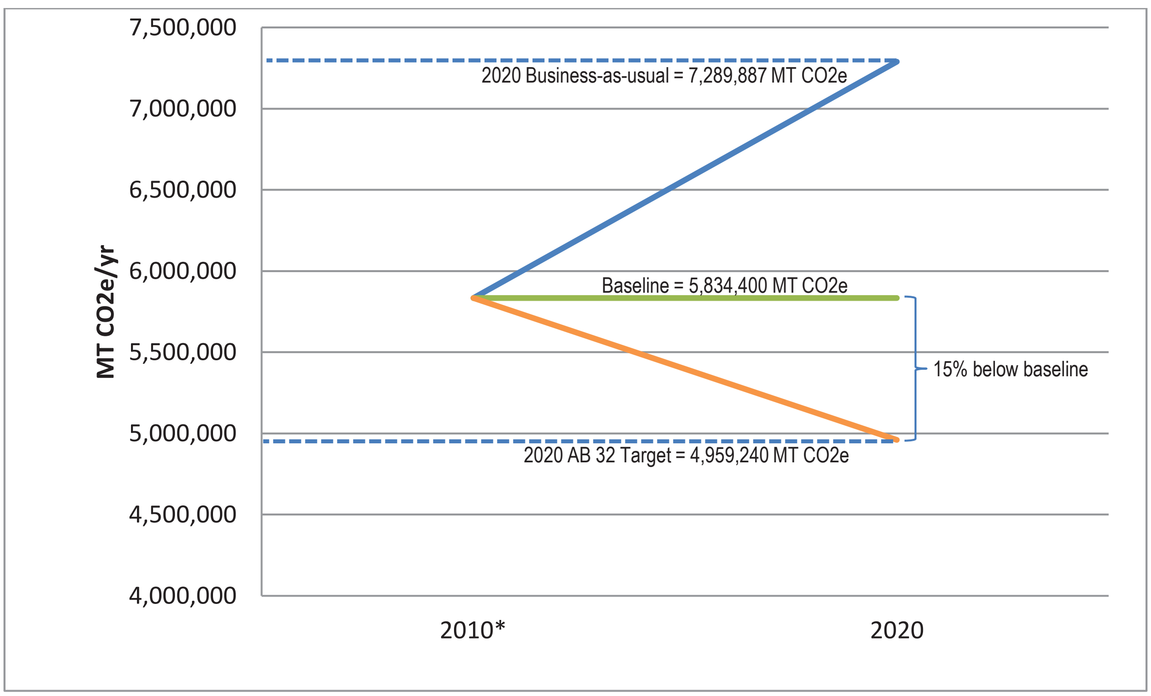


The inventory reflects the emissions that result from motor vehicles driven, electricity and natural gas consumed, waste generated, water consumed, and wastewater treated within participating jurisdictions' limits. It provides a useful tool to track community and local government emissions over time, and to target climate protection strategies to address the main emissions sources.

REDUCING OUR EMISSIONS

WRCOG's subregional emissions reduction targets are 15% below 2010 levels by 2020, and 49% below 2010 levels by 2035. This plan focuses on feasible actions Western Riverside County communities can and should take between now and 2020, as well as innovative approaches currently beyond our current reach that will be needed to achieve the 2035 target. Based on forecasted emissions levels, a 15% reduction from 2010 levels equates to a GHG emissions reduction of nearly 2,330,647 metric tons below business-as-usual (BAU) conditions by 2020, as shown in Figure ES-2. This CAP identifies objectives and actions in four categories to set the subregion on a path to meet our 2020 GHG emission target.

Figure ES-2: WRCOG Subregion–Community GHG Business as Usual Forecasts and Reduction Target for 2020



*2010 is used as baseline year for all jurisdictions except for the cities of Eastvale and Jurupa Valley, as noted in Chapter 2.

TAKING ACTION

This CAP includes feasible strategies that will help the WRCOG subregion advance toward GHG emissions reduction goals, while affording our communities other economic and environmental benefits. The Plan builds upon existing successes and encompasses a range of strategies from expanding the successful HERO program, to increasing residential and business recycling, to reducing vehicle miles traveled, and increasing energy efficiency. It offers cost-effective strategies that will support our local economy; reduce risks for energy and fuel price increases and volatility; and offer a wide range of other environmental, social, and economic benefits. Actions that reduce GHG emissions also support other local community goals and contribute to sustaining the WRCOG subregion as a vibrant community.

The CAP contains GHG reduction measures organized into four primary sectors, as follows:

ENERGY

- Energy measures will increase community-wide building and equipment efficiency and renewable energy use, and promote energy efficiency and renewable energy generation use supporting municipal operations in our communities.

TRANSPORTATION AND LAND USE

- Transportation and land use measures will reduce single-occupancy vehicle travel, increase non-motorized travel, improve public transit access, increase motor vehicle efficiency, and promote sustainable growth patterns.

SOLID WASTE

- Solid waste measures will reduce community and municipal solid waste sent to landfills.

WATER

- Water measures will increase community water conservation and reduce water consumed to support municipal operations in our communities.

If fully implemented, the CAP will exceed our 2020 goal by 2.6%, achieving an overall 17.6% reduction in GHG emissions by 2020. Annual progress reports will allow the Plan to evolve along with local budget priorities, carbon markets, and technology.

REALIZING OUR GOALS

While measuring GHG emissions, establishing reduction targets, and developing a CAP are essential steps, the most important work lies ahead: **Implementation.**

Turning this plan into action rests on more than just good ideas and intentions. It requires residents, businesses, municipal governments, and other institutions in our communities to rise to the challenge of change. Infrastructure, technology, workforce development, and our daily decisions must reflect these goals.

The CAP recommends strategies to support individuals' and businesses' efforts to consume less energy, move more efficiently, and produce less waste. Implementing the plan will, for example, increase access to public transit and make it safer to commute by foot or bicycle, provide incentives to make homes and businesses more energy efficient, and increase the convenience of recycling and composting waste.

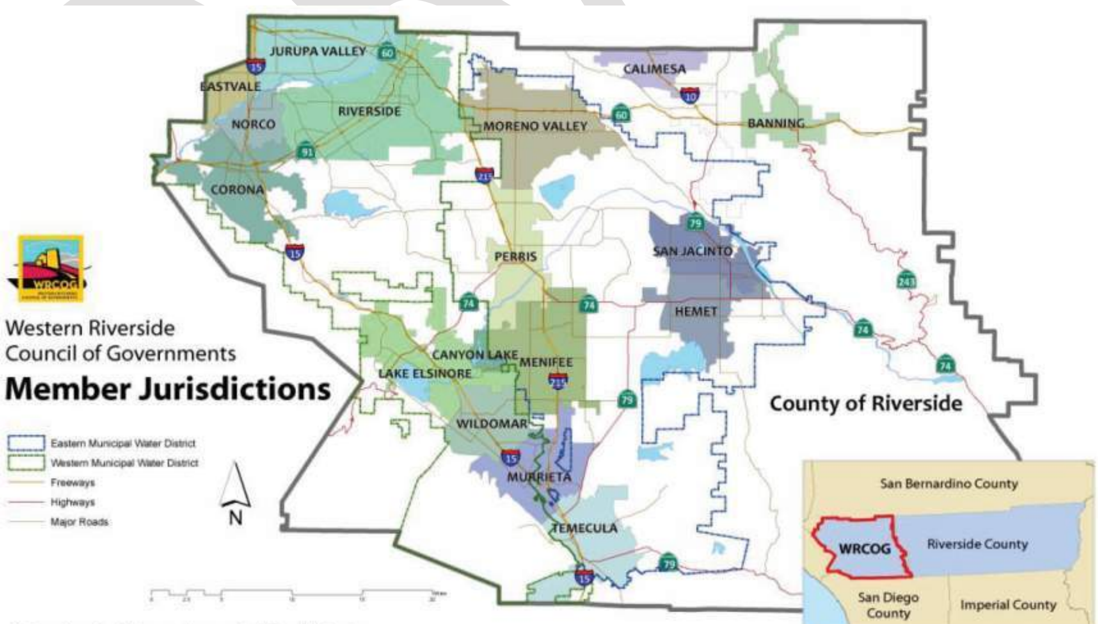
WRCOG is committed to leading the region toward a more sustainable future by realizing the goals set forth in this plan. How can ***you*** contribute?

Chapter 1 Introduction

PURPOSE

The Western Riverside Council of Governments (WRCOG) has a strong legacy of collaboration among its member agencies (see **Figure 1-1**) and innovation in implementing programs that are environmentally, economically, and socially beneficial to the subregion. WRCOG has been a leader in promoting sustainability through its adopted Sustainability Framework, Western Riverside Energy Leader Partnership (WRELP), HERO Program - an energy efficiency and water conservation financing program, and Western Riverside County Clean Cities Coalition. This Climate Action Plan (CAP) is another innovative subregional planning effort, led by WRCOG, to reduce **greenhouse gas (GHG) emissions**.

Figure 1-1: WRCOG Subregion



Notes: Areas in white are unincorporated Riverside County.
Eastern Municipal Water District and Western Municipal Water District are also members of WRCOG. The Riverside County Superintendent of Schools and the Morongo Band of Mission Indians are ex-oficio members.

Western Riverside County is establishing itself as a leader in energy efficiency and sustainability efforts and each of WRCOG's member jurisdictions are addressing climate change through different local programs. Twelve cities in Western Riverside County have joined efforts to develop this Subregional CAP, which sets forth a subregional emissions reduction target, emissions reduction measures, and action steps to assist each community to demonstrate consistency with California's Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32). Several jurisdictions in the WRCOG subregion have already adopted a local CAP, or are in the process of doing so. **Table 1-1** below illustrates which jurisdictions are participating in this Subregional CAP effort, and also lists additional sustainability programs that jurisdictions participate in relevant to the subregional CAP. The WRELP Program is a collaboration between WRCOG Southern California Edison (SCE), and the Southern California Gas Company (SCG), which includes the development of Energy Action Plans for 11 communities. Several jurisdictions are participating in separate partnership efforts with SCE, also targeting energy efficiency. Four of WRCOG's member jurisdictions have municipally-owned utilities, which provide energy and/or water and wastewater services to their communities and pursue individual efficiency and sustainability efforts.

AB 32 directs California to reduce statewide GHG emissions to 1990 levels by 2020. To achieve these reductions, the California Air Resources Board (CARB) recommends that local governments target their 2020 emissions at 15% below "current"[1] levels, consistent with the statewide commitment, to account for emissions growth that has occurred since 1990. Several initiatives at the state level will help the subregion reduce GHG emissions, but they alone will not be sufficient to meet the 2020 target. This CAP provides a roadmap for individual communities in the subregion to reduce GHG emissions through local actions.

The release of GHGs into the atmosphere is the direct and indirect result of everyday activities as residents and businesses use energy in their homes and offices, travel to work, generate waste, and use water. Local governments also emit GHGs as they perform essential services and operate buildings, vehicles, street lights, traffic signals, water systems, and wastewater plants. Strategies in this CAP to reduce such emissions include increasing energy efficiency in buildings and facilities, utilizing renewable energy sources, increasing vehicle fuel efficiency, supporting alternative modes of transportation, reducing waste generation, and reducing water consumption. In addition to addressing climate change, reducing GHG emissions often provides co-benefits such as reducing energy and transportation costs for residents, businesses, and local governments; creating green jobs and supporting advancement of green technologies and industries; improving air quality and the overall health of residents; and making the community a more attractive place to live and locate a business.

The WRCOG Subregional CAP is the result of an analysis of existing GHG reduction programs and policies that have already been implemented in the subregion and of applicable best practices from other regions to assist in meeting the 2020 subregional reduction target. The resulting GHG reduction measures were chosen by the subregion based on their GHG-reduction potential, cost-benefit characteristics, funding availability, and feasibility of implementation. The level of implementation of each measure was determined by each community; however, this CAP presents the results collectively, demonstrating the collaborative effort and partnership that will facilitate implementation.

This CAP is organized into four chapters:

- **Chapter 1, Introduction:** provides the framework for the CAP, places the CAP in the context of current climate change science and policy, describes existing regional and local sustainability efforts and accomplishments, and discusses the CAP's relationship to the California Environmental Quality Act (CEQA).
- **Chapter 2, Emissions Inventory, Projections, and Goals:** describes the emissions inventory process and results, forecasted business-as-usual emissions for the subregion, and the adopted subregional emissions reduction target.
- **Chapter 3, Reduction Measures and Actions:** contains the anticipated State and federal emissions reductions, and the local reduction measures and actions that will be implemented to meet the subregional reduction target.
- **Chapter 4, Implementation and Monitoring:** provides best practices and specific resources for implementing reduction measures, the role for measure-specific evaluations, periodic updates to the inventories, use of indicators to monitor the subregion's progress, and the need for future iterations of the CAP to incorporate new data and reduction measures as they become available.

[1] "Current" is a term used by CARB in its Climate Change Scoping Plan of September 2008, but is undefined. It is generally taken to mean emissions for a year between 2005 and 2008, although other years have been used by local communities.

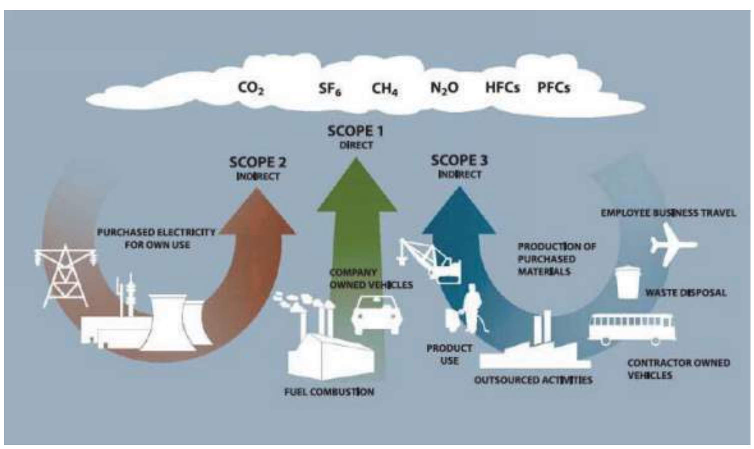
GREENHOUSE GAS EMISSIONS IMPACTS

Naturally occurring gases dispersed in the atmosphere determine the Earth's climate by trapping infrared radiation (heat). This phenomenon is known as the greenhouse effect and without it, the Earth would be about -2°F. Overwhelming evidence shows that human activities are increasing the concentration of GHGs in the atmosphere, trapping more heat, and changing the global climate. The most significant contributor is the burning of fossil fuels for transportation, electricity generation, and other purposes, which introduces large amounts of carbon dioxide and other GHGs into the atmosphere. Collectively, these gases intensify the natural greenhouse effect, causing global average surface and lower atmospheric temperatures to rise, a phenomenon known as global climate change.

The most important GHGs to reduce are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), which constitute over 98% of human-released GHGs in the U.S.[2] Other important GHGs include hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These gases are emitted through a variety of natural processes and human activities (see **Figure 1-2**), including:

- Fossil fuel combustion (CO_2, N_2O, and CH_4);
- Agricultural operations, such as fertilization of crops (N_2O), livestock production, and rice cultivation (CH_4);
- Anaerobic composting and landfill off-gassing (CH_4);
- Refrigeration and cooling (HFCs); and
- Industrial manufacturing, including aluminum production (PFCs), semi-conductor manufacturing (SF_6), and cement production (CO_2).

Figure 1-2: Greenhouse Gases Regulated Under AB 32



Global Warming Potential (GWP) is a quantitative measurement that expresses the relative warming potency of each GHG over a specific period of time. CO_2 is assigned a GWP value of 1 and the other GHGs are assigned GWPs relative to CO_2. For GHG emission inventories, the amount of each gas emitted is multiplied by its GWP and presented in units of carbon dioxide equivalents (CO_2e). **Table 1-2** lists the six primary GHGs as defined in AB 32, their chemical formula, the lifetime of the compound, and their

---

[2] U.S. Environmental Protection Agency, 2011, http://www.epa.gov/climatechange/ghgemissions/gases.html

GWPs relative to CO_2. Although CO_2 has a lower GWP than other GHGs, it is the largest contributor to human-caused global warming, constituting about 84% of U.S. emissions.[3]

Table 1-2: Greenhouse Gases Regulated Under AB 32

Greenhouse Gas	Chemical Formula	Lifetime (years)	Global Warming Potential for 100-year horizon
Carbon Dioxide	CO_2	Variable	1
Methane	CH_4	12	21
Nitrous Oxide	N_2O	114	310
Sulfur Hexafluoride	SF_6	3,200	23,900
Hydrofluorocarbons	HFCs	1.4 – 270	140 – 11,700
Perfluorocarbons	PFCs	1,000 – 50,000	6,500 – 9,200

Source: International Panel on Climate Change (IPCC) Second Assessment Report: Climate Change 1995 (SAR). Available at: http://www.ipcc.ch/publications_and_data/publications_and_data_reports.shtml

Note: According to the Local Government Operations Protocol (LGO Protocol) and the U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions (Community Protocol), the GWP values in **Table 1-2** were applied in this CAP. Since the SAR was published in 1995, the IPCC has published updated GWP values in its Third Assessment Report (TAR) and Fourth Assessment Report (AR4) that reflect new information on atmospheric lifetimes of GHGs and an improved calculation of the radiative forcing of CO_2. However, GWP values from the SAR are still used by international convention to maintain consistency in GHG reporting. For GWP values that were not quantified in the SAR, GWP values from the TAR were used.

While the anticipated effects of climate change are likely to vary regionally, it is anticipated to have the following global effects[4]:

- Higher maximum temperatures and more hot days over most land areas;
- Higher minimum temperatures, fewer cold days, and frost days over most land areas;
- Reduced diurnal temperature range over most land areas;
- Increased heat index over land areas; and
- More intense precipitation events.

Many secondary effects are anticipated to result from climate change in California, including: loss in snow pack; sea level rise and inundation of coastal areas; increased flooding of low-lying areas; more extreme heat days per year; high ozone days; increased incidence of large forest fires; and more frequent and severe drought years.

REGULATORY CONTEXT

Many strategies for monitoring and addressing climate change have emerged at the international, national, and state levels. California remains a leader in the effort to reduce GHG emissions through mitigation and adaptation strategies. With AB 32, California is the first state in the U.S. to mandate GHG emissions reductions across its entire economy. To support AB 32, California has been developing policy and passing legislation that seeks to control emissions of gases that contribute to climate change. These have included regulatory approaches such as mandatory reporting for significant sources of GHG emissions and caps on emission levels, as well as market-based mechanisms, such as cap-and-trade. Voluntary local actions are also increasing, such as conducting emissions inventories, implementing practices to reduce emissions, and purchasing offsets and renewable energy certificates. While many local actions are currently voluntary, there is more emphasis being placed on monitoring and reporting emissions to demonstrate the effectiveness of policies and local consistency with state reduction goals. The following section highlights the primary state legislation and guidance related to this CAP.

STATE LEGISLATION AND GUIDANCE

AB 32, also known as the Global Warming Solutions Act of 2006, directs public agencies in California to support the statewide goal of reducing GHG emissions to 1990 levels by 2020. Preparing a CAP supports AB 32 at the local level. The CAP provides a policy framework for how the subregion can do its part to reduce emissions. While compliance with AB 32 is not a requirement for local jurisdictions, demonstrating consistency with statewide reduction goals can significantly assist WRCOG jurisdictions to qualify for incentives such as grant funding. Efforts to address climate change, reduce consumption of resources, and improve energy efficiency led by state legislation or programs are briefly described below and identified in **Figure 1-3**.

Executive Order S-3-05

On June 1, 2005, Governor Arnold Schwarzenegger signed Executive Order (EO) S-3-05, which established the following GHG emission reduction targets:

- by 2010, California shall reduce GHG emissions to 2000 levels;
- by 2020, California shall reduce GHG emissions to 1990 levels; and
- by 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

EO-S-3-05 created the California Climate Action Team (CAT), which is tasked with the preparation of biennial science assessment reports on climate changes and adaptation options for California. The first CAT Report to the Governor and Legislature was published in 2006, and contains recommendations and strategies to help meet the targets in EO-S-3-05. These were expanded upon in the 2009 CAT Biennial Report to the Governor and Legislature. The new information includes revised climate and sea-level projections, and an evaluation of climate change within the context of broader social changes, such as land-use changes and demographic shifts[5]. The action items in the report focus on the preparation of the Climate Change Adaptation Strategy, required by EO-S-13-08.

[5] California EPA - Climate Action Team Report to Governor Schwarzenegger and the Legislature, March 2006. Available at: http://www.climatechange.ca.gov/climate_action_team/reports/index.html

Assembly Bill 32 – California Global Warming Solutions Act of 2006

AB 32 was approved by the legislature and signed by Governor Schwarzenegger in 2006. The landmark legislation requires CARB to develop mechanisms that will reduce GHG emissions to 1990 levels by 2020. Mandatory actions under the legislation to be completed by CARB include:

- Identification of early action items that can be quickly implemented to achieve GHG reductions. These early action items were adopted by CARB in 2007 and include regulations affecting landfill operations, motor vehicle fuels, car refrigerants, and port operations, among other regulations.
- Development of a scoping plan[6] to identify the most technologically feasible and cost-effective measures to achieve the necessary emissions reductions to reach 1990 levels by 2020. The Scoping Plan identifies a variety of GHG reduction measures that include direct regulations, alternative compliance mechanisms, incentives, voluntary actions, and market-based cap-and-trade program. The Plan identifies local governments as strategic partners to achieving the state goal and translates the reduction goal to a 15% reduction of current emissions by 2020.
- Creation and adoption of regulations to require the state's largest industrial emitters of GHGs to report and verify their emissions on an annual basis.

Senate Bill 97 – California Environmental Quality Act Guideline Amendments of 2007

Senate Bill (SB) 97 was adopted in 2007 and directed the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to address GHG emissions. The CEQA Guidelines prepared by OPR were adopted in December 2009 and went into effect March 18, 2010. Local governments may use adopted plans consistent with the CEQA Guidelines to assess the cumulative impacts of projects on climate change, if the plan for the reduction of GHG emissions accomplishes the following:

- Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area.
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable.
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area.
- Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level.
- Establish a mechanism to monitor the plan's progress toward achieving the level and to require an amendment if the plan is not achieving specified levels.
- Be adopted in a public process following environmental review.

