\hline 2 & Winchester Road at Pourroy Road/Abelia Street & Signalized & HCM 2010 & WB Left & 0.659 & 14.7 & B \\
\hline 3 & Winchester Road at Whisper Heights Parkway/Pourroy Road & Signalized & HCM 2010 & EB Left & 0.699 & 16.9 & B \\
\hline 4 & Winchester Road at Jean Nicholas Road/Skyview Road & Signalized & HCM 2010 & SB Left & 0.796 & 13.8 & B \\
\hline 5 & Winchester Road at Max Gillis Boulevard/Thompson Road & Signalized & HCM 2010 & WB Left & 1.308 & 165.2 & F \\
\hline 6 & Winchester Road at Benton Road & Signalized & HCM 2010 & WB Right & 1.199 & 87.0 & F \\
\hline 7 & Pat Road at Pourroy Road & Two-way stop & HCM 2010 & NB Left & 0.018 & 10.3 & B \\
\hline 8 & Jean Nicholas Road at Elliot Road & Two-way stop & HCM 2010 & WB Left & 0.004 & 9.4 & A \\
\hline 9 & Pourroy Road at Skyview Road & All-way stop & HCM 2010 & EB Left & & 11.2 & B \\
\hline 10 & Pourroy Road at Thompson Road & All-way stop & HCM 2010 & NB Thru & & 17.3 & C \\
\hline
\end{tabular}

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. for all other control types, they are taken for the whole intersection.

Intersection Analysis Summary
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline ID & Intersection Name & Control Type & Method & Worst Mvmt & V/C & Delay (s/veh) & LOS \\
\hline 1 & Winchester Road at Keller Road & Signalized & HCM 2010 & SB Left & 0.973 & 8.9 & A \\
\hline 2 & Winchester Road at Pourroy Road/Abelia Street & Signalized & HCM 2010 & WB Left & 0.685 & 15.2 & B \\
\hline 3 & Winchester Road at Whisper Heights Parkway/Pourroy Road & Signalized & HCM 2010 & EB Left & 0.727 & 17.8 & B \\
\hline 4 & Winchester Road at Jean Nicholas Road/Skyview Road & Signalized & HCM 2010 & SB Left & 0.718 & 14.9 & B \\
\hline 5 & Winchester Road at Max Gillis Boulevard/Thompson Road & Signalized & HCM 2010 & WB Left & 1.360 & 184.7 & F \\
\hline 6 & Winchester Road at Benton Road & Signalized & HCM 2010 & WB Right & 1.247 & 98.3 & F \\
\hline 7 & Pat Road at Pourroy Road & Two-way stop & HCM 2010 & NB Left & 0.018 & 10.3 & B \\
\hline 8 & Jean Nicholas Road at Elliot Road & Two-way stop & HCM 2010 & WB Left & 0.110 & 14.9 & B \\
\hline 9 & Pourroy Road at Skyview Road & All-way stop & HCM 2010 & EB Left & & 11.4 & B \\
\hline 10 & Pourroy Road at Thompson Road & All-way stop & HCM 2010 & NB Thru & & 18.8 & C \\
\hline
\end{tabular}

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. for all other control types, they are taken for the whole intersection.

\section*{Appendix}

This page intentionally left blank.```

[^0]:    -     - Project Boundary

[^1]:    1 Forbs are flowering plants lacking woody stems, other than grasses.

[^2]:    2 Separate consultation letters respecting tribal cultural resources were sent by the Riverside County Planning Department.
    3 An isolate is fewer than 3 isolated artifacts; and does not contain enough associated artifacts to form an archaeological site. A pictograph is rock art painted on stone (compare to petroglph, which is carved into stone).
    4 Olivella is a genus of marine snails.

[^3]:    5 The Potential Fossil Yield Classification system is a five-point scale from very low potential to contain paleontological resources (Class 1) to very high potential (Class 5). Riverside County assigns four categories of paleontological sensitivity: High (with two subcategories, High A and High B); Low, and Undetermined.

[^4]:    6 The Irvingtonian and Rancholabrean ages are components of a chronology for fossil North American land mammals. The Irvingtonian Age extend from about 1.8 mybp to $240,000 \mathrm{ybp}$; the Rancholabrean extends from about 240,000 to 11,000 ybp.