SB 375 – Sustainable Communities and Climate Protection Act of 2008

SB 375, also known as the Sustainable Communities and Climate Protection Act of 2008, builds off of AB 32 and aims to reduce GHG emissions by linking transportation funding to land use planning. It requires the state's metropolitan planning organizations (MPO) to create a sustainable communities strategy (SCS) in their regional transportation plans (RTP) for the purpose

e of reducing urban sprawl. Under SB 375, CARB established regional targets for GHG emissions reductions from passenger vehicle use for each MPO. The regional reduction targets for the Southern California Association of Governments (SCAG) region, which is the MPO with jurisdiction over the

[6] CARB 2008 Scoping Plan. Available at http://arb.ca.gov/cc/scopingplan/scopingplan.htm

WRCOG subregion, are 8% per capita by 2020, and a conditional target of 13% per capita by 2035 from 2005 levels. In April 2012, SCAG adopted its first SCS, which demonstrates how the region will achieve the GHG emissions reduction targets set by CARB.

Figure 1-3 categorizes the applicable state regulations that provide a policy framework for addressing climate change. A more detailed description of these regulations is included in the jurisdictional Greenhouse Gas Inventory Reports (Appendix X).

REGIONAL PROGRAMS

The regional initiatives described below contribute to the development and success of this CAP. Many of these programs are administered by WRCOG and several are conducted by other regional entities in partnership with WRCOG.

Southern California Association of Governments Regional Transportation Plan and Sustainable Communities Strategy

SCAG is the regional planning agency for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties, and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SCAG serves as the federally designated MPO for the Southern California region and is the largest MPO in the U.S. With respect to air quality planning, SCAG has prepared the 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012 RTP/SCS): Towards a Sustainable Future, to fulfill federal planning requirements contained in the Safe, Accountable, Flexible, Efficient, Transportation Equity Act: A Legacy for Users (SAFETEA-LU), which calls for regions to consider urban form and natural resources as part of the transportation planning process. Under SB 375, all of California's MPOs must prepare an SCS as a component of their RTP. The RTP serves as a long-range transportation plan that is developed and updated by SCAG every four years. The RTP provides a vision for the development of transportation facilities throughout the region based on growth forecasts and economic trends that project over a 20-year period. The SCS expands upon transportation strategies in the RTP to analyze growth patterns and establish future land use strategies that aid the region in meeting its GHG reduction targets. The SCS does not mandate future land use policies for local jurisdictions, but rather provides a foundation of regional policy upon which local governments can build. WRCOG and its member jurisdictions partner with SCAG and are active members in the development and implementation of the RTP/SCS.

HERO Program

Established under the guidance of AB 811 (2008) and AB 474 (2009), WRCOG's HERO Program is a Property Assessed Clean Energy (PACE) program that provides financing to residential and commercial property owners for the installation of energy efficient, renewable energy, and water conservation improvements on existing properties. Financing provided through the HERO Program is repaid through an assessment on property tax bills over 5-, 10-, 15-, 20-, and 25-year terms, based on the useful life of the products, and upon sale of the property, the balance generally stays with the property.

Sustainability Framework for Western Riverside County

WRCOG's Sustainability Framework (Framework) is a subregional planning effort that establishes, implements, and continuously refines an overarching sustainability plan for the communities in Western Riverside County. The Framework aims to: initiate a dialogue about the importance of sustainability in the region; provide a vision and goals to guide local action and regional collaboration; define more immediate short-term goals that can contribute to the longer-term vision of the Framework; and define indicators, benchmarks, and targets that provide a measure of the effectiveness of Framework programs and policies. The Framework acts as a "living" document and contains goals and actions applying to economic development, education, public health, transportation, water and wastewater, energy, and the environment.

Western Riverside County Clean Cities Coalition

The Western Riverside County Clean Cities Coalition (Coalition) is a voluntary local government and industry partnership that aims to reduce the consumption of petroleum fuels and improve air quality in the WRCOG subregion. The Coalition works to mobilize local stakeholders toward expanding the use of alternative fuel vehicles (AFV) and advanced technology vehicles, promoting local idle reduction measures, and strengthening local AFV fueling infrastructure. The governments of Western Riverside County have taken leadership roles in the Coalition, coordinating efforts between government and industry to recognize the value of partnership in achieving air quality, energy efficiency, economic development, and transportation goals, while advancing the clean air and energy efficiency goals of the national Clean Cities program administered by the U.S. Department of Energy.

Healthy Communities

WRCOG and its member jurisdictions are engaged in numerous efforts and initiatives to promote healthy communities, including participating in the Riverside County Health Coalition (RCHC). The RCHC is a collaboration of public and private sectors, school districts, community businesses, local and regional organizations and community members committed to policy development and advocacy, environmental change and community empowerment for healthy lifestyles in Riverside County. This initiative includes a focused partnership effort with local governments to integrate healthy communities into the local planning and policy-making process.

Multiple Species Habitat Conservation Plan

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is a comprehensive, multi-jurisdictional plan to conserve sensitive species and their associated habitats in the subregion. Created in 2004 by the Western Riverside County Regional Conservation Authority (RCA), the MSHCP provides subregional transportation and green infrastructure benefits to local agencies and allows WRCOG jurisdictions to make land use decisions and maintain a strong economy in a context that comprehensively addresses federal and state Endangered Species Acts (ESA and CESA) requirements.

Transportation Uniform Mitigation Fee

WRCOG's Transportation Uniform Mitigation Fee (TUMF) was implemented in 2003 as one of the largest multi-jurisdictional fee programs in the nation. TUMF makes improvements to the regional transportation system and provides transportation demand management through funds from new development, ensuring that development mitigates for increases in traffic volumes. TUMF is a 32-year program that provides subregional transportation and infrastructure benefits to local agencies in Western Riverside County. The program is expected to raise $4.2 billion, and 1.64% is allocated to the Riverside Transit Agency (RTA) for transit improvements. To mitigate the impacts of transportation construction projects, WRCOG allocates 1.59% of TUMF funds collected to the RCA to purchase habitat for the MSCHP.

EXISTING LOCAL SUSTAINABILITY ACCOMPLISHMENTS

Several jurisdictions within the WRCOG subregion have already adopted, or are in the process of adopting, GHG emissions reduction policies or entire CAPs independent of the Subregional CAP process. Existing policies and programs were identified that reduce GHGs through energy conservation, renewable energy development, solid waste reduction, commute reduction, and the expansion of the urban forest. Several energy programs are available throughout the subregion, which are managed by WRCOG, SCE, Southern California Gas Company (SCG), Riverside Public Utilities (RPU), Banning Electric Utility (BEU), and the County of Riverside. These programs include financing for building energy retrofits and renewable energy projects, energy efficiency retrofit rebates, smart metering and smart grid technologies, and various energy efficiency education and outreach campaigns.

Some jurisdictions have building code requirements to implement and expand upon the California Green Building Standards Code (CALGreen), or policies to streamline energy efficiency and renewable energy permitting. Many are improving the efficiency of public realm lighting, including street lights, traffic lights, parking lot lighting and outdoor commercial lighting, and their water and wastewater conveyance and treatment facilities.

Policies to reduce solid waste include waste collection billing policies through municipalities or their contracted waste haulers, food scrap and compostable paper diversion outreach, lumber scrap diversion ordinances and outreach, yard waste collection, recycling outreach campaigns and voluntary waste audits, landfill methane capture, and food waste biodigestion programs in Norco and Riverside.

Policies that reduce GHG emissions from potable water conveyance focus on reducing water demand through consumer behavior pricing, water conservation education, and landscape irrigation efficiency. Some jurisdictions have adopted ordinances requiring the installation of certain water conservation measures at properties before selling or renovating properties. While many jurisdictions are seeking to expand recycled water deliveries, fewer promote rainwater collection or graywater system use at this time.

Existing transportation policies focus on enhancing pedestrian and bicycle amenities and facilities alongside the expansion and improvement of transit systems, but also include various transportation demand management programs to reduce single-occupancy vehicle miles traveled (VMT) during commute hours. Several jurisdictions have policies supporting the expansion of the urban forest, and some have mandatory shade tree planting requirements that also reduce building energy. Finally, many jurisdictions are actively expanding mixed-use developments and transit-oriented developments to encourage people to drive less, and enrich the character and economic vitality of their communities.

WESTERN RIVERSIDE ENERGY LEADER PARTNERSHIP

The WRELP Program builds upon the existing policies and programs in the region to analyze energy-sector emissions and propose energy conservation and renewable energy measures that reduce GHG emissions within Energy Action Plans (EAPs) for 11 WRCOG jurisdictions served by SCE. The WRELP partners include Calimesa, Canyon Lake, Hemet, Lake Elsinore, Menifee, Murrieta, Norco, Perris, Temecula, San Jacinto, and Wildomar (see **Table 1-1**). The WRELP effort uses funding provided by SCE to implement within the region the California Long-Term Energy Efficiency Strategic Plan (CEESP), developed by the California Energy Commission (CEC) as a collaborative effort in response to California's need for a long-term strategic energy efficiency plan. Following CEESP Goal 4, individual EAPs were developed for each participating jurisdiction, creating a comprehensive program to address energy efficiency, sustainability, and climate change through the years 2020 and 2035. The EAPs informed the development of the energy efficiency measures in this CAP.

RELATIONSHIP TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

In 2007, state lawmakers identified the need to analyze GHG emissions in the CEQA process through the adoption of SB 97. The bill required OPR to develop, for adoption by the Natural Resources Agency, amendments to the CEQA Guidelines that clarified several points about the analysis and mitigation of GHG emissions. Aside from establishing the need for lead agencies to analyze and mitigate for a project's potentially significant impacts relating to GHG emissions, the amendments also provided that a lead agency may streamline the analysis of GHG emissions for projects that follow a programmatic GHG emissions reduction plan, or climate action plan, meeting certain criteria. The amendments to the CEQA Guidelines became effective on March 18, 2010. OPR is currently developing a Technical Advisory that will further describe, among other climate action planning topics, how plans for reducing GHGs can be used in CEQA analyses.

Chapter 2
Emissions Inventory

A jurisdiction's greenhouse gas (GHG) inventory serves multiple purposes. It quantifies the GHG emissions resulting from activities taking place throughout the community by residents, businesses, and local governments, and creates an emissions baseline against which the jurisdiction can set emissions reduction targets and measure future progress. It also provides an understanding of where GHG emissions originate and allows a jurisdiction to develop effective policies, strategies, and programs to reduce emissions.

As part of the Subregional Climate Action Plan (CAP) process for Western Riverside County, baseline inventories were prepared for each participating jurisdiction to quantify GHG emissions resulting from the community and government operations (Appendix X). Community-wide inventories encompass the GHG emissions resulting from activities taking place within each jurisdiction's boundaries, where the local government has jurisdictional authority, in addition to some activities taking place outside the boundaries that support activities in the jurisdiction (for example, solid waste sent to landfill areas outside the boundaries). The baseline inventories include emissions from the following sectors: residential energy, commercial/industrial energy, transportation, waste, and wastewater.

2010 is the inventory base year for 10 of the 12 participating jurisdictions within the WRCOG subregion (the cities of Banning, Calimesa, Canyon Lake, Hemet, Norco, Perris, Riverside, San Jacinto, Temecula, and Wildomar). For the cities of Eastvale and Jurupa Valley, which incorporated in October 2010 and July 2011, respectively, the most recent available data were used. The baseline inventory summary presented in this chapter describes the cumulative GHG emissions generated by the jurisdictions participating in the WRCOG Subregional CAP effort, as determined from individual jurisdictional inventories.

BASELINE EMISSIONS INVENTORY

INVENTORY PROCESS

The emissions inventory for each participating jurisdiction was developed using guidance from two standards for emissions accounting and reporting: the Local Government Operations Protocol (LGO Protocol) and the U.S. Community Protocol for Accounting and Reporting of GHG Emissions (Community

Protocol). The LGO Protocol was developed through a partnership between CARB, The Climate Registry, and ICLEI USA. The Community Protocol was released by ICLEI USA in October 2012 and represents the first comprehensive U.S. standard for community-wide inventories.

The emissions inventory is intended to represent emissions sources in each jurisdiction with greatest influence on community-wide activities and government operations. As communities provide different services to their residents and businesses, the scale of the services and resulting emissions are highly dependent upon the size and purview of the local government. For these reasons, comparisons among community or local government inventories should not be made without also describing the municipal services provided by each jurisdiction or presenting community-level indicators such as population or socioeconomic factors.

Furthermore, the inventory estimates current emissions using the best available data and methods at the time the inventory was completed. As data collection and estimation methodologies evolve, future inventories may incorporate emission sources that were not captured previously, or may use newer approaches to estimating emissions.

INVENTORY CATEGORIES

In the community inventory, baseline emissions are categorized into sectors based on their source(s), as follows:

- Residential Energy: Residences consume electricity and natural gas for daily operations and heating/cooling.
- Commercial/Industrial Energy: Commercial and industrial buildings consume electricity and natural gas for daily operations and heating/cooling. This sector includes all non-residential building energy use, including municipal government buildings, industrial buildings, and commercial buildings.
- Transportation: On-road passenger and freight vehicle use results in combustion of gasoline and diesel fuels.
- Waste: Disposal of solid waste in landfills causes anaerobic decomposition, which results in GHG emissions (CH_4).
- Wastewater: Emissions in this sector are associated with the treatment of community industrial, residential, and commercial wastewater.

The LGO inventory is a subset of the community inventory, and represents what the municipality owns or operates and has operational control over, such as government buildings, vehicles, and other municipally-owned equipment and services. While the overall community inventory is important to focus GHG reduction efforts, the LGO inventory provides a closer look at what changes a local jurisdiction can make to improve efficiency and reduce emissions.

INVENTORY RESULTS

The baseline GHG inventory for the 12 WRCOG subregion jurisdictions participating in the CAP totals 5,834,400 metric tons (MT) of carbon dioxide equivalents (CO_2e). **Figure 2-1** and **Table 2-1** provide a breakdown of these emissions by sector. Emissions from the transportation sector accounted for 3,317,387 MT CO_2e, or 57% of the total emissions in the subregion, followed by the commercial/industrial energy sector, which generated 1,226,479 MT CO2e, or 21% of the total. The residential energy sector produced 1,167,843 MT CO2e, or 20% of the total.

Figure 2-1: WRCOG Subregion – Baseline Community Emissions by Sector

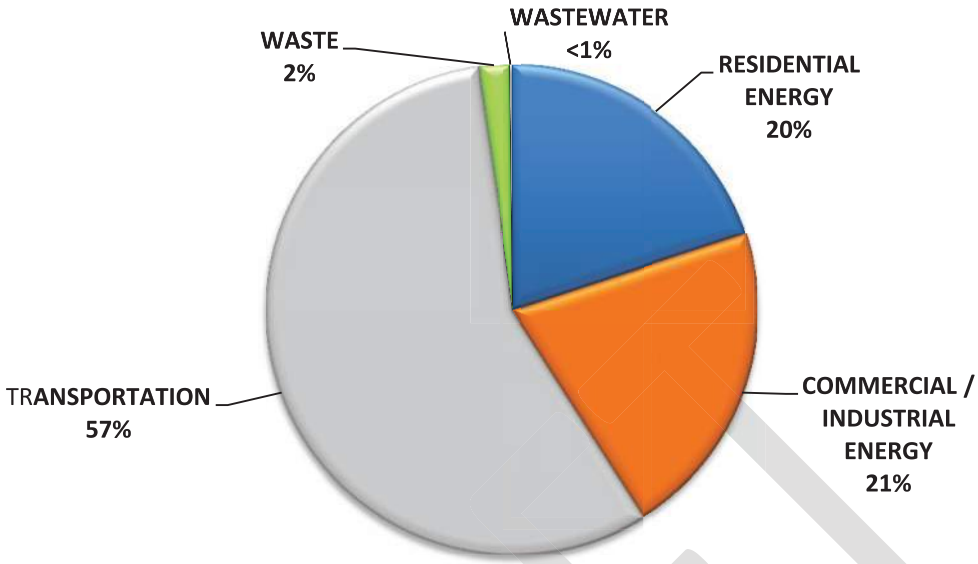

Table 2-1: WRCOG Subregion – Baseline Community Emissions by Sector (MT CO_2e)

Sector	Total Emissions (MT CO_2e)	% of Total
Transportation	3,317,387	56.9%
Commercial/Industrial Energy	1,226,479	21.0%
Residential Energy	1,167,843	20.0%
Waste	112,161	1.9%
Wastewater	10,531	0.2%
TOTAL INVENTORY	**5,834,400**	**100%**

Note: Totals may not add up due to rounding.

The baseline total GHG inventory for each participating jurisdiction is shown in **Figure 2-2** below, sorted by greatest to smallest total emissions. **Figure 2-3** shows baseline community emissions by service population for each jurisdiction. Service population is the number of residents and jobs in each community, and can be useful for measuring progress per-unit reduction of GHGs and comparing emissions between jurisdictions. Per capita emissions ranged from 3.6 MT CO_2e emissions per service population in Eastvale to 7.2 MT CO_2e in Calimesa.

Figure 2-2: Baseline Total Community Emissions by Jurisdiction (MT CO_2e)

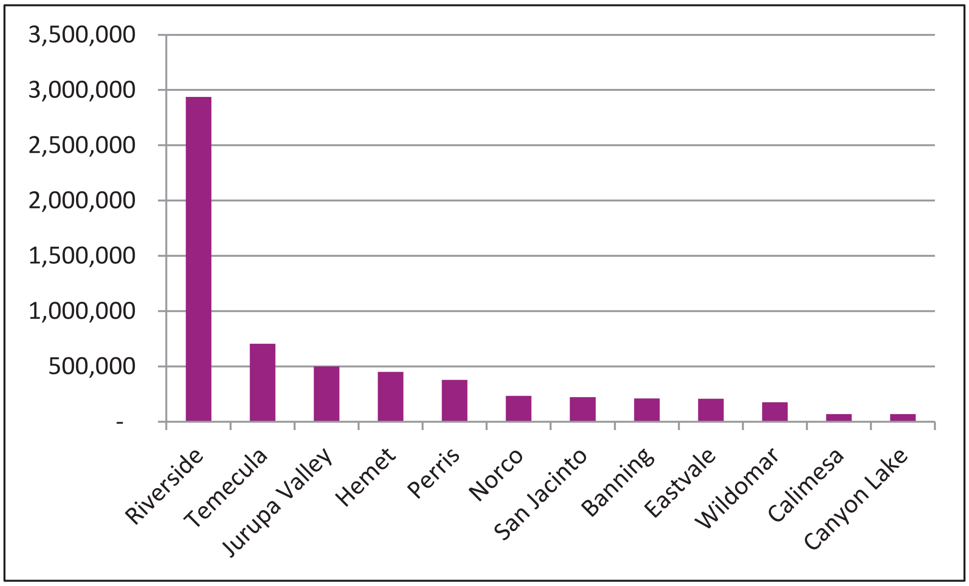

Figure 2-3: Baseline Community Emissions per Service Population by Jurisdiction (MT CO_2e/SP)

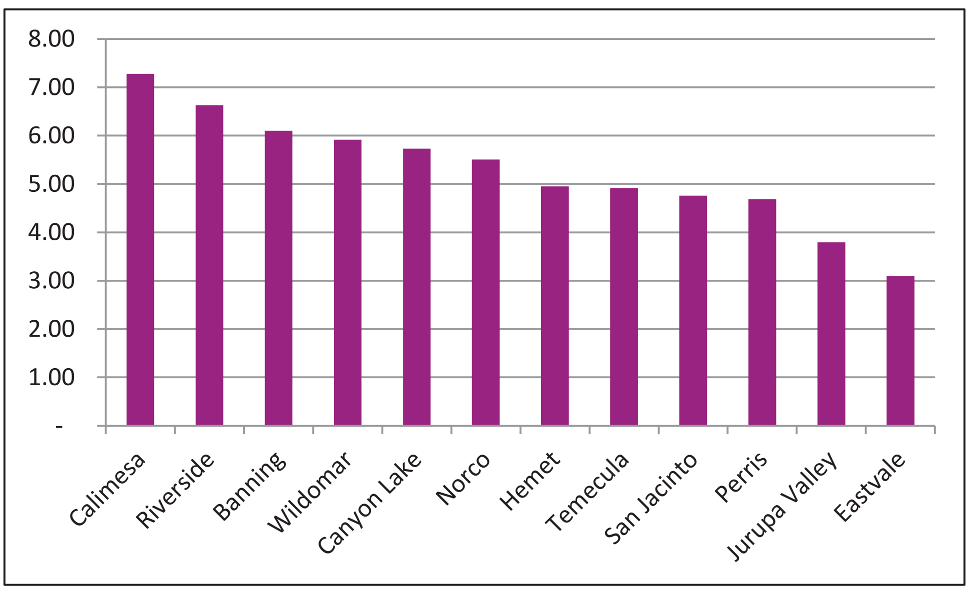
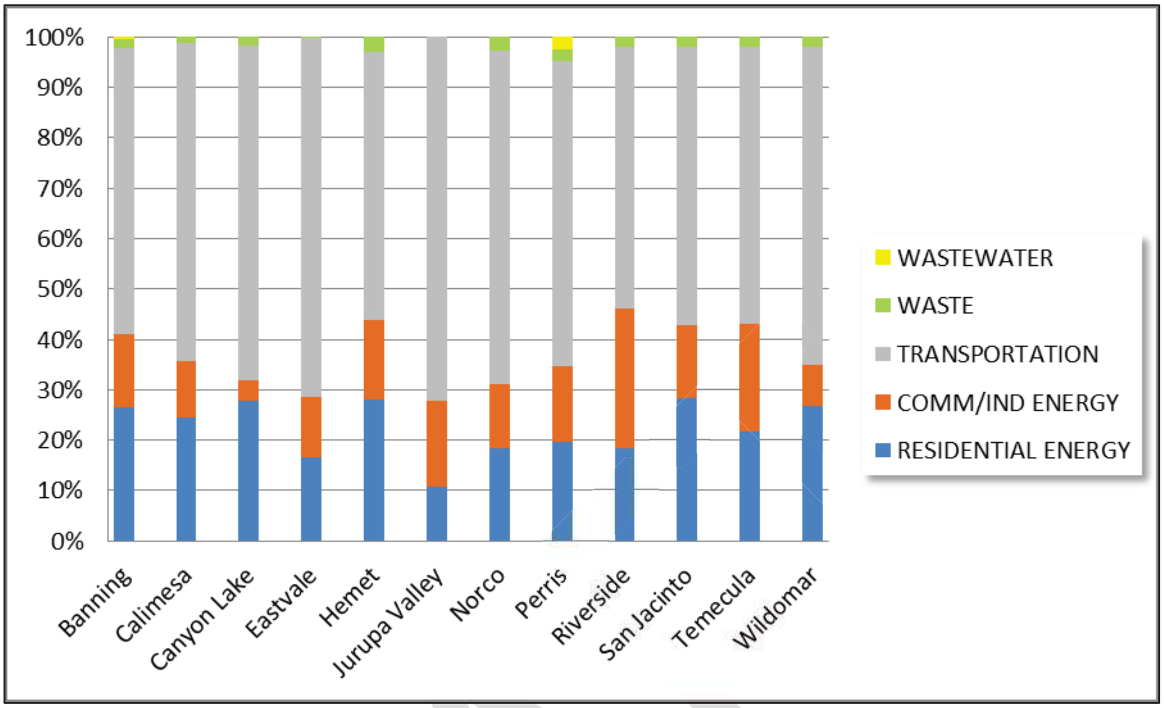


The baseline GHG Inventory by sector for each participating region is shown in **Figure 2-4** below. The transportation sector is the largest emissions source in each jurisdiction, followed by residential energy, commercial/industrial energy, and waste for most jurisdictions. For the communities of Jurupa Valley and Riverside, commercial/industrial energy takes up a larger share of emissions than residential energy, due to a more developed commercial and industrial building infrastructure. Perris is the only jurisdiction for which wastewater emissions are included, because they are the only community containing a wastewater treatment plant within its boundaries for which emissions data could be calculated, and they make up a larger share of the Perris inventory than waste-related emissions.

Figure 2-4: Baseline Community Emissions by Jurisdiction by Sector



EMISSIONS FORECASTS

The emissions forecasts establish projections for future-year 2020 and 2035 emissions under "business-as-usual" (BAU) conditions. If the WRCOG subregion were to continue historic patterns of vehicular travel, energy consumption, and waste/wastewater generation and disposal, the resulting emissions would be considered business-as-usual. BAU emissions are GHG emissions that would take place in the absence of state, regional, and local strategies designed to reduce emissions over time.

Future BAU emissions projections have been developed using regionally-adopted estimates for population and employment growth within each city under BAU conditions. Reduction goals were established for 2020 and 2035 using guidance from the California Air Resources Board (CARB).

Annual community emissions in participating WRCOG subregion jurisdictions are projected to increase over time. In 2020, subregional emissions are expected to be approximately 7,289,887 MT CO_2e, which represents an approximate 25% increase from baseline conditions. In 2035, subregional emissions are projected to increase to about 9,113,087 MT CO_2e, which represents an increase of approximately 56% from baseline conditions.

Table 2-2 presents community GHG emissions BAU forecasts by sector for 2020 and 2035. Transportation is expected to contribute the largest share of emissions through 2035. **Figure 2-5** illustrates 2020 BAU community emissions by sector. The percentage contributions from each sector in 2035 are expected to be similar to those in 2020. **Figure 2-6** shows community emissions BAU forecasts by jurisdiction for 2020 and 2035.

Table 2-2: WRCOG Subregion – Projected Business-As-Usual Community Emissions by Sector (MT CO_2e)

Sector	2020 Emissions (MT CO_2e)	% of Total	2035 Emissions (MT CO_2e)	% of Total
Transportation	4,057,626	55.7%	5,399,600	59.3%
Commercial/Industrial Energy	1,655,925	22.7%	1,953,137	21.4%
Residential Energy	1,368,126	18.8%	1,729,452	19.0%
Waste	138,326	1.9%	169,107	1.9%
Wastewater	13,740	0.2%	18,797	0.2%
TOTAL INVENTORY	**7,289,887**	**100%**	**9,113,087**	**100%**

Note: Totals may not add up due to rounding.

Figure 2-5: WRCOG Subregion – 2020 Community Emissions Business as Usual Forecast by Sector

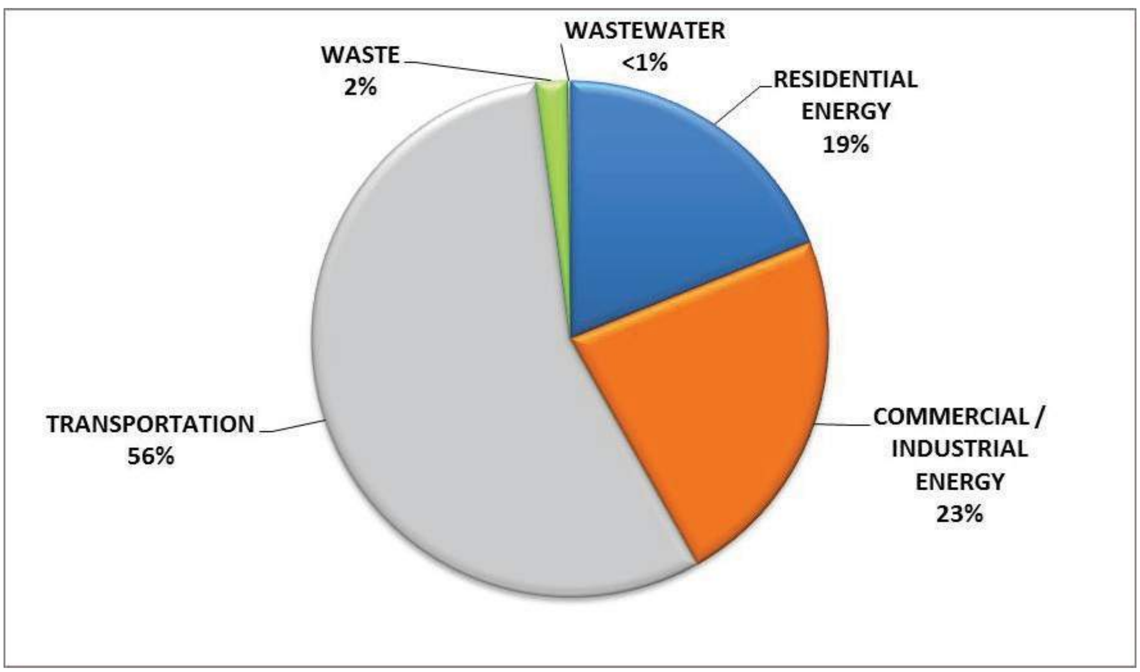


Figure 2-6: 2020 and 2035 Community Emissions Business as Usual Forecast by Jurisdiction ($MT\ CO_2e$)

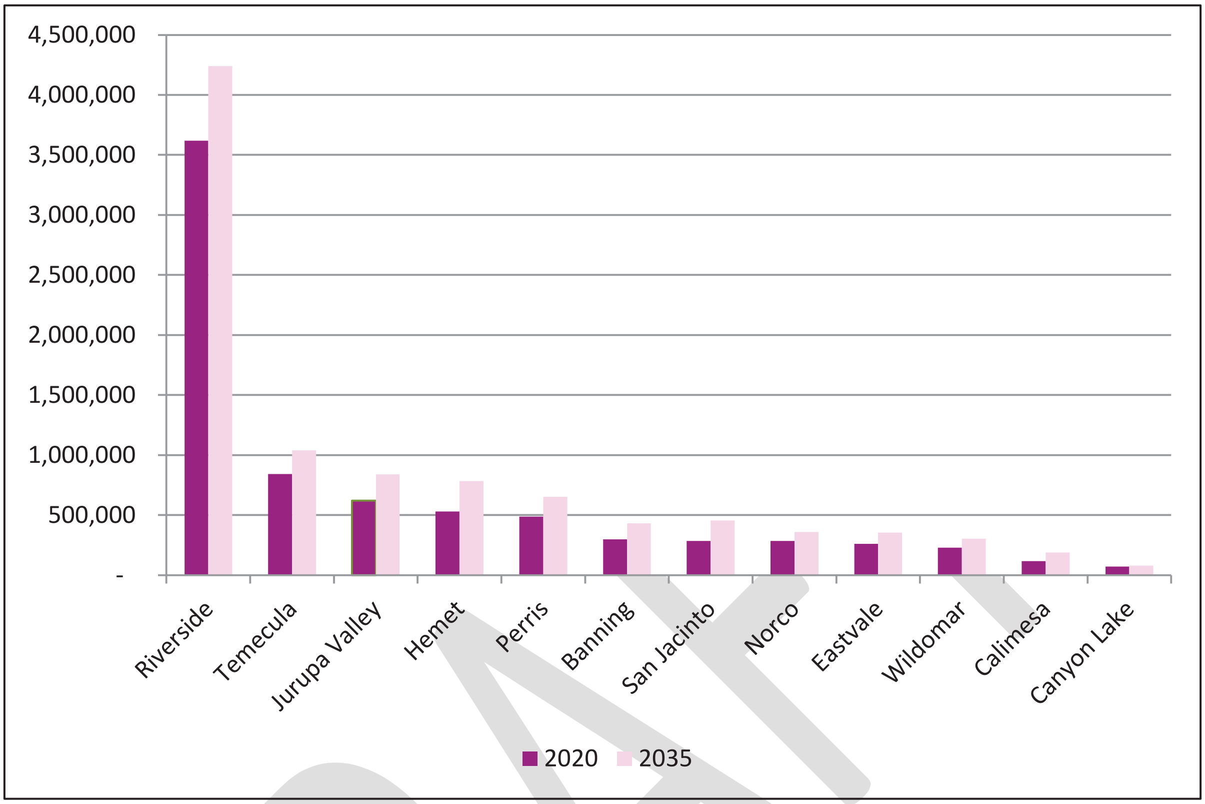


EMISSIONS REDUCTION TARGET

The WRCOG Subregional CAP establishes a community-wide emissions reduction target of 15% below 2010, following guidance from CARB and the Governor's Office of Planning and Research. CARB and the California Attorney General have determined this approach to be consistent with the state-wide AB 32 goal of reducing emissions to 1990 levels.[1] The Subregional CAP does not establish a reduction target for 2035 or future years; however the CAP identifies a reduction goal of 49% below baseline emissions levels to set the WRCOG subregion on a trajectory to meet targets identified in SB 375 and Executive Order (EO) S-3-05, recognizing that information, methodologies, and data availability may change between now and 2035.

As further described in Chapter 4, progress toward achieving the 2020 emissions reduction target will be monitored over time through preparation of an annual memorandum documenting program implementation and performance. Following each annual report, WRCOG and the participating jurisdictions may adjust or otherwise modify the strategies to achieve the reductions needed to reach the target. Such adjustments could include more prescriptive measures, reallocation of funding to more

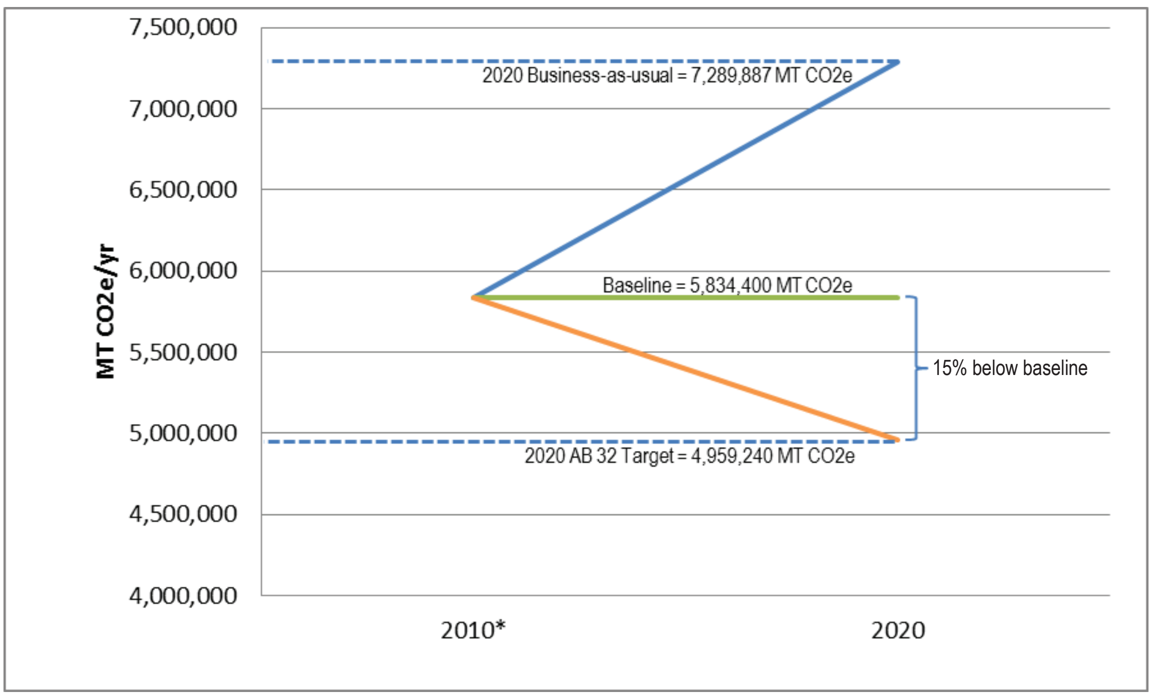
[1] In its Climate Change Scoping Plan of September 2008, CARB recommends that local governments adopt a GHG reduction target consistent with the State's commitment to reach 1990 levels by 2020. This is identified as equivalent to either 15% below 2005 levels by 2020 or a 28% reduction below BAU forecasts by 2020.

successful programs, and modifications to the 2020 BAU emissions projection and reduction target based on revised population, housing, and employment growth estimates. Additionally, there will be a comprehensive inventory update prior to 2020 to track overall progress toward meeting the GHG reduction target.

COMMUNITY EMISSIONS TARGET

The Subregional CAP target for community emissions in 2020 is 4,959,240 MT CO_2e equivalent to a 15% reduction from 2010 baseline emissions of 5,834,400 MT CO_2e. This is a net a reduction of 2,330,647 MT CO_2e from the 2020 BAU emissions forecast of 7,289,887 MT CO_2e. The community-wide emissions reduction target is shown in **Figure 2-7**. As outlined in the next chapter, CAP strategies are expected to reduce community-wide emissions by 2,480,559 MT CO_2e by 2020, exceeding the target by approximately 2.6% (for a total 17.6% reduction).

Figure 2-7: WRCOG Subregion–Community GHG Business as Usual Forecasts and Reduction Target for 2020



*2010 is used as baseline year for all jurisdictions except for the cities of Eastvale and Jurupa Valley, as noted previously.

Chapter 3
Reduction Measures

The emissions projections described in Chapter 2 illustrate the need for the subregion to implement strategies to reduce greenhouse gas (GHG) emissions by 2020 and beyond. Western Riverside County jurisdictions have a long history of working collectively through WRCOG toward common objectives, and have successfully demonstrated commitment to reduce energy and water consumption, solid waste, and vehicle miles traveled (VMT) through existing programs like the HERO Program, the Western Riverside County Clean Cities Coalition, and the Transportation Unified Mitigation Fee (TUMF).

This chapter discusses how participating jurisdictions are uniting to meet shared GHG emissions reduction goals. The approach offers flexibility to jurisdictions to participate at a level that is feasible and practical for each community.

PROCESS AND OVERVIEW

The process of developing this Subregional Climate Action Plan (CAP) included ongoing coordination and information sharing among participating jurisdictions. The WRCOG Planning Directors' Technical Advisory Committee (PD TAC) served as the primary technical working group. The PD TAC met regularly over the course of three years to discuss the CAP and provide feedback. Perspectives from jurisdictions participating in this CAP and those in the subregion who had already prepared a CAP were shared. In addition, WRCOG staff met individually with each participating jurisdiction to review emissions inventories, discuss potential emissions reduction measures and participation levels, and review the Draft CAP. Regular presentations were made to the WRCOG Public Works Committee, Technical Advisory Committee, and Executive Committee to keep jurisdictional staff, management officials, and elected leaders informed.

The following stakeholder agencies and organizations served as advisors throughout the process:

- American Lung Association
- Building Industry Association – Riverside County Chapter
- California Apartment Association – Apartment Association of the Greater Inland Empire
- California Air Resources Board

- Caltrans, District 8
- The Governor's Office of Planning & Research
- Riverside County Department of Public Health
- Riverside County Transportation Commission
- Riverside Transit Agency
- Safe Routes to School – Southern California Regional Network
- Southern California Edison
- South Coast Air Quality Management District
- Southern California Association Governments
- Southern California Gas Company
- TransForm

Why a "subregional" Climate Action Plan?

Developing a subregional CAP encourages input and coordination among participating jurisdictions. A subregional CAP uses consistent methodologies and allows jurisdictions to collaboratively implement regionally-effective measures. This creates economies of scale and may lead to lower administrative costs and greater publicity of incentives. It also demonstrates that WRCOG member jurisdictions can continue to work effectively towards common goals.

REDUCTIONS ACHIEVED

To meet emissions reduction targets, the CAP considers existing programs and policies in the subregion that achieve GHG emissions reductions in addition to new GHG reduction measures. Several proposed measures apply to participating jurisdictions uniformly, because they respond to adoption of a state law (e.g., the Low Carbon Fuel Standard) or result from programs administered at the discretion of a utility serving multiple jurisdictions (e.g. utility rebates). For other, more discretionary measures, participating jurisdictions have voluntarily committed to a participation level that could be implemented in their community. These levels—categorized and referred to for the purposes of this CAP as Silver, Gold, and Platinum—generally range from programs that a jurisdiction may promote through its website or outreach campaigns (Silver level), to programs that could be codified through local ordinances (Platinum level). Gold and Platinum levels have the benefit of achieving higher GHG reductions using fewer programs and often with less administrative burden to the jurisdiction. However, Silver level programs offer greater flexibility to determine how GHG reduction measures best fit individual projects.

MEASURE DEVELOPMENT

The GHG emissions reduction potential of each measure was estimated for jurisdictions participating at each level. Maximum participation in GHG reduction measures was encouraged, but jurisdictions were also encouraged to participate at a level that could be realistically achieved by 2020. As a result of the subregion's efforts, the 2020 reduction goal is achieved through implementation of the measures described below. Implementation of the CAP will result in a 15% reduction from the subregion's baseline (2010) emissions, consistent with State-recommended goals for local jurisdictions. Considering the large amount of anticipated growth in Western Riverside County, this equates to a 32% reduction below a business-as-usual (BAU) scenario. The CAP also looks beyond 2020 and demonstrates an ongoing commitment to reducing GHG emissions aligned with State-established goals included in SB 375 and Executive Order (EO) S-3-05. Continued implementation of the CAP beyond 2020 will place the subregion on a trajectory to reduce GHG emissions 49% below baseline emissions by 2035.

FEDERAL, STATE, AND REGIONAL EMISSIONS REDUCTIONS

Emissions reductions are achieved through the efforts of federal, State, and regional programs, in addition to local measures that jurisdictions will implement in their community. State and federal emissions reductions are primarily achieved through regulations, such as efficiency standards for passenger vehicles (e.g., the Corporate Average Fuel Economy standards), reduction in carbon content of transportation fuels (e.g., the Low Carbon Fuel Standard), and minimum renewable energy supply requirements for utilities (e.g., the Renewables Portfolio Standard). Measures regulated and implemented by the State and federal government achieve reductions without additional action by local communities. That is, even if vehicle miles traveled within the subregion remain constant over time, resulting GHG emissions would decrease because as new vehicles are purchased, they would in general be more GHG-efficient than those they replace.

Some State and federal programs also require local action within communities. The California Green Building Standards Code (CALGreen) requires, at a minimum, that new buildings and renovations in California meet certain design standards. New residential and commercial buildings must meet certain baseline efficiency and sustainability standards. These baselines are established through locally-adopted building codes and will result in GHG reductions. Additional voluntary building code provisions, known as Tier 1 and Tier 2 requirements, can be adopted locally, providing even greater energy savings and emissions reductions.

The Water Conservation Bill, known as SB X7-7, requires the State to reduce urban per capita water use 20% by 2020. Regional Urban Water Management Plans provide strategies and create incentives to achieve these targets, but local implementation strategies vary, and consumer participation is necessary to realize water use reductions. Local implementation strategies typically include tiered pricing or water budget-based (i.e., pricing water according to the amount consumed); water-efficient landscape requirements for water and irrigation management, planting location, and plant materials; and incentives where some utilities pay for turf grass removal and replacement with efficiently-irrigated landscaping.

Regional programs are those developed or administered at a level of government above the local jurisdiction but below the State. These programs often are more responsive to local context than statewide programs. They require local participation but do not require local administration to achieve GHG reductions.

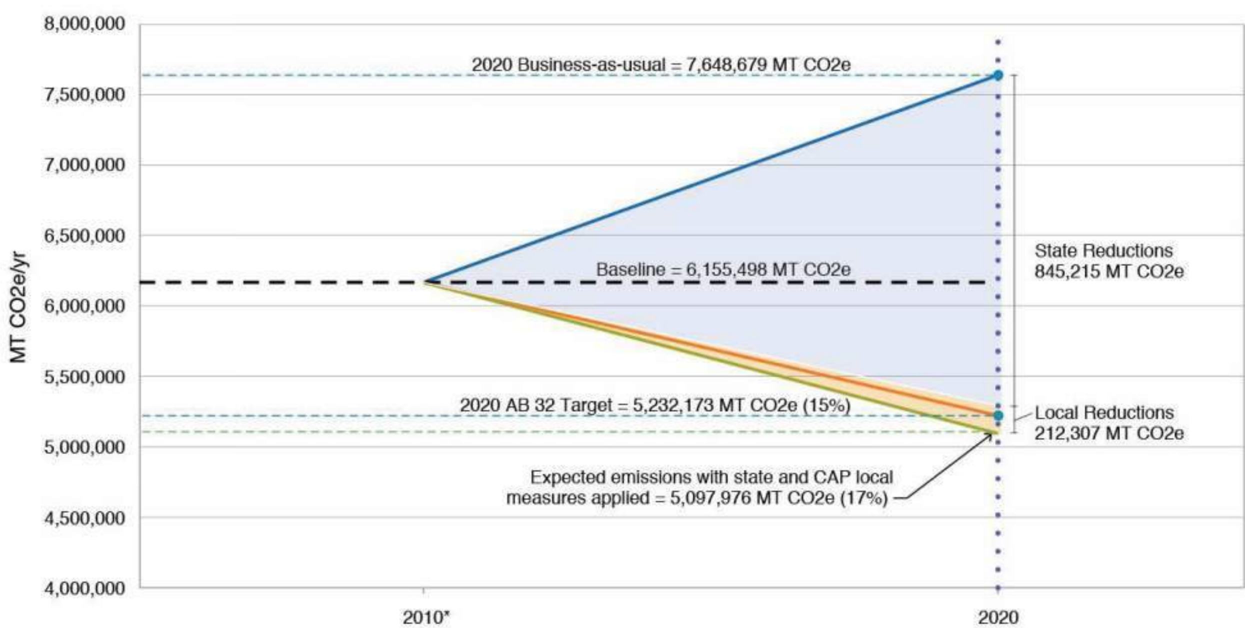
The WRCOG HERO Program, described in Chapter 1, is a regionally-administered program that offers financing options for home and business owners to retrofit or install energy-efficient, water conservation, and/or renewable energy generating products. This program is voluntary and therefore also up to individuals to implement, but regional administration lowers the burden to local governments and has already led to demonstrable reductions in the subregion since the HERO Program's inception in 2011.