[^5]:    7 Water vapor $\left(\mathrm{H}_{2} \mathrm{O}\right)$ is the strongest GHG and the most variable in its phases (vapor, cloud droplets, ice crystals). However, water vapor is not considered a pollutant, but part of the feedback loop rather than a primary cause of change.
    8 Black carbon contributes to climate change both directly, by absorbing sunlight, and indirectly, by depositing on snow (making it melt faster) and by interacting with clouds and affecting cloud formation. Black carbon is the most strongly light-absorbing component of PM emitted from burning fuels. Reducing black carbon emissions globally can have immediate economic, climate, and public health benefits. California has been an international leader in reducing emissions of black carbon, with close to 95 percent control expected by 2020 due to existing programs that target reducing PM from diesel engines and burning activities (CARB 2014). However, state and national GHG inventories do not yet include black carbon due to ongoing work resolving the precise global warming potential of black carbon. Guidance for CEQA documents does not yet include black carbon.
    9 Life cycle emissions include indirect emissions associated with materials manufacture. However, these indirect emissions involve numerous parties, each of which is responsible for GHG emissions of their particular activity. The California Resources Agency, in adopting the CEQA Guidelines Amendments on GHG emissions found that lifecycle analyses was not warranted for projectspecific CEQA analysis in most situations, for a variety of reasons, including lack of control over some sources, and the possibility of double-counting emissions (see Final Statement of Reasons for Regulatory Action, December 2009). Because the amount of materials consumed during the operation or construction of the proposed project is not known, the origin of the raw materials purchased is not known, and manufacturing information for those raw materials are also not known, calculation of life cycle emissions would be speculative. A life-cycle analysis is not warranted (OPR 2008).
    10 Particulate matter emissions, which include black carbon, are analyzed in Section 3.2, Air Quality. Black carbon emissions have sharply declined due to efforts to reduce on-road and off-road vehicle emissions, especially diesel particulate matter. The State's existing air quality policies will virtually eliminate black carbon emissions from on-road diesel engines within 10 years (CARB 2016).

[^6]:    11 This threshold is based on a combined threshold of 3,000 MTCO2e for all land use types, proposed by SCAQMD's Working Group based on a survey of the GHG emissions inventory of CEQA projects. Approximately 90 percent of CEQA projects' GHG emissions inventories exceed 3,000 MTCO2e, which is based on a potential threshold approach cited in CAPCOA's white paper, "CEQA and Climate Change."

[^7]:    12 This map—which was prepared in 2009—also shows a Very High Fire Hazard Severity Zone on two parcels about 150 feet north of the west end of the site; however, those two parcels consist of rural residential uses, some ornamental vegetation, and bare land, and the classification does not appear to reflect current conditions.
    ${ }^{13}$ Automatic aid is assistance dispatched automatically by contractual agreement between two communities or fire districts. Mutual aid, by comparison, is arranged case by case.

[^11]:    16 That is, the second line item in the table for Winchester Road, south of Keller Road, shows a predicted future level of 76.5 dBA CNEL. With line-source spreading loss attenuation from the 50 -foot reference distance to the envisioned school buildings, this level would be reduced to approximately 69 dBA CNEL.
    17 "Conditionally acceptable" means that a detailed acoustical study for sound insulation features is needed for county and state design approvals.

[^12]:    18 Per information in the Traffic Impact Analysis for Temecula Valley Charter School prepared by PlaceWorks, 2016, in Appendix H.
    19 Audible increases in general community noise levels usually refer to a change of 3 dB or more since this level has been found to be the threshold of perceptibility in exterior environments.

[^13]:    20 As sound energy travels outward from the source, spreading loss accounts for a 6 dB decrease in noise level. Soft ground and atmospheric absorption effects can decrease this by an additional 1.5 dB .

[^14]:    21 Estimated to be approximately 10 to 20 percent of the overall construction duration.

[^15]:    22 Automatic aid is assistance dispatched automatically by contractual agreement between two communities or fire districts. Mutual aid, by contrast, is arranged case by case.

[^21]:    Emission Rates, per source, from Source Emissions Inventories (Appendix A).
    ${ }^{2}$ AERMOD Output (Appendix C) at the maximum exposed receptor (MER) are based on unit emission rates for emission sources ( $1 \mathrm{~g} / \mathrm{s}$ per source).

[^22]:    ${ }^{1} \mathrm{PM}_{2.5}$ is the main cause of reduced visibility (haze) in parts of the United States.

[^23]:    2 Particulate matter can be carried over long distances by wind and then settle on ground or water, making lakes and streams acidic; changing the nutrient balance in coastal waters and large river basins; depleting the nutrients in soil; damaging sensitive forests and farm crops; and affecting the diversity of ecosystems.
    ${ }^{3}$ Particulate matter can stain and damage stone and other materials, including culturally important objects such as statues and monuments.
    ${ }^{4}$ CARB approved the SCAQMD's request to redesignate the SoCAB from serious nonattainment for $\mathrm{PM}_{10}$ to attainment for PM $\mathrm{PM}_{10}$ under the National AAQS on March 25, 2010, because the SoCAB has not violated federal 24-hour $\mathrm{PM}_{10}$ standards during the period from 2004 to 2007. In June 2013, the EPA approved the State of California's request to redesignate the $\mathrm{PM}_{10}$ nonattainment area to attainment of the $\mathrm{PM}_{10}$ National AAQS, effective on July 26, 2013.
    ${ }^{5}$ Source-oriented monitors record concentrations of lead at lead-related industrial facilities in the SoCAB, which include Exide Technologies in the City of Commerce; Quemetco, Inc., in the City of Industry; Trojan Battery Company in Santa Fe Springs; and Exide Technologies in Vernon.
    Monitoring conducted between 2004 through 2007 identified that the Trojan Battery Company and Exide Technologies exceed the federal standards (SCAQMD 2012).