WRCOG also administers the TUMF Program. The TUMF Program establishes a funding source to mitigate the cumulative regional transportation impacts of new development on regional arterials. TUMF fees are collected locally, and WRCOG works with its member agencies to identify priority projects to fund using fee revenues in order to reduce subregional transportation impacts caused by development. Facilitating movement on roads, by encouraging non-motorized transportation, increasing access to transit, or easing congestion on critical roadways may lead to GHG reductions. Therefore, TUMF can fund projects that meet this objective. Because the project relies on locally-collected fees, available funding depends on the economic vitality and development opportunities in the region.

A number of other transportation-related programs and projects under the primary control of the Riverside Transit Agency (RTA), Riverside County Transportation Commission (RCTC), California Department of Transportation (Caltrans), and other transportation entities can be implemented to reduce GHG emissions. The long-term planning of major transportation infrastructure is not under the participating jurisdictions' direct control; however, subregional jurisdictions participate in transportation planning decisions in a way that benefits the subregion. Local jurisdictions are in direct control of land uses, which can dictate how future transit is shaped. Individuals also play an important role in how they choose to move throughout the subregion; therefore, while individual jurisdictions do not implement these programs, local input is critical to the success of these programs. Additional projects anticipated to result in GHG reductions include California High Speed Rail, Metrolink expansion, express lanes, congestion pricing, goods movement, high frequency transit service, and electric vehicle infrastructure implementation.

Through federal, state, and regional measures implemented at the subregion level, participating jurisdictions can reduce 2020 emissions by 1,980,815 $MTCO_2e$, representing 78% of the subregion's 2020 reductions, as illustrated in **Figure 3-1**.

Figure 3-1: WRCOG Subregion–GHG Reductions Achieved through State, Regional, and Local Measures



*2010 is used as baseline year for all jurisdictions except for the cities of Eastvale and Jurupa Valley, as noted previously.

LOCAL EMISSIONS REDUCTIONS

While federal, state, and regional measures are critical to meet emission reduction goals, choices made by each local government, resident, and business owner will determine the subregion's ability to achieve the overall emissions reduction target. Through outreach campaigns, incentives, zoning changes, and ordinances, local communities can achieve additional reductions identified in this CAP.

Reduction measures are organized into major economic sectors, similar to the emissions inventory:

- Energy – including electricity and natural gas consumption
- Transportation and Land Use
- Water
- Waste

Each measure is described using the following information.

MEASURE DESCRIPTION

A general description of each measure is provided along with the implementing actions that constitute the Silver, Gold, or Platinum level that each participating jurisdiction will take to implement the measure. Jurisdictions are listed by level of participation.

What is a metric ton of CO_2e?

GHG emissions are reported as metric tons (MT) of CO_2e. Emitting 1 MT CO_2e is equal to the following:

- **102 gallons of gasoline**
- **41 propane cylinders used for home barbecues**
- **One month's worth of energy used in a house**

In contrast, reducing 1 MT CO_2e would require:

- **Growing 25 tree seedlings for 10 years**
- **Recycling 600 pounds of waste instead of throwing it away**

Note: Equivalencies are approximate and are adapted from: http://www.epa.gov/cleanenergy/energy-resources/calculator.html

GHG REDUCTIONS

The GHG reduction potential of each measure is quantified based on the assumption that past trends would continue into the future (e.g., energy consumption, VMT) and standard methods and assumptions recommended by the State (e.g., CAPCOA 2010)[1]. For voluntary programs, the level of participation anticipated by each jurisdiction was developed using case studies and evidence of success with similar programs.

PROGRESS METRICS

Monitoring emissions and reporting reductions will be necessary to validate the success of the measures or to identify measures that are not achieving anticipated reductions. Metrics for monitoring progress are provided for individual measures, although jurisdictions are also encouraged to work with WRCOG to re-inventory local government and community-wide emissions to demonstrate progress.

[1] California Air Pollution Control Officers Association Report titled Quantifying Greenhouse Gas Mitigation Measures (CAPCOA), 2010

COMMUNITY BENEFITS

CAP measures often have benefits that go beyond reducing GHG emissions. Many measures will improve public health by encouraging walking and biking or reducing air pollution; increase economic potential of the subregion by providing development and retrofitting incentives; reduce energy use and lower utility bills; preserve natural resources by consuming and wasting less; and increase mobility through alternative transportation measures. The following icons are used to identify co-benefits that jurisdictions can achieve by implementing local GHG reduction measures.

STATE AND REGIONAL MEASURES

Table 3-1 lists the state and regional measures included in the Subregional CAP and provides a breakdown of the GHG reduction potential for these measures.

Table 3-1: 2020 Reductions Achieved Through State and Regional Measures

State and Regional Measures by Sector		2020 (MT CO_2e/yr)
SR-1	Renewables Portfolio Standard	434,606
SR-2	2013 California Building Energy Efficiency Standards (Title 24, Part 6)	30,923
SR-3	HERO Residential Program	71,649
SR-4	HERO Commercial Program	10,079
SR-5	Utility Programs	9,182
SR-6	Pavley & Low Carbon Fuel Standard	1,095,555
SR-7	Metrolink Expansions	23,074
SR-8	Express Lanes	60,864
SR-9	Congestion Pricing	3,246
SR-10	Telecommuting	40,576
SR-11	Goods Movement	22,688
SR-12	Electric Vehicle Plan and Infrastructure	81,152
SR-13	Construction and Demolition Waste Diversion	3,574
SR-14	Water Conservation and Efficiency	23,192
TOTAL STATE AND REGIONAL REDUCTIONS		**1,910,361**

Note: Total may not add up due to rounding.

STATE AND REGIONAL ENERGY MEASURES

The following are state and regional measures that are expected to reduce GHG emissions associated with the energy sector.

Measure SR-1: Renewables Portfolio Standard

Utilities must secure 33% of their power from renewable sources.

2020 GHG Reduction Potential: 434,606 MT CO_2e/yr

Through a series of increasingly stringent bills first enacted in 2002, California has placed requirements on electric utilities to procure a portion of their energy from renewable sources. The standard, known as the Renewables Portfolio Standard (RPS), applies to investor-owned utilities, publicly-owned utilities, electricity service providers, and community choice aggregators. Therefore, all electricity-providing utilities in Western Riverside (SCE, Riverside Utility and Banning Utility) must meet these targets:

- 20% of retail sales from renewables by 2013
- 25% of retail sales from renewables by 2016
- 33% of retail sales from renewables by 2020

Meeting these goals will likely lead to reduced emissions associated with electricity, as more electricity will be generated by less carbon-intensive sources.

Community Benefits

Measure SR-2: 2013 California Building Energy Efficiency Standards (Title 24, Part 6)

Mandatory energy efficiency standards for buildings.

2020 GHG Reduction Potential: 30,923 MT CO_2e/yr

Building energy efficiency standards are designed to ensure new and existing buildings achieve energy efficiency and preserve outdoor and indoor environmental quality. These measures (Title 24, Part 6) are listed in the California Code of Regulations. These standards began in 1978 and are updated every 5 years. The 2013 standards differ from the 2008 standards by requiring usage of less energy for lighting, heating, cooling, ventilation, and water heating. Buildings are also required to be solar-ready, allowing for easier and less expensive installation of photovoltaic or solar thermal panels in the future. The California Energy Commission estimates that the 2013 standards will result in residential construction that is 25% more efficient and nonresidential construction that is 30% more efficient than the 2008 standards. The new standards go into effect on July 1, 2014 and as the industry moves toward the goal of net-zero energy, even greater energy and GHG savings may be achieved over time.

Community Benefits

Measure SR-3: HERO Residential Program

Financing for homeowners to make energy efficient, renewable energy, and water conservation improvements.

2020 GHG Reduction Potential: 71,649 MT CO_2e/yr

The HERO Program is a public-private partnership administered by WRCOG, offering financing to homeowners in the subregion for the installation of energy efficient, renewable energy, and water conservation improvements. This property assessed clean energy (PACE) financing program offers a continually expanding list of eligible products for financing and an ever-growing cadre of trained contractors who can assist property owners with selecting and installing eligible products. Products eligible for HERO Financing include, but are not limited to:

- Energy audits
- Insulation of attics, floors, walls, and home perimeter
- Lighting upgrades
- Drip and weather-based irrigation systems
- Rainwater catchment systems
- Pool pumps and heaters
- Energy-efficient windows
- Solar PV panels
- Air sealing and weatherization
- Cool roof system
- Cool wall coatings

This award-winning program is offered to eligible property owners in the WRCOG subregion who wish to participate.

WRCOG's Residential Program partner, Renovate America, collects data regarding participation, energy savings, renewable energy installation, job creation, and economic development by jurisdiction in the subregion. WRCOG will continue to partner with Renovate America to track ongoing participation and energy savings on a monthly or annual basis. Emissions reduction estimates for this CAP were calculated based on program participation assumptions developed by Renovate America. Since its inception in 2011, the HERO program has funded more than $135 million worth of eligible projects, and created more than 1,000 jobs. The program's growth has led to energy savings, GHG reductions, water conservation, and local job creation in each of its participating communities. The HERO program has also been an award-winning model for other PACE programs, earning recognition from various industry organizations including the Southern California Association of Governments, the U.S. Green Building Council, the Urban Land Institute, and the Governor of California.

Community Benefits

Measure SR-4: HERO Commercial Program

Financing for business owners to make energy efficient, renewable energy, and water conservation improvements.

2020 GHG Reduction Potential: 10,079 MT CO_2e/yr

The HERO Program is a public-private partnership administered by WRCOG, offering financing to business owners in the subregion for the installation of energy efficient, renewable energy, and water conservation improvements. This PACE financing program offers a continually expanding list of eligible products for financing and an ever-growing cadre of trained contractors who can assist property owners with selecting and installing eligible products. Products eligible for HERO Financing include, but are not limited to:

- Energy audits
- Insulation of attics, floors, walls, and home perimeter
- Lighting upgrades
- Drip and weather-based irrigation systems
- Rainwater catchment systems
- Pool pumps and heaters
- Energy-efficient windows
- Solar PV panels
- Air sealing and weatherization
- Cool roof system
- Cool wall coatings

This award-winning program is offered to eligible property owners in the WRCOG subregion who wish to participate.

Community Benefits

Measure SR-5: Utility Programs

Financing for business owners to make energy efficient, renewable energy, and water conservation improvements.

2020 GHG Reduction Potential: 9,182 MT CO_2e/yr

Southern California Edison (SCE), Southern California Gas Company (SCG), Riverside Public Utilities (RPU), and the Banning Electric Utility (BEU) provide energy to customers in the subregion. Each utility offers rebate programs to reduce energy consumption, which in turn, reduces local GHG emissions. The utilities offer a selection of rebates and other incentives to assist property owners (residential and commercial) with the installation of energy- and water-saving products. The following list provides a sample of programs and indicates which utilities are currently offering:

- ENERGY STAR™ appliance rebates – SCE, SCG, RPU, BEU
- Light bulb discounts – SCE
- Solar rebates – SCE, RPU
- Low-income programs – SCE, SCG, RPU, BEU
- Shade trees – RPU, BEU

Note: Some programs may have funding cycle and annual rebate limits; check with your local utility for up-to-date information regarding specific rebates.

These utility programs are provided to customers throughout the subregion and are managed at the discretion of each participating utility. Therefore, they do not have tiered implementation actions.

Community Benefits

STATE AND REGIONAL TRANSPORTATION MEASURES

The following are state and regional measures that are expected to reduce GHG emissions associated with the transportation sector.

Measure SR-6: Pavley and Low Carbon Fuel Standard

Requirements for vehicles to use cleaner fuels.

2020 GHG Reduction Potential: 1,095,555 MT CO_2e/yr

In 2002, California adopted AB 1493, referred to as "Pavley I", which directed CARB to develop fuel-efficiency standards for passenger vehicles in California by 2005. Through a series of rulings, CARB and the federal government agreed on federal standards that began in 2009 and increase through 2016. CARB and the federal government are currently finalizing fuel-efficiency standards that continue to become increasingly-stringent from 2017 through 2025. Building from Pavley 1, Executive Order S-1-07, known as the Low Carbon Fuel Standard (LCFS), requires the carbon-intensity of California's transportation fuel to be reduced by at least 10% by 2020.

Community Benefits

Measure SR-7: Metrolink Expansion

Additional Metrolink transit service provided to Western Riverside County.

2020 GHG Reduction Potential: 23,074 MT CO_2e/yr

Identified in SCAG's 2012 RTP/SCS, the Metrolink Perris Valley Line will be extended from Riverside to Perris in Western Riverside County, allowing for alternative transportation, reducing VMT and GHG emissions in Western Riverside County. Service along this route is expected to begin in 2015.

Community Benefits

Measure SR-8: Express Lanes

Additional express lanes added along major freeways in Western Riverside County.

2020 GHG Reduction Potential: 60,864 MT CO_2e/yr

SCAG's analysis of critical corridors found inter-county trips account for over 50% of all trips. Ongoing congestion issues—and therefore increased idle time and GHG emissions—have led to SCAG proposing increasing the network of express lanes that connect counties, including Riverside County. Extension of express lanes along State Route-91 (SR-91) and Interstate-15 (I-15) would be operational by 2017 and 2020 respectively, and would lead to reduced congestion according to regional transportation modeling. The SR-91 extension project is currently under construction. The I-15 Toll Express Lanes from State Route-60 (SR-60) to Cajalco Road has entered the preliminary engineering phase, and the anticipated opening year is 2020.

Community Benefits

Measure SR-9: Congestion Pricing

Additional express lanes added along major freeways in Western Riverside County.

2020 GHG Reduction Potential: 3,246 MT CO_2e/yr

Transportation demand management (TDM) consists of methods used to encourage transportation other than single-occupancy vehicle travel at peak traffic times. TDM strategies and are generally categorized as "soft" or "hard" strategies. Soft mechanisms are incentive-based and include:

- Increasing the availability and use of carpooling, vanpooling, transit, bicycling, and walking;
- Shifting work schedules to non-peak periods or locations; and
- Using telecommuting.

Congestion pricing is a TDM tool examined by SCAG through its Express Travel Choices Study. Pricing mechanisms may include toll lanes/roads or mileage-based user fees, which discourage automobile traveling by increasing travel costs. Currently an expansion of the toll lanes on SR-91 is planned to continue these toll lanes through Corona and into Riverside.

The effectiveness of congestion pricing reflects the regional share of VMT reduction associated with this strategy, in addition to local actions. This approach accounts for the high degree of out-commuting that currently occurs in Western Riverside County as residents travel to jobs in Los Angeles, San Bernardino, and Orange Counties. Since many TDM strategies will be implemented at employment locations instead of residential locations, a separate accounting is needed in addition to the jurisdiction-specific TDM strategies identified in this Subregional CAP.

Community Benefits

Measure SR-10: Telecommuting

Additional express lanes added along major freeways in Western Riverside County.

2020 GHG Reduction Potential: 40,576 MT CO_2e/yr

Telecommuting is a soft TDM mechanism that has increased considerably over the past decade. According to SCAG, telecommuting could increase even more by 2020 (to 5% of workers in the region) and 2035 (to 10% of workers), from the current 2.6% that currently telecommute. By telecommuting, GHG emissions associated with vehicles no longer on the road are reduced, as are idling or congestion-related emissions from vehicles remaining on the road. Similar to **Measure SR-9: Congestion Pricing**, this strategy reflects the regional share of TDM strategies that may be implemented on a regional level given the high degree of out-commuting that occurs in Western Riverside County.

Community Benefits

Measure SR-11: Goods Movement

Efficient movement of goods through inland Southern California.

2020 GHG Reduction Potential: 22,688 MT CO_2e/yr

Southern California is a major hub for importing and exporting goods. SCAG estimates that over $2 trillion in cargo was moved across the region in 2010 alone, much of which travels through inland Southern California, including Western Riverside County. However, the many warehouses and distribution facilities employ non-passenger vehicles that contribute to GHG emissions. At the state level, more standards are being implemented to increase vehicle efficiencies and the 2012 RTP/SCS and AQMD are supporting greater penetration of low-emission trucks in the region. While goods will continue to be moved to support local and regional economies, electrification and other low-emission technologies installed in vehicles can reduce the GHG emissions of goods movement. The GHG reductions estimated here account for the region's "share" of SCAG and AQMD's anticipated investments and the effect of the investment on GHG emissions. These investments include both policies as well as physical improvements such as "truck climbing" lanes on State Route-60 (SR-60), funded by RCTC.

Community Benefits

Measure SR-12: Electric Vehicle Plan and Infrastructure

Facilitate electric vehicle use by providing necessary infrastructure.

2020 GHG Reduction Potential: 81,152 MT CO_2e/yr

SCAG has developed a regional plug-in electric vehicle (PEV) readiness plan, and WRCOG has a similar subregional plan for PEV readiness. Together, these plans identify viable locations for charging stations, changes to development codes, and other strategies to encourage the purchase and use of electric vehicles. PEV chargers are already being installed in the WRCOG subregion. Through these plans and outreach efforts, alternative-fuel vehicles will be promoted as one strategy to reduce GHG emissions associated with passenger vehicles. This measure is anticipated to reduce nearly 82,000 MT CO_2e in participating jurisdictions by 2020.

Community Benefits

STATE SOLID WASTE MEASURE

The following state measure is expected to reduce GHG emissions associated with the solid waste sector.

Measure SR-13: Construction & Demolition Waste Diversion

Mandatory requirement to divert 50% of construction and demolition waste from the landfill waste stream.

2020 GHG Reduction Potential: 3,574 MT CO_2e/yr

Recycling construction and demolition materials reduces GHG emissions by removing material from landfills that would otherwise generate methane. Construction and demolition (C&D) waste recycling also may reduce the need to harvest and transport new raw construction materials, as recycled materials can be locally repurposed and reused. For growing areas like the WRCOG subregion, C&D waste accounts for a significant portion of the waste stream.

Effective July 1, 2012, CALGreen, the state's Green Building Standards Code, requires jurisdictions to divert a minimum of 50% of their nonhazardous C&D waste from landfills.

Community Benefits

STATE AND REGIONAL WATER MEASURES

The following state measure is expected to reduce GHG emissions associated with the water sector.

Measure SR-14: Water Conservation and Efficiency

State requirement to reduce urban per capita water use.

2020 GHG Reduction Potential: 23,192 MT CO_2e/yr

SB X7-7 is part of a California legislative package passed in 2009 that requires urban retail water suppliers to reduce per-capita water use by 10% from a baseline level by 2015, and to reduce per-capita water use by 20% by 2020. In Southern California, energy costs and GHG emissions associated with the transport, treatment, and delivery of water from outlying regions are high. Therefore, the region has extra incentive to reduce water consumption. While this is considered a state measure, it will be up to the local water retailers, jurisdictions, and water users to meet these targets. A number of policies have been established at the local level within the subregion requiring more efficient use of water, including landscape ordinances that require native or low-irrigation landscaping. Water retailers also offer resources that incentivize purchase of high-efficiency appliances and provide information on best management practices, landscaping, and the use of recycled and gray water systems.

Community Benefits

LOCAL REDUCTION MEASURES

Table 3-2 lists the local measures included in the Subregional CAP and provides a breakdown of the GHG reduction potential for these local measures.

Table 3-2: 2020 Reductions Achieved from Local Measures

Local Measures by Sector		2020 Reductions Achieved (MT CO_2e/yr)
E-1	Energy Action Plans	357,581
E-2	Traffic and Street Lights	4,697
E-3	Shade Trees	2,014
Energy Subtotal		***364,292***
T-1	Bicycle Infrastructure Improvements	29,255
T-2	Bicycle Parking	6,290
T-3	End of Trip Facilities	1,836
T-4	Promotional Transportation Demand Management	1,831
T-5	Transit Service Expansion	704
T-6	Transit Frequency Expansion	2,723
T-7	Traffic Signal Coordination	94,600
T-8	Density	2,857
T-9	Mixed-Use Development	4,069
T-10	Design/Site-Planning	912
T-11	Pedestrian Only Areas	2,812
T-12	Limited Parking Requirements for New Development	28,423
T-13	High Frequency Transit Services	1,801
T-14	Voluntary Transportation Demand Management	2,464
T-15	Accelerated Bike Plan Implementation	5,340
T-16	Fixed Guideway Transit	10,489
T-17	Neighborhood Electric Vehicle Programs	4,707
T-18	Subsidized Transit	3,628
Transportation Subtotal		***204,744***
SW-1	Yard Waste Collection	1,007
SW-2	Food Scrap and Paper Diversion	155
Solid Waste Subtotal		***1,162***
TOTAL LOCAL ACTION REDUCTIONS		**570,199**

LOCAL ENERGY MEASURES

The following are local measures that can be implemented to reduce GHG emissions associated with the energy sector. As described in Chapter 1, at the time this CAP was developed 11 jurisdictions were participating in the Western Riverside Energy Leader Partnership (WRELP) Program, which includes the development of municipal and community-wide Energy Action Plans (EAPs) for these jurisdictions (**Table 1-1**). Measure E-1 includes the aggregate total GHG reduction potential for the 11 WRELP jurisdictions implementing the EAPs, while Measures E-2 and E-3 describe the GHG reduction potential from energy strategies implemented by the 4 jurisdictions included in this Subregional CAP that were not WRELP jurisdictions at the time of this CAP development.