[^24]:    ${ }^{6}$ SCAQMD's Air Quality Significance Thresholds are current as of March 2011 and can be found here: http://www.aqmd.gov/ceqa/hdbk.html.

[^25]:    ${ }^{7}$ The four intersections were: Long Beach Boulevard and Imperial Highway; Wilshire Boulevard and Veteran Avenue; Sunset Boulevard and Highland Avenue; and La Cienega Boulevard and Century Boulevard. The busiest intersection evaluated (Wilshire and Veteran) had a daily traffic volume of approximately 100,000 vehicles per day with LOS E in the morning peak hour and LOS F in the evening peak hour.

[^26]:    ${ }^{8}$ Water vapor $\left(\mathrm{H}_{2} \mathrm{O}\right)$ is the strongest GHG and the most variable in its phases (vapor, cloud droplets, ice crystals). However, water vapor is not considered a pollutant, but part of the feedback loop o rather than a primary cause of change.
    ${ }^{9}$ Black carbon contributes to climate change both directly, by absorbing sunlight, and indirectly, by depositing on snow (making it melt faster) and by interacting with clouds and affecting cloud formation. Black carbon is the most strongly light-absorbing component of particulate matter ( PM ) emitted from burning fuels such as coal, diesel, and biomass. Reducing black carbon emissions globally can have immediate economic, climate, and public health benefits. California has been an international leader in reducing emissions of black carbon, with close to 95 percent control expected by 2020 due to existing programs that target reducing PM from diesel engines and burning activities (CARB 2014). However, state and national GHG inventories do not yet include black carbon due to ongoing work resolving the precise global warming potential of black carbon. Guidance for CEQA documents does not yet include black carbon.

[^27]:    ${ }^{10} \mathrm{CO}_{2}$-equivalence is used to show the relative potential that different GHGs have to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. The global warming potential of a GHG is also dependent on the lifetime, or persistence, of the gas molecule in the atmosphere.

[^28]:    ${ }^{11}$ CARB defines BAU in its Scoping Plan as emissions levels that would occur if California continued to grow and add new GHG emissions but did not adopt any measures to reduce emissions. Projections for each emission-generating sector were compiled and used to estimate emissions for 2020 based on 2002-2004 emissions intensities. Under CARB's definition of BAU, new growth is assumed to have the same carbon intensities as was typical from 2002 through 2004.

[^29]:    12 The Scoping Plan references a goal for local governments to reduce community GHG emissions by 15 percent from current (interpreted as 2008) levels by 2020 , but it does not rely on local GHG reduction targets established by local governments to meet the state's GHG reduction target of AB 32 .

[^30]:    ${ }^{13}$ SB 350 also sets a goal of increasing energy efficiency in existing buildings by 50 percent by 2030.
    ${ }^{14}$ The green building standards became mandatory in the 2010 edition of the code.

[^31]:    ${ }^{15}$ The Governor's Office of Planning and Research recommendations include a requirement that such a plan must be adopted through a public review process and include specific requirements that reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable, notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

[^32]:    ${ }^{16}$ It should be noted that the Working Group also considered efficiency targets for 2035 for the first time in this Working Group meeting.
    ${ }^{17}$ SCAQMD took the 2020 statewide GHG reduction target for land use only GHG emissions sectors and divided it by the 2020 statewide employment for the land use sectors to derive a per capita GHG efficiency metric that coincides with the GHG reduction targets of AB 32 for year 2020.

    18 Life cycle emissions include indirect emissions associated with materials manufacture. However, these indirect emissions involve numerous parties, each of which is responsible for GHG emissions of their particular activity. The California Resources Agency, in adopting the CEQA Guidelines Amendments on GHG emissions found that lifecycle analyses was not warranted for projectspecific CEQA analysis in most situations, for a variety of reasons, including lack of control over some sources, and the possibility of double-counting emissions (see Final Statement of Reasons for Regulatory Action, December 2009). Because the amount of materials consumed during the operation or construction of the proposed project is not known, the origin of the raw materials purchased is not known, and manufacturing information for those raw materials are also not known, calculation of life cycle emissions would be speculative. A life-cycle analysis is not warranted (OPR 2008).
    ${ }_{19}$ Particulate matter emissions, which include black carbon, are analyzed in Section 5.2, Air Quality. Black carbon emissions have sharply declined due to efforts to reduce on-road and off-road vehicle emissions, especially diesel particulate matter. The State's existing air quality policies will virtually eliminate black carbon emissions from on-road diesel engines within 10 years (CARB 2016c).