Measure E-1: Energy Action Plans

Improve municipal and community-wide energy efficiency and reduce energy consumption through the adoption of local Energy Action Plans (EAP).

2020 GHG Reduction Potential: 357,581 MT CO_2e/yr

In 2011, Southern California Edison (SCE) provided funding to WRCOG to implement the California Long-Term Energy Efficiency Strategic Plan (CEESP) developed by the California Energy Commission. WRCOG and 11 participating jurisdictions established the WRELP Program and adopted energy efficiency targets and programs to meet those targets, which will reduce utility costs and GHG emissions associated with the energy use at the municipal and community level (**Table 1-1**). These targets and actions are captured in each jurisdiction's EAP. The EAPs use a similar approach to that described in this CAP, but only address emissions and GHG reductions associated with the energy sector. The CAP contains similar energy-efficiency actions for non-EAP jurisdictions.

By implementing the proposed efficiency measures, jurisdictions demonstrate the potential economic, social, and environmental benefits of increasing energy efficiency and providing environmental stewardship within the community.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
This measure does not include tiered implementation actions. Each WRELP jurisdiction has individual energy-conserving measures and actions in its EAP. Energy sector reductions anticipated in each jurisdiction's EAP are captured within this local CAP measure, and will be tracked and reported in conjunction with the measures proposed within the CAP for non-WRELP jurisdictions.		357,581
PROGRESS INDICATORS		**YEAR**
1	Each WRELP jurisdiction has received a tracking and monitoring tool, which identifies the jurisdiction's energy usage projections and goals, and provides a user-friendly workbook to evaluate emissions annually. Each jurisdiction has its own monitoring tool, but the assumptions used are consistent across all tools in the subregion and can be aggregated for subregional monitoring and reporting.	2020

Measure E-2: Traffic and Street Lights

Replace traffic and street lights with high-efficiency bulbs.

2020 GHG Reduction Potential: 4,697 MT CO_2e/yr

Similar to many household light fixtures, traffic lights are typically illuminated with inefficient incandescent bulbs. Street lights commonly use high-pressure sodium (HPS) bulbs, which also produce light inefficiently. Newer lighting technology, such as light-emitting diodes (LEDs), last significantly longer than traditional incandescent or HPS bulbs, and use much less energy to perform the same task. Jurisdictions can install LEDs in their traffic signals and upgrade street light fixtures to accommodate LEDs or other high-efficiency bulbs to lower municipal utility costs and reduce maintenance costs associated with bulb replacement.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	100% of traffic and street lights converted to high-efficiency bulbs by 2020. Banning, Jurupa Valley, Riverside	4,697
GOLD LEVEL	75% of traffic and street lights converted to high-efficiency bulbs by 2020. No jurisdictions participating at this level.	0
SILVER LEVEL	50% of traffic and street lights converted to high-efficiency bulbs by 2020. No jurisdictions participating at this level.	0

	PROGRESS INDICATORS	YEAR
1	Banning: 1.02 million kWh/year in savings from Freeway Lighting and Streetlights subsectors of Local Government GHG Inventory. (Appendix X)	2020
2	Jurupa Valley: 11,000 kWh/year in savings from Streetlights subsector of Local Government GHG Inventory. (Appendix X)	2020
3	Riverside: 1.26 million kWh/year in savings from Streetlights and Traffic Signals/Controllers subsector of Local Government GHG Inventory. (Appendix X)	2020

Community Benefits

Measure E-3: Shade Trees

Strategically plant trees to reduce the urban heat island effect.

2020 GHG Reduction Potential: 2,014 MT CO_2e/yr

Planting additional trees in urban environments has a number of benefits, including lowering peak-load energy demands during the hottest months, enhancing the visual aesthetic of a community, and naturally sequestering carbon dioxide. Properly selected and located shade trees can help keep indoor temperatures low, thereby reducing air conditioner demands and utility costs. Trees can also provide shade for parking lots and other paved areas, reducing the urban heat island effect communitywide.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Shade trees are required for all new development or redevelopment. Eastvale, Jurupa Valley	638
GOLD LEVEL	Subsidized program to support planting jurisdiction-identified shade tree species. Banning, Riverside	1,376
SILVER LEVEL	Outreach program to promote the benefits of planting additional trees in urban environments. No jurisdictions participating at this level.	0

	PROGRESS INDICATORS	YEAR
1	Banning: 4,300 new shade trees by 2020	2020
2	Eastvale: 12,400 new shade trees by 2020	2020
3	Jurupa Valley: 20,000 new shade trees by 2020	2020
4	Riverside: 62,900 new shade trees by 2020	2020

Community Benefits

LOCAL TRANSPORTATION MEASURES

The following are local measures that can be implemented to reduce GHG emissions associated with the transportation sector.

Measure T-1: Bicycle Infrastructure Improvements

Expand on-street and off-street bicycle infrastructure, including bicycle lanes and bicycle trails.

2020 GHG Reduction Potential: 29,255 MT CO_2e/yr

By providing more bicycle lanes and better connections between existing bicycle lanes, WRCOG jurisdictions can increase the viability of bicycling as an emission-free commute option. Several WRCOG jurisdictions have adopted or are preparing bicycle master plans. Implementing these plans will increase alternative transportation options in the sub-region and can reduce vehicle miles traveled and congestion for vehicles. Community health benefits from increased bicycling include improved air quality and exercise.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Implement a 50% increase in bicycle lane mileage from baseline levels. Riverside	15,905
GOLD LEVEL	Implement a 25% increase in bicycle lane mileage from baseline levels. No participating jurisdictions at this level.	0
SILVER LEVEL	Implement a 10% increase in bicycle lane mileage from baseline levels. Banning, Canyon Lake, Eastvale, Hemet, Jurupa Valley, Norco, Perris, San Jacinto, Temecula, Wildomar	13,350
PROGRESS INDICATORS		**YEAR**
1	Annual percentage increase in bicycle lane mileage from baseline levels.	2020

Community Benefits

Measure T-2: Bicycle Parking

Provide additional options for bicycle parking.

2020 GHG Reduction Potential: 6,290 MT CO_2e/yr

Safe and convenient bicycle parking is a relatively low-cost action that leads to a demonstrated shift from automobile use to bicycle use. Helping business owners understand the potential benefits of bicycle parking and requiring new development projects to include bike racks as a condition of approval can facilitate implementation of this measure.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Amend zoning to require provision of bike parking for all multi-family or mixed-use projects consisting of a mix of residential, retail, and office space. Calimesa, Canyon Lake, Eastvale, Hemet, Jurupa Valley, Norco, Perris, Riverside, San Jacinto, Temecula, Wildomar	6,152
GOLD LEVEL	Amend zoning to require provision of bike parking for multi-family projects consisting of more than 50 dwelling units, and mixed-use projects greater than 50,000 square feet consisting of a mix of residential, retail, and office space. Banning	138
SILVER LEVEL	Provide information to applicants for large development projects describing the benefits of bike parking. No jurisdictions participating at this level.	0

PROGRESS INDICATORS		YEAR
1	Annual number of new bike parking spaces installed.	2020

Community Benefits

Measure T-3: End of Trip Facilities

Encourage use of non-motorized transportation modes by providing appropriate facilities and amenities for commuters.

2020 GHG Reduction Potential: 1,836 MT CO_2e/yr

End-of-trip commuter facilities further incentivize alternative transportation modes, such as walking and biking. Such facilities commonly include showers, changing rooms, lockers, and bike racks.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Amend zoning to require installation of end-of-trip facilities for new commercial buildings greater than 50,000 square feet. Riverside	1,119
GOLD LEVEL	Amend zoning to require installation of end-of-trip facilities for new commercial buildings greater than 100,000 square feet. Banning, Jurupa Valley, Perris	391
SILVER LEVEL	Provide information to commercial project applicants describing the benefits of installing end-of-trip facilities. Calimesa, Canyon Lake, Eastvale, Hemet, San Jacinto, Temecula, Wildomar	326

PROGRESS INDICATORS	YEAR
1 Annual number of development projects installing end-of-trip facilities.	2020

Community Benefits

Measure T-4: Promotional Transportation Demand Management

Encourage Transportation Demand Management strategies.

2020 GHG Reduction Potential: 1,831 MT CO_2e/yr

Transportation demand management (TDM) describes strategies to reduce demand for roadway travel, particularly in single-occupancy vehicles. TDM strategies can include both “carrot” and “stick” approaches to change travel behavior patterns. Specific examples include preferential parking for carpoolers and parking pricing.

While SCAG offers regional approaches such as high-occupancy vehicle lanes, this measure focuses on efforts by individual existing business owners in the WRCOG sub-region to develop TDM strategies, such as parking “cash out” programs and allowing telecommuting. Several TDM strategies can be offered; often, multiple programs can enhance one another rather than being redundant. In addition to reducing GHG emissions, TDM strategies often ease congestion and improve air quality.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Allocate a full-time staff person to promote TDM strategies to existing businesses. No jurisdictions participating at this level.	0
GOLD LEVEL	Allocate the equivalent of ½ of a full- time staff person to promote TDM strategies to existing businesses. No jurisdictions participating at this level.	0
SILVER LEVEL	Train an existing staff person to promote TDM strategies to existing business. Eastvale, Hemet, Jurupa Valley, Norco, Riverside	1,831

	PROGRESS INDICATORS	YEAR
1	Number of jurisdictions with full-time or part-time staff promoting TDM programs to be established through an annual survey conducted by WRCOG.	2020

Community Benefits

Measure T-5: Transit Service Expansion

Collaborate with local and regional transit providers to increase transit service provided in the subregion.

2020 GHG Reduction Potential: 704 MT CO_2e/yr

It will be crucial for jurisdictions anticipating growth to coordinate with the Riverside Transit Agency (RTA) and Banning Pass Transit to appropriately expand service. Several jurisdictions have identified a need for additional transit service and are working with RTA to identify critical investments to maximize ridership. Increased transit ridership improves air quality as fewer single-occupancy vehicles use the roadways, improves traffic flow for remaining vehicles, and offers mobility to low-income and other disadvantaged communities. Information related to this measure may be updated upon completion of the RTA Forward 10-Year Transit Plan, a comprehensive operational analysis that will guide RTA's bus route and service decisions in future years.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Work with RTA to increase fixed-route service miles by 20% by 2020. No jurisdictions participating at this level.	0
GOLD LEVEL	Work with RTA to increase fixed-route service miles by 10% by 2020. Eastvale, Norco	324
SILVER LEVEL	Work with RTA to increase fixed-route service miles by 5% by 2020. Banning, Jurupa Valley, Temecula, Wildomar	380

PROGRESS INDICATORS		YEAR
1	Annual miles of fixed-route service provided by RTA	2020

Community Benefits

Measure T-6: Transit Frequency Expansion

Collaborate with local and regional transit providers to provide more frequent transit in the subregion.

2020 GHG Reduction Potential: 2,723 MT CO_2e/yr

Future annual transit ridership is expected to grow by 3.5% across the nation, and many transportation systems are already operating beyond their capacity (APTA 2010). In addition to expanding service, transit agencies will need to increase service frequency by reducing headways or the time between buses on existing routes. . WRCOG jurisdictions are working with RTA and Banning Pass Transit to share information regarding anticipated land development patterns and to maximize service frequency investments. Similar to transit service expansion, this measure provides air quality and mobility co-benefits by reducing the number of single-occupancy vehicles on the road. Information related to this measure may be updated upon completion of the RTA Forward 10-Year Transit Plan, a comprehensive operational analysis that will guide RTA's bus route and service decisions in future years. This measure differs from T-5 in that it considers service improvements along existing routes.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL ($MT\ CO_2e/yr$)
PLATINUM LEVEL	Work with RTA to increase fixed-route service frequency by 20% over baseline levels in transit priority areas as defined by SCAG in the RTP/SCS. Perris	698
GOLD LEVEL	Work with RTA to increase fixed-route service frequency by 10% over baseline levels in transit priority areas as defined by SCAG in the RTP/SCS. Eastvale	241
SILVER LEVEL	Work with RTA to increase fixed-route service frequency by 5% over 2010 levels in transit priority areas as defined by SCAG in the RTP/SCS. Banning, Jurupa Valley, Norco, Temecula, Wildomar	1,784

	PROGRESS INDICATORS	YEAR
1	Percentage change in average annual fixed-route service frequency in transit priority areas compared to baseline levels.	2020

Community Benefits

Measure T-7: Traffic Signal Coordination

Incorporate technology to synchronize and coordinate traffic signals along local arterials.

2020 GHG Reduction Potential: 94,600 MT CO_2e/yr

Traffic signal coordination describes a method of timing groups of traffic signals along an arterial to provide smooth movement of traffic with minimal stops. This technique reduces motorist stops and delays, lowers the amount of fuel need to move a certain distance, and reduces GHG emissions. Signal coordination also lessens congestion and resulting tail pipe emissions, which reduces GHG emissions and improves air quality.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Coordinate traffic signals on an additional 50% of arterial roads which were not coordinated in the base year. Canyon Lake, Perris, Riverside, Temecula	78,318
GOLD LEVEL	Coordinate traffic signals on an additional 25% of arterial roads which were not coordinated in the base year. Banning, Hemet, San Jacinto	10,131
SILVER LEVEL	Coordinate traffic signals on an additional 10% of arterial roads which were not coordinated in the base year. Eastvale, Jurupa Valley, Wildomar	6,151

PROGRESS INDICATORS		YEAR
1	Annual percentage of arterial roads with signal coordination which were not coordinated in the base year.	2020

Community Benefits

Measure T-8: Density

Improve jobs-housing balance and reduce vehicle miles traveled by increasing household and employment densities.

2020 GHG Reduction Potential: 2,857 MT CO_2e/yr

Density describes the number of people, jobs, or housing units in a given area. Increasing density generally results in shorter distances between locations, making transit and non-motorized transportation options such as walking and biking more viable. GHG emissions associated with vehicle miles traveled (VMT) are reduced as more individuals choose alternative transportation modes. Increases in density must generally fit within assumptions of a jurisdiction's General Plan, although amendments can be made to increase density in certain areas.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Achieve a 25% increase in community-wide household and employment density over baseline conditions by 2020. No jurisdictions participating at this level.	0
GOLD LEVEL	Achieve a 10% increase in community-wide household and employment density over baseline conditions by 2020. Perris, Riverside, Temecula	2,054
SILVER LEVEL	Achieve a 5% increase in community-wide household and employment density over baseline conditions by 2020. Eastvale, Hemet, Jurupa Valley, Norco, San Jacinto, Wildomar	803

PROGRESS INDICATORS	YEAR
1 Annual percentage change in community-wide household and employment density compared to baseline conditions	2020

Community Benefits

Measure T-9: Mixed-Use Development

Provide for a variety of development types and uses.

2020 GHG Reduction Potential: 4,069 MT CO_2e/yr

Development can occur in many forms, ranging from single-family homes on large plots of land to multi-family housing with high vertical construction for residential areas, and single-use to multi-use zoning for commercial properties. While land development choices are typically made at the household or business level, recent studies show that individuals are more frequently demanding higher-density, multi-use regions that are more walkable. Most WRCOG jurisdictions have identified portions of their communities where future higher-density development is desirable. Such development reduces both VMT and GHGs, as individuals can accomplish many tasks in a single mixed-use area. This also can improve community health by encouraging bicycling and walking, improve air quality by reducing tailpipe emissions, and increase the community's sense of place.

For the WRCOG subregion, mixed-use development is classified as having at least three of the following features either on-site or within ¼ mile:

- Residential development;
- Retail development;
- Park;
- Open space; or
- Office.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL ($MT\ CO_2e/yr$)
PLATINUM LEVEL	Achieve a 25% jobs/housing ratio improvement over baseline conditions. Eastvale, Jurupa Valley	1,897
GOLD LEVEL	Achieve a 10% jobs/housing ratio improvement over baseline conditions. Hemet, Perris	764
SILVER LEVEL	Achieve a 5% jobs/housing ratio improvement over baseline conditions Banning, Norco, Riverside, Temecula, Wildomar	1,408
PROGRESS INDICATORS		**YEAR**
1	Annual percentage change in jobs/housing ratio within new development areas compared to baseline conditions.	2020

Community Benefits

Measure T-10: Design/Site Planning

Design neighborhoods and sites to reduce VMT.

2020 GHG Reduction Potential: 912 MT CO_2e/yr

The design of projects affects travel behavior. Typical suburban development patterns feature longer blocks which often discourage walking and biking. Conversely, projects with shorter blocks and more frequent intersections have higher levels of walking, biking, and transit use. This higher use of non-motorized and alternative modes leads to a reduction in automobile use, VMT, and GHG emissions.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	25% increase in intersection density and reduction in block length in new development compared to the baseline countywide average. No jurisdictions participating at this level.	0
GOLD LEVEL	10% increase in intersection density and reduction in block length in new development compared to the baseline countywide average. No jurisdictions participating at this level.	0
SILVER LEVEL	5% increase in intersection density and reduction in block length in new development compared to the baseline countywide average. Hemet, Perris, Temecula	912

PROGRESS INDICATORS		YEAR
1	Annual percentage of neighborhood streets with traffic calming treatments installed.	2020

Community Benefits

Measure T-11: Pedestrian-Only Areas

Encourage walking by providing pedestrian-only community areas.

2020 GHG Reduction Potential: 2,812 MT CO_2e/yr

Also referred to as an urban non-motorized zone, a pedestrian-only area restricts certain portions of a central business district or major activity center to non-motorized transportation.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Designate one additional major activity center in the community as a permanent pedestrian-only area over baseline conditions. Perris, Riverside	1,747
GOLD LEVEL	Designate one additional pedestrian-only area during weekends over baseline conditions. No jurisdictions participating at this level.	0
SILVER LEVEL	Designate one additional pedestrian-only area during weekends tied to a special event (e.g. farmer's market) over baseline conditions. Banning, Hemet, Jurupa Valley, Norco, San Jacinto, Temecula	1,065

PROGRESS INDICATORS	YEAR
1 Annual number of temporary or permanent pedestrian-only zones compared to baseline conditions.	2020

Community Benefits

Measure T-12: Limit Parking Requirements for New Development

Reduce requirements for vehicle parking in new development projects.

2020 GHG Reduction Potential: 28,423 MT CO_2e/yr

Limiting parking requirements for new development in certain areas may encourage alternative individual transportation choices, but caution should be taken to minimize the resulting incentive to travel to more distant locations with plenty of parking. This can be accomplished by:

- Eliminating (or reducing) minimum parking requirements;
- Creating maximum parking requirements; and
- Implementing shared parking.

Limiting parking requirements would encourage modes of transportation other than single-occupancy vehicles, thereby reducing VMT and GHG emissions. If these alternative transportation modes include walking and biking, mobility and health benefits would also be realized.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Amend zoning to reduce parking requirements for new non-residential development by 25% over baseline conditions. Riverside	17,482
GOLD LEVEL	Amend zoning to reduce parking requirements for new non-residential development by 10% over baseline conditions Jurupa Valley, Perris	6,093
SILVER LEVEL	Amend zoning to reduce parking requirements for new non-residential development by 5% over baseline conditions. Canyon Lake, Hemet, Norco, Temecula, Wildomar	4,848

PROGRESS INDICATORS		YEAR
1	Number of jurisdictions which have amended their parking requirements to reduce parking spaces required within new development or redevelopment areas.	2020

Community Benefits

Measure T-13: High Frequency Transit Service

Implement high frequency transit service in the subregion to provide alternative transportation options.

2020 GHG Reduction Potential: 1,801 MT CO_2e/yr

The WRCOG subregion is one of the fastest growing areas in California. As more residents and employees occupy the area, there will be increased need to move people efficiently in and out of the area. A high frequency transit system such as bus rapid transit (BRT) would provide an alternative to constructing more roadways and allow commuters and residents additional transportation options. Jurisdictions participating in this measure have an objective to work with RTA to identify corridors where BRT service would provide an effective and logical transportation option.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Work with RTA to offer high frequency transit service within three (3) corridors No jurisdictions participating at this level.	0
GOLD LEVEL	Work with RTA to offer high frequency transit service within two (2) corridors Eastvale, Riverside	1,640
SILVER LEVEL	Work with RTA to offer high frequency transit service within one (1) corridor Hemet	161

	PROGRESS INDICATORS	YEAR
1	Number of corridors in which high frequency transit service has been implemented.	2020

Community Benefits

Measure T-14: Voluntary Transportation Demand Management

TDM describes strategies to reduce demand for roadway travel, particularly in single-occupancy vehicles. TDM strategies can include both "carrot" and "stick" approaches to change travel behavior patterns. Specific examples include preferential parking for carpoolers and parking pricing.

While SCAG offers regional approaches such as high-occupancy vehicle lanes, this measure focuses on efforts by individual existing business owners in the WRCOG subregion to develop TDM strategies, such as parking "cash out" programs and allowing telecommuting. Several TDM strategies can be offered; often, multiple programs can enhance one other rather than being redundant. In addition to reducing GHG emissions, TDM strategies often ease congestion and improve air quality.

2020 GHG Reduction Potential: 2,464 MT CO_2e/yr

Body text.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	50% of employees within the jurisdiction participate in voluntary TDM programs No jurisdictions participating at this level.	0
GOLD LEVEL	25% of employees within the jurisdiction participate in voluntary TDM programs Riverside	2,185
SILVER LEVEL	12.5% of employees within the jurisdiction participate in voluntary TDM programs Perris	279

PROGRESS INDICATORS		YEAR
1	Percentage of employees in each jurisdiction participating in voluntary TDM programs.	2020

Community Benefits

Measure T-15: Accelerated Bike Plan Implementation

Accelerate the implementation of all or specified components of a jurisdiction's adopted bike plan.

2020 GHG Reduction Potential: 5,340 MT CO_2e/yr

Several jurisdictions within WRCOG are currently implementing existing Bicycle Master Plans and/or Trails Plans. These plans outline a series of on-street and off-street facilities to increase bicycle use within the community. This measure addresses accelerated implementation of these Master Plans to provide additional facilities by 2020 beyond those identified in Measure T-1.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Install 75% of all bicycle facility miles identified in jurisdiction's Bike Plan by 2020 Riverside	3,496
GOLD LEVEL	Install 50% of all bicycle facility miles identified in jurisdiction's Bike Plan by 2020 No jurisdictions participating at this level.	0
SILVER LEVEL	Install 25% of all bicycle facility miles identified in jurisdiction's Bike Plan by 2020 Hemet, Perris, Temecula, Wildomar	1,844

NOTE: Reductions are assumed to be 1/2 of total reduction for bicycle infrastructure measure.

PROGRESS INDICATORS		YEAR
1	Annual % of bicycle facility miles identified in jurisdiction's Bike Plan installed	2020

Community Benefits

Measure T-16: Fixed Guideway Transit

Introduce a fixed-route transit service in the jurisdiction.

2020 GHG Reduction Potential: 10,489 MT CO_2e/yr

This measure applies specifically to the City of Riverside's efforts to conduct a preliminary engineering and economic study for a proposed Streetcar. This Streetcar would provide fixed-route transit service through the City of Riverside, providing access to major destinations such as the University of California, Riverside, Downtown Riverside, and other major destinations throughout the city. The City would plan, design, construct, and operate the streetcar.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Implement a fixed-guideway transit system. Riverside	10,489
GOLD LEVEL	N/a No jurisdictions participating at this level.	0
SILVER LEVEL	N/a No jurisdictions participating at this level.	0

PROGRESS INDICATORS		YEAR
1	Annual community-wide fixed guideway transit ridership.	2020

Community Benefits

Measure T-17: Neighborhood Electric Vehicle Programs

Implement development requirements to accommodate Neighborhood Electric Vehicles and supporting infrastructure.

2020 GHG Reduction Potential: 4,707 MT CO_2e/yr

Neighborhood electric vehicles (NEVs) emit fewer GHGs than traditional passenger vehicles and reduce local air pollution. NEVs generally are used in areas with speed limits of 35 miles per hour or less for relatively short (less than 30 miles) trips. This measure introduces development requirements for signage and educational programs related to the use of NEVs consistent with state regulations.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Provide dedicated NEV facilities within the community. No jurisdictions participating at this level.	0
GOLD LEVEL	Adopt a comprehensive NEV program including signage for NEVs and an educational program related to the use of NEVs. Riverside	3,496
SILVER LEVEL	Adopt an educational program related to the use of NEVs. Hemet	1,211

PROGRESS INDICATORS		YEAR
1	Number of jurisdictions which have implemented NEV plans.	2020

Community Benefits

Measure T-18: Subsidized Transit

Increase access to transit by providing free or reduced passes.

2020 GHG Reduction Potential: 3,628 MT CO_2e/yr

One approach to increase transit use within a jurisdiction is lowering the cost of using transit. Within Western Riverside County, the typical approach has been to provide reduced cost transit passes such as those provided by several universities. This approach is generally targeted at groups such as students or seniors who may lack access to vehicles.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Provide subsidized or discounted transit passes to 3% of residents, students, and employees living, working, or going to school in the community. Riverside	3,496
GOLD LEVEL	Provide subsidized or discounted transit passes to 2% of residents, students, and employees living, working, or going to school in the community. No jurisdictions participating at this level.	0
SILVER LEVEL	Provide subsidized or discounted transit passes to 1% of residents, students, and employees living, working, or going to school in the community. Norco	132

	PROGRESS INDICATORS	YEAR
1	Annual number of discounted transit passes provided per total of residents, students, and employees living, working, or going to school in the community.	2020

Community Benefits

LOCAL SOLID WASTE MEASURES

The following are local measures that can be implemented to reduce GHG emissions associated with the solid waste sector.

Measure SW-1: Yard Waste Collection

Provide green waste collection bins community-wide.

2020 GHG Reduction Potential: 1,007 MT CO_2e/yr

All jurisdictions in the subregion offer green waste collection bins for residential yard waste. Diverting yard waste from landfills helps to extend the life of area landfills. In addition, grass clippings and leaves can be composted into nutrient-rich topsoil amendments, and branches can be chipped into mulch for reuse in landscaping. Removing beneficial organic materials from landfills also helps avoid the creation of landfill methane, a potent GHG.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Adopt an ordinance prohibiting deposit of yard waste in the solid waste stream. No jurisdictions participating at this level.	0
GOLD LEVEL	Provide residential green waste bins for collection and transport to an organic waste processing facility. Banning, Calimesa, Canyon Lake, Eastvale, Hemet, Jurupa Valley*, Norco, Perris, Riverside, San Jacinto, Temecula, Wildomar	1,007
SILVER LEVEL	Conduct an outreach campaign promoting the benefits of yard waste collection, without provision of green waste bins. No jurisdictions participating at this level.	0

*Jurupa Valley offers yard waste collection bins, however waste emissions were not quantified within the jurisdiction's inventory due to lack of available data. Therefore, yard waste reductions for Jurupa Valley are not included within this CAP.

	PROGRESS INDICATORS	YEAR
1	Achievement of 95% diversion of residential yard waste from landfill waste stream.	2020

Community Benefits

Measure SW-2: Food Scrap and Compostable Paper Diversion

Divert food and paper waste from landfills by implementing collection system.

2020 GHG Reduction Potential: 155 MT CO_2e/yr

Food scraps are unwanted cooking preparation and table scraps, such as banana peels, apple cores, vegetable trimmings, bones, egg shells, meat, and pizza crusts. Compostable paper, sometimes called food-soiled paper, usually comes from the kitchen and is not appropriate for paper recycling due to contamination. Materials such as stained pizza boxes, uncoated paper cups and plates, used coffee filters, paper food cartons, napkins, and paper towels are all compostable paper. Food scraps alone represent nearly 20% of total landfilled solid waste statewide. Diverting these organic items from landfills helps to reduce landfill methane gas generation, and can help prolong the lifespan of area landfills.

PARTICIPATION LEVEL	ACTIONS + PARTICIPATING CITIES	GHG REDUCTION POTENTIAL (MT CO_2e/yr)
PLATINUM LEVEL	Accept food scraps and compostable paper within residential green waste bins; establish a commercial food scrap collection program. No jurisdictions participating at this level.	0
GOLD LEVEL	Accept food scraps and compostable paper within residential green waste bins or provide separate food scrap collection bins. Riverside, Temecula	155
SILVER LEVEL	Provide community outreach about benefits of food scrap and compostable paper collection with information about at-home composting. Banning, Calimesa, Canyon Lake, Eastvale, Jurupa Valley, Norco, Perris	0

PROGRESS INDICATORS	YEAR
1 Temecula - 20% of commercial businesses divert 90% of their waste	2020

Community Benefits

Chapter 4
Next Steps

PREPARING THE SUBREGION FOR CLIMATE CHANGE

A key next step, and important to the success of WRCOG's sustainability planning efforts including the Subregional Climate Action Plan (CAP), is the evaluation, analysis, and integration of climate adaptation and resiliency strategies. The WRCOG subregion is expected to experience impacts due to projected changes in the climate, and jurisdictions should begin preparing for them. The effects of climate change will cumulatively affect all sectors, including: water supply and wastewater management, agriculture, public infrastructure (pipelines, wastewater treatment plants, bridges, and roads), public health and public services (fire protection, emergency preparedness), and ecosystem health (diversity and connectivity of habitats), among others.

Despite significant efforts by the subregion and the State of California to reduce GHG emissions, changes in our climate cannot be avoided entirely over the long term. Even if GHG emissions were reduced to pre-industrial levels today, the GHG emissions that have already been added to the atmosphere will continue to warm the planet for centuries. While mitigation is still the most cost-effective approach to preventing long-term catastrophic impacts of climate change, adaptation efforts are needed to increase the resilience of communities and natural resources to changes expected over the next few decades.

In California, anticipated climate change impacts include sea level rise; increased periods of drought; and more frequent extreme weather events, including heat waves and severe storms. Secondary effects include projected inundation of the shoreline; more frequent and severe flooding; more frequent and severe wildfires on the urban fringe; a less reliable water supply; altered agricultural productivity, increased incidence of disease and mortality (both from effects of heat waves and from changing patterns of disease distribution); and disruption of local ecosystems.

The *California Planning Adaptation Planning Guide: Understanding Regional Characteristics (July 2012)*[1] designates climate impact regions based on county boundaries in combination with projected climate impacts, existing environmental setting, socioeconomic factors, and regional designations. The WRCOG subregion falls within the Desert climate impact region, which includes Imperial, Riverside, and San Bernardino Counties, and the *Adaptation Planning Guide* identifies the following climate change impacts to this area:

- Temperature increases
- Reduced precipitation
- Flooding
- Reduced agricultural productivity
- Reduced water supply
- Wildfires
- Public health and heat

ADAPTATION PLANNING APPROACH

Effective adaptation planning and management entails dealing with uncertainty. Adaptation is likely to be a long-term process, including immediate action when necessary and allowing adjustments to changing conditions and new knowledge. Effective public engagement and education is critical, along with an inclusive planning process that ensures the resulting actions are feasible and widely accepted. Five important steps to effective adaptation planning are summarized below:

- **Increase Public Awareness; Engage and Educate the Community:** Local outreach campaigns to build awareness of the dangers of heat exposure and to promote low-cost and low-GHG emitting adaptation strategies. It is critical that the public understand the magnitude of the challenge and why action is needed. The planning process should be inclusive of all stakeholders. These efforts should leverage similar efforts undertaken at the regional, state, and federal levels.
- **Assess Vulnerability:** Perform a detailed vulnerability analysis to assess potential climate change impacts to infrastructure and natural systems. Both short-term and long-term adaptation strategies should be identified. Level of risk can be categorized in terms of likelihood of damage within the forecasting period and the severity of the damages. Understanding vulnerability to climate change impacts is critical to developing effective adaptation strategies. The vulnerability assessment can also provide a framework for agency and community education and participation, inform other planning documents, and identify funding needs. WRCOG intends to initiate a vulnerability/risk assessment in Spring 2014 that will inform not only the CAP, but member jurisdictions' General Plan Safety Elements and Local Hazard Mitigation Plans. It will incorporate the diversity of needs and integrate climate adaptation strategies with existing and proposed programs and initiatives to make the best use of limited resources.
- **Establish Goals, Criteria and Planning Principles:** Engage with stakeholders to establish planning priorities, decision criteria, and build community support for taking action. Rank physical and natural assets for preservation efforts. Where possible, look for situations where a mitigation

[1] California Climate Planning Adaptation Guide, July 2012. Available at http://resources.ca.gov/climate_adaptation/docs/1APG_Planning_for_Adaptive_Communities.pdf

action has adaptation co-benefits (e.g., planting trees to reduce urban heat islands while sequestering carbon and providing habitat).

- **Develop Adaptation Plan:** Identify specific strategies, develop cost estimates, and prioritize actions to increase local resilience of public infrastructure and critical assets, including natural systems like wetlands and urban forests. Look for synergies between natural processes and engineering solutions. An adaptation plan should include a prioritized list of actions (e.g. projects), with a timeline, capital expenditure plan, and a framework for monitoring and adaptive management.
- **Ongoing Monitoring and Adaptive Management:** Reassess climate change vulnerabilities on a regular basis and modify actions accordingly. This includes monitoring the effectiveness of current policies, strategies and actions, and keeping up with changing science, funding opportunities, and regulatory actions.

IMPLEMENTATION OF THE SUBREGIONAL CLIMATE ACTION PLAN

Implementation of the Subregional CAP, including meeting the subregional reduction targets and achieving GHG reduction benefits, will require collaboration between WRCOG, local governments, and the communities at large. Meaningful implementation of the CAP would require the following components, described in more detail below:

- Administration
- Schedule of implementation
- Potential funding sources
- Monitoring and reporting

These steps are not specific to WRCOG or any individual jurisdiction, but are basic steps that WRCOG or any jurisdiction might take, or that other California communities have taken to implement a CAP. These are suggested, not required, and are intended to guide WRCOG and its members in implementation planning for the future.

ADMINISTRATION

WRCOG will continue to provide staffing and administrative support at the subregional level, particularly in implementing subregional programs such as the Transportation Uniform Mitigation Fee (TUMF), HERO Program, Western Riverside Energy Leader Partnership (WRELP) and Clean Cities Coalition. WRCOG will also work to align these programs, and future subregional initiatives, with the goals established in this CAP, where applicable. WRCOG recommends that participating jurisdictions appoint a "CAP coordinator" to oversee the successful implementation and tracking of local GHG reduction strategies. The local CAP coordinator would primarily be responsible for coordinating across municipal departments to gather data, report on progress, track completed projects, and ensure that scheduling and funding of upcoming projects is discussed at key meetings. Some jurisdictions may wish to have the coordinator work primarily as part of the development review process for new projects (i.e., Planning Department staff). The coordinator may be existing staff and does not necessarily require a dedicated full-time position. **Table 4-1** describes the potential responsibilities for WRCOG staff and local CAP coordinators.

In general, the goal in implementing the CAP is not to create new administrative tasks or new staff positions, but rather to leverage existing programs and staff to the maximum extent feasible. Local governments should seek to incorporate GHG planning and long-term reductions into their existing procedures, institutional organization, reporting and long-term planning; this is a process that will be unique to each jurisdiction.

Table 4-1: Climate Action Plan Implementation Responsibilities

WRCOG	Jurisdictions/CAP Coordinators
Secure financing to implement GHG reduction measures (i.e., grants)	Secure long-term financing to implement GHG reduction measures
Coordinate meetings among member jurisdictions, regional partners and stakeholders	Coordinate meetings amongst local community stakeholders
Serve as the external communication hub to regional climate action organizations including California Air Resources Board (CARB), South Coast Air Quality Management District (SCAQMD), Southern California Association of Governments (SCAG)	Serve as the communication hub to the community and local stakeholders
Conduct public outreach to inform the community of the subregion's reduction planning efforts	Submit annual reports to governing bodies
Develop a protocol for monitoring the effectiveness of emissions reduction programs	Utilize tool developed by WRCOG to report and document emission reduction progress
Establish guidelines and develop a tool for reporting and documenting emissions reduction progress	
Submit annual reports to the WRCOG Executive Committee and member agency governing bodies	
Develop a protocol for utilizing the real-time information collected through the verification process to modify and revise existing reduction programs	
Track state and federal legislation and its applicability to member jurisdictions	

SCHEDULE OF IMPLEMENTATION

WRCOG will track State measures, facilitate implementation of the regional measures and will coordinate with each participating jurisdiction to implement local measures. When feasible, WRCOG will act as the convener and assist in identifying funding, establishing partnerships, and track and monitor progress. Ultimately, each participating jurisdiction will be responsible for initiating the local actions to reduce emissions, but success for many measures will ultimately depend on public participation. Tasks that require active promotion may require updates to the WRCOG and jurisdictions' websites, distribution of physical promotional materials, and other active outreach activities. WRCOG and its members will develop programs to reach the public, including public forums, workshops, and meetings; these programs will be administered with the intent to foster an open public input and commenting process. Collaboration and coordination with transportation agencies (e.g., Riverside Transit Agency [RTA], Banning Pass Transit, and Riverside County Transportation Commission [RCTC]) will be essential to improving and increasing transit ridership, and enhancing mobility and transportation efficiency through better planning.

Further, coordination with external agencies and the private sector is critical for the success of many strategies, including utility companies for energy conservation and renewable energy programs, waste haulers for waste reduction actions, local water purveyors for water saving actions, and other local jurisdictions for work-sharing partnerships designed to take advantage of the common goals across Western Riverside County. Dependence on outside agency participation is mentioned explicitly in the strategy descriptions; WRCOG, its member jurisdictions, and partner stakeholders will continue to explore strategies for collaboration.

Table 4-2 provides a summary of the state, regional, and local measures included in this Subregional CAP and the emissions reductions associated with these measures anticipated by 2020. Chapter 3 provides a detailed description of each measure, jurisdictional participation, progress indicators, and community benefits.

Table 4-2: Implementation Summary

Measure	2020 Annual GHG Reductions (MT CO_2e/yr)	Objectives
SR-1: Renewables Portfolio Standard	434,606	• 20% of retail sales from renewables by 2013. • 25% of retail sales from renewables by 2016. • 33% of retail sales from renewables by 2020.
SR-2: 2013 California Building Energy Efficiency Standards (Title 24, Part 6)	30,923	• Residential construction 25% more efficient and nonresidential construction 30% more efficient than the 2008 standards.
SR-3: HERO Residential Program	71,649	• Expanding list of eligible products for financing. • Increase in funded applications and completed projects. • Increased energy savings, renewable energy installation, job creation, and economic development.
SR-4: HERO Commercial Program	10,079	• Expanding list of eligible products for financing. • Increase in funded applications and completed projects. • Increased energy savings, renewable energy installation, job creation, and economic development.
SR-5: Utility Programs	9,182	• Increased participation in programs.

Measure	2020 Annual GHG Reductions ($MT\ CO_2e/yr$)	Objectives
SR-6: Pavley & Low Carbon Fuel Standards	1,095,555	• Increasingly-stringent fuel-efficiency standards for passenger vehicles 2017 through 2025. • The carbon-intensity of California's transportation fuel to be reduced by at least 10% by 2020.
SR-7: Metrolink Expansion	23,074	• Extension of service to Perris by 2015.
SR-8: Express Lanes	60,864	• Extended express lanes along SR-91 and I-15 operational by 2020.
SR-9: Congestion Pricing	3,246	• Congestion pricing on the SR-91 and I-15 by 2020.
SR-10: Telecommuting	40,576	• Increasing the availability and use of carpooling, vanpooling, transit, bicycling, and walking. • Shifting work schedules to non-peak periods or locations. • Using telecommuting. • 5% of workers in the region telecommuting by 2020.
SR-11: Goods Movement	22,688	• Penetration of electric and low-emission trucks. • Physical improvements on freeways such as truck climbing lanes.
SR-12: E-Vehicle Plan and Infrastructure	81,152	• Charging stations, changes to development codes, and other strategies to encourage purchase and use of electric vehicles.
SR-13: Construction and Demolition Waste Diversion	3,574	• 50% of scrap lumber diverted from landfill waste stream.
SR-14: Water Conservation	23,192	• Urban retail water suppliers to reduce per-capita water use by 10% from a baseline level by 2015. • Reduce per-capita water use by 20% by 2020.
E-1: Energy Action Plans	357,581	• Implement programs to meet energy efficiency targets.
E-2: Traffic & Street Lights	4,697	• Platinum Level: 100% of traffic & street lights converted to high-efficiency bulbs by 2020. • Gold Level: 75% of traffic & street lights converted to high-efficiency bulbs by 2020. • Silver Level: 50% of traffic & street lights converted to high-efficiency bulbs by 2020.

Measure	2020 Annual GHG Reductions (MT CO_2e/yr)	Objectives
E-3: Shade Trees	2,014	• Platinum Level: Shade trees required for all new developments. • Gold Level: Subsidized program to support planting city-identified tree species. • Silver Level: Outreach program promoting the benefits of planting additional trees in urban environments.
T-1: Bicycle Infrastructure	29,255	• Platinum Level: 50% increase in bicycle lane mileage from 2010 levels. • Gold Level: 25% increase in bicycle lane mileage from 2010 levels. • Silver Level: 10% increase in bicycle lane mileage from 2010 levels.
T-2: Bicycle Parking	6,290	• Platinum Level: Amend zoning to require provision of bike parking for all multi-family or mixed-use projects. • Gold Level: Amend zoning to require provision of bike parking for multi-family projects consisting of more than 50 dwelling units, and mixed-use projects greater than 50,000 sf. • Silver Level: Provide information to applicants for large development projects describing the benefits of bike parking.
T-3: End of Trip Facilities	1,836	• Platinum Level: Amend zoning code to require installation of end-of-trip facilities for new commercial buildings greater than 50,000 sf. • Gold Level: Amend zoning to require installation of end-of-trip facilities for new commercial buildings greater than 100,000 sf. • Silver Level: Provide information to commercial project applicants describing the benefits of installing end-of-trip facilities.
T-4: Promotional Transportation Demand Management	1,831	• Platinum Level: Allocate a full-time staff person to promote TDM strategies to existing businesses. • Gold Level: Allocate the equivalent of ½ of a full-time staff person to promote TDM strategies to existing businesses. • Silver Level: Train an existing staff person to promote TDM strategies to existing businesses.

Measure	2020 Annual GHG Reductions (MT CO_2e/yr)	Objectives
T-5: Transit Service Expansion	704	• Platinum Level: 20% increase in fixed-route service miles. • Gold Level: 10% increase in fixed-route service miles. • Silver Level: 5% increase in fixed-route service miles.
T-6: Transit Frequency Expansion	2,723	• Platinum Level: 20% increase in fixed-route service frequency over 2010 levels in transit priority areas (TPAs) as determined by the latest available SCAG SCS/RTP. • Gold Level: 10% increase in fixed-route service frequency over 2010 levels in TPAs. • Silver Level: 5% increase in fixed-route service frequency over 2010 levels in TPAs.
T-7: Traffic Signal Coordination	94,600	• Platinum Level: Coordinate traffic signals on an additional 50% of arterial roads. • Gold Level: Coordinate signals on an additional 25% of arterial roads. • Silver Level: Coordinate signals on an additional 10% of arterial roads.
T-8: Density	2,857	• Platinum Level: Achieve a 25% increase in community-wide household and employment density over 2010 baseline conditions by 2020. • Gold Level: Achieve a 10% increase in density by 2020. • Silver Level: Achieve a 5% increase in density by 2020.
T-9: Mixed-Use Development	4,069	• Platinum Level: Achieve a 25% jobs/housing ratio improvement Citywide over 2010 baseline conditions. • Gold Level: Achieve a 10% jobs/housing ratio improvement. • Silver Level: Achieve a 5% jobs/housing ratio improvement.

Measure	2020 Annual GHG Reductions (MT CO_2e/yr)	Objectives
T-10: Design/Site Planning	912	• Platinum Level: 25% increase in intersection density and reduction in block-length in new development. • Gold Level: 10% increase in intersection density and reduction in block-length in new development. • Silver Level: 5% increase in intersection density and reduction in block-length in new development.
T-11: Pedestrian Only Areas	2,812	• Platinum Level: Designate one additional major activity center in the community as a permanent pedestrian-only area. • Gold Level: Designate one additional pedestrian-only area during weekends. • Silver Level: Designate one additional pedestrian-only area during weekends tied to a special event such as a Farmer's market.
T-12: Limiting Parking Requirements for New Development	28,423	• Platinum Level: Amend zoning to reduce parking requirements for new non-residential development by 25%. • Gold Level: Reduce parking requirements for new non-residential development by 10%. • Silver Level: Reduce parking requirements for new non-residential development by 5%.
T-13: High Frequency Transit Service	1,801	• Platinum Level: Work with RTA to offer high frequency transit service within 3 corridors • Gold Level: Offer high frequency transit service within 2 corridors • Silver Level: Offer high frequency transit service within 1 corridor
T-14: Voluntary Transportation Demand Management	2,464	• Platinum Level: 50% of employees within the jurisdiction participation in voluntary TDM programs. • Gold Level: 25% of employees within jurisdiction participate in voluntary TDM programs. • Silver Level: 12.5% of employees within the jurisdiction participate in voluntary TDM programs.
T-15: Accelerated Bike Plan Implementation	5,340	• Install 75% of all bicycle facility miles identified in City's Bike Plan by 2020 • Install 50% of all bicycle facility miles • Install 25% of all bicycle facility miles

Measure	2020 Annual GHG Reductions (MT CO_2e/yr)	Objectives
T-16: Fixed Guideway Transit	10,489	• Implementation of streetcar could potentially double existing transit mode split within City, which equates to 1.5% reduction in VMT.
T-17: Neighborhood Electric Vehicle Programs	4,707	• Adopt comprehensive NEV programs including signage and designated facilities.
T-18: Subsidized Transit	3,628	• Platinum Level: Provide subsidized or discounted transit passes to 3% of residents, students, and employees living, working, or going to school in the community. • Gold Level: Provide subsidized or discounted transit passes to 2%. • Silver Level: Provide subsidized or discounted transit passes to 1%.
SW-1: Yard Waste Collection	1,007	• Platinum Level: Adopt an ordinance prohibiting deposit of yard waste in the solid waste stream. • Gold Level: Provide residential green waste bins for collection and transport to organic waste processing facility. • Silver Level: Conduct an outreach campaign promoting the benefits of yard waste collection, without provision of green waste bins.
SW-2: Food Scrap and Paper Diversion	155	• Platinum Level: Accept food scraps and compostable paper within residential green waste bins; establish a commercial food scrap collection program • Gold Level: Accept food scraps and compostable paper within residential green waste bins or provide separate food scrap collection bins • Silver Level: Provide community outreach about benefits of food scrap and compostable paper collection with information about at-home composting

POTENTIAL FUNDING SOURCES

Funding Mechanisms

The GHG reduction strategies in this document were formulated with an understanding that WRCOG and member jurisdictions have limited staff time and financial resources to implement them. The costs for implementation include the creation or promotion of voluntary programs, continuing administration of those programs, coordination and outreach with other government agencies and businesses, and—in some cases—exploration or study of potential legislative or regulatory mechanisms not yet codified. A few strategies require up-front capital expenditures by local agencies. WRCOG and member jurisdictions will use a combination of staff time, grant funding, direct spending, and collaboration with other agencies and organizations to achieve CAP goals. This section presents a summary of funding and financing options (Table 4-3) available at the time this document was prepared.

Some funding sources are not necessarily directed towards a jurisdiction, but to a larger regional agency such as WRCOG, SCAG, a Joint Powers Authority (JPA), or a waste services provider serving multiple jurisdictions. WRCOG and its members should continually monitor private and public funding sources for new grant and rebate opportunities and to better understand how larger agencies are accessing funds that can be used for GHG reductions at the local level. Leveraging financing sources is one of the most important roles WRCOG and a local government can play in helping the community to implement many of the GHG reduction measures.

Table 4-3: Potential Funding Sources to Support CAP Implementation

Federal Funds	
Energy Efficient Mortgages	▪ The Federal Housing Administration (FHA) offers an Energy Efficient Mortgage Loan program that assists current or future homeowners with lowering their utility bills. This would be accomplished by enabling homeowners to incorporate the cost of adding energy-efficient improvements into their home mortgage. Energy efficient upgrades could be chosen that would allow owners to realize net monthly savings. The goal is to provide owners additional financing for energy efficiency upgrades at a discounted interest rate.
Moving Ahead for Progress in the 21st Century (MAP-21)	▪ Federal funding through the MAP-21 program is administered through the state and regional governments. MAP-21 funding is administered through Caltrans, MPOs (SCAG in Southern California) and RTPAs (RCTC in Riverside County). Most of the funding programs are transportation versus recreation oriented, with an emphasis on reducing auto trips and providing an intermodal connection. In most cases, MAP-21 provides matching grants of 50 to 100%.
Safe Routes to Schools	▪ Safe Routes to Schools is an international movement focused on increasing the number of children who walk or bike to school by funding projects that remove barriers to doing so. These barriers include a lack of infrastructure and non-infrastructure projects, safety, and limited programs that promote walking and bicycling. In California, two separate Safe Routes to School programs are available at both the state and federal level, and both programs fund qualifying infrastructure projects.

American Recovery and Reinvestment Act (ARRA) Community Partnerships	▪ Federal funding for local energy efficiency programs is available. Funding for energy efficiency has been provided to the California Department of Community Services and Development, which has dispersed funds locally through the Community Action Partnership of Riverside County. The Partnership provides free home weatherization and other energy assistance resources to low-income and elderly citizens of Riverside County. Programs include the Low-Income Home Energy Assistance Program and the Weatherization Assistance Program.
State Funds	
California Air Resources Board (CARB)	▪ CARB offers several grants, incentives, and credits programs to reduce on-road and off-road transportation emissions. Residents, businesses, and fleet operators can receive funds or incentives depending on the program. ○ The following programs can be utilized to fund local measures: ○ Air Quality Improvement Program (AB 118) ○ Carl Moyer Program – Voucher Incentive Program ○ Goods Movement Emission Reduction Program (Prop 1B Incentives) ○ Loan Incentives Program ○ Lower-Emission School Bus Program/School Bus Retrofit and ○ Replacement Account (Prop 1B and EPA Incentives)
California Energy Efficiency Financing	▪ For years, the California Energy Commission (CEC) has provided a loan program that supports local government energy retrofits and some new construction projects. Since 1979, more than $272 million has been allocated to more than 773 recipients, as of 2012. The program provides low interest loans for feasibility studies and the installation of cost-effective energy projects in schools, hospitals, and local government facilities. The loans are repaid out of the energy cost savings and the program will finance lighting, motors, drives and pumps, building insulation, heating and air conditioning modifications, streetlights and traffic signal efficiency projects, and certain energy generation projects, including renewable energy projects and cogeneration. Loans can cover up to 100% of project costs and there is a maximum loan amount of $3 million.
California Department of Resources Recycling and Recovery (CalRecycle)	▪ CalRecycle grant programs allow jurisdictions to assist public and private entities in management of waste streams. ▪ Incorporated cities and counties in California are eligible for funds. ▪ Program funds are intended to: ○ Reduce, reuse, and recycle all waste. ○ Encourage development of recycled-content products and markets. ○ Protect public health and safety and foster environmental sustainability.
Strategic Growth Council (SGC)	▪ In September 2008, California Senate Bill 732 created the Strategic Growth Council, which is a cabinet level committee whose tasks include coordinating the activities of member state agencies to assist state and local entities in the planning of sustainable communities and meeting AB 32 goals, including coordination of Planning Grants and Urban Greening Grants.

State Funding for Infrastructure	▪ The state's Infill Infrastructure Grant Program may potentially be used to help fund measures that promote infill housing development. ▪ Grants can be used for gap funding for infrastructure improvements necessary for specific residential or mixed-use infill development projects.
Existing Capital Improvement Program	▪ State and federal funds would most likely continue to local governments, builders, and homeowners in the following forms: ○ Grants ○ Transportation and transit funding ○ Tax credit and rebate programs ○ The Capital Improvement Program can be utilized for measures relating to traffic or transit.
Private and Non-Governmental Support	
▪ Community-based non-profits, local businesses, and investor owned utilities should be considered as resources for direct and indirect support, including funding, for program activation and operations. ▪ Private investors may provide funding to local governments. For example, energy service companies can finance the up-front investments in energy efficiency, reimbursed by the local government over a contract period. Private companies may finance solar power installations, and then recoup their investment by selling the resulting power to the building owner.	

Additional Considerations

In addition to pursuing the funding options above and monitoring the availability of others, WRCOG and its member jurisdictions may take the following steps to inform decisions related to the cost of GHG reduction measures.

- **Perform and refine cost estimates:** Cost estimates for local reduction measures should be performed to identify the cost-effectiveness of each measure to inform and guide the implementation process. This analysis will likely be based on a variety of participation, per-unit and other assumptions. As programs are developed, cost estimates should be refined an updated over time with more precise implementation-level data.
- **Integrate GHG measures into existing city budget and Capital Improvement Plan (CIP):** Certain capital improvements, particularly those identified in Energy and Land Use/Transportation Measures, may need to be added to the city's CIP and facility master plan programs, as well as those of the city utility enterprises and other public agencies (such as transit agencies) that have control for project implementation. For CIPs completely under the city's control, new projects would need to be assessed for consistency with a city's local CAP or adherence to some minimum energy efficiency standard similar to that achieved by the local plan.
- **Adopt or update ordinances and/or codes:** Some local reduction measures may represent a continuation of recently enacted ordinances, while others would require new ordinances. WRCOG will develop a "plug and play" implementation toolkit of model general plan, zoning and building code amendments and other programs to help facilitate the GHG reduction and climate adaptation measures outlined in the Subregional CAP. The model "best practices and programs" aspect of the toolkit will include, but not be limited to, those related to energy, water, land use, transportation, stormwater management, building reuse, and waste reduction. The policies and model codes of the toolkit will be drafted so they can be easily integrated into a jurisdiction's planning process.
- **Pursue outside funding sources:** A range of funding from state and federal agencies has been identified. WRCOG and local jurisdictions should pursue these and other emerging funding sources as a part of implementation efforts.

- **Implement and direct preferred city funding sources.** While city funding sources are limited in most cities, the city, when financially able, as a part of its budget process, could appropriate funding from general sources or make changes in its fee schedules, utility rates, and other sources as needed to support funding the implementation of the GHG reduction measures.
- **Create monitoring/tracking processes:** Local reduction measures will usually require program development, tracking, and/or monitoring. WRCOG will develop a tool to enable member jurisdictions to report their progress on a regular basis. GHG emissions reduction and adaptation measures could be sorted based on implementation timing, responsible agency, and level of success/completion. By allowing specific tasks to be checked off once each phase of the CAP is completed, jurisdictions will be able to save time reviewing reports, tracking data manually, and verifying that measures are fully completed. Each proposed measure included in the CAP will be built-in the database with information such as:
  - Program;
  - Responsibility;
  - Cost;
  - Potential Funding Sources;
  - Priority; and
  - Time Frame
- **Identify economic and health indicators to consider future funding options:** Identification and monitoring of economic and health indicators and trends, such as home prices, energy prices cost per kWh on solar installations, unemployment rates, or real wage increases, can guide the potential for funding local reduction measures through different financing mechanisms. WRCOG will work with the County of Riverside and other regional agencies to identify and develop measurable health outcome indicators for each CAP measure. Indicators will be used to identify health co-benefits of the CAP, establish priorities, develop target resources, create benchmarks, and track progress towards community objectives.

MONITORING AND REPORTING

Regular monitoring is important to ensure programs are functioning as they were originally intended. Early identification of effective strategies and potential issues would enable WRCOG and its member jurisdictions to make informed decisions on future priorities, funding, and scheduling. Moreover, monitoring provides concrete data to document the subregion's progress in reducing GHG emissions. WRCOG will work with local jurisdictions to develop a protocol for monitoring the effectiveness of emissions reduction programs as well as for undertaking emissions inventory updates.

- **Update GHG Inventory**: It is recommended that emissions be inventoried on a regular basis, including regular data collection in each of the primary inventory sectors (utility, regional VMT, waste, wastewater, and water), and compare to the baseline GHG emissions in 2010. A combined inventory effort could be conducted through WRCOG similar to the inventory preparation that was done for this Subregional CAP.
- **Track State Progress**: The Subregional CAP relies heavily on state-level measures. WRCOG may be responsible for tracking the state's progress on implementing state-level programs. Close monitoring of the real gains being achieved by state programs would allow WRCOG and participating jurisdictions to adjust its CAP, if needed.
- **Track Completion of GHG Reduction Measures**: Tracking of measures implemented as scheduled in the CAP, including progress reports on each measure, funding, and Savings will allow at least a rough attribution of gains when combined with regular GHG inventory updates.

- **Regular Progress Reports**: WRCOG will develop a formal framework for monitoring performance and tracking the progress of CAP implementation, including health and economic indicators. The framework may take the form of an annual report card, progress report, or similar type of tool that will help monitor the achievements, effectiveness and appropriateness of each performance measure. If annual reports, periodic inventories, or other information indicates that the GHG reduction measures are not as effective as originally anticipated, the CAP may need to be adjusted, amended, or supplemented. The report card (or similar) will be periodically (i.e., annually) presented to WRCOG's Executive Committee and various technical committees (Technical Advisory Committee, Planning Directors' Technical Advisory Committee, and Public Works Committee) as well as member jurisdictions and will focus on the status of agreed upon performance measures.

REDUCING GHG EMISSIONS AFTER 2020

In order to assess whether implementing this CAP achieves the state's long-term climate goals, one must look beyond 2020 to see whether the emissions reduction measures included for the 2020 milestone set the subregion on the trajectory toward future greater reductions in the post-2020 period. To date, there is no state or federal mandate requiring local action to reduce GHG emissions after 2020. AB 32 contains no post-2020 reduction target nor provides CARB with the authority to mandate compliance with a post-2020 target. SB 375, while it contains requirements for SCAG to promote reductions in the passenger and light duty vehicle sector, does not contain mandatory requirements for local jurisdictions to reduce their GHG emissions overall.

Governor Schwarzenegger's Executive Order (EO) S-3-05 calls for an 80% reduction below 1990 GHG emissions levels by 2050. However, an executive order is only binding on state agencies, and does not represent a legal mandate for local governments or the private sector. Nevertheless, S-03-05 contains a 2050 reduction target that is based on current scientific understanding of the reductions needed to avoid the effects of climate change that could result from unabated rise in anthropogenic GHG emissions. The 2050 target in EO-S-03-05 is equivalent to a 2050 statewide target of about 85 million metric tons of carbon dioxide equivalent (MT CO_2e) (total emissions), as compared to the 1990 level of 427 million MT CO2e.

The state is on track to achieve significant reductions by 2020 and has made some advancement towards deeper reductions by 2050, however, it is clear that our energy-intensive economy cannot achieve long-term growth unless we find greater efficiencies and low-carbon alternatives to powering our industries, homes, businesses, and transportation systems.Climate protection must be compatible with economic growth for successful implementation of GHG reduction strategies in California. The AB 32 Scoping Plan emphasizes clean energy, end-use efficiencies and clean vehicle standards to lower the state's emissions, outlining a mix of incentives and programs designed to smooth California's transition to a low-carbon economy. The 2013 update to the Scoping Plan points to the critical need for rapid market penetration of new technologies that reduce energy demand, electrify our vehicle fleets, and decarbonize electricity and fuel supplies.

Meanwhile, the Governor's Office of Planning and Research (OPR) recently released its first draft Environmental Goals and Policy Report (EGPR) in almost 35 years, entitled *California @ 50 Million:*

California's Climate Future[2] The central theme of that document is "growth in the context of climate change," emphasizing the massive challenge the state faces in meeting its long-term (2050) GHG emissions goal. As the report states, achieving the 2020 target is just one step toward long-term stabilization of the climate. Significant GHG reductions by 2050 can only be achieved through a low-carbon transformation of our economy and its supporting infrastructure and mobility systems, which in turn must be driven by focused investments and strong policy signals. This is the direction the state is headed, calling for commitments that will "send a strong signal of support for the innovators and entrepreneurs to drive technology and development to tackle the challenge of climate change." The EGPR indicates that climate change will influence nearly every aspect of the state's next phase of planning and investment for the future.

Full implementation and expansion of CARB's Scoping Plan to increase efforts beyond 2020 and expansion of the strategies studied in this CAP could put the subregion on a path toward achieving these required long-term reductions. While the specific measures needed to meet the 2050 goal are too far in the future to define in detail, one can examine the level of achievement that would be needed to keep the region on track through 2035. The measures needed to achieve longer-term targets are logical extensions of the programs recommended in the CARB Scoping Plan at the state level and the measures included in this CAP at the local level. By building on planned state efforts during this period and ramped up efforts in the local building energy and transportation (and other) sectors on the part of local governments, the subregion can be on track to reach a 2035 goal.

This CAP has not assumed any benefit from a cap-and-trade system by 2020, but when implemented, such a system may result in reductions beyond those currently anticipated in the CAP for 2020, and in additional reductions for 2030. The California Cap-and-Trade Program will particularly affect large stationary sources, which are excluded from local measures in this CAP to avoid duplication of state and federal regulatory efforts. In addition, the Cap-and-Trade Program will also affect electricity generation and transportation fuels, which may change energy prices, in turn potentially altering energy use and transportation behavior beyond that assumed for the various local measures included in this CAP.

WRCOG will continue to monitor developments at the national and state levels regarding implementation of GHG emissions reductions beyond 2020.

CEQA PROJECT REVIEW

Under the California Environmental Quality Act (CEQA), the effects of GHG emissions are considered a potentially significant environmental impact. In addressing climate change, CEQA provides a useful mechanism for local agencies to evaluate the environmental effects of new development, but may also create inefficiencies for both agency staff and applicants through repetitive assessments of small projects on an individual basis, rather than considering cumulative effects of future development and determining needed mitigation up front. The CEQA Guidelines recognize this, and include a provision for streamlining the analysis of projects that are consistent with a comprehensive plan for the reduction of GHG emissions (CEQA Guidelines, Section 15183.5).

[2] California @ $50 Million, September 2013. Available at opr.ca.gov/docs/EGPR_ReviewDraft.pdf.

To meet the requirements of CEQA Guidelines Section 15183.5(b)(1) a qualified CAP must:

1. Quantify existing and projected GHG emissions within the plan area
2. Establish a reduction target based on AB 32's provisions (a level where GHG emission are not cumulatively considerable)
3. Identify and analyze sector specific GHG emissions from Plan activities
4. Specify policies and actions (measures) that local jurisdictions will enact and implement over time to achieve specified reduction target
5. Establish a tool to monitor progress and amend if necessary
6. Adopt in a public process following environmental review

WRCOG is seeking funding to prepare the required environmental document in order for jurisdictions to adopt the Subregional CAP and utilize streamlining benefits. A Program EIR specifically for the Subregional CAP will be prepared explicitly with tiering in mind, by developing mitigation measures that are tailored to the WRCOG subregion environment, and will set performance metrics for future project impacts that cannot be analyzed at the program level.

A development project would demonstrate consistency with the CAP if it is consistent with the CAP assumptions regarding the amount and type of future development, and is consistent with the GHG reduction measures identified in the CAP. Projects consistent with the CAP, including conformance with any performance measures applicable to the project, would not require additional GHG emissions analysis and mitigation under CEQA Guidelines Sections 15064(h) and 1513.5(b)(2).[3] However, a project applicant can always choose to demonstrate compliance with the AB 32 target by preparing an individual project analysis that calculates GHG emissions as part of their CEQA documentation.

In a future phase of the work program, WRCOG will develop a checklist to assist with determining project consistency with the CAP. The checklist is intended to provide individual projects the opportunity to demonstrate that they are minimizing GHG emissions, while ensuring that new development achieves a proportion of emissions reduction consistent with what is assumed in the CAP. The project review checklist will screen projects for important GHG reduction measures that, when implemented, will facilitate and not impede the subregion's ability to meet its 2020 GHG emissions target. The checklist will apply to all projects subject to CEQA.

[3] If there is substantial evidence that the effects of a particular project may be cumulatively considerable, notwithstanding the project's compliance with the CAP, CEQA requires that an EIR be prepared.

Efficient use of land to meet sustainable energy needs

Rebecca R. Hernandez[1,2]*, Madison K. Hoffacker[1,2] and Christopher B. Field[1,2]

The deployment of renewable energy systems, such as solar energy, to achieve universal access to electricity, heat and transportation, and to mitigate climate change is arguably the most exigent challenge facing humans today[1–4]. However, the goal of rapidly developing solar energy systems is complicated by land and environmental constraints, increasing uncertainty about the future of the global energy landscape[5–7]. Here, we test the hypothesis that land, energy and environmental compatibility can be achieved with small- and utility-scale solar energy within existing developed areas in the state of California (USA), a global solar energy hotspot. We found that the quantity of accessible energy potentially produced from photovoltaic (PV) and concentrating solar power (CSP) within the built environment ('compatible') exceeds current statewide demand. We identify additional sites beyond the built environment ('potentially compatible') that further augment this potential. Areas for small- and utility-scale solar energy development within the built environment comprise 11,000–15,000 and 6,000 TWh yr^{-1} of PV and CSP generation-based potential, respectively, and could meet the state of California's energy consumptive demand three to five times over. Solar energy within the built environment may be an overlooked opportunity for meeting sustainable energy needs in places with land and environmental constraints.

Technology, economics and environmental values are decisive factors in identifying areas most compatible for renewable energy development, including solar energy systems. Environmental values are underlying determinants of attitudes, behaviours and beliefs about the environment[8,9]. These attitudes, behaviours and beliefs can, in turn, guide decisions concerning which ecosystems and human assets to protect. They can also inform the way that the emphasis on different kinds of impact changes with the scale of the solar energy deployment[10,11]. Solar energy systems integrated within the built environment have several advantages if protecting ecosystems and their services are priority values. They confer the lowest environmental and land-use and land-cover change impacts[6,12], reduce energetic losses from and load on transmission, and are co-located with the energy needs of a growing population expected to be concentrated entirely in urban areas (that is, 62% by 2035; refs 13,14). Such installations are modular in their capacity, ranging from small-scale (<1 MW) to utility-scale (≥1 MW), and can use existing infrastructure within the built environment (for example, residential rooftops, commercial rooftops).

Utility-scale solar energy (USSE) systems are uniquely advantageous with their large economy of scale, compatibility with a wide range of sites, and numerous environmental co-benefit opportunities[6]. With a land-use efficiency of 35 W m^{-2} at a capacity factor of 0.20, a single terawatt of USSE capacity scales to 142,857 km^2 (roughly the area of the state of New York)[12], providing challenges for the integration of potentially massive projects into complex and fragmented landscapes. Criteria for siting USSE can be diverse, emphasizing, for example, warehouse rooftops, degraded lands, deserts, or sites remote from human populations. However, resource constraint and opportunity modelling can be used to assess value-based trade-offs and technical potential at large spatial scales where energy development is needed[7,15–17].

The state of California (USA) has been a long-standing model system for understanding the land–energy–environment nexus owing to its early and aggressive adoption of renewable energy systems (predominately wind and geothermal), vast land area (larger than 189 countries, for example, Germany, the Philippines and Zimbabwe), large population (that is, 38 million) and economy (that is, the eighth largest in the world), vulnerability to climate change, and sensitive ecosystems[12,18,19]. Abundant solar resources and diverse storage technology options suggest that small- and USSE technologies within the built environment and in places that minimize environmental impacts may be underutilized within California's current resource mix. Here, we test the hypothesis that land, energy and environmental compatibility can be achieved with small-scale solar energy and USSE within landscapes that are already managed for human uses in the state of California (USA), a global solar energy hotspot[6,20–22].

To determine whether land, energy and environmental compatibility can be achieved within existing developed areas in the state of California, we developed the Carnegie Energy and Environmental Compatibility (CEEC) model (Supplementary Methods) to achieve four objectives. First, we seek to quantify the capacity-based technical potential (that is, satellite-based estimates of PV and CSP technologies operating at their full, nominal capacity over 0.1° surface cells). Second, we seek to quantify the (accessible) generation-based technical potential (that is, realized potential incorporating a satellite-based capacity factor model with 0.1 × 0.1° surface resolution) for PV and CSP. Owing to California's limited water resources, we model dry-cooled CSP parabolic trough technology. Photovoltaic technologies included three subtypes: fixed tilt (TILT25), single-axis (AX1FLAT), dual-axis (AX2). Third, we seek to create a compatibility index (that is, 'compatible', 'potentially compatible' and 'incompatible' areas) to categorize and quantify land resources meeting land, energy and environmental compatibility for solar energy infrastructure. Last, we seek to determine to what extent energy and climate change goals can be met therein.

California has a total area of over 400,000 km^2 with a solar resource of 881,604 TWh yr^{-1} and 1,000,948 TWh yr^{-1} for PV

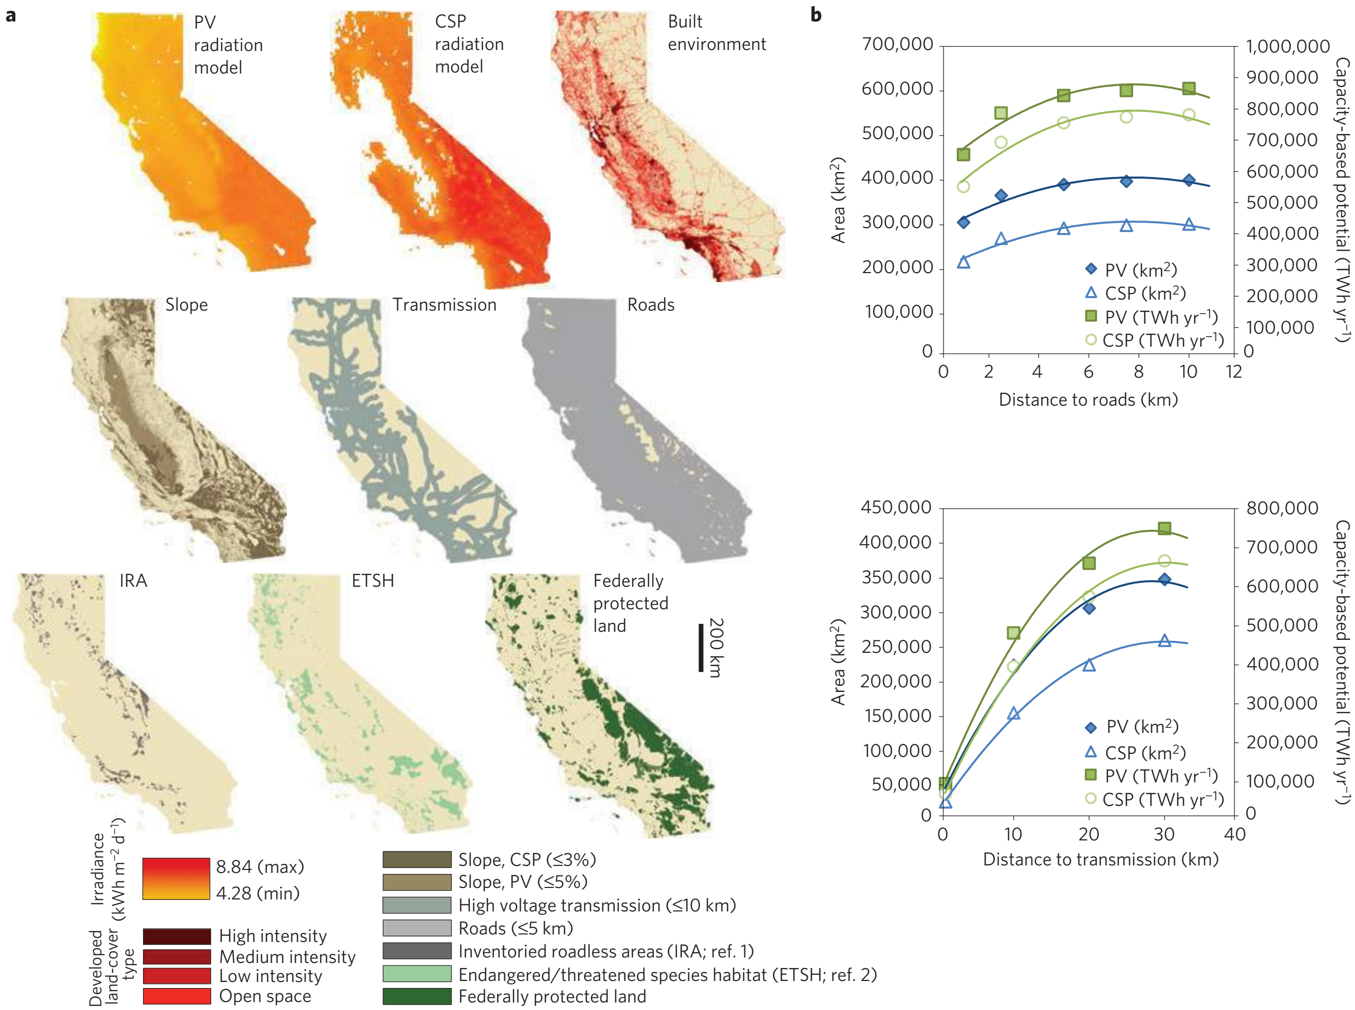

Figure 1 | Selected model inputs and sensitivity analyses. a, Maps showing resource opportunities (that is, PV and CSP radiation models, built environment land-cover types (high, medium, low intensity, and open space)) and resource constraints including slope, proximity to transmission, proximity to roads, inventoried roadless areas, endangered and threatened species habitat, and federally protected land (for greater detail, see Supplementary Section 2). **b**, Solar resource area (km^2) and technical potential (TWh yr^{-1}) as a function of distance to existing high-voltage transmission ($\geq$69 kV; 38,835 km total) and roads (700,914 km total). Trendlines are the best fit (polynomial), where the saturation point (slope = 0) is the mean distance between transmission corridors ($\mu \approx 30$ km) and between roads ($\mu \approx 8$ km). Technical potential increases with increasing distance from existing transmission corridors and road infrastructure up to approximately 30 km and 8 km, respectively ($r^2_{PV} = 0.99714$; $r^2_{CSP} = 0.99901$; $r^2_{PV} = 0.98499$; $r^2_{CSP} = 0.98768$). Last, incremental increases in capacity are greatest in the kilometre closest to existing transmission or roads and decrease as distance increases from these elements.

and CSP, respectively (Table 1 and Fig. 1a). However, CSP is economically maximized where direct normal irradiance (DNI) is 6 kWh m^{-2} d^{-1} or greater. California comprises approximately 310,000 km^2 of land where solar resources meet this criterion, conferring a theoretical capacity-based CSP potential of 795,973 TWh yr^{-1}. Although PV systems can be deployed on water, conferring reduced evaporation as a co-benefit (for example, floatovoltaics, Supplementary Table 1), we excluded open bodies of water and perennial ice and snow (Supplementary Section 1).

Collectively, 8.1% of all terrestrial surfaces in California, particularly along the west coast, have been modified by humans ('developed'; 32,675 km^2) and are classified as: high intensity, medium intensity, low intensity, and open space[23]. On the basis of our hypothesis about the adequacy of the areas modified by humans, we defined these developed areas as the 'compatible' opportunity space for solar energy generation (Fig. 1a and Supplementary Table 1). We excluded CSP potential from the built environment classified as high and medium density, because CSP schemes are, at this time, not deployed in such locations. More than a third of these developed areas (12,372 km^2) are urban open space, which is a matrix of vegetation with some constructed infrastructure (<20% impervious surfaces) as is commonly found in large-lot single-family residential units, parks, golf courses and vegetated landscape elements. Within the urban open space land-cover type, the total capacity-based PV (for example, ground or rooftop mounted) and CSP generation is 25,902 and 16,680 TWh yr^{-1}, respectively (Supplementary Table 1). Low- and medium-intensity environments are mostly single-family housing units and together encompass about as much land (13,336 km^2) as urban open space. The area of land potentially available for PV development is approximately equal in low- and medium-intensity built environments, and PV capacity-based generation (for example, ground or rooftop mounted) in these areas is comparable at 13,749 TWh yr^{-1} and 14,204 TWh yr^{-1}, respectively. PVs in high intensity developed land (for example, mostly rooftop modules) have a capacity-based generation potential of 3,244 TWh yr^{-1}. CSP in low-intensity developed land has a capacity-based generation potential of 7,268 TWh yr^{-1}, encompassing 2,942 km^2.

To identify 'potentially compatible' development opportunities beyond these 'compatible', developed areas, we identified

USSE installations necessitate parcels large enough for a 1 MW power plant after ref. 12. CSP schemes are all utility-scale. *Reported area and solar potential do not include areas of open water, perennial ice and snow, and for CSP areas where DNI is $<6\,kWh\,m^{-2}\,d^{-1}$. †Slope must be ≤5% and ≤3% for PV and CSP, respectively. ‡Endangered and threatened species habitat. §Fixed tilt (TILT25), single-axis (AX1FLAT), dual-axis (AX2).

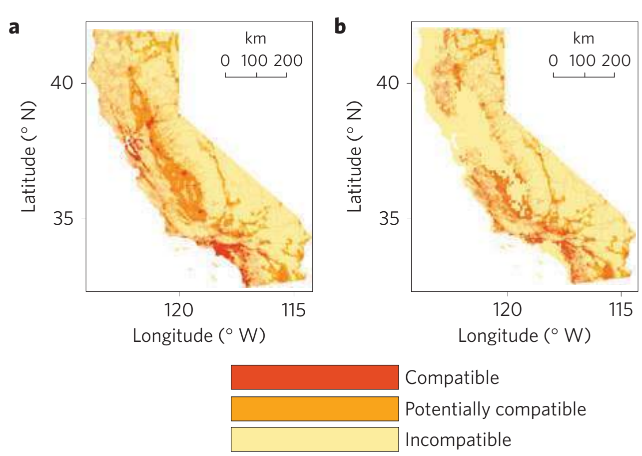

Figure 2 | Compatibility matrices for PV and CSP. a,**b**, Compatible (red polygons), potentially compatible (orange polygons), and incompatible (yellow polygons) areas for PV (**a**) and CSP (**b**) energy systems within the state of California. Compatible areas are restricted to areas within the built environment (that is, developed land-cover type).

topography most suitable for solar energy systems; where slopes are 3% and 5% or less, for CSP and PV installations, respectively. Next, we prioritized a 10 km development zone on each side of high-voltage (≥69 kV; 38,835 km total) transmission lines, and prioritized a 5 km development zone along each side of all roads of interest (700,914 km total). Last, we identified and excluded 20,193 km^2 of ecologically sensitive, federally protected habitat (Fig. 1a and Supplementary Table 1 and Supplementary Section 2). Such constraints, which are adjustable in the model, can be set to manage economic costs and environmental values associated with construction activities and materials (Methods and Supplementary Section 1.3). We qualify these areas as 'potentially compatible', recognizing that local-scale constraints and regulations beyond the scope of this study may render such areas 'incompatible'[20].

Slope and access to transmission had the greatest absolute effect on the compatibility of land and technical potential. For CSP, DNI was also an important constraint (Supplementary Table 2 and Supplementary Section 1.3). Owing to economic and environmental costs of high-voltage and long-distance transmission and road construction, we performed a sensitivity analysis to determine the effect of distance to transmission and roads on area and capacity-based technical potential for CSP and PV technologies, and to determine mean distance between transmission corridors and be-

*2020 RPS data for PVs represent potential for areas compatible for all schemes: small- and utility-scale. †Fixed tilt (TILT25), single-axis (AX1FLAT), dual-axis (AX2). ‡Total California state energy usage in 2011 was 2,291 TWh from, in order of increasing consumption: coal, other petroleum, nuclear electric power, distillate fuel oil, jet fuel, net interstate flow of electricity, motor gasoline, hydroelectric power, other renewables, biomass, natural gas, residual fuel, and liquefied petroleum gas. Source: Supplementary Table 4.

tween roads. Relationships between distance to infrastructure and area (or capacity-based potential) are nonlinear and best-fit equations are polynomial; that is, incremental increases in capacity are greatest in the kilometre closest to existing transmission or roads and decrease as distance increases from these elements. Technical potential increases with increasing distance from existing transmission corridors and road infrastructure up to approximately 30 km and 8 km, respectively ($r^2_{PV} = 0.99714$; $r^2_{CSP} = 0.99901$; $R^2_{PV} = 0.98499$; $R^2_{CSP} = 0.98768$; Fig. 1b).

In total, California has more than 27,286 km^2 and 6,274 km^2 of 'compatible' land for PV and CSP solar energy development, respectively (Table 1 and Fig. 2). Areas within California that are considered 'potentially compatible' amount to a total of 55,733 km^2 for PV systems and 27,215 km^2 for CSP technology. These areas constitute 174,148 TWh yr^{-1} of PV and 84,951 TWh yr^{-1} of CSP capacity-based potential. Utility-scale PV systems can be developed in 96% of these areas, that is, 77,761 km^2 in area and 166,540 TWh yr^{-1} of capacity-based potential. Next, we calculated realized generation-based solar energy potential for fixed tilt (TILT25), one-axis tracking (AX1FLAT), and two-axis tracking (AX2) PV installations and for parabolic trough CSP installations for all resource opportunities and constraints (Table 1). After integrating each resource opportunity and constraint (Supplementary Table 3), total realized generation-based potential in 'compatible' areas for development ranges from 10,617 to 14,612 TWh yr^{-1} for PV technologies and is 5,947 TWh yr^{-1} for CSP (Table 1). The generation-based potential for PV installations constructed at the utility-scale in 'compatible' areas ranges from 8,565 to 11,744 TWh yr^{-1}. 'Potentially compatible' areas have approximately three times the generation-based potential for PV and CSP technologies as 'compatible' areas.

California's dynamic renewable energy landscape is driven, in part, by legislation and renewable portfolio standards (RPS) that, for example, require renewables to serve 33% of retail electricity load by 2020—enacted as a 'floor' rather than 'ceiling'[22]—and greenhouse-gas emissions 80% below 1990 levels by 2050. In 2012, 22% of retail electricity sales were derived from renewable sources[24] and total energy consumption was 2,231 TWh where non-biomass, non-hydro renewable energy consumption comprises 6.7% (153.3 TWh; Supplementary Table 4). On the basis of the RPS and related legislation (for example, California Global Warming Solutions Act), California state and governmental agencies are directed by law to take all appropriate actions to facilitate the timely realization of RPS requirements including siting, permitting, procurement and transmission infrastructure needs[22].

Framing the realized, generation-based potential of solar energy technologies within the context of policy goals is a useful exercise for weighing its potential contribution to California's current renewable energy mix. We calculated the number of times over that PV (small- and utility-scale schemes) and CSP energy systems could meet the 2020 renewable net short (difference between current renewable energy production and target levels) for three different demand scenarios: low, medium and high. Total projected statewide retail sales demand is 292.6, 297.9 and 305.3 TWh. Net short demand is 35.3, 41.3 and 47.0 TWh for these respective scenarios[22,25]. Within 'compatible' areas, PV generation could meet the state of California's 33% renewable energy goal 301 (low demand), 257 (medium demand) and 226 (high demand) times over with fixed tilt (TILT25) modules. CSP generation in 'compatible' areas could meet the state's goal 436 (low demand), 373 (medium demand) and 328 (high demand) times over (Table 2).

Comparing the realized, generation-based potential of solar energy technologies to the state of California's total energy consumption further underscores the value of solar. The quantity of energy that could be produced solely within the built environment (that is, 'compatible'; conferring the least land-use or land-cover change) exceeds the energy needed to meet the state's total energy consumption (Table 2). Potential realized PV generation (small- and utility-scale) within 'compatible' areas is 4.8, 5.8 and 6.5 times greater than current demand using fixed tilt, single-axis and dual-axis modules. CSP generation within 'compatible' areas is 2.7 times greater than current total energy demand.

The built environment is conducive to high levels of solar energy development. The authors of ref. 26 estimate that 20–27% of all United States residential rooftop space and 60–65% of commercial rooftops are favourable for PV systems, depending on climate and accounting for roof material and structure, shading and orientation. For example, the 121 km^2 city of San Francisco has 23 MW of PV capacity producing an estimated 31,113 MW h yr^{-1} on residential and commercial rooftops and other features within the built environment[27]. At present, 11% and 44% of CSP installations are sited in 'compatible' and 'potentially compatible' areas, respectively, corroborating their feasibility within these land-cover types (R.R.H., unpublished data). Our model assumes that deployed CSP will use dry-cooling technology and therefore water resource constraints may pose unanticipated trade-offs for wet-cooled systems. Last, issues of cost, intermittency and storage, and local siting opposition can impact the scale of deployment in California and elsewhere.

Our study identified a diverse suite of sites in California that could be candidates for small- and USSE development, focusing on the generation potential of well-suited areas within the built environment and additional land that combines high-quality solar resources with proximity to existing roads and transmission lines. These areas provide options for minimizing environmental impacts associated with a large-scale transition to a renewable energy mix where solar energy technologies serve as a growing source alongside increasingly flexible, and optimized transmission integration[10,11,28,29]. California's energy stakeholders, developers and policymakers can use our results to inform development decisions, and the multiple-criteria model, CEEC, can be implemented in other regions.

Methods

Full details are in Supplementary Methods. The CEEC model is an adaptable multiple-criteria model that calculates technical solar energy potential for areas of interest, incorporating user-specified development opportunities and resource constraints. For this study, we applied the CEEC model for California (USA), integrating satellite-based solar radiation estimates with hydrologic, socioeconomic, topographic, energy infrastructure, and ecological opportunities and constraints (for data sources, see Supplementary Table 5). Model outputs include intermediate products of interest (for example, land area and technical potential) as well as a spatially explicit compatibility index ('compatible', 'potentially compatible', 'incompatible'). With a spatial resolution of $0.1 \times 0.1°$, CEEC calculated capacity-based technical potential for PV and CSP (that is, energy output for systems operating at their full, nominal capacity), and generation-based technical potential (that is, realized potential incorporating a capacity factor model) for CSP (dry-cooled, parabolic trough) and for PV technology subtypes (that is, fixed tilt, single-axis, dual-axis).

Radiation estimates were from the National Renewable Energy Lab (NREL) Diffuse/Direct Normal Irradiation Model and the NREL Direct Normal Irradiation Model. These estimates incorporate geostationary weather satellite imagery, daily snow cover data, and monthly atmospheric water vapour, trace gas and aerosol data as well as ground measurement validation (1998–2005) to output annual average daily total solar energy at a spatial resolution of $0.1 \times 0.1°$ ($\sim 10 \times 10$ km).

Capacity factors were from the NRELPV Watts model[30] for three PV system types: fixed tilt, south-facing with a 25° tilt (TILT25); one-axis tracking, rotating east–west with a ±45° maximum tracking angle (AX1FLAT); and two-axis tracking, rotating east–west and north–south of the sun across the horizon (AX2). We used five direct normal irradiance classes of capacity factors for a parabolic trough CSP system (Supplementary Table 6).

Features assessed with spatially explicit mapping included bodies of open water and perennial ice and snow; space within the built environment; topography suitable for solar energy systems, that is, where slopes are 3% and 5% or less for CSP and PV installations, respectively; 10-km-wide corridors on each side of high-voltage (≥69 kV) transmission lines; 5-km-wide corridors along each side of all roads; and ecologically sensitive and protected habitat (Supplementary Methods).

To better understand the amount of energy potential available within California and the CEEC Model Compatibility Matrix areas, we calculated the ratio of PV and CSP capacity and generation-based technical potential to the net short needed for meeting the state's RPS, defined as requiring renewables to serve 33% of retail electricity load by 2020 using the following equation:

potential to meet RPS goal (times over) = solar energy technical potential / (net short = difference between current renewable energy production and target levels)

Renewable net short is calculated for upper, mid-, and lower bound cases as:

net renewable net short (TWh) = ([projected retail electricity sales − energy efficiency programs − combined Heat & power customer services − self-generation additions − other demand reduction programs] × policy goal percentage) − generation from existing eligible renewable facilities likely to be generating in 2020.

Estimates of renewable net short depend on assumptions of future energy supply and demand and are, therefore, subject to change over time (for example, reductions in electricity retail sales will reduce renewable net short)[22].
